The career of an officer in the English navy begins with his nomination as a naval cadet. These nominations are made at the will of the admiralty, and number about 40 for each class or half year. They join the training ship Britannia for two years' study after a medical and mental examination, the latter including writing, reading, arithmetic, elementary algebra and geometry, Latin and French. The course of study embraces mathematics as far as spherical trigonometry, navigation and nautical astronomy, and a great deal of practical work. At the end of this course the cadets, who are then between fourteen and fifteen, are detailed for the cruising men-of-war, where their instruction is kept up under a naval instructor. Upon the return of a cadet to England after five years' service afloat, including the time aboard the Britannia, he goes to the Royal Naval College at Greenwich for six months. Here there is a very extensive scientific course, a portion of which is required, the rest being voluntary. The discipline of the college is rather that of a university than of a naval establishment. Such restrictive regulations as exist bear chiefly upon the younger students. The general method of instruction, like that of the Britannia, is a system of informal exposition, study and practice with the instructors. The only recorded test of general results, upon which certificates are given, is the final examination. In addition to these institutions, there are special schools of gunnery and torpedoes for advanced training.

In France they have a polytechnic school, naval school, training school for line officers, engineers' training school, medical, torpedo, machinists', gunnery and artillery schools. The polytechnic is designed for the preliminary training of candidates for all scientific branches of the public service, and furnishes a certain number of midshipmen to the navy every year. The naval school at which nearly all the cadets of the line receive their education is on board the old wooden line-of-battle ship Borda, at Brest. The examination for admission is one of the most important parts of the French system, on account of its scope, its method, and its close relation to the system of public instruction in the country. It is competitive in character, its requirements are high and extend over a considerable range of subjects. The examination is written and oral, and to save the candidates the expense of a long journey, the simple method is adopted of having different centres of examination, at any one of which candidates may present themselves. The age of entry is between the limits of 14 and 17. French, Latin, English, history, geography, mathematics from arithmetic to descriptive geometry, and sketching form the examination. This high standard and the competitive examination have not so far been found productive of cramming, but are the natural outcome of the course pursued at the schools throughout the country. The course is two years. A few books of reference are used, but text-books are almost unknown, and recitations, in the ordinary sense, do not exist, the main feature of the system being the lecture. After the annual examination merit-rolls are made out for the year and for the course. Upon the latter depends the seniority of the graduates as cadets or *aspirants*. On passing the examinations, which embrace subjects of a professional, historical, mathematical, geographical and scientific nature, the graduates become midshipmen, and are sent to sea in cruising ships. They remain in this grade two years, making a total of five years from their admission to the service to their promotion to the grade of ensign. This period embraces a year spent in the training school aboard the practice ship. The engineers' school is a school of ship and engine design and construction, and it corresponds in a general way to the advanced classes for constructors and designing engineers in the Royal Naval College at Greenwich. The medical schools are three in number, at Brest, Rochefort and Toulon. The course of study is two years, and the students after passing the examinations become assistant surgeons or assistant pharmacists. The torpedo, gunnery and artillery schools are for the practical and theoretical education of those officers who incline to become specialists. The machinists' school is for the training of the warrant and petty officers of this branch for higher grades, and the selection by a competitive examination of those who are worthy of promotion.

The Naval Academy and Naval School in Germany form really two establishments

united under one government. The Academy is devoted to the higher education of officers who have shown marked ability, and who come as voluntary students for two years. The school is attended by midshipmen or acting sub-lieutenants and cadets, and its course is compulsory for all officers. Both institutions are under the supervision of the commander-in-chief at Kiel, in matters of command and discipline, but in all that pertains to instruction and maintenance they are directly under the Admiralty. The direct object of the cadets' course is preparation for the midshipmen's examination, and it furnishes the first theoretical instruction received by junior officers. It embraces navigation, seamanship, gunnery, land tactics, mathematics, natural philosophy, official duties, surveying, English and French. The cadets go aboard ship, and at the end of a two years' cruise (four years' service) they are promoted to midshipmen, and after one year's course of study they are made sub-lieutenants. The principle of scrutinizing the aptitude and desirability of an officer, and those intellectual and moral qualities which cannot be gauged in an examination room, is continued throughout an officer's career. The selection and advancement of officers in the German service is influenced by no sentiment, but is based upon the highest considerations of honor and efficiency. The most important improvements in recent years in the training of the personnel is the organization of a special torpedo corps to take charge of all matters, including education and training, which pertain to this department.

The Royal Naval School of Italy was composed of two divisions, the first at Naples and the second at Genoa, the course lasting two years, of which the first two were passed in the first division and the last two in the second. Owing to the expense of maintaining two somewhat similar establishments, the school is now established at Leghorn and the schools of gunnery and torpedoes at Spezia. The mechanicians are trained in an industrial school at Venice, a technical school for engineers and constructors being at Genoa. The examination to the school at Leghorn includes arithmetic, algebra, geometry, history, geography, Italian and French. Students pay the government $180 per year, payable quarterly in advance. A certain sum is appropriated each year by the ministry for scholarships, which are given to sons of naval officers or of civil functionaries connected with the naval administration. The course includes mathematics from algebra to applied mechanics, physics and chemistry, history, literature, geography, French and English, drawing, gunnery, seamanship, tactics, military art and naval construction. On passing the final examination, the students are admitted to the navy with the rank of midshipmen. The restraints imposed in general by discipline are more severe at this school than at similar institutions in most other states. As in France, the students have no standing as officers; they are designated simply pupils (*allievi*), and the regulations for their government are based on an extreme form of this theory.

Professor J. Russell Soley's *Foreign Systems of Naval Education* and Lieutenant S. A. Staunton in the Office of Naval Intelligence *Annual* for 1888.

NAVAL SIGNALS. The general code of naval signals is composed of square and triangular flags. The square flags represent the first ten numerals, and if any one or more of the numerals have to be repeated, three triangular flags called repeaters are used for this purpose. When the "first repeater" is in the hoist it repeats the first number, the "second repeater" the second number, etc., no matter what the position may be in the sequence of flags flown. The interrogatory pennant hoisted above a signal turns it into a query; the preparatory pennant indicates that the signal will be again made before it need be carried out. The numeral pennant shows that a number follows, and not a phrase, command, word, or sentence. There is also a geographical pennant, which when used before a series of numbers shows that some geographical place is intended. Mixed numerals, such as latitude and longitude, dollars and cents, hours and minutes, are shown by interspersing the pennants among the signals representing the numbers. A telegraphic flag is flown when the telegraphic dictionary is to be consulted. Besides these there are other flags, such as despatch, quarantine, cornet, powder, the meal pennant, etc., each of which has its particular signification. A signal-book loaded with lead, so that it will sink when thrown overboard, and so prevent conveying useful information to an enemy, is furnished each vessel, and it contains a description of the various flags and a key to their meaning either singly or in combination. A system of night signals, Very's, is used, and consists of firing a number of red and green stars, which, in addition to rockets, convey the same information that is to be had from the flags. White lights and torches by night, and "*wig-wag*" flags by day are also used for the purpose of conversing by means of the Morse telegraphic code. Various shapes and forms for distant signalling are also occasionally used for practice. The combination of a speed ball and pennant, replaced at night by lights, is used to indicate a vessel's speed. Distinguishing pennants are furnished the various vessels of a squadron, the same information at night is conveyed by lanterns hoisted aloft. Besides which each vessel has a particular number assigned her in the signal-book.

NAVAL TACTICS. Modern naval tactics, as embodying a series of rules for

maneuvering to the best advantage, corresponding to what is known on land as "*la grande guerre*," may be said to date only from the time of Cromwell's admiral, Blake. Little change from then till the war of 1812 took place in the general principles of attack, with the single exception of the introduction of reliable mortars, but at that date the invention of the breech-sight altered the conditions of the problems as regards range. The introduction of steam causes the next change at the battle of Navarino, since when evolutions under steam form the subject of greatest consequence. Armor and projectile are constantly opposed, nor is it likely that either can long hold the balance, until the introduction of some extraneous factor, like torpedoes exploded by electricity, shall definitely change the efforts of seamen and constructors to a new direction. Our late war proved that heavy ordnance might be silenced by the successive attack of unarmored vessels; and Admiral Tegethoff, at the battle of Lissa, sunk, with wooden ships, the finest iron-clads of that day. In a squadron consisting of eight or more vessels, moving in line, or a column in echelon—that is in column, say, from n. to s., but each vessel heading n.w. movements are executed much on the principles of army tactics—by division, half-division, or single vessels. Thus, from line into column, upon right, left, or center; double column, wheels, changing of front, right about, by either flank, in echelon, and at various distances. Foxhall A. Parker (*Squad. Tactics under Steam*, New York, 1864), then a commander, proposed, as the necessary signals were not in the code, a series of signals for maneuver and change of direction, counting from the right by quarter points. Nos. 1 to 32 indicated points of the compass, and from 33 to 116 orders for movements.

NA'VAN, a market t. of Meath county, Ireland, situated at the junction of the Boyne and Blackwater, 28 m. n. w. of Dublin, with which city it is connected by two railways. Pop. '91, 3963, the majority being Roman Catholics. Navan is connected by canal with Drogheda, and is surrounded by some of the richest land in the kingdom. It carries on considerable inland trade and contains a large power-loom factory. It is the center of the Meath militia, and of the Meath hunt district. There are also an endowed school, a Roman Catholic seminary (one of the first opened in Ireland after the repeal of the penal law), and several national schools. There are girls' schools attached to the Roman Catholic convent. Several interesting remains, both Celtic and Norman-English, are found in Navan and the vicinity.

NAVARI'NO, or Neo-Castro, a seaport and citadel on the s.w. coast of the Morea in Greece, contained, '91, 2,128 inhabitants, but is of importance from its position, commanding the entrance of the bay of Navarino, at the southern extremity of which it is situated. On the island of Sphagia, or Sphacteria, which closes the bay's mouth, was formerly situated Pylus Messeniaca, the town of Nestor, in a spot where now stands old Navarino or Palæocastron. The bay of Navarino was the scene of a great sea-fight between the Athenians under Cleon, and the Spartans (425 B.C.), in which the latter were defeated; and on Oct. 20, 1827, it saw the annihilation of the Turkish and Egyptian navies by the combined British, French, and Russian fleets under sir Edward Codrington.

NAVARRE', a province, and formerly a kingdom of Spain, is bounded on the n. by France, on the s. and e. by Aragon, and on the w. by the Biscays. Area, 6046 sq. miles. • Pop. '87, 304,122. The country is mountainous, being bounded and traversed by the Pyrenees, spurs of which occupy almost the whole of the province in its northern and eastern parts. The highest peaks are Altovisear, Adi, Alcorrunz, and Ruña. Navarre is watered by the Bidassoa, the Anezo, and by the Ebro, together with its tributaries, the Ega and Aragon, on the level shores of which corn, wine, and oil of good quality are produced. Some of the valleys which intersect the mountain ranges have a fruitful soil, and yield good crops when properly irrigated, but in the mountain districts, husbandry is impracticable, and the inhabitants nearly all follow the chase, as much from necessity as inclination; and while a large number of the Navarrese are soldiers, a still larger proportion are smugglers—the proximity of the province to France, and the dangerous character of the almost inaccessible mountain passes which alone connect the two countries, holding out many inducements and facilities in the way of smuggling. The mountain forests, which are not as yet penetrated by roads, still harbor bears, wolves, wildcats, goats, deer, and an abundance of game of every other kind. Iron ore abounds but is not worked, while manufactures are undeveloped. The people of Navarre are a hardy, brave, and hospitable race, loyal to the sovereign, attentive observers of the forms of their religion, and, except in the matter of smuggling, honest and moral; but they are passionate and distrustful, prone to anger, and keen in avenging an insult, real or imaginary. Although not industrious, the people follow a few branches of industry, and manufacture glass, leather, soap, chocolate, etc., of good quality.

The Navarrese, with few exceptions, are members of the church of Rome, to whose tenets they cling with superstitious devotion. They have always intermarried chiefly among their own compatriots, and are a nearly pure Basque race. In the mountainous districts, Basque is still spoken, but in the plains, the modern Castilian form of Spanish is rapidly supplanting the ancient language of the country. The chief town is Pampeluna (q.v.).

The territory known from an early period of Spanish history under the name of

Navarre, was occupied in ancient times by the Vascones, who were subdued by the Goths in the 5th century. After having become gradually amalgamated with their conquerors, the people continued to enjoy a species of turbulent independence under military leaders until the 8th c., when they were almost annihilated by the hordes of Arabs who were rapidly spreading their dominion to all parts of the peninsula. The Gothic Vascones of Navarre, who had been converted to Christianity, offered a gallant resistance to their infidel invaders, and although repeatedly beaten, they were not wholly subdued. The remnant which escaped the sword of their Moslem enemies took refuge in the fastnesses of the mountains, and choosing a knight of their number, Garcia Ximenes, as their leader or king, they sallied forth, and by their gallant resistance, compelled the Arabs to leave them in the enjoyment of an independence greater than that of the neighboring states. On the extinction of the race of Ximenes, in the middle of the 9th c., the Navarrese elected as their king Inigo Sanchez, count of Bigorre, in whose family the succession remained till the marriage of Philip the fair with queen Joanna I. of Navarre; and the accession of the former to the throne of France in 1285, rendered Navarre an appanage of the crown of France. It continued a part of that kingdom during the successive reigns of Louis X., Philip V., and Charles the Fair, but on the death of this last in 1328, France fell to the family of Valois, and the daughter of Louis X., the rightful heir, succeeded to Navarre as Joanna II. The events of the kingdom present no features of interest during the next hundred years. The marriage of Blanche, daughter of Charles III. of Navarre, with John II. of Aragon, in 1441, did not produce an annexation of Navarre to Aragon, as John suffered his wife to rule her own kingdom as she pleased, and even after her death and his subsequent re-marriage, he resigned the government entirely to his son by Blanche. This son, known as Charles, prince of Viano, having attempted to remain neutral in his father's quarrels with Castile, John expelled him and his elder sister Blanche, who sided with him, from Navarre, and conferred the kingdom on Leonora countess de Foix, his younger daughter, by Blanche, whose misrule completed the disorganization which these family quarrels had commenced. Her son, Francis, called Phœbus, from his beauty, succeeded in 1479, and his sister Catharine in 1483. Ferdinand and Isabella sought to marry the young queen to their son and heir, the prince of Asturias, but her mother, a French princess, married her to Jean d'Albret. Ferdinand, however, was not willing to let the prize escape him, and on some slight pretext he seized Navarre in 1512. After this act of spoliation, there remained nothing of ancient Navarre beyond a small territory on the northern side of the Pyrenees, which was subsequently united to the crown of France by Henri IV. of Bourbon, king of Navarre, whose mother, Jeanne d'Albret, was granddaughter of queen Catharine; and hence the history of Navarre ends with his accession to the French throne in 1589. The Navarrese were, however, permitted to retain many of their ancient privileges, until the reign of queen Isabella II., when the active aid which they furnished to the pretender, Don Carlos, in the rebellion of 1834–39, led to the abrogation of their *fueros*, or national assembles, and to the amalgamation of their nationality with that of the kingdom at large. In the later Carlist struggle of 1872–76, Navarre was again a principal seat of the war, the inhabitants being stimulated in their assistance of the representative of the claims and title of Don Carlos by his promise of restoring their *fueros*. See Boissonade, *Histoire de la réunion de la Navarre à la Castile* (1893).

NAVARRE'TE, Domingo Fernandez de, 1610–89; b. Spain; was educated at Valladolid as a Dominican, and in 1647 went on a mission to the Philippine islands, where he soon became professor of theology in the college of Manilla. A few years later, however, he went to China and busied himself in the interior of the country, studying the people and their language until he was persecuted and thrown into prison in Canton. As soon as he escaped and arrived in Europe he visited Rome, and complained to the pope of the work of the Jesuits in China, accusing them of accommodating their religion to the superstition of the natives. He then returned to Spain and published a large work on the *History, Politics, Ethics, and Religion of the Chinese Monarchy*, shortly after which he received the appointment of archbishop of San Domingo in the West Indies, where he passed the remainder of his life.

NAVARRETTE, Juan Fernandez, a Spanish artist, was born at Logroño, Spain, in 1526, and died about 1579. Having become deaf and dumb, he turned his attention to painting, which he studied at Estrella in the monastery of the Hieronymites, and afterwards in Italy under Titian. Most of his works are to be seen in the Escurial, and all are of sacred subjects. He was popularly known as *El Mudo* ("the mute"), and has been called "the Spanish Titian." He was patronized by Philip II.

NAVARRETE, Martino Fernandez de, 1765–1844; b. Spain; entered the Spanish navy in 1780, was present at the attack on Gibraltar in 1782, and afterwards served against the Moors and Algerines. Ill health, however, forced him to retire from the service for some years which he spent in collecting documents respecting the history of Spanish maritime discovery, labors that resulted in 1825 in the publication of the first and second volumes of a work by him entitled *Colleccion de los Viages y Descubrimientos que hicieron por mar los Españoles desde fines del Siglo XV.*, which was pronounced by Humboldt to be "one of the most important historical monuments of modern times." In 1829 the third volume appeared; and eight years later, the fourth and fifth volumes.

But before the sixth and seventh were completed the author died. He was the author of several other lesser works, and a distinguished member of the Spanish academy.

NAVAR'RO, a co. in n.e. Texas, on the Trinity river; 1020 sq. m.; pop. '90, 26,373, includ. colored. The surface is undulating, with a large proportion of prairie. The chief productions are corn, cotton, and sweet potatoes. Cattle and pork are raised. It is drained by Chambers and Richland creeks, and is on the Houston and Texas Central and the St. Louis Southwestern railroads. Co. seat, Corsicana.

NAVARRO, MADAME ANTONIO. See ANDERSON, MARY ANTOINETTE.

NAVAS DE TOLOSO, an insignificant village in the province of Andalusia, Spain, about 39 miles north of Jaen, noteworthy only on account of a battle that took place here in 1212, between the king of Castile, Aragon, and Navarre, aided by 100,000 crusaders, chiefly English and French, and an army of Moors under Mohammed Ibn Abdallah. The Christians were victorious. Here also, in 1812, a battle took place between the Spanish and French.

NAVASOTA, a city in Grimes co., Tex.; on the Navasota river near its confluence with the Brazos, and on the Houston and Texas Central and the Gulf, Colorado and Santa Fé railroads; 70 miles n.w. of Houston. It has several churches, a high school, two banks, and a number of large cotton warehouses. It manufactures wagons, flour, and cotton-seed oil. Two weekly papers are published. Pop. '90, 2997.

NAVASOTA, a river of Texas, rises in Limestone county, in the northeast central part of the state, and after a course of nearly 171 miles, joins the Brazos river near Washington. It forms the boundary between Robertson and Brazos counties on the right, and Leon, Madison, and Grimes counties on the left. The soil in its valley is very fertile.

NAVE. See CHURCH.

NA'VESINK (or NEVERSINK) **HIGHLANDS**, a chain of hills that form a bold headland along the coast of New Jersey on the border of Monmouth county. To ships approaching New York, they are important landmarks and located on them are two first-class light-houses 53 ft. high, both of which show fixed white lights. Though the neighboring region is a beautiful one and only 20 m. from New York, it remains primitive and sparsely inhabited. It is now, however, coming into notice and drawing visitors.

NA'VEW (Fr. *navette*), a garden vegetable much cultivated in France and other parts of the continent of Europe, although little used in Britain. It is by some botanists regarded as a cultivated variety of *Brassica napus*, or rape (q.v.), whilst others refer it to *B. campestris*, sometimes called wild navew, the species which is also supposed to be the original of the Swedish turnip (q.v.). The part used is the swollen root, which is rather like a carrot in shape. Its color is white. Its flavor is much stronger than that of the turnip. It succeeds best in a dry light soil. The seed is sown in spring, and the plants thinned out to 5 in. apart.

NAVEZ, FRANÇOIS JOSEPH, 1787–1869; b. Belgium; studied art in Brussels and Ghent; and in Paris was a pupil of the great painter David. After finishing his studies he resided in Brussels till his death, and became director of the Fine Arts Academy. His works almost all represent biblical scenes such as: "The Prophet Samuel," "The Ascension of the Virgin," "Hagar in the Desert," and "Meeting of Isaac and Rebecca."

NAVIC'ULA (Lat. a little ship), a genus of *Diatomaceæ* (q.v.), receiving its name from the resemblance of its form to that of a boat. Some of the species are very common.

NAVIC'ULAR DISEASE, in the horse, consists in strain of the strong flexor tendon of the foot, at the point within the hollow of the fetlock, where it passes over the navicular bone. It is most common amongst the lighter sorts of horses, and especially where they have upright pasterns, out-turned toes, and early severe work on hard roads. It soon gives rise to a short tripping yet cautious gait, undue wear of the toe of the shoe, wasting of the muscles of the shoulder, and projecting or "pointing" of the affected limb whilst standing. When early noticed, and in horses with well-formed legs, it is often curable; but when of several weeks standing, it leads to so much inflammation and destruction of the tendon and adjoining parts, that soundness and fitness for fast work are again impossible. Rest should at once be given, the shoe removed, the toe shortened, and the foot placed in a large, soft, hot poultice, changed every few hours. Laxative medicine and bran mashes should be ordered, and a soft bed made with old short litter. After a few days, and when the heat and tenderness abate, cold applications should supersede the hot; and, after another week, a blister may be applied round the coronet, and the animal placed for two months in a good yard or in a grass field, if the ground be soft and moist; or, if sufficiently strong, at slow farm-work on soft land. Division of the nerve going to the foot removes sensation, and consequently lameness; and hence is useful in relieving animals intended for breeding purposes or for slow work. The operation, however, is not to be recommended where fast work is required; for the animal, insensible to pain, uses the limb as if nothing were amiss, and the disease rapidly becomes worse.

NAVIES, ANCIENT AND MEDIÆVAL. The ancient method of naval warfare consisted in great part, in the driving of *beaked* vessels against each other: and therefore skill and celerity in maneuvering, so as to strike the enemy at the greatest disadvantage, were of the utmost importance. The victory thus usually remained with the best sailor. This mode of conflict has been attempted to be revived at the present time, and vessels called "steam-rams" are specially constructed for this species of conflict. The earliest powers having efficient fleets appear to have been the Phenicians, Carthaginians, Persians, and Greeks; the Greeks had fleets as early as the beginning of the 7th c. B.C.—the first sea-fight on record being that between the Corinthians and their colonists of Corcyra, 664 B.C. The earliest great battle in which tactics appear to have distinctly been opposed to superior force, and with success, was that of Salamis (480 B.C.), where Themistocles taking advantage of the narrows, forced the Persian fleet of Xerxes to combat in such a manner, that their line of battle but little exceeded in length the line of the much inferior Athenian fleet. The Peloponnesian war, where "Greek met Greek," tended much to develop the art of naval warfare. But the destruction of the Athenian marine power in the Syracusan expedition of 414 B.C., left Carthage mistress of the Mediterranean. The Roman power, however, gradually asserted itself, and after two centuries, became omnipotent by the destruction of Carthage. For several following centuries, the only sea-fights were occasioned by the civil wars of the Romans. Towards the close of the empire, the system of fighting with pointed prows had been discontinued in favor of that which had always co-existed—viz., the running alongside, and boarding by armed men, with whom each vessel was overloaded. Onagers, balistæ, etc., were ultimately carried in the ships, and used as artillery; but they were little relied on, and it was usual, after a discharge of arrows and javelins, to come to close quarters. A sea fight was therefore a hand-to-hand struggle on a floating base, in which the vanquished were almost certainly drowned or slain. See illus., ROME, vol. XII.

The northern invaders of the empire, and subsequently the Moors, seem to have introduced swift-sailing galleys, warring in small squadrons and singly, and ravaging all civilized coasts for plunder and slaves. This—the break-up of the empire—was the era of piracy, when every nation, which had more to win than lose by freebooting, sent out its cruisers. Foremost for daring and seamanship were the Norsemen, who penetrated in every direction from the Bosporus to Newfoundland. Combination being the only security against these marauders, the mediæval navies gradually sprang up; the most conspicuous being—in the Mediterranean, those of Venice, Genoa, Pisa, Aragon; on the Atlantic sea-board, England and France. In the Mediterranean, Venice, after a long struggle with the Genoese, and subsequently with the Turks, became the great naval power. The Aragonese fleet gradually developed into the Spanish navy, which, by the epoch of Columbus, had a rival in that of Portugal. Many struggles left, in the 16th and 17th centuries, the principal naval power in the hands of the English, French, Dutch, Spaniards, and Portuguese. The present state of these and other existing navies will be briefly given under NAVIES, MODERN.

NAVIES, MODERN. ARGENTINE REPUBLIC in 1896 ranked third among South American states in respect to the importance of its navy. It had in that year 2 cruisers of the first class, 3 armored cruisers, 3 cruisers of the second class and 6 cruisers of the third class, besides 2 port defence armor-clads and 14 torpedo craft. Among the armored cruisers were the *Almirante Brown*, which was built in 1880. The other large battle-ships were the *Nueve de Julio*, launched in 1892, the torpedo boat *Aurora* and the cruiser rams, *Libertad* and *Independencia*.

AUSTRIA-HUNGARY in 1896 had 1 battleship of the first class, 5 of the second and 2 of the third; 31 cruisers, and 67 torpedo craft. The navy is mainly occupied in coast defence. It is well manned and equipped, and is under the administration of the naval department of the Ministry of War. It includes a flotilla of monitors for the Danube river. Among the most powerful vessels in the Austrian navy are the *Budapest*, the *Monarch* and the *Wien*. A large armored cruiser, the *Maria Teresa*, was planned in 1896, and in that year it was proposed to strengthen the Danube flotilla by the addition of a number of monitors, now that the obstacles to the navigation of the lower Danube have been removed. Besides the headquarters of the fleet at Pola, there are several other establishments on the Dalmatian coast. The personnel of the Austrian navy is not numerous. On a peace footing in 1895 it consisted of 628 officers and cadets, 448 petty officers, etc., 7500 sailors and 4500 marines.

BELGIUM. The coast of Belgium is only 42 miles in length and the country has no navy, properly so called, but there are some steam vessels, principally employed as packets, which are under the orders of the government, and all of which would be found useful under certain conditions of naval warfare.

BRAZIL has a considerable navy, including in 1896 a battleship of the second class, 7 port defence armor-clads of which 5 were river monitors, a cruiser of the first class, 4 cruisers of the second class and 9 of the third class. There were also 14 torpedo craft and a number of small vedette craft, and in 1896 a plan was entered upon for increasing the navy. There was a revolt of the fleet under Admiral De Mello in September, 1893. The insurrection was unsuccessful, and came to an end in March, 1894. There were in 1896 5 naval arsenals, at Rio de Janeiro, Para, Pernambuco, Bahia and Ladrio de Matto Grosso.

BULGARIA. This principality has a nucleus of naval force in a flotilla consisting of

the Prince's yacht, 3 steamships of fair size and 7 small steamboats. In 1896 there were 2 armored gunboats in process of construction at Leghorn.

CHILE has an armored fleet of 4 iron-clads, 5 deck-protected cruisers, several gunboats and a protected flotilla. In 1896 there was a cruiser of the first class launched and another in process of construction in France. A famous vessel of the Chileans is the *Capitan Prat*, which has a high speed and a powerful armament with guns worked either by hand or by electricity. The cruiser *Esmeralda* is also a very powerful vessel, being steel-built, sheathed and coppered and having a six-inch armor belt. She has a steel deck two inches in thickness, beneath which are the machinery, the magazines and the steering apparatus.

CHINA. During the war between Japan and China, the naval strength of the latter country was found to be far inferior to what had been supposed. Though the seamen were brave, the usefulness of the navy was destroyed through the inefficiency and corruption of the officers, and its harmonious action was impaired by the provincial system of its organization. During the war it remained in Chinese waters and rendered no important services. At the very beginning of the hostilities, a Chinese transport was sunk in an engagement with the Japanese, and a small cruiser was driven ashore. In the battle of the Yalu, or as a result of that action, 1 armor-clad and 4 cruisers were sunk or burned. In 1896 the Chinese could not be said to have a really effective navy. The fleet consists of different squadrons raised and supported by the provinces. In 1896 the naval strength was as follows: 7 second class cruisers, 4 third class cruisers and 34 torpedo craft.

DENMARK. The Danish navy is not large and is maintained chiefly for coast defence. In 1896 it consisted of 1 battle ship, 3 port defence ships, 3 armored cruisers of the first class, 1 of the second class, 16 of the third class, 12 torpedo boats of the first, 2 of the third class and some of smaller size. One of the most remarkable vessels was the *Tordenskjold*, which was without side armor but carried the largest gun in the navy. During the year important naval improvements were voted, such as the equipment of vessels with Maxim and marine guns, and the commissioning of an improved training squadron.

EGYPT formerly had a small navy, but in 1896 possessed no effective war ships.

ENGLAND has a navy that is easily the first in the world, and it does not fall far below the combined naval strength of any two other powers. It is under the control of the Board of Admiralty, consisting of the first Lord of the Admiralty, who is a member of the cabinet, and five other commissioners. The administration of the different departments is apportioned among the members of the board. The general direction is in the hands of the First Lord. The First Naval Lord gives his advice on questions of naval policy and strategy, the distribution of the fleet, discipline, courts-martial, etc. The responsibility for the maintenance of the personnel of the fleet, as well as for naval education and training, belongs to the Second Naval Lord, while the Third Naval Lord has charge of such matters as buildings and repairs, machinery, dock-yards, purchase and disposal of ships, etc. Questions of pay, of coaling, prize-money, pensions, uniforms, hospital, medical, victualing services, etc., come under the supervision of the Junior Naval Lord. The Civil Lord is responsible for the works department. Since 1889 great additions have been made to the fleet. The Naval Defence Act of that year provided for the construction of 70 vessels, comprising 10 first class battle ships, 9 first class cruisers, 29 second class cruisers, 4 third class cruisers, and 18 torpedo gunboats. All these vessels have been built and launched. A new programme was entered upon in 1896–7, calling for 5 battle ships, 4 first class cruisers, 3 second class cruisers, 6 third class cruisers and 28 torpedo boat destroyers. Besides these important additions to the navy, many old or disabled vessels were refitted in 1896–7. In the fall of 1896 there were 209 ships in commission in the British navy. Forty-six of these were armored vessels, 130 unarmored, 6 training ships, 27 flag ships, store ships, drill ships, etc. The battle ships launched in December, 1896, numbered 28 of the first, 5 of the second and 9 of the third class. The port defence ships numbered 23. The cruisers numbered 45 of the first, 54 of the second and 174 of the third class. The torpedo craft numbered 125 of the first, 4 of the second and 20 of the third class. Of the 10 new battle ships added to the navy in accordance with the Naval Defence Act of 1889, 7 are very powerful vessels of the type of the *Royal Sovereign*. In 1896 there were 9 battle ships of the *Majestic* type, which with the exception of the *Italia* and the *Lepanto* were the largest war ships then afloat, length being 390 ft. and displacement 14,900 tons. As to the personnel, the total number of all ranks in 1896–7, including officers, seamen and marines, was 93,750. In that as in preceding years, the largest portion of the fleet engaged in foreign or particular service was stationed in the Mediterranean and Red seas. In 1897 there were 37 ships engaged in those services. Next in importance was the service off the coast of China, where 26 vessels were engaged. The Royal Marines are a military force trained to service in the fleet as well as on land. In 1897 it numbered 15,861. They are divided into two classes, artillery and light infantry, and are called into active service in cases of emergency. With the increase of the personnel of the navy in recent years, the question of a reserve has come up for discussion. It has been maintained that when the navy reaches a strength of 100,000 men in active service, all further additions should constitute a reserve rather than a permanent increase of the naval strength on a peace footing. This policy has been adopted, for, as the above figures show, the total strength of the active navy, including marines, was over 93,000 in 1896. According to the estimates of 1896–7 the naval reserve consisted of 25,800 officers and men. Eligibility to service in the naval reserve requires various qualifications in respect to age, physical

condition and length of service at sea. For service in the first class of the reserve a man must be under 30 years of age unless he has served in the navy, in which case he may enter the reserve up to the age of 35. He must also have passed a satisfactory medical examination and have served a specified time at sea. There has been some criticism on the policy pursued by Great Britain in carrying out the programme set forth by the Naval Defence Act of 1889, in that she has spent such vast sums in the construction of extremely large vessels, rather than in completing a larger number of smaller ships. Lord Brassey, writing on this subject in the NAVAL ANNUAL for 1890, summing up various expert opinions says, "If the heavy ships have great offensive powers and can be more fully protected by armor, the arguments from many of the authorities seem to incline the scale in favor of types of the less exaggerated form, a greater number of which can be produced for any given sum of money. Whatever be the type, there remains a conspicuous advantage in the superiority of numbers."

FRANCE. Her armored fleet has some of the finest war ships afloat, to which she is annually making additions. In 1897, according to the budget estimates of the expenditure for that year, the item of 237,147,390 francs was set down to the Department of Marine, which figures show a considerable increase since 1880. The administration of the French navy is under the control of the Minister of Marine, whose staff is divided into three sections having charge respectively of coast defences and colonial affairs; observation of the development and administration of foreign navies; and the mobilization, training, and distributing of the French navy. The French coast is divided into five maritime sections having headquarters at the naval ports of Cherbourg, Brest, Lorient, Rochefort and Toulon, each with extensive shipyards and naval stores. France maintains an active reserve squadron in the Mediterranean, a squadron in the Channel, and vessels in the Atlantic, Pacific, the far east, the waters about Cochin China, and the Indian Ocean. Besides these, a number of vessels are employed as training ships, and there are numerous vessels at local stations. The continual accessions to and improvements of the French navy had brought it in 1896 to a position second only in rank to that of the British navy. At the close of 1891 what was known as the "decennial programme" was entered upon, and in accordance with it, the navy has been increased and improved, but since that date the programme has been modified in several particulars. It was planned to replace all inferior ships, or such ships as were becoming antiquated, by entirely new vessels. Eight new ships were, according to this plan, to be constructed each year, reaching a total of 82 additional vessels by the year 1901. This number has not been annually launched, but the budget estimates for 1897 contemplate a greater activity in shipbuilding. The numbers of the French navy are maintained partly by voluntary enlistment and partly by conscription. It has been customary since the time of Colbert to keep a list of the names of men in the country who lead a seafaring life. By these means a naval reserve is secured numbering about 114,000 men, of whom 25,500 serve with the fleet. The law of 1872 permits a certain number of young men liable to military or naval service to choose between the army and the navy, even though not enrolled on these lists. The naval statistics for 1896 were as follows: 20 battle ships of the first class, 8 of the second class, 6 of the third class, 14 port defence ships, 14 cruisers of the first, 29 of the second, and 106 of the third class, and 211 torpedo craft. Besides these there were in process of construction 1 battle ship, 3 cruisers of the first class, 3 of the second class, and 3 of the third class, and 9 torpedo craft of the first class. Some of the largest vessels are the *Gaulois*, *St. Louis*, *Bouvet*, *Charlemagne*, *Masséna*, *Carnot*, *Jauréguiberry*, *Charles Martel*, *Brennus*, *Magenta*, *Marceau*, *Neptune*, *Hoche*, *Formidable*, *Amiral Baudin*, *Courvet*, *Dévastation*, *Amiral Duperré*, each of which has a displacement of over 10,000 tons and an indicated horse power ranging from 7,000 to 14,500. The *Hoche*, with a tonnage of 10,823 and an indicated horse power of 11,000, is one of the most remarkable vessels in the fleet, having an extraordinarily high superstructure. Her guns are considerably above the water line and can be worked in all weathers. Revolving turrets, each enclosing a 13.4-inch gun, are fore and aft, and she has two 10.8-inch guns with barbette turrets, protected by shields. The speed is estimated at 17 knots. The *Neptune*, *Marceau*, and *Magenta* resemble the *Hoche*. The *Masséna* and the *Bouvet* are still more powerful vessels, the latter having a displacement of 12,012 tons, with an indicated horse power of 14,000. The *Charles Martel* is also a remarkable vessel. It was launched in 1893 and was the largest vessel constructed at the French government dockyards.

GERMANY. In the German navy one of the most important changes lies in the fact that she is now able to build the hulls and machinery within her own borders, and to show as fine models and workmanship as can be found in any of the other maritime nations. The organization of the navy was of course changed after the formation of the empire at the end of the war of 1870–71, and a further reorganization was carried out in accordance with the cabinet order of March 30, 1889. The administration is under a naval secretary of state, who, in turn, is under the chancellor of the empire. The chief command is separated from the administration and is vested in a naval officer. As to the distribution of the fleet, it is divided between stations in the Baltic and stations in the North sea, the chief establishments being those at Kiel in the former, and Wilhelmshaven in the latter. and communication between these points is now afforded by the Kaiser Wilhelm canal from Kiel to the Elbe, which was opened in 1895. There was a new programme for naval extension laid down in 1888–89, calling for what was practically a new fleet. Among the vessels planned were four first-class barbette battle-ships of 10,000 tons, and with 13¾-inch armor. There were also to be 10 new coast-defence armor-clads, 8 cruisers, 5 small cruisers, and a number of small vessels. The programme was changed

in some particulars, but at the close of the year 1895, including such additions as had been made, the fleet comprised 5 battle-ships of the first, 5 of the second, and 4 of the third class, 20 port-defence ships, 35 cruisers, and 105 torpedo craft. There were also at that time 1 battle-ship of the first class, 7 cruisers, and 9 torpedo craft in process of construction. Among the largest vessels in the German navy, in 1896, was the *König Wilhelm*, with a tonnage of 9,603. This however, is an old vessel, having been launched in 1868. The *Wörth*, launched in 1892, and having a displacement of 9,840 tons and an indicated horse-power of 9,500; the *Weissenburg*, and the *Kurfürst Friedrich Wilhelm*, each launched in 1891 and having the same displacement and indicated horse-power as the first named, are also important vessels. The *Kaiser Friedrich III.*, launched in 1896, is a still larger vessel, having a displacement of 10,054 tons, with an indicated horse-power of 13,000. In 1896 a new armored cruiser, the *Leipsic*, with a displacement of 10,482 and an indicated horse-power of 15,000, was in process of construction. The thickest armor plating on any of the vessels was 15¾ inches. There are certain merchant vessels which are subsidized by the German navy as cruisers. The principle on which the service is manned is that of conscription of the maritime population, which term includes not only sailors, fishermen, ship-carpenters and the like, but also men who have had less experience on the sea. In 1896 the number of seafaring Germans in the country was estimated at 80,000. In 1896–97 the personnel of the fleet comprised a total of 21,835 officers and men.

Greece. The Greek fleet was supposed, on the outbreak of the war of 1897, to be by far the more efficient arm of the service, and its great superiority to the poor affair which Turkey calls her fleet, led to high hopes of its success in the coming war. It was condemned, however, by the policy of the government to comparative inaction, and accomplished little. It consisted, in 1896, of three cruisers of the first class, 3 of the second class, 2 port-defence armor-clads, 6 torpedo craft of the first, and 11 of the third class, and several smaller vessels. The personnel numbered 3,165 men. The navy is manned partly by conscription from the people on the sea-coast, and partly by enlistment, the term of service being 2 years.

Hayti. The republic of Hayti has a fleet of small cruisers. In 1895 there was an addition to the flotilla of the *Crête-a-Pierrot*, with a displacement of 940 tons and a speed of 15.5 knots.

Italy. The organization of the navy is based on the royal decree issued in 1893. There is a naval general secretaryship, with the assistant secretary of the navy at its head. Under him is an admiral, as chief of the staff, a medical inspector, and other officers having special charges. The department of merchant marine is administered by a civil official under the direction of the assistant secretary. The Italian coast is divided into 3 prefectures, namely Spezia, Naples, and Venice, and vessels of the fleet are apportioned under these prefectures, and some are stationed at Taranto. A large sum has been devoted in recent years to the improvement of the navy. The item of expenditure for the year ending June 30, 1897, was set down as nearly 95,000,000 *lire*. In 1896 the fleet consisted of 10 battle-ships, 2 port-defence ships, 49 cruisers, and 145 torpedo craft. At that date there were also 2 battle-ships of the first class, 7 cruisers and 2 torpedo craft in process of construction. The tonnage of the first class cruisers is 5,000 or more, and they have a speed of 17 knots or over. They are deck-protected and have side armoring. The heaviest battle-ships afloat in 1896 were the *Italia* and the *Lepanto*, with a displacement of 15,900 tons. These are among the largest and the strongest war-ships afloat. The *Ruggiero di Lauria*, with a displacement of over 11,000 tons, and her two sister ships are also very powerful vessels, with 18-inch armor protecting the vital parts. Other vessels especially worthy of notice are the *Re Umberto*, *Sardegna*, and *Sicilia*. The battle-ship *Ammiraglio di Saint-Bon*, in process of construction in 1896, seems to mark a change of policy on the part of the Italian government in the building of armor-clads, for more attention is given to the armor and equipment than to mere size, its displacement being only 9,800 tons. In 1896 the total number of officers and men in the Italian navy was 24,560.

Japan. Japan has a navy which in the war with China gave proof of great bravery and effectiveness. It is under the administration of the minister of marine, who is a member of the cabinet. The chief command is in the hands of the admiral, who is chosen from those on the active list, and is responsible to the emperor for the conduct of the fleet. For purposes of administration the Japanese coast is divided into 5 maritime districts, with docks, arsenals, and barracks at their respective headquarters. In 1896 the navy consisted of 2 first class battle-ships, and 6 in process of construction, 5 armored cruisers, 10 second-class cruisers, and 6 in process of construction, 17 third-class cruisers, and 4 in process of construction, 28 torpedo boats, 4 torpedo destroyers, and several other torpedo craft in process of construction. The largest vessels in 1896 were the battle-ships *Yashima* and *Fuji*, with a displacement of 12,446 and 12,140 tons respectively, and an indicated horse-power of 13,687 and 14,194 respectively. Each carried 38 guns, and had an estimated speed of 18¼ knots. With the exception of these, the vessels in the Japanese navy do not show a large displacement. The next in size to the two mentioned was a battle-ship captured from the Chinese, having a displacement of only 7,430 tons. The personnel of the navy, in 1894, numbered 7,542. The exact numbers in 1896 were not given, but there was undoubtedly a considerable increase over preceding years. A programme for naval expansion was undertaken in 1896, involving an addition to the navy by the end of 1902 of 4 battle-ships of 15,000 tons each, as well as a number of large cruisers and torpedo craft. This plan would make an addition of 101,860 tons.

Mexico. Mexico has a small fleet of 2 unarmored gun-vessels, 2 despatch boats, a steel training ship, and in process of construction, in 1896, 4 gun-boats and 5 first-class torpedo-boats.

Netherlands. The Dutch navy performs the double duty of protecting the Dutch waters and coast, and of defending the East Indian possessions. Those which fulfill the latter purpose are supported in part by contributions from the East Indian colonies. In 1896 the navy, including the Indian marine, contained 79 cruisers, 28 port defence ships and 37 torpedo craft. The Dutch vessels do not have, as a rule, a large displacement. Among the largest ships are the *Koning der Nederlander* and the *Koningin Wilhelmina*, with a displacement of 5,400 and 4,600 tons respectively. In 1896 a considerable number of vessels were building. The greater portion of the fleet is composed of vessels which are merely for coast defence.

Norway and Sweden. Both these countries maintain navies solely for the purpose of coast defence. The Norwegian navy consisted in 1896 of 4 iron-clad monitors, 1 wooden corvette, 4 unarmored gun vessels, 28 small gunboats, a small torpedo flotilla, and in process of construction in 1896, 2 ironclads. The Swedish navy comprised, in 1896, 17 coast defence turret ships, 3 steam corvettes, 11 gunboats and despatch vessels, 16 torpedo craft, and a number of other small vessels.

Persia. In 1896 Persia had the semblance of a navy in 2 vessels, the one a screw steamship of 600 tons, and the other a river steamer on the Karûn.

Peru. Since the Chilean war, the Peruvian navy has been greatly reduced, most of the vessels being old. In 1896 it consisted of a single cruiser with a displacement of 1700 tons. This was the only effective warship. There were also 3 steamers which might be of some service in an emergency, and one training ship.

Portugal. A royal decree, issued March 20, 1890, announced that substantial additions were to be made to the fleet, and since that date the navy has increased to some extent. In 1895 there were 1 armored cruiser, 2 cruisers of the second, and 30 of the third class, 3 gunboats, 23 torpedo-boats, and several ships in process of construction.

Roumania. The Roumanian navy comprises a protected cruiser of 1320 tons' displacement, a despatch vessel, 8 small gunboats, 8 torpedo-craft and a training ship.

Russia. The Russian navy is subdivided into 4 distinct fleets, each with its own organization. This is required on account of the peculiar situation of the empire, having its bounds on widely separated bodies of water. The Baltic fleet consisted, in 1896, of 10 battle-ships of the first class, of which 4 were not at that date completed; a number of armored coast-defence ships, and a large number of torpedo craft. The Black Sea fleet has several powerful iron-clads and a considerable torpedo flotilla. The Pacific fleet consists chiefly of small vessels, as does also the flotilla in the Caspian sea. A large part of the work of construction has been done in foreign countries, but Russia now has good facilities for shipbuilding within her own limits. The general admiral is commander-in-chief of the Russian navy. The strength of the fleet in all its divisions, in 1896, was 19 battle-ships, 14 cruisers of the first class, of which 3 were building; 3 cruisers of the second class, of which one was in process of construction; 55 cruisers of the third class, of which one was building, and 80 torpedo craft of which 24 were building. In 1896 the total number of seamen was 38,000, of officers 1249. The chief base of the Baltic fleet is the strongly fortified city of Cronstadt.

Siam. Siam has a navy of 22 vessels, of which 11 are over 500 tons. The largest in 1896 was a cruiser yacht of 3,000 tons' burden. There are besides 5 gunboats, 3 training ships, several torpedo-craft, despatch boats, etc.

Spain. There have been considerable additions to the Spanish fleet in recent years, and in 1896 there were 1 battle-ship of the first class; 1 port defence ship, 8 cruisers of the first, 6 of the second, and 99 of the third class, and 38 torpedo craft, besides which there were 10 vessels in process of construction. The cruisers of the first class were new vessels, and 6 of them have 12-inch steel belts, a tonnage of 7,000 and an indicated horse power of 13,000. A powerful armored cruiser, the *Emperador Carlos V.* was launched at Cadiz in 1892. During the year 1895 the Spanish navy was especially unfortunate, losing 4 of her vessels, one being a cruiser of the second and the others of the third class cruisers. In 1896 there were 1002 officers in the Spanish navy, 725 mechanics and other employees, and 14,000 sailors. The marines numbered 9,000. The navy is manned by conscription from the seafaring population.

Turkey. The Turkish navy was at one time of some importance, but, in 1896, was chiefly of interest as an instance of naval decay. Since the sale of a number of its vessels to foreign powers, it has never regained its former strength. In 1896 there were only 3 vessels which could be called sea-going armor-clads, and the others were ships of small tonnage and built many years before. Nominally the strength of the Turkish navy, in 1896, was 1 battle-ship of the first, 1 of the third class, 7 port defence ships, 9 cruisers of the first, 50 of the third class, 37 torpedo craft, and 12 vessels in process of construction. The *Abdul Kader*, which was building in 1896, was the largest ship in the fleet, with a displacement of 8,000 tons and an indicated horse power of 11,500. The navy is manned partly by enlistment and partly by conscription, the term of service being 12 years, of which 5 are spent in active service, 3 in the reserve, and the remaining 4 years in the Redif. The personnel, in 1896, numbered 6 vice-admirals, 11 rear-admirals, 208 captains, 289 commanders, 228 lieutenants, 187 ensigns, and 30,000 sailors. The marine numbered about 9,000.

United States. For an account of the status of the United States navy on Jan. 1, 1897, see the article United States.

NAVIGATION, Art of. We shall give a few indications of the manner of con-

ducting the course of a ship at sea, referring to the various headings, such as SEXTANT, LATITUDE AND LONGITUDE, GREAT-CIRCLE SAILING, etc., for the more scientific explanation of the operations in use for determining position.

A vessel having completed her lading, she is steered out of port by a pilot, who lays his course by the *ranges* with which long familiarity has made him acquainted. Arrived off soundings, or at a point where his local knowledge is no longer of value, he leaves the vessel to the captain, who then assumes all responsibility. While off the coast the captain steers by his *chart* and by the *lead*, assisted by *landmarks* and *buoys* by day, and by *lights* at night. It is his duty, without waiting for foggy weather, nor for any doubt of his situation, to keep the lead going, and a careful watch, while on soundings. When, finally, he is about to lose sight of the coast, he determines a last position, called the *point* of *departure*, which serves as the base of his reckoning. The problems involved in a long voyage are many, some intricate, but position is always ascertainable, either by *observations* or *dead reckoning*. Two things must be known, *speed* and *direction*. The first is found by the *log*, whose unit, the *knot*, predicates the number of nautical *miles*, 1851.85 meters, traversed per *hour*. The second is indicated by the *compass*, from which is read the angle, known as the *course*, between the magnetic meridian and the axis of the keel. But to reduce this to the true course with reference to the terrestrial meridian, the magnetic *variation* must be known and applied. The log is not an accurate instrument, nor is it possible, in a sailing vessel, to throw it as often as slight changes in the rate of motion occur; besides, it seldom happens that the course of a vessel is exactly that read from the compass, for decomposing into two forces the normal line of action of the wind on the sails, there results a certain side-push, forming an angle with the keel, and resulting in a falling-off from the true course known as *drift*. Allowance must also be made for the influence of local, tidal, or ocean currents, the force of which, even where not known by experience nor laid down on the chart, must be carefully judged, and anxiously watched for. The amount of drift is ascertained from the *wake*, either by a back-sight of the compass, or by means of a quadrant and eye-pieces, and can be always combined with the magnetic variation to obtain the true course. Then make allowance for the *set* of the current, the effect on a course of given length and direction of the known speed and trend of the stream.

When, as is necessary every day, it is desired to follow a *rhumb-line*, the course is deduced by making allowance inversely for variation, drift, and set. This course the captain lays down, and the officer of the deck continually oversees the steersman, so that, granting this course continually kept, the path of the vessel successively intersects each meridian at the same angle, called the *angle* of *rhumb*, and this line, a curve of double flexure, is the *loxodrome*, or *loxodromic line*. But for a vessel to sail directly from point of departure to destination is almost impossible, whether from baffling winds, intervening coasts, or adverse currents; the best that can be done then is to substitute a series of loxodromic curves, as little removed from the true course as possible, to make as few and as advantageous stretches as possible, and to take advantage of known currents and favorable winds to substitute for a short but questionable passage a more circuitous but quicker route. The log must always be thrown whenever wind, sails, or course may change; the course and the speed are noted, say every half-hour, on a tally, and at the end of each watch the course is transferred to the *log-book*. Finally, every day at noon, or oftener as advisable, the reckoning is cast up, and the position of the vessel marked on the chart, taking as point of departure the last calculated position. The future course is deduced from this. All navigation by reckoning should be checked at least once a day, and as often and in as many different ways as can be accomplished by observations, repeated if possible, and the mean taken.

NAVIGATION, FREEDOM OF, in the open or high seas has been fully established for nearly a century, and such efforts as have been made in the past to claim exclusive jurisdiction were founded rather on national pride or arrogance than on reasonable principles or considerations of commercial value. The most pretentious claims which have been made were those of Spain and Portugal in the 15th c. based on bulls of popes Nicholas V. and Alexander VI., giving Portugal control over the African seas, and dividing between the two the sovereignty of the Pacific. Of course Protestant nations paid no attention to these claims. The true principles of sovereignty in regard to seas, bays, etc., were first laid down by Grotius in his *Mare Liberum*, 1608, but, notwithstanding, his countrymen the Dutch for a long time opposed the right of the Spaniards to trade with the Philippines *via* the cape of Good Hope. In 1635 Selden published *Mare Clausum*, an attempt to refute Grotius and defend the claims of the English to sovereignty over the seas about the United Kingdom as far as to the coasts of other nations. His argument was weak, being based entirely on alleged precedents. The latest serious claim of the kind was that of Russia, which formerly asserted dominion over the Pacific n. of 51° n. lat. on the ground that no other state possessed territory bordering thereon. This was withdrawn in treaties with the United States and Great Britain in 1824–25. But while the open sea is free to all, inland seas are subject to the jurisdiction of the country in which they are situated; and where, as in the Black sea, two nations border on an inland sea, and in the case of gulfs or straits, questions of some difficulty have arisen. It is conceded that marine jurisdiction extends a short way from the coast, a marine league being the generally accepted limit; so also, gulfs and bays

belong to the countries owning the promontories between which they lie. But this doctrine must not be carried too far, and the idea suggested by chancellor Kent in the early part of this century, that sovereignty might be in future claimed over the waters inclosed by lines drawn from cape Cod to cape Ann, Nantucket to Montauk Point, thence to the Delaware capes and from the extremity of Florida to the Mississippi (before Texas was annexed), is now considered untenable, as is also the proposition that the line of the gulf stream should bound the sovereignty of the United States. For purposes connected with the laws of revenue and commerce, four leagues are allowed. As to narrow seas, gulfs, and straits, there has existed from time immemorial a claim on the part of England to sovereignty over the English and St. George's channels, the Irish sea and the North channel, and theoretically it may still exist; but long since the only exactions from other nations have been in requiring certain honors to be paid to the British flag, and even this custom has fallen into disuse. Over the Baltic sea Denmark long exercised a rather despotic rule, based partly on the natural position of the sea, partly on precedent, and partly on the cost of maintaining light-houses and signals. Heavy tolls were laid on foreign vessels, and caused the war with the Netherlands in the 17th century. In 1857 the powers agreed to pay Denmark a round sum as compensation for the renunciation of her alleged sovereignty, and the United States paid nearly $400,000 as its share. The questions in regard to the Black sea have had great prominence in the European and Turkish complications of this century. Previous to 1829 Turkey claimed the sole sovereignty. At that date Russia and her allies were admitted to the right of navigation. In 1841 it was agreed that vessels of war should not enter the Bosporus or Dardanelles; while by the treaty of 1856 the Black sea was made neutral, ships of war still being prohibited from entrance, though Russia and Turkey were to allow each other a small naval force for protection of commerce, etc. The action of the Berlin congress of 1878 tends to confirm and strengthen the neutrality of this inland sea. Navigation of rivers has also given rise to questions of international interest, and there has been a constantly increasing freedom and enlargement of the privileges allowed by the country controlling the mouth and lower course to the countries lying above.

NAVIGATION, History of. In its widest sense, this subject is divisible into three sections—the history of the progressive improvement in the construction of ships, the history of the growth of naval powers, and the history of the gradual spread and increase of the science of navigation. Although these three sections are to some extent interwoven, the present article will be limited to a consideration of the last, the first two being sufficiently described under Ship-Building and Navies.

The first use of ships, as distinguished from boats, appears to have been by the early Egyptians, who are believed to have reached the western coast of India, besides navigating the Mediterranean. Little, however, is known of their prowess on the waves; and, whatever it may have been, they were soon eclipsed by the citizens of Tyre, who, to make amends for the unproductiveness of their strip of territory, laid the seas under tribute, and made their city the great emporium of eastern and European trade. They spread their merchant fleets throughout the Mediterranean, navigated Solomon's squadrons to the Persian gulf and Indian ocean, and planted colonies everywhere. Principal among these colonies was Carthage, which soon outshone the parent state in its maritime daring. The Carthaginian fleets passed the pillars of Hercules, and, with no better guide than the stars, are believed to have spread northward to the British isles, and southward for some distance along the w. coast of Africa. From the 6th to the 4th centuries B.C., the Greek states gradually developed the art of navigation, and at the time of the Peloponnesian war, the Athenians appear to have been skillful tacticians, capable of concerted maneuvers. The Greeks, however, were rather warlike than commercial in their nautical affairs. In the 4th c. B.C., Alexander destroyed the Tyrian power, transferring its commerce to Alexandria, which, having an admirable harbor, became the center of trade for the ancient world, and far surpassed in the magnitude of its marine transactions any city which had yet existed. Rome next wrested from Carthage its naval power, and took its vast trade into the hands of the Italian sailors. After the battle of Actium, Egypt became a Roman province, and Augustus was master of the enormous commerce both of the Roman and the Alexandrian merchants. During all this period, the size of the vessels had been continually increasing, but probably the form was that of the galley, still common in the Mediterranean, though a more clumsy craft then than now. Sails were known, and some knowledge was evinced even of beating up against a foul wind; but oars were the great motive-power; speed was not thought of, a voyage from the Levant to Italy being the work of a season; and so little confidence had the sailors in their skill or in the stability of their ships (still steered by two oars projecting from the stern), that it was customary to haul the vessels up on shore when winter set in. During the empire, no great progress seems to have been made, except in the size of the vessels; but regular fleets were maintained, both in the Mediterranean and on the coast of Gaul, for the protection of commerce. Meanwhile the barbarian nations of the north were advancing in quite a different school. The Saxon, Jutish, and Norse prows began to roam the ocean in every direction; in small vessels they trusted more to the winds than to oars, and, sailing singly, gradually acquired that hardihood and daring which ultimately rendered them masters of the sea. The Britons were no mean seamen, and

when Carausius assumed the purple in their island, he was able, for several years, by his fleets alone to maintain his independence against all the power of Rome.

The art of navigation became almost extinct in the Mediterranean with the fall of the empire; but the barbarous conquerors soon perceived its value, and revived its practice with the addition of new inventions suggested by their own energy. The islanders of Venice, the Genoese, and the Pisans, were the carriers of that great inland sea. Their merchants traded to the furthest Indies, and their markets became the exchanges for the produce of the world. Vast fleets of merchant galleys from these flourishing republics dared the storm, while their constant rivalries gave occasion for the growth of naval tactics. So rich a commerce tempted piracy, and the Moorish corsairs penetrated everywhere on both sides of the straits of Gibraltar in quest of prey; evincing not less skill and nautical audacity than savage fury and inhuman cruelty. But the Atlantic powers, taught in stormy seas, were rearing a naval might that should outrival all other pretenders. The Norsemen extended their voyages to Iceland, Greenland, and Newfoundland, while they first ravaged and then colonized the coasts of Britain, France, and Sicily. The sea had no terrors for these hardy rovers; their exploits are imperishably recorded in the Icelandic sagas, and in the numerous islands and promontories to which they have given names.

Early in the 15th c. the introduction of the mariner's compass rendered the seaman independent of sun and stars—an incalculable gain, as was soon shown in the ocean-voyages of Columbus, Cabot, and others. In 1492 Columbus rendered navigation more secure by the discovery of the variation of the compass. Between that and 1514 the "cross-staff" began to be used; a rude instrument for ascertaining the angle between the moon and a fixed star, with the consequent longitude. Early in the 16th c., tables of declination and ascension became common. In 1537 Nuñez (Nonius), a Portuguese, invented various methods of computing the rhumb-lines and sailing on the great circle. In 1545 the two first treatises on systematic navigation appeared in Spain, one by Pedro de Medina, the other by Martin Cortes. These works were speedily translated into French, Dutch, English, etc., and for many years served as the text-books of practical navigation. Towards the end of the century, Bourne in England, and Stevin in Holland, improved the astronomical portion of the art, while the introduction of time-pieces and the log (q.v.) rendered the computation of distance more easy.

It would be tedious to enumerate the successive improvements by which the science of navigation has been brought to its present high perfection; but as conspicuous points in the history of the art, the following stand out: The invention of Mercator's chart in 1569; the formation by Wright of tables of meridional parts, 1597; Davis's quadrant, about 1600; the application of logarithms to nautical calculations, 1620, by Edmund Gunter; the introduction of middle-latitude sailing in 1623; the measure of a degree on the meridian, by Richard Norwood, in 1631. Hadley's quadrant, a century later, rendered observations easier and more accurate; while Harrison's chronometers (1764), rendered the computation of longitude a matter of comparatively small difficulty. Wright, Bond, and Norwood were the authors of scientific navigation, and their science is now made available in practice by means of the *Nautical Almanac*, published annually by the British admiralty. The more important points of the science of navigation are noticed under such heads as Dead-reckoning, Latitude and Longitude, Great-Circle Sailing, Sailings, etc.

NAVIGATION, Inland. No part of the world has grander or more serviceable water-ways than the U. S., and the natural facilities afforded by its lake and river systems are unparaleled. The Mississippi is not only in itself one of the largest rivers in the world, but several of its tributaries, as the Missouri, Ohio, Arkansas, and Red, are larger than the largest rivers of most other countries; and these tributaries again are fed by rivers of more than average size and importance. An area of 1,244,000 sq.m., comprising nearly all that part of the U. S. which lies between the Alleghanies and the Rocky mountains, is drained by this river and its tributaries, and a large part of this area is consequently made accessible to water-craft. The total commerce of the Mississippi and its tributaries is placed in round numbers at $2,000,000,000 annually. The chief articles of commerce on the upper Mississippi are grain, lumber, pork, flour and groceries; on the lower an interchange of grain and northern products generally is effected with the sugar, molasses, cotton, coffee, tropical fruits, and other products or imports of the southern states. On the Ohio river and its tributaries, which absorb fully $700,000,000, or nearly one-third of the entire yearly commerce of the Mississippi system, the chief articles of freight are coal, iron and its products, lumber, petroleum, furniture, salt, liquors, and groceries. Commerce on the Missouri river, of whose tributaries only the Osage and Yellowstone are even partially navigable, has to some extent ceased since the building of northwestern railways; but the products of the mines, in Montana and elsewhere, are still shipped down stream in large quantities. On the n. boundary of the U. S. the great chain of lakes, communicating through canals and through the St. Lawrence with the ocean, and through canals with the Mississippi river, affords another unique system of water-ways. The larger proportion of the surplus grain raised in the states bordering on and west of the Mississippi finds its way to tide-water through these lakes, which also do a heavy commerce in coal, iron and its manufactures, lumber, and salt. So

complete is the communication established by these two great systems of waterways that goods taken on board at New York may be transported to New Orleans without being transshipped. Other navigable waters in the U. S. are the Hudson river, through which the immense traffic of the Erie canal finds its way to and from the sea; the Kennebec, on which a large ice and lumber business are done below Augusta; the Penobscot, which has a large commerce in lumber below Bangor; the Connecticut, through which direct commerce with foreign cities is carried on to a limited extent, and which carries a good passenger and local trade; the Potomac, into which passes the coal-trade of the Chesapeake and Ohio canals; the James on which a considerable commerce is done in the products of Va.; the Alabama and its tributaries, on which large quantities of cotton are transported; and the Sacramento, which carries a large and miscellaneous business. The San Joaquin, the Columbia, and the Willamette rivers are also navigable to a greater or less extent. Since 1870 congress has been very liberal in the appropriation of surplus revenues for the improvement of rivers and harbors, the last bill for this purpose, passed 1882–83, over Pres. Arthur's veto, distributing the sum of $28,743,875 throughout the various states for the purpose of improving I. N. But though undoubtedly many objects well worth the care of the national government have been attained in this way, there is reason to believe that a majority of the appropriations were secured rather for the personal benefit of the legislator, who might thus earn the ignorant applause of a portion of his constituents. The special appropriations that from time to time have been made for the purpose of facilitating commerce on the Mississippi river are far more practical in their aims. The bars at the efflux of the passes at the mouth of this river were early recognized as serious impediments to navigation; and, beginning with 1837, various appropriations were made to secure an increased depth, but no permanent improvement was effected until 1875, when James B. Eads was authorized to create and maintain a channel out of the South Pass of the Mississippi, having an ultimate depth of 30 ft. The channel is now nearly finished, and has proved of great advantage. The improvement of other portions of the Mississippi and its tributaries also has called for financial assistance, both from the bordering states and from the national government. See Mississippi River.

NAVIGATION LAWS. In regard to the United States laws of navigation which affect the property in and management of ships, see Shipping, Law of. Only the regulation of congress in regard to the motions of ships coming near each other in such a way as to make a collision possible will be here considered. These regulations, which will be carried into effect in the courts of the United States, are also enforced in most commercial countries; and have taken the place of the general rules of the maritime law. They are the same which were adopted by France and Great Britain in 1863, and have since been agreed to by the United States and Canada, the chief continental commercial powers, Brazil, and the South American republics. Every steamship under sail and not under steam is to be considered a sailing-ship; and every steamship under steam, whether under sail or not, is to be considered a ship under steam. Every steam vessel under way must carry at the foremast head a white light; on the port side a red light; on the starboard side a green light; and both the green and red side-lights are to be fitted with inboard screens so as to keep the lights from being seen across the bow. Steamships towing other ships must carry two bright white lights vertically beside their side-lights to prevent them from being confounded with other steamships. Sailing-ships under way, or being towed, carry the same lights as steamships, with the exception of mast-head lights. Both steamships and sailing-vessels, when at anchor in roadsteads, shall exhibit a white light. Sailing pilot-vessels carry a white light at the mast-head, and show a flare-up light every 15 minutes. In case of a fog signals are to be sounded at least every 5 minutes. Steamships and sailing-vessels not under way sound a bell. Steamships under way sound a steam-whistle. Sailing vessels under way sound a fog-horn. A steamship coming near enough to a ship to make collision probable must stop and reverse. If two ships under steam are crossing each other, the ship which has the other on her starboard side must keep out of the other's way. If two sailing-ships meet end on so as to hazard collision the helms of both shall be put to port; and so with steamships. A vessel overtaking another must keep out of the latter's way. If two sailing-ships cross each other with the wind on different sides the one with the wind on the port side must keep out of the way of the one with the wind on the starboard side; but if they have the wind on the same side, or one has the wind aft, the one to windward must keep out of way of the one to leeward.

NAVIGATION, Ocean Steam. See Steam Navigation

NAVIGA'TORS' or **SAMO'AN ISLANDS,** a group of nine islands, with some islets, in the Pacific ocean, lying N. of the Friendly islands, in lat. 13° 30′ to 14° 30′ S. and long. 168° to 173° west. The four principal islands of the group are Mauna, Tutuila, Upolu, and Savaii. Area of the group estimated at 9150 sq. m.; pop. about 56,000. With the exception of one (Rose Island), the Navigators' Islands are all of volcanic origin and the volcanoes have not yet entirely died out, frequent tremors being felt. For the most part they are lofty, and broken and rugged in appearance, rising in some cases to 4300 ft. in height, and covered with the richest vegetation. The soil, formed chiefly by the de-

composition of volcanic rock, is rich, and the climate is moist. The forests, which include the bread-fruit, the cocoanut, banana, and palm trees, are remarkably thick. The orange, lemon, tacca (from which a kind of sago is made), coffee, sweet-potatoes, pine-apples, yams, nutmeg, wild sugar-cane, and many other important plants, grow luxuriantly. Until recently, when swine, horned-cattle, and horses were introduced, there were no traces among these islands of any native mammalia, except a species of bat. The Samoans belong to the Polynesian race, and these islands are regarded as the center whence that race spread over the Pacific. There are English and American mission-stations on the islands, as well as several Roman Catholic establishments, and the natives are all now nominally Christians. The English novelist, Robert Louis Stevenson, lived on Upolu, dying there in 1894. See his *Valima Letters*. The government is in the hands of the hereditary chiefs. The U. S., Germany, and Great Britain have obtained coaling stations at the islands, and subjects of the three powers own large tracts of land. In 1884 Germany and Great Britain agreed to respect the independence of the islands, but Germany has since intrigued to gain control. In 1889 an agreement between the United States, Great Britain, and Germany was ratified at Berlin, by which the three powers recognized one of the native chiefs and established an international court to be presided over by a judge appointed by the king of Sweden, to which disputes between resident foreigners were to be decided. See APIA.

NAVY, BRITISH. See NAVIES, MODERN.

NAVY REGISTER is a list of the commissioned and warrant officers of the navy and marine corps It begins with the secretary of the navy, his eight bureau-chiefs and the judge advocate general. Then are given the flag-officers, admirals, and commodores, followed by the other officers of the line, giving the date of present duty, the expiration of last cruise, and the amount of sea and shore service, together with the state from which appointed and the dates of commission in the various grades. The medical, pay, and engineers corps follow, and then come the chaplains, professors of mathematics, secretaries, naval constructors, and civil engineers. The warrant officers and mates come next, then the naval academy, the retired list, and the marine corps, with a list of resignations, retirements, deaths and dismissals for the previous year. The various stations are next given, with the names of the vessels and officers serving on board of them, followed by navy yards, shore stations, and officers employed on special service. A list of the serviceable and unserviceable naval vessels, followed by the pay tables of the navy and the marine corps, completes the book.

NAVVY (abridged from "navigator") meant originally a laborer on canals for internal *navigation*. Later it came into use for a laborer on any *public works*, as railroads, embankments, aqueducts, etc. The term is chiefly employed in England.

NAX'OS, the largest, most beautiful, and most fertile of the Cyclades, is situated in the Ægean, midway between the coasts of Greece and Asia Minor. Extreme length, about 20 m.; breadth, 15 miles. Pop. 89, 14,572. The shores are steep, and the island is traversed by a ridge of mountains, which rise in the highest summit, Dia, upwards of 3,000 feet. The plains and valleys are well watered; the principal products and articles of export are wine, corn, oil, cotton, fruits, and emery. The wine of Naxos (the best variety of which is still called in the islands of the Ægean, *Bacchus-wine*) was famous in ancient as it is in modern times, and on this account the island was celebrated in the legends of Dionysius, and especially in those relating to Ariadne. Among its antiquities are a curious Hellenic tower, and an unfinished colossal figure, 34 ft. long, still lying in an ancient marble quarry in the north of the island, and always called by the natives a figure of Apollo. It was ravaged by the Persians, 490 B.C., and after the conquest of Constantinople by the Latins, became the seat of a dukedom, founded by the Venetians. It now forms a portion of the kingdom of Greece (q.v.). Naxos, the capital, with a population of '89, 1,869, is situated on the n. w. coast, contains Greek and Catholic churches, a castle built by the Venetians, and is the seat of a Greek and a Latin bishop.

NAYLOR, JAMES, 1618–60; b. in Yorkshire, England, of humble parentage. In 1641 he became an adherent of the parliament, and served for about 8 years under Fairfax and Lambert, rising to the rank of quartermaster. The fanatical religious movements of the time seem to have completely overthrown his judgment; he was first a Presbyterian, then an Independent, and in 1651 was led by George Fox to become a Quaker. His ignorant exhortations and frenzied ravings soon caused the main body of Quakers to disown him, but he found a few deluded people who regarded him as an inspired prophet, and followed him from place to place. He suffered and perhaps encouraged these disciples to regard him as a forerunner of Christ, and when he was released from imprisonment at Exeter in 1656, they spread their garments in his path in imitation of the Savior's entrance into Jerusalem. Naylor was at once arrested on charges of blasphemy, tried before parliament, and sentenced to stand in the pillory for two hours, to be whipped at the cart's-tail from Palace-yard to the exchange, the letter B was to be branded on his forehead, and his tongue to be bored by a red-hot iron. After this he was to be taken to Bristol, whipped through that town, and then to be imprisoned for two years. The whole punishment was inflicted. Naylor recanted his errors, and was again received by the society of Quakers. A collection of his writings was published in 1716, and his *Memoirs* in 1719 and reprinted in 1800.

NAZAREANS. See CHRISTIANS OF ST. JOHN.

NAZARENE (Gr. *Nazarenos* and *Nazaraios*, an "inhabitant of Nazareth"), was used by the Jews as one of the designations of our Lord, and afterward became a common appellation of the early Christians in Judæa. Although, originally, it is but a local appellation, there can be no doubt that as Nazareth was but a second-rate city of the despised province of Galilee, it was eventually applied to our Lord and his followers as a name of contempt (John xviii. 5, 7; Acts xxiv. 5). For the Judaizing sect called Nazarenes, see EBIONITES.

NAZ'ARETH, a small t. or v. of Palestine, anciently in the district of Galilee, and in the territory of the tribe of Zebulon, 17 m. s. e. of Acre. It lies in a hilly tract of country, and is built partly on the sides of some rocky ridges, partly in some of the ravines by which they are seamed. It is celebrated as the scene of the Annunciation, and the place where the Savior spent the greater part of his life in obscure labor. Pop., estimated at 7,000. In the earliest ages of Christianity, Nazareth was quite overlooked by the church. It did not contain a single Christian resident before the time of Constantine, and the first Christian pilgrimage to it took place in the 6th century. It was taken by the Saladin in 1187 and was entirely ruined by the Soldan of Egypt in 1263. The principal building is the Latin convent, reared, according to pious tradition, on the spot where the angel announced to the Virgin the birth of her Savior-son; but the Greeks have also erected, in another part of Nazareth, a church on the scene of the Annunciation. Besides these rival edifices, the traveler is shown a Latin chapel erected by the Franciscans in 1840 and affirmed to be built over the "workshop of Joseph;" also the chapel of "the Table of Christ" (*Mensa Christi*), a vaulted chamber containing the veritable table at which our Lord and his disciples used to eat; the synagogue out of which he was thrust by his townsmen; and "the Mount of Precipitation," down which he narrowly escaped being cast headlong. The view from behind the town embracing Lebanon, Carmel, Hermon and the Mediterranean is very beautiful.

NAZ'ARITES (from Heb. *nazar*, to separate), denoted among the Jews those persons, male or female, who had consecrated themselves to God by certain acts of abstinence, which marked them off, or "separated them," from the rest of the community. In particular, they were prohibited from using wine or strong drink of any kind, grapes, whether moist or dry, or from shaving their heads. The law in regard to Nazarites is laid down in the book of Numbers (vi. 1–21). The only examples of the class recorded in Scripture are Samson, Samuel, and John the Baptist, who were devoted from birth to that condition, though the law appears to contemplate temporary and voluntary, rather than perpetual Nazariteship.

NAZARITES, a Christian sect found in Hungary and Russia, and particularly numerous in the Magyar districts of eastern Hungary. They are Spiritualists, reject the sacraments, hold marriage to be a civil ceremony, and from their refusal to perform military service or to pay taxes have given the Austrian government much trouble. See Hagenbach, *Church History of the 18th and 19th Centuries,* ii., 464.

NAZARUS, ST., venerated by the Roman Catholic Church, is said to have been the son of a Roman officer and a Christian mother, Perpetua, who suffered martyrdom at Carthage at the beginning of the third century, and is known as St. Perpetua. Brought up in the Christian faith, Nazarus at an early age began to promulgate its doctrines, but was arrested at Milan, together with a young friend, Celsus, and both were put to death. About the year 395 St. Ambrose discovered their graves and removed their remains to the Church of the Apostles. Their fête day is the 28th of July.

NAZZARI, BARTOLOMEO, an Italian painter of portraits and historical pictures, was born in the territory of Clusame, province of Bergamo, in 1699, and died in 1758. His art studies were pursued at Venice under Angelo Trevisani, and at Rome under Benedetto Luti and Francesco Trevisani. His life, with the exception of short sojourns in different Italian and German states, was spent at Venice.

NAZZARI, FRANCESCO, 1634–1714, an Italian ecclesiastic astronomer and littérateur, a professor of philosophy in the College of Sapience at Rome, founder of the *Giornale de litterati* (1668–79), and of a college at Rome for natives of Bergamo.

NEAGH, LOUGH, the largest lake of the British islands, is situated in the province of Ulster, Ireland, and is surrounded by the counties of Armagh, Tyrone, Londonderry, Antrim, and Down. It is 17 m. (English) in length, and 10 m. in breadth, contains 153 sq. m., is 40 ft. in mean depth, and is 48 ft. above sea-level at low water. It receives the waters of numerous streams, of which the principal are the Upper Bann, the Blackwater, the Moyola, and the Main; and its surplus waters are carried off northward to the north channel by the Lower Bann. Communication by means of canals subsists between the lough and Belfast, Newry, and the Tyrone coal-field. In some portions of the lough the waters show remarkable petrifying qualities, and petrified wood found in its waters is manufactured into hones. The southern shores of the lough are low and marshy, and dreary in appearance. It is well stocked with fish, and its shores are frequented by the swan, heron, bittern, teal, and other water-fowl.

NEAGLE, JOHN, 1796–1865; b. Mass.; began the study of painting as a coachmaker's apprentice, residing in Philadelphia, and at the age of 19 took his first sketches from

life. In 1820 he married the daughter of the painter, Thomas Sully. In 1826 his picture "Patrick Lyon, the Blacksmith" brought him some distinction. He painted the portraits, among other celebrities, of Washington, now in Independence hall, Philadelphia; Gilbert Stuart, Mrs. Wood as *Amina*, Mathew Carey, Henry Clay, Dr. Chapman, and commodore Barron.

NEAL, Alice Bradley. See Haven, Alice Bradley.

NEAL, Daniel, a dissenting minister and author, was b. in London, Dec. 14, 1678. He was educated first at Merchant Taylor's school, and afterwards at Utrecht and Leyden, in Holland, and in 1706 succeeded Dr. Singleton as pastor of a congregation in his native city. Neal's first work was a *History of New England* (1720), which met with a very favorable reception in America. Two years afterwards he published a tract entitled *A Narrative of the Method and Success of Inoculating the Small-pox in New England by Mr. Benjamin Colman*, which excited considerable attention; but the production on which his reputation rests is his *History of the Puritans* (4 vols. 1732–38), a work of great labor, and invaluable as a collection of facts and characteristics both to churchmen and dissenters, though, of course, written in the interest of the latter. It involved its author in several controversies, which failing health rendered it impossible for him to prosecute. Neal died at Bath, April 4, 1743.

NEAL, David Dolloff, artist; b. Lowell, Mass., 1837; resided in Munich since 1861. He studied art under his father-in-law, the Chevalier Ainmuller, and under Piloty. He was the first American to receive the great medal of the Royal Bavarian acad. of fine arts, which was given him for his "First Meeting of Mary Stuart and Rizzio." He has also painted "The Chapel of the Kings, Westminster Abbey," "St. Mark's, Venice," "Return from the Chase," "James Watt," "The Burgomaster," etc.

NEAL, John, an American author and poet, of Scottish descent, was b. at Falmouth, now Portland, Maine, Aug. 25, 1793. His parents belonged to the society of Friends, of which he was a member until disowned, at the age of 25, because he failed to live up to the rule of "living peaceably with all men." With the scanty education of a New England common school, he became a shop-boy at the age of 12; but learned and then taught penmanship and drawing. At the age of 21 he entered a haberdashery trade, first in Boston and then in New York; and a year after became a wholesale jobber in this business at Baltimore, in partnership with another American literary and pulpit celebrity, John Pierpont. They failed in 1816, and Neal turned his attention to the study of law. With the energy which acquired for him the *sobriquet* of "Jehu O'Cataract," affixed to his poem *The Battle of Niagara*, he went through the usual seven years' law-course in one, besides studying several languages, and writing for a subsistence. In 1817 he published *Keep Cool*, a novel; the next year a volume of poems; in 1819 *Otho*, a five-act tragedy; and in 1823 four novels—*Seventy-six*, *Logan*, *Randolph*, and *Errata*. These impetuous works were each written in from 27 to 39 days. In 1824 he came to England, where he became a contributor to *Blackwood's* and other magazines and reviews, and enjoyed the friendship and hospitality of Jeremy Bentham. On his return to America he settled in his native town, practiced law, wrote, edited newspapers, gave lectures, and occupied his leisure hours in teaching boxing, fencing, and gymnastics. Among his numerous works are *Brother Jonathan; Rachel Dyer; Bentham's Morals and Legislation; Authorship; Down-easters*, etc. After a long silence, devoted to professional business, he published, in 1854, *One Word More*, and in 1859, *True Womanhood*. The latter work, though a novel, embodies the more serious religious convictions of his later years. In 1870 appeared his *Wandering Recollections of a Somewhat Busy Life*. Neal's voluminous writings, with all their glaring faults of haste and inexperience, are full of genius, fire, and nationality.

NEAL, Joseph Clay, 1807–47; b. N. H. He settled in Philadelphia, where in 1831 he became editor of *The Pennsylvanian*, a democratic journal. In 1844 he founded the *Saturday Gazette*, which had a large circulation. His best-known book, *Charcoal Sketches; or, Scenes in a Metropolis*, enjoyed a considerable degree of popularity and was republished in London. He wrote also *Peter Ploddy and Other Oddities*, and a second series of *Charcoal Sketches*.

NEALE, John Mason, 1818–66; b. London. After graduating from Trinity college, Cambridge, he took orders in the Church of England. In 1846 he became incumbent of Crawley and warden of Sackville college, East Grinstead. On nine occasions between 1845 and 1861 he gained the Seatonian prize for an English sacred poem. His published writings on theological and ecclesiastical subjects amount to no less than seventy volumes, of which the best known are: *The History of the Holy Eastern Church; the Patriarchate of Alexandria; Mediæval Preachers; History of the so-called Jansenist Church of Holland; Essays on Liturgiology and Church History; Mediæval Hymns from the Latin*, and *Hymns of the Eastern Church*. He issued, also, a revised edition of Bunyan's *Pilgrim's Progress* for the use of children, which, on account of his notes, was the cause of considerable controversy. He was distinguished as a champion of the ritualistic party in the English church, and as the founder of an Anglican sisterhood of St. Margaret.

NEANDER, Johann August Wilhelm, by far the greatest of ecclesiastical historians, was born at Göttingen, Jan. 16, 1789, of Jewish parentage. His name prior to baptism was David Mendel. By the mother's side, he was related to the eminent phil-

osopher and philanthropist Mendelssohn (q.v.). He received his early education at the Johanneum in Hamburg, and had for companions, Varnhagen von Ense, Chamisso the poet, Wilhelm Neumann, Noodt, and Sieveking. Already the abstract, lofty, and pure genius of Neander was beginning to show itself. Plato and Plutarch were his favorite classics as a boy; and he was profoundly stirred by Schleiermacher's famous *Discourses on Religion* (1799). Finally, in 1806, he publicly renounced Judaism, and was baptized, adopting, in allusion to the religious change which he had experienced, the name of Neander (Gr. *neos*, new; *aner*, a man), and taking his Christian names from several of his friends. His sisters and brothers, and later his mother also, followed his example. He now proceeded to Halle, where he studied theology with wonderful ardor and success under Schleiermacher, and concluded his academic course at his native town of Göttingen, where Planck was then in the zenith of his reputation as a church historian. In 1811 he took up his residence at Heidelberg university as a privat-docent; in 1812 he was appointed there extraordinary professor of theology; and in the following year was called to the newly established university of Berlin as professor of church history. Here he labored till his death, July 14, 1850. Neander enjoyed immense celebrity as a lecturer. Students flocked to him not only from all parts of Germany, but from the most distant Protestant countries. Many Roman Catholics, even, were among his auditors, and it is said that there is hardly a great preacher in Germany who is not more or less penetrated with his ideas. His character, religiously considered, is of so noble a Christian type that it calls for special notice. Ardently and profoundly devotional, sympathetic, glad-hearted, profusely benevolent, and without a shadow of selfishness resting on his soul, he inspired universal reverence, and was himself, by the mild and attractive sanctity of his life, a more powerful argument on behalf of Christianity than even his writings themselves. Perhaps no professor was ever so much loved by his students as Neander. He used to give the poorer ones tickets to his lectures, and to supply them with clothes and money. The greater portion of what he made by his books, he bestowed upon missionary, Bible, and other societies, and upon hospitals. As a Christian scholar and thinker, he ranks among the first names in modern times, and is believed to have contributed more than any other single individual to the overthrow, on the one side, of that anti-historical rationalism, and on the other of that dead Lutheran formalism, from both of which the religious life of Germany had so long suffered. To the delineation of the development of historical Christianity, he brings one of the broadest, one of the most sagacious (in regard to religious matters), one of the most impartial yet generous and sympathetic intellects. His conception of church history as the record and portraiture of all forms of Christian thought and life, and the skill with which, by means of his sympathy with all of these, and his extraordinary erudition, he elicits, in his *Kirchengeschichte*, the varied phenomena of a strictly Christian nature, have placed him far above any of his predecessors. Neander's works, in the order of time, are: *Ueber den Kaiser Julianus und sein Zeitalter* (Leip. 1812); *Der Heil. Bernhard, und sein Zeitalter* (Berl. 1813); *Genetische Entwickelung der vornehmsten Gnostischen Systeme* (Berl. 1818); *Der Heil. Crysostomus und die Kirche besonders des Orients, in dessen Zeitalter* (2 vols. Berl. 1821–22; 3d ed. 1849); *Denkwürdigkeiten aus der Geschichte des Christenthums und des Christlichen Lebens* (3 vols. Berl. 1822; 3d ed. 1845–46); *Antignosticus, Geist des Tertullianus und Einleitung in dessen Schriften* (Berl. 1826); *Allgemeine Geschichte der Christlichen Religion und Kirche* (6 vols. Hamb. 1825–52); *Geschichte der Pflanzung und Leitung der Kirche durch die Apostel* (2 vols. Hamb. 1832–33; 4th ed. 1847); *Das Leben Jesu Christi in seinem geschichtlichen Zusammenhange*, written as a reply to Strauss's work (Hamb. 1837; 5th ed. 1853); *Wissenschaftliche Abhandlungen*, published by Jacobi (Berl. 1851); *Geschichte der Christlichen Dogmen*, also published by Jacobi (1856). The majority of these works, including the most important, have been translated into English, and form more than a dozen volumes of Bohn's "Standard Library."

NEAP-TIDES. See TIDES.

NEAR'CHUS, the commander of the fleet of Alexander the Great in his Indian expedition, 327–26 B.C., was the son of one Androtimus, and was born in Crete, but settled in Amphipolis. In 329 B.C. he joined Alexander in Bactria, with a body of Greek mercenaries, and when the latter ordered a fleet to be built on the Hydaspes, Nearchus received the command of it. He conducted it from the mouth of the Indus to the Persian gulf, in spite of great obstacles, resulting partly from the weather and partly from the mutinous disposition of his crews. Nearchus left the Indus on Sept 21, 325, and arrived at Susa, in Persia, in February 324, shortly after Alexander himself, who had marched overland. Fragments of his own narrative of his voyage have been preserved in the *Indica* of Arrian.—See Dr. Vincent's *Commerce and Navigation of the Ancients in the Indian Seas* (vol. i. pp. 68–77, Lond. 1807), and Geier's *Alexandri Magni Historiarum Scriptores* (pp. 108–150).

NEATH, a parliamentary and municipal borough and river-port of the co. of Glamorgan, South Wales, on a navigable river of the same name, seven m. n.e. of Swansea. It is built on the site of the Roman station *Nidum*, and it contains the remains of an ancient castle, burned in 1231. In the immediate vicinity are the imposing ruins of Neath abbey, described by Leland as "the fairest abbey in all Wales," but now sadly decayed and begrimed by the smoke and coal-dust of the public works of the district. There are at Neath several extensive copper and tin works. Copper, spelter,

iron and tin plates, and fine bricks are extensively exported, stones are quarried, and coal and culm are raised. The trade of the port has largely increased. Pop. 1891, 11,157.

NEB-NEB, or NIB-NIB, the dried pods of *Acacia Nilotica*, one of the species of Acacia (q.v.) which yield gum-arabic, and a native of Africa. These pods are much used in Egypt for tanning, and have been imported into Britain.

NEBO, the name of a well-known deity of the Babylonians and Assyrians. He presided over learning and letters. He is called the "far-hearing," "he who possesses intelligence," "he who teaches or instructs." He generally has the distinguished titles of "Lord of lords," "Holder of the scepter of power," etc. Hence Layard thinks the name is derived from the Egyptian *Neb*, Lord. The wedge or arrow-head—the essential element of cuneiform writing—was his emblem. His character corresponds with that of the Egyptian Thoth, the Greek Hermes, and the Latin Mercury. A statue of Nebo was set up by Pul, the Assyrian monarch, at Calah (Nimrud), which is now in the British museum. Nebo early held a prominent place in Babylonia, and from a remote age a great temple was dedicated to him at Borsippa, the modern *Birs Nimrud*, and that ancient town was especially under his protection. He was the tutelar god of the most distinguished Babylonian kings, of whose names the word Nebo or *Nabu* forms a part, as *Nebu*-chadnezzar. Astronomically, Nebo is identified with the planet nearest the sun. Nebuchadnezzar rebuilt his temple at Borsippa, where his worship was continued to the third or fourth century after Christ.

NEBO (Heb. "hill-top"), the modern *Jebel Nebba*, a mountain 2685 ft. high, situated 5 m. s.w. of Heshbon in eastern Palestine. It is mentioned in Genesis 32 : 49.

NEBRASKA, a central western state, and the 24th in order of admission; lying between lat. 40° and 43° n.; long. 95° 23′ and 104° w.; bounded on the n. by South Dakota; on the e. by Iowa and Missouri, the Missouri river intervening; on the s. by Kansas and Colorado, and on the w. by Colorado and Wyoming; greatest length from e. to w., about 420 m.; width, 210 m.; land area, 76,840 sq.m.; gross area, 77,510 sq.m., or 49,606,400 acres.

History.—N. was originally a part of the Louisiana territory, ceded to the U. S. by France in 1803, and in 1804–05 was visited by Lewis and Clarke, supposed to have been the first white persons who traveled through it. Its aboriginal inhabitants were the Sioux, Pawnees, Otoes, and Omahas. From 1812 on, it formed a part of the Missouri territory, and the first settlement by whites was in 1847, at Bellevue, below Omaha. During the winter of 1854 Stephen A. Douglas succeeded, amid much political excitement, in having congress pass what was widely known as his Kansas-Nebraska bill, which resulted in the establishment of N. as a territory (May 30), including part of the Dakotas, Montana, Wyoming, and the n.e. portion of Colorado, but in 1861 parts were set off, and in 1863, Mar. 3, it was reduced to its present limits. Until the construction of the Pacific railroad the population increased very slowly.

In Mar., 1860, a proposition to form a state government was rejected by a small majority. In 1864 congress passed an enabling act, but troubles with the Indians hindered the taking of further steps. In 1866 a constitution was prepared by the territorial legislature, and was ratified by the people, June 21. Bills for the admission of N. were passed by congress, July 28, and in Jan., 1867, both of which were vetoed by Pres. Johnson. The bill was passed over the second veto, Feb. 9, and on Mar. 1 N. became a state. Bellevue was the first capital; then Omaha, from 1855–67, when Lincoln was selected as the permanent seat. N. furnished 3157 men to the union army. A new constitution was adopted in 1875.

Topography.—N. is a vast and uneven plain, forming a part of the great eastern slope of the Rocky mts. A few ridges and hills break the surface, but only in the n.w. and w. are there any mountains. Here are seen peaks 6000 ft. high, while in the eastern part of the state the average altitude is only 900 ft. above the sea. North of the Niobrara the country is largely made up of sand-hills, and beyond this "Bad lands" extending into South Dakota. The chief rivers are the Missouri on the eastern boundary, the Niobrara or Eau-qui court, flowing from w. to e. across the state, and near the northern boundary; the Nebraska or Platte, a large tributary of the Missouri, coursing through a broad and fertile valley, and receiving from the n. the Loup fork and the Elkhorn; and the Republican and Big and Little Blue, which pass across the southern border into Kansas. Nearly all the streams have a s.e. direction, and most of them have worn deep channels, leaving bluffs on either side.

Geology and Mineralogy.—Three fourths of the state is occupied by miocene tertiary formations. The cretaceous, carboniferous, and Permian have more limited areas in the e. and s.e., and a small portion of the n.w. corner is pliocene tertiary. Evidences of glacial action abound along the Missouri and lower Platte. Metals and minerals have not yet been found to any extent in N. Coal has been discovered here and there, ranging in layers from 5 to 22 in., but it has not so far yielded sufficient quantities for the home demand. It is thought that this deposit is the western margin of the great coal-basin of Missouri and Iowa, and that the coal is so much thinned out by pressure from above that it will not prove profitable to mine to any extent. Lignite coal is obtained in the s.w. cos. Building limestone has also been discovered, and is in use for the erection of dwellings, together with a dark, yellowish-gray sandstone, a gray magnesian limestone, taking a fine polish, and blue Trenton limestone. Marble, lime, and gypsum

AREA AND POPULATION OF NEBRASKA BY COUNTIES.

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

also are found, as well as rock salt in the gulches of the s.w. The central and western cos. contain immense beds of peat. Clay, for the manufacture of brick, is easily obtained, and in the central and western parts of the state there are numerous salt-basins.

Zoölogy.—The large wild animals are the elk, dear, antelope, mountain sheep, grizzly, black and brown bear, panther, and prairie wolf. The otter, coyote, lynx, raccoon, opossum, skunk, beaver, etc., are numerous, and among wild fowl, the turkey, quail, grouse, pinnated grouse, etc. Fully 260 species of birds are known. There are several species of serpent, two of them venomous. The board of fish commissioners has a hatchery in Sarpy co. of 52 acres, and has stocked many of the streams and bodies of water with salmon, German carp, brook, and California trout.

Botany.—The trees include the elm, maple, black walnut, hickory, red cedar, linden, hackberry, cottonwood, two species of pine and two of spruce. The principal growth of timber, and that cottonwood, is along the streams. Considerable attention is paid to forestry. The flowering plants number about 2000 species.

Climate and Soil.—The climate is mild and dry, but drought rarely damages the crops, for the soil is such that it withstands extreme and prolonged heat. The mean temperature during the winter months ranges from 22° to 30°; that of the spring from 47° to 49°; of the summer from 70° to 74°; and of the autumn from 49° to 51°. The heat of the summer is tempered by the prairie winds, and the nights are usually cool. The greatest amount of rain falls in May and June. The average annual temperature at Kearney, for 15 years, was 47.53°; at Omaha it is about 48°. The average annual rainfall at Kearney is 25.25 ins. In parts of the w. and s.w. it is from 17 to 19 ins. The soil in the eastern part of the state is a rich, black vegetable mold from 2 to 10 ft. deep, slightly impregnated with lime, free from stones or gravel, easily plowed, and underlaid by a yellow clay in most places.

Agriculture.—This and stock-raising are the principal industries of the state. The grazing sections comprise about 23,000,000 acres, and are for the most part well watered. The wild grasses, which formerly covered large portions of the state, were very nutritious, and large herds of cattle were brought from Texas and elsewhere to be fattened on these grasses preparatory to sale; the cattle droves which passed through the state were a source of material prosperity, but the old "Texas trails" are now abandoned, owing to the thick settlement of the land. Much of the great plateau has been converted into stock farms, and stock-raising both for market and for breeding purposes is becoming a prominent industry. The farm and ranch animals number about 4,000,000 head, of a local value of over $55,000,000; and the cereal, potato, and hay crops have an annual value of over $65,000,000. The state ranks second in production of corn, nearly 299,000,000 bushels; ninth in wheat; seventh in oats; and fourth in hay. The soil of this state has also been found peculiarly adapted to the sugar beet, and to encourage its culture the legislature has attempted to provide a bounty for all sugar manufactured in the state from beets, but one law was repealed by a subsequent legislature and a second one was declared unconstitutional by the supreme court, 1896. The U. S. government has established a sugar beet experiment station at Schuyler, and factories have been erected by private parties at Grand Island, Norfolk, and elsewhere. The machinery used in the factories is of the most delicate mechanism. The beets are taken into the factory fresh from the ground, with the soil still clinging to them, and without the touch of a human hand they pass on through the factory, from one process to another, until, in eighteen hours' time, they come out white sugar, ready for market. In foreign countries the beets are taken from the ground and topped by hand; but a machine has been invented in the United States which, drawn by two horses, cuts under the beet, throws it out, tops it, and carries it by an endless apron to a wagon by the side of the machine.

Industries.—Agriculture and stock-raising, already spoken of, are the principal industries of the state; but manufacturing is also carried on to some extent. Omaha, the metropolis, besides a wholesale trade exceeding $75,000,000 annually, has one of the most complete establishments in the United States for smelting, separating, and refining ores of gold, silver, copper, lead, and zinc, brought here from mining regions on the line of the Union Pacific and other railroads. Other industries include machine shops, distilleries, and manufactures of bricks, steam engines, etc. In South Omaha are the extensive stock yards of the Union Pacific Railroad, occupying a large tract of land. It is the third largest pork-packing city in the world, with immense packing houses having plants valued at over $2,500,000. Lincoln, a great railroad center, has foundries and grain elevators, extensive manufactures of salt, also of leather, furniture, bricks and tiles. Kearney, Nebraska City, and Hastings are also places of considerable importance. Beatrice, in the extreme southeastern part, has large quarries. The U. S. census of 1890 reported 3,014 manufacturing establishments, having $37,569,508 capital, 27,876 persons employed, and output $93,037,794.

Commerce and Transportation.—Nebraska necessarily has only a domestic commerce. Excepting that portion of productions and manufactures that is shipped on the Missouri River, everything is transported over the railroads. The Platte and other rivers in the interior are too shallow for navigation. The leading railroads are the Chicago, Burlington and Quincy; Kansas City, St. Joseph and Council Bluffs; Missouri Pacific; Union Pacific; Chicago, Rock Island and Pacific; the Nebraska divisions of the Northwestern; Sioux City and Pacific; Burlington and Missouri river. The Union Pacific traverses the entire state from east to west, and the Missouri Pacific places the eastern part of Nebraska in communication with St. Louis. The total mile-

age is over 5,500 miles, and the equalized assessed valuation of railroad property, nearly $26,000,000.

Banks.—In 1896 there were 114 national banks in operation, with capital $11,525,000, and deposits $39,700,922; and 438 state banks, with capital $8,770,590, and deposits $13,207,339.

Religious Denominations, Education, etc.—The leading denominations are the Lutheran, Christian (Disciples), Methodist Episcopal, Presbyterian, Baptist, Congregational, Protestant Episcopal, and Roman Catholic.

The educational interests of the state have been for many years watchfully managed and the common schools are most liberally provided for and under the supervision of a state superintendent. The public school fund exceeds $8,000,000 and it is believed it will aggregate $20,000,000 when all the public lands are sold. The enrollment (1895) was 274,282; average daily attendance, 171,859. The proportion of illiteracy is smaller than in any other state, being (1890) only 3.1 per cent. of the population over ten years of age. The free text-book system has been largely adopted, much to the advantage of the schools, since the cost of the books is much less, and the children of the poorer classes are held in school longer. Teachers' institutes are held annually in about two-thirds of the counties; Arbor Day (April 22d) is generally observed throughout the state with planting of trees and an appropriate literary programme. In 1892, October 20th was set aside as a permanent Library Day, and it is hoped soon to have public school libraries in every school in the State. The larger towns have public high schools.

The institutions for higher instruction include the State university at Lincoln; university of Omaha (Pres.), Bellevue; Cotner university (Christian), Bethany; Union college (Seventh Day Adv.), College view; Doane college (Cong.), Crete; Fairfield college (Christ.), Fairfield; Gates college (Cong.), Neligh; Creighton university (R. C.), Omaha; Nebraska Wesleyan university (M. E.), University place; York college (Unit. Breth.), York; Grand Island college (Bapt.), Grand Island; Hastings college (Pres.), Hastings; Platte collegiate institute (P. E.), Kearney; Brownell hall (P. E.), Omaha; academies at Chadron, Columbus, Franklin, Lincoln, North Platte, Omaha, Pawnee City, Wahoo, Weeping Water, and York; Nebraska state normal and training school at Peru; Fremont normal school, Fremont; Lincoln normal university, Lincoln; Lincoln polytechnic institute, Lincoln; North Nebraska normal college, Madison; Santee normal training school, Santee Agency; Bryant normal university, Stromsburg; Nebraska normal college, Wayne; Trinity seminary (Luth.), Blair; Presbyterian theological seminary, Omaha; theological institute (Cong.), Santee Agency; college of law at the State university; John A. Creighton and Omaha medical colleges, Omaha; and medical school at Cotner university. In 1896 there were over 40 libraries of 1,000 volumes each and upward, with an aggregate of over 226,000 volumes, and there were over 580 periodicals, including over 30 daily, 500 weekly, and 30 monthly publications.

Government.—The capital is Lincoln. The constitution of Nebraska provides that every male person of the age of twenty-one years and upward, who is a citizen of the United States or has declared his intention thirty days previous to an election to become a citizen, and who is neither insane, an idiot, nor an unpardoned felon, shall be entitled to vote, provided he has resided in the state six months, forty days in the county, and ten days in the precinct. Registration of voters is required in cities of over 2500 inhabitants. New ballot laws based on the Australian system were adopted in 1891. The state elections are held biennially on the Tuesday after the first Monday in Nov. The governor receives a salary of $2500. The legislature is composed of 33 senators and 100 representatives, each elected for two years, who receive $5 a day. It meets biennially in odd-numbered years on the first Tuesday in January; session limited to 60 days. The supreme court consists of a chief-justice and two associates, elected by the people for six years, and receiving $2500 each.

The property of corporations is taxed in the same manner as that of individuals. Property acquired by a wife after marriage remains separately hers. Women who own assessed property, or who have children of school age, may vote in school meetings. A high-license liquor law was adopted in 1881. The legal rate of interest is seven per cent.; ten is allowed by contract, and the penalty for usury is forfeiture of interest and cost. Among reformatory, penal, and charitable institutions are the Penitentiary near Lincoln, the Asylum for the Blind at Nebraska City, School for the Deaf and Dumb at Omaha, the Industrial School for boys at Kearney, Industrial School for girls at Geneva, Home for the Friendless at Lincoln, and the asylums for the insane at Lincoln and Norfolk, and at Hastings (for incurables), and for the feeble-minded near Beatrice. The National Guard has an authorized strength of 2,000 officers and men; number liable to military duty, over 175,000. The Soldiers' and Sailors' Home, opened in 1888 at Grand Island, has a large building for unmarried veterans, and a series of cottages on tracts of two to five acres for men with families.

The electoral votes have been cast as follows; 1868, Grant and Colfax, 3; 1872, Grant and Wilson, 3; 1876, Hayes and Wheeler, 3; 1880, Garfield and Arthur, 3; 1884, Blaine and Logan, 5; 1888, Harrison and Morton, 5; 1892, Harrison and Reid, 8; 1896, Bryan and Sewall, 8.

Finances.—The total assessed valuation of real and personal property in the state, according to the last United States census reports, was $184,770,305; per capita, $174.49. The state debt was $253,879; county debt, $5,510,175; municipal debt, $7,124,506; combined net debt, $15,536,772; 1896, assessed valuation, $167,078,270; funded state debt, $449,267; resources, $593,190.

POPULATION.—In 1860, 28,841; 1870, 122,993; 1880, 452,402; 1890, 1,058,910. There are 90 cos.; for pop., 1890, see census tables, vol. XV. The largest cities, 1890, were Omaha, 140,452; Lincoln, 55,154; Beatrice, 13,836; Hastings, 13,584.

NEBRASKA OR PLATTE river is formed by the North and South Platte rivers or forks, which rise in the Rocky mts. in Colorado. The North fork takes a circuitous course through southeastern Wyoming before passing into N., and unites with the South fork in Lincoln co. The N. is about 900 m. long, from the source of the North fork to its mouth, and flows through a broad and very fertile valley. It is not navigable.

NEBRASKA CITY, city and co. seat of Otoe co., Mo.; on the Missouri river and the Burlington route and the Missouri Pacific railroads; 60 miles e. by s. of Lincoln, the state capital. It contains a U. S. government building, erected in 1888 at a cost of $125,000, the state institution for the blind, a branch of St. Benedict's college, public library provided by the city, high school, several ward and suburban schools, waterworks supplied from the river and operated under a city franchise, gas and electric light plants, a street railroad system, Morton park, and a smaller park. The city is the center of a noted fruit belt, also of a rich corn region, and the river is here spanned by a steel railroad bridge. The principal industrial plants are large stock yards, cereal and flour mills, lumber and planing mills, foundry, starch factory, packing and provision house, plow factories, breweries, brick works, and distillery. Pop. '90, 11,494.

NEBULÆ, a name given to indistinct patches of light in the heavens, supposed to proceed from aggregations of rarely distributed matter belonging to distant worlds in the course of formation. By the gradual improvement of telescopes in power and distinctness, these nebulæ have, one after another, become resolved into clusters of distinct stars. It is probable that the group of stars with which our system is immediately surrounded would, if looked upon from the immeasurable distances at which the so-called nebulæ are situated, itself assume the appearance of such a nebula. See STARS. Some nebulæ are of a round form presenting a gradual condensation towards the centre; others consist of one star surrounded by a nebulous haze; while a third class present just the same appearance as would be exhibited by the solar system, if seen from a point immensely distant. These and other phenomena suggested to Laplace the idea, afterwards developed into a theory, and known as the *nebular hypothesis*, that these nebulæ were systems in process of formation; the first stage presenting an agglomeration of nebulous matter of uniform density, which, in the second stage, showed a tendency to gradual condensation towards the centre; and, finally, the nebulous matter round the now-formed centre of the system separated itself into distinct portions, each portion becoming condensed into a planet. The same opinion regarding the formation of planets from nebulæ was put forward by sir William Herschel in 1811.

The earliest mention of nebulæ is that attributed to the Arabian astronomer, Sufi, who, in the tenth century, described the Magellanic clouds and the nebula in Andromeda. Ptolemy had made a catalogue of "cloudy stars," but the objects he mentioned are easily resolvable into star clusters with small telescopes. The nebula in Andromeda, which is visible to the naked eye, was the only one discovered before the invention of the telescope, although a few others are now known which are faintly visible. In 1656 Huyghens discovered the great nebula in the constellation Orion, publishing an account of it along with the discovery of the rings of Saturn in 1659. In 1714 Halley described six nebulæ. In 1755 La Caille sent a list of 42 nebulæ which he had discovered at the cape of Good Hope, to the Academy of Sciences at Paris. Messiers published a list in 1783 and 1784, containing an account of 103 nebulæ, the greatest number described by one observer before the observations of sir William Herschel, who, in 1781, with a five-foot reflector of his own construction, began his investigation of the heavens, his first performance being the discovery of Uranus. By the use of this and other telescopes he was enabled in 1786 to communicate to the Royal Society a catalogue of 1000 new nebulæ and clusters; in 1787 a second catalogue of another 1000, and in 1802 a third, containing 500 more. Sir John Herschel, between 1825 and 1830, reviewed a portion of his father's work, adding a list of 500 nebulæ and clusters of his own discovery, making in all a list of 2306 nebulæ and clusters in the northern hemisphere, which he sent to the royal society. In 1833 he took his instruments to the cape of Good Hope, the result of which was a catalogue of 1708 nebulæ and clusters in the southern heavens. The whole number of nebulæ and clusters now known is over 5000. The most complete catalogue is that of sir John Herschel, published in 1864, which contains all that were accessible to him up to 1863. The number there recorded is 5079. The *nebulæ* have presented a subject about which there has always been doubt, in regard to their position as well as constitution. After many of them had been resolved into starry clusters it was thought they were all galaxies similar to our own solar system, and sir William Herschel adopted this view in regard to certain nebulæ which he supposed were external to our stellar system; but afterwards, in developing his nebular hypothesis, he found it difficult to distinguish between the external nebulæ and those which are generally thought to be parts of our own sidereal system. Proctor expresses the opinion "that our sidereal system extends far beyond the limits which have ordinarily been assigned to it, and that there are no nebulæ which can be regarded as external to it." Herschel concluded that there were nebulæ which are not resolvable into stars, and that they consisted of gaseous matter. The forms of nebulæ

are various, and they change in appearance with different powers of the telescope. The spiral nebulæ, which were first made known by lord Rosse are examples of this kind, their spiral form having previously not been suspected. Some planetary nebulæ resemble planets, and when viewed with telescopes of high power present a complicated appearance. Some have the appearance of a ring and are called annular nebulæ; there is a beautiful example in the constellation Lyra in which a central mass is surrounded by a ring. Some are in pairs, like double stars. Small nebulæ generally have the appearance of a bright nucleus surrounded by a veil; some of them are called stellar nebulæ. Others are very irregular, and have long filmy arms. Those in Orion and Andromeda are examples, as also the great nebula in Argo which was carefully described by sir John Herschel in his Cape observations. Those nebulæ which are resolvable into stars give spectra which resemble the spectra of stars, while those which are obtained from the light of unresolvable nebulæ give a spectrum of three, sometimes four, bright lines, one of which corresponds to a line in the spectrum of hydrogen, and another to a line in that of nitrogen. The planetary nebulæ also give similar gaseous spectra. Of 70 nebulæ examined by Huggins about one-third gave gaseous spectra. The nebular hypothesis in regard to the formation of the universe, although previously proposed by Swedenborg, Buffon, and Kant, was first systematized by Herschel and Laplace, and has been since modified. Laplace's earlier ideas were embraced in a consideration as to the manner of the formation of our solar system. He conceived that a mass of highly-heated vaporous matter occupied a space larger than the orbit of the farthest planet. In consequence of molecular and gravitating forces it acquired rotation, by which it threw off rings of matter which afterwards broke up into planets and their satellites. Herschel's theory caused a modification of Laplace's who adopted the idea that primordial nebulous matter still existed which was being formed into nebulæ and clusters. The general idea now entertained is that this primordial matter has accomplished the work of world formation by the action of gravity aided by molecular forces. It is assumed by some that on physical principles primordial matter widely distributed through space would pass through the following changes. Gravitation would cause the mass to contract, and become more dense; this would be followed by atomic repulsion, which acting against gravitation would produce heat. After a certain degree of condensation had taken place molecular combination would result, which would again cause a great evolution of heat; this would be followed by radiation and precipitation of binary atoms as flocculi floating in the rarer medium: these flocculi will tend to move toward a common center, but as the mass is irregular the motion will really be to one side of the center. This will result in a spiral movement. Mutual attraction will produce groups of flocculi, moving around local centers of gravity. There will be here and there detached portions which will not coalesce with the larger internal masses, but will slowly follow without overtaking them, thus accounting for the formation of comets. Many dynamic principles are involved in such motions and changes of matter which have received the attention of scientists, of which may be mentioned the investigation of molecular vortices by Rankine, and of vortex rings by Helmholtz and Thomson, and the preservation and disruption of revolving rings by Maxwell, Peirce, and Hind in memoirs on the rings of Saturn, that although grand and instructive views have been obtained of the regions of space, the brilliant investigations of science have as yet afforded no positive knowledge of its infinite depths, or of its genesis.

NE'BULY, one of the partition lines in heraldry, which runs out and in in a form supposed to represent the uneven edges of clouds.

NECESSITY. This word occurs in connection with two different philosophical subjects, namely, the freedom of the will (see FREE-WILL), and the nature of our belief in fundamental truths, such as the axioms of mathematics. It is alleged by some philosophers that the truths held by us as most certain are the result of experience, and that the degree of certainty is but a measure of the universality of the experience. Others contend that such first principles as the axioms of mathematics are not only true, but *necessarily* true. Such necessity, it is argued, cannot come from mere experience, and therefore implies an innate or intuitive source. Hence the theory of necessary truth is only another name for the theory of instinctive or intuitive truth.

Necessity is a word too vague in its signification to serve as a leading term in philosophy. There are several meanings attaching to it which should be clearly set forth before entering on the discussion of such questions as those above mentioned.

1. Necessity, in the first place, means that one fact or statement is *implied* in another. Thus, if we say that all the apostles were Jews, it follows necessarily that Peter was a Jew; this is not a new fact, but merely a reassertion of a portion of the same fact. We are not at liberty to affirm a thing in one form, and then deny the same thing when expressed in a different form. If we say this room is hot, it is repeating the assertion in another way, to say that it is not cold. These truths follow by necessary inference. Hence the general axiom of the syllogism, that what is true of a whole class must be true of each individual, is a necessary truth in this sense. In affirming such a truth, we merely declare that we shall be consistent, and that when we have affirmed a proposition in company with other propositions, we are prepared to affirm it when taken apart from the others This kind of necessity is sometimes called logical necessity, and sometimes

mathematical necessity. We might call it deductive necessity, or necessity by implication.

2. A second meaning is inductive certainty; or the certainty that arises from a well-grounded experience. That lead will sink in water; that animals need food and air in order to live; that warmth promotes vegetation,—are truths that we call necessary, in the sense of being so certain that we may always count upon them. We presume with the highest confidence, that an unsupported body will fall to the ground, not because the fact of falling is implied in the fact of matter, but because nature has uniformly conjoined the two facts. We can speak even of moral necessity; by which we mean only uniform sequence and consequent certainty. When we declare that children, whose education has been neglected, must fall into evil courses, we declare what experience has shown us will happen in relation to the human mind.

3. When necessity means neither deductive implication, nor inductive certainty, it refers us to a peculiar test supposed to apply to the truths in dispute—namely, the inconceivableness of their opposite. It is said that, not only can we not *believe* in the opposite of the axiom, that "the sums of equals are equal," but we cannot even *conceive*, imagine, or picture to ourselves the opposite of it. This impossibility of conceiving the contradiction of any statement, is regarded by many as a peculiarly cogent circumstance in its favor. It distinguishes the axiomatic first principles from the truths of inductive science, these having, it is said, an inferior order of certainty. To this it may be replied, however, that men's power of conceiving is so much affected by their education and habits, that many things, whose opposites were at one time inconceivable, have since been found to be false. For example, the notion that men could live at the antipodes was once reckoned inconceivable, and we now know it to be a fact. An unvarying association will often produce a disability to conceive anything different.

In commencing a discussion as to the necessary character of any truth, the disputants should agree beforehand which of the three meanings they intend. In the controversy on the mathematical axioms, maintained between Dr. Whewell on the one hand, and sir John Herschel and Mr. J. S. Mill on the other, the third meaning is more particularly involved. The doctrine of inconceivability, as the test of truth, has been put forward by Mr. Herbert Spencer, under the title of the universal postulate (*Principles of Psychology*, Part I.).

NECHES, a river of Texas, rises in the central eastern portion of the state, and flows s. by e., 200 m., into Sabine bay, where its waters, with those of the Sabine river, find their way, by Sabine pass, into the gulf of Mexico.

NECHO, Pharaoh Necho, or Neku, an Egyptian king, son and successor, according to Herodotus, of Psammeticus, and contemporary of Josiah king of Judah. Sacred and profane writers relate his successful wars in Syria. Soon after his accession to the throne he prepared large fleets on the Mediterranean and Red seas, and sent some expert Phenician sailors to explore the coasts of Africa. They are said to have circumnavigated Africa, by which its peninsular form was ascertained, more than 2,000 years before Vasco de Gama doubled the cape of Good Hope. He attempted also to reopen the canal connecting the Red sea with the Nile. To check the power of the Assyrians, he collected a large army at the beginning of his reign, B.C. 610, and entered Palestine with the view of besieging Carchemish on the Euphrates. But Josiah resented his passage through his territory, and, though Necho sent messengers disclaiming any hostile designs, Josiah encountered him in the plain of Megiddo, about 40 m. n. of Jerusalem. Josiah's forces were routed with great slaughter. He himself was wounded with an arrow, and his attendants, removing him from his chariot, conveyed him to Jerusalem, where he died. Necho proceeded on his march to the Euphrates. Three months after the capture of Carchemish and the defeat of the Chaldeans, he learned that Jehoahaz, a younger son of Josiah, had usurped the throne of his father. Necho deposed him, condemned the land to a yearly tribute, and carried him prisoner to Jerusalem. He then made Eliakim king, changing his name to Jehoiakim, took the silver and gold which had been levied from the Jewish nation, and returned to Egypt with Jehoahaz. Four years afterwards he again marched into Syria against the Babylonians, but Nebuchadnezzar completely routed his army, and, advancing through Palestine, took from Necho all the Egyptian possessions from the Euphrates to the southern extremity of Syria. Nebuchadnezzar deposed Jehoiachin, who had succeeded his father, and carried the warriors and treasures to Babylon. Necho died soon after, having reigned, according to Herodotus, 16 years. He was of the Saïte 26th dynasty, of which Manetho makes him either the fifth ruler or the sixth. Herodotus calls him Nechôs. He was succeeded by Psammeticus II.

NECKAR, one of the largest tributaries of the Rhine, and the principal river of Würtemberg, rises near to the source of the Danube, on the eastern declivity of the Black forest, and close to the village of Schweningen. It has a winding course of 246 m., first n.e. to its junction with the Fils, then n. to its junction with the Jaxt, and finally n.w. to Mannheim, where it joins the Rhine. The principal places on its banks are Tübingen, Heilbronn, Heidelberg, and Mannheim. Its course, leading first through a deep and narrow dale, leads afterwards through a succession of wide and fertile tracts, inclosed by soft vine-clad hills. The scenery of its banks is, in general, very beautiful, and in many places highly romantic. From Cannstadt, about midway in its course, the Neckar is

navigable; steamers ply regularly to Heidelberg. Good wines are grown on its banks. Chief affluents, on the left, the Enz; on the right, the Fils, Rems, the Kocher, and the Jaxt.

NECKER, Jacques, a famous financier and minister of France, was b. Sept. 30, 1732, at Geneva, where his father, a native of Brandenburg, but of Anglo-Irish descent, was professor of German law. He became a banker in Paris and acquired a large fortune during the seven years' war. After retiring from business he became the representative of his native city at the French court; and also acquired a high but not exactly a solid reputation by his publications on political economy and finance, particularly his *Essai sur la Législation et le Commerce de Grains* (Par. 1775). In this essay he appears as the opponent of the wise Turgot's liberal measures in regard to the traffic in grain, and claims for the state the right of fixing its price, and if it thinks it necessary, of prohibiting its exportation. On the removal of Turgot from office in June, 1776, Necker was called to assist in financial affairs, and after the brief administration of Clugny he was made general director of finances in June, 1777. Necker could not conceal his elation. This was his weak point. He had all the vanity, egotism, and love of show that marked his brilliant but superficial daughter. Nevertheless he succeeded not only in meeting the exigences of the American war, but in restoring to some degree of order the general financial affairs of the country, though mainly by the perilous expedient of borrowing, which he was enabled to do to an almost unlimited extent, owing to the confidence reposed in his financial dexterity. Some years he borrowed as much as 490,000,000 of francs. His Protestantism, however, and some retrenchments which he made in the royal household, with his publication on the financial affairs of France (*Compte Rendu*, which produced an immense sensation), made him an object of great dislike to the queen and court, and on May 12, 1781, he was suddenly dismissed. He retired to Geneva, where he was visited, from motives of sympathy and respect, by the highest personages in the realm, the prince of Condé, the dukes of Orleans and Chartres, the prince of Beauvau, the duke of Luxembourg, maréchal de Richelieu, the archbishop of Paris, etc., but returned to Paris in 1787, from which he was soon banished on account of an attack which he published on the financial management of the reckless and ignorant Calonne. In the financial and political crisis, however, which followed upon the financial administration of Loménie de Brienne, Louis XVI. found himself under the necessity of calling Necker in Nov., 1788, to the office of comptroller-general of finances and minister of state. Necker recommended the calling of the states-general, and thereby acquired the greatest popularity. He failed, however, in the difficulties which ensued, having no capacity for political affairs in other than their mere financial aspects. When the court, on June 23, 1789, determined upon nullifying the resolution of the third estate, Necker hesitated, and the king therefore dismissed him on July 11, and required him to leave the French dominions immediately. He obeyed, but the disturbances of July 12, 13, and 14 (on the last of which days the Bastille was taken) were the result of his dismissal, and the king was under the necessity of recalling him. He now allied himself with Mounier and other ministers for the introduction of a constitution like that of Britain, with two chambers or houses of parliament; but this caused a great diminution of his popularity, and he was unable to contend in debate with Mirabeau and other great leaders of the national assembly. On the rejection by the assembly of his scheme of a loan, and the adoption instead of it of Mirabeau's scheme of assignats, he resigned his office in Sept., 1790, and retired to his estate of Coppet, near Geneva, where he died, April 9, 1804. Besides the works already mentioned he published several on political and on religious subjects, particularly a work on the French revolution (4 vols. Par. 1796), which has been frequently reprinted. His daughter was the celebrated madame de Staël.

NECKER, Susanne Curchod, 1739–94; b. Crassier, Switzerland. Her father, the pastor of Nyon, gave her an excellent education, but opposed her union with Gibbon, the historian, with whom she was intimate. In 1764 she was married to Jacques Necker, the finance minister of Louis XVI. Her house in Paris became the resort of Buffon, Diderot, D'Alembert, and most of the celebrities of the time, whose influence she used to further her husband's political advancement. Her principal literary works are *Réflexions sur le Divorce; Mémoire sur l'Etablissement des Hospices*, a treatise upon hasty interments, and five volumes of miscellanies, published by her husband after her death. She founded a hospital in Paris which bears her name. Her life was written in 1820 by Auguste de Staël-Holstein.

NECK-MOLDING. A molding at the junction of the capital and shaft of a column. The plain space between the astragal of the shaft and the moldings of the cap of the Roman Doric order is called the *neck*.

NECROLOGY is a term generally used to specify an account of deaths, or a register of deaths, though it is sometimes applied to lists of deceased benefactors of cathedrals, monasteries, etc.

NECROMANCY (Gr. *nekros*, dead, and *manteia*, divination), a mode of divination by the conjuring up of the dead to question them concerning the future. It originated in the east, and in times of the most remote antiquity. It is condemned in the Old Testament; and the story of the witch of Endor affords a remarkable illustration of it, which

nas not a little perplexed interpreters of Scripture. The eleventh book of Homer's *Odyssey* bears the title of *Νεκρομαντεια*, and in it the shade of Tiresias is represented as brought up and consulted by Ulysses. In most parts of Greece necromancy was practiced by priests or consecrated persons in the temples; in Thessaly it was the profession of a distinct class of persons called psychagogoi ("evokers of spirits"). The practice of it in that country was ultimately connected with many horrid rites, in which human blood, half-burned portions of bodies from funeral piles, the immature fetus cut out of the womb, etc., were employed, and sometimes human beings were slain that their spirits might be consulted ere they finally passed into the lower world. The establishment of Christianity under Constantine caused necromancy to be placed under the ban of the church. There are evident traces of necromancy in some of the older Norse and Teutonic poems. The mediæval belief in the evocation of spirits belongs rather to sorcery than to necromancy. See Peucer's *Commentarius de Præcipuis Divinationum Generibus* (Zerbst, 1591). See Spiritualism.

NECROPHILISM, an unnatural and revolting love or appetite for the dead which has manifested itself in various ways. Consorting or living with the dead has been observed as a characteristic of melancholia. Individuals have inhabited grave-yards, preferring the proximity and association of corpses with which they had no tie, to the cheerfulness and comforts of home; and there is recorded one notorious case in which a gentleman, although on bad terms with his wife while alive, carried her body with him through India, scandalizing the natives and outraging the feelings of all by placing the coffin under his bed. This hideous tendency may enter into certain developments of cannibalism where the feast is celebrated in memory of a departed friend, rather than in triumph over a slain foe. It is affirmed that there were anthropophagous epidemics in 1436 and 1500; and the history of vampirism connects that delusion with the moral perversion now described. Patients in asylums, especially in continental asylums, are still often encountered who bemoan the crime of having devoured the dead and violated charnel-houses. The most extraordinary exhibition of necrophilism is where individuals, not in fancy but in reality, have exhumed corpses to see them, to kiss them, to carry them away to their own homes, or to mutilate and tear them to pieces. It is worthy of notice that, so far as such cases have been observed in Great Britain, they have been confined to communities living in remote places, of rude and unenlightened character, and cherishing the superstitions of ages and states of society with which they have no other connection, and of which they have almost lost the recollection.—*Annales, Medico Psychologiques,* t. viii. p. 472.

NECROP'OLIS, a Greek term, meaning the city of the dead, and applied to the cemeteries in the vicinity of ancient cities. It occurs in classical antiquity only as applied to a suburb of Alexandria, lying to the w. of that city, having many shops and gardens and places suitable for the reception of the dead. The corpses were received and embalmed in it. Here Cleopatra, the last of the Ptolemies, applied the asp to her breast to avoid the ignominy of being led in triumph by Augustus. The site of the necropolis of ancient Alexandria seems to have been where are now the catacombs, consisting of galleries and tombs hollowed out of the soft calcareous stone of which the city is built, and lying at the extremity of the city. The term necropolis is now, however, used in a much more extended sense, and applied to all the cemeteries of the ancient world. These consisted either of tombs, constructed in the shape of houses and temples, and arranged in streets, like a city of the dead; or else of chambers hollowed in the rock, and ornamented with façades to imitate houses and temples. Such cemeteries are to be distinguished from the *columbaria,* or subterraneous chambers of the Romans, in which their urns were deposited; or the rows of tombs along the Via Appia; or the cemeteries of the Christians, whose bodies were deposited in the ground. The most remarkable necropolises are that of Thebes in Egypt, situated at a place called Gournah, on the left bank of the Nile, capable of holding 3,000 persons, and which it is calculated must at least have contained 5,000 mummies; those of El-Kab or Eileithyia; of Beni-Hassan, or the Speos Artemidos; and of Madfun or Abydos; of Siwah or the oasis of Ammon. See Oasis. In Africa the necropolis of Cyrene is also extensive; and those of Vulci, Corneto, Tarquinii, and Capua are distinguished for their painted tombs (see Tomb), and the numerous vases and other objects of ancient art which have been exhumed from them. Large necropolises have also been found in Lycia, Sicily, and elsewhere.

NECROSIS (Gr. *nĕkros,* dead) is a term employed to denote the death or mortification of bone, but often restricted to the cases in which the shaft of a long bone dies, either directly from injury or from violent inflammation, and is inclosed by a layer of new bone; the death of a thin superficial layer, which is not inclosed in a shell of new bone, being usually termed *exfoliation.*

The bones of the lower extremity—the femur and tibia—are those which are most frequently affected by necrosis. The lower jaw is, however, extremely often affected by it in persons engaged in making lucifer-matches, the disease being set up by the pernicious action of the vapor of phosphorus. The dead bone, known as the *sequestrum,* generally consists of the circumference of the shaft only, and not of the interior, and the inside of the dead portion presents a rough appearance, as if worm-eaten. If the membrane investing the bone (the periosteum) remain healthy, it deposits lymph, which

speedily ossifies, forming a shell of healthy bone, which invests the dead portion. The essential point in the treatment is the removal of the *sequestrum*, which is too purely a surgical operation to be described in these pages.

NECTAR, the name given by Homer, Hesiod, Pindar, and the Greek poets generally, and by the Romans, to the beverage of the gods, their food being called *ambrosia* (q.v.). But Sappho and Alcman make nectar the food of the gods, and ambrosia their drink. Homer describes nectar as resembling red wine, and represents its continued use as causing immortality. By the later poets nectar and ambrosia are represented as of most delicious odor ; and sprinkling with nectar, or anointing with ambrosia, is spoken of as conferring perpetual youth, and as the symbols of everything delightful to the taste.

NECTARINE. See PEACH.

NECTARY, in botany, an organ in the flowers of many phanerogamous plants, devoted either to the secretion or the reception of honey. Of the former kind are nectariferous glands, scales, and pores; of the latter, tubes, cavities, etc. But the term was for a long time very vaguely employed by botanists, and seemed to be found convenient for the designation of any part of a flower for which no other name was known. Thus amongst the parts called nectaries by the older botanists may be found those now called *disk* (q.v.), and that which bears the name of *corona* (q.v.).

NEDJED, or NEJD. See WAHABIS.

NEEDFIRE (Ger. *nothfeuer;* allied to Sw. *gnida*, to rub; Eng. *knead*), fire obtained by the friction of wood upon wood, or the friction of a rope on a stake of wood, to which a wide-spread superstition assigns peculiar virtues. With varieties of detail, the practice of raising needfire in cases of calamity, particularly of disease among cattle, has been found to exist among most nations of the Indo-European race. It has been supposed effectual to defeat the sorcery to which the disease is assigned. When the incantation is taking place, all the fires in the neighborhood must be extinguished, and they have all to be relighted from the sacred spark. In various parts of the Scottish highlands the raising of needfire was practiced not long ago, and it is perhaps still had recourse to in some very remote localities. The sacrifice of a heifer was thought necessary to insure its efficiency. The ways of obtaining fire from wood have been various; one is by an apparatus which has been called the "fire-churn," a cylinder turning on a pivot, and furnished with spokes, by means of which it is made to revolve very rapidly, and fire is generated by the friction. Fire struck from metal has been supposed not to possess the same virtue, and in some instances the persons who performed the ceremony were required to divest themselves of any metal which might be about them. In its origin the fire-churn was considered a model of the apparatus by which the fires of heaven were daily rekindled. It is still in daily use in the temples of the Hindus. The same superstition was doubtless the origin of the story of Prometheus (q.v.). See Grimm's *Deutsche Mythologie*; Supplement to Jamieson's *Scottish Dictionary.*

NEEDHAM, a town in Norfolk co. Mass.; on the Charles river and a division of the New England railroad; 12 miles s.w. of Boston. It was incorporated in 1711, and contains the villages of Needham Centre, Highlandville, Charles River Village, and Upper Falls. There are a high school, graded schools, public library, weekly newspaper, large cranberry and market-gardening farms, and manufactories of bicycles, hosiery, hammocks, cigars, and other articles. The center of the town is 4 miles from Dedham, the co. seat. Pop. '90, 3,035.

NEEDLE-GUN. See BREECH-LOADING ARMS.

NEEDLES are instruments of metal, or other material, for the purpose of carrying the thread in sewing, embroidery, knitting, netting, and other similar operations. They are generally made of metal, but bone, ivory, and wood are also used ; for ordinary needlework, called sewing, they are made of fine steel, and are too well known to need description ; for other kinds of work they are often much larger and differently formed.

Needle-making is an important branch of industrial art, and it has of late years attained to extraordinary perfection. Small bars of steel, not thicker than a good-sized bristle, can be made perfectly round, pointed at one end with wonderful accuracy, pierced at the other end with an oval hole, the sides of which are so smoothly rounded that there is no friction upon the thread, and the whole of each instrument, not more than an inch in length, beautifully polished, and sold at less than a shilling per hundred, notwithstanding that a large part of the operations required in their manufacture are manual. The first operation, after the wire has been selected and its thickness accurately gauged, is to cut it into eight-feet lengths; this is done by winding it in a coil of 16 ft. circumference, and then cutting this coil into exact halves with powerful cutting shears. The coiling of the wire is so managed that there are 100 pieces in each half when cut; the bundles of 100 wires are again cut into the necessary lengths for two needles; and so well arranged are the cutting shears, that a man can easily cut enough for 1,000,000 needles in a day of 12 hours. The pieces cut from a coil, although now reduced to the length of two small needles, are nevertheless somewhat curved; they are therefore collected into bundles of about 6,000, and placed in two iron rings, which hold them loosely together; they are then slightly softened by firing, and are laid on an iron plate or bench, and are pressed with a small curved bar in two or three positions, by which the operator

manages to make them all perfectly straight. They are now taken to the grinder, who sits in front of his grindstone upon a seat which is hollow, and forms an air-shaft open towards the stone; through this a blast of air is forced when the wheel is in motion, which carries away from the grinder every particle of the subtle dust from the needle points and the stone. Before this humane invention, which has rendered the operation quite innocuous, the loss of life in this manufacture was more serious than in any other industrial occupation. The operator, with great tact, holds about 25 of the wires, by means of his thumb pressed against the inside of his fingers, the wires, which are held straight and applied to the grindstone, being dexterously turned round on the inside of the hand by means of the thumb, until they are ground sharp at one end; they are then reversed, and the other ends are similarly sharpened. They are next taken to the *impressing* machine, which in principle consists of a weight hanging to a block, which is raised by the hand and let fall at pleasure; the wires are placed in succession under this, so that the falling weight strikes each wire exactly in the middle, and there flattens it. The hardening of the flattened part by the blow is removed in the annealing oven, and the holes are next punched, two in each flattened portion. These are either done by hand-punches worked by children, who acquire great nicety in the operation, or by a machine on the same principle as the *impressing* machine; this not only punches the two holes, but also forms a small cross-cut between them, which is otherwise made by a file. At this cross-cut the wire is broken in two, and may now be regarded as two rudely-formed needles, each having a flattened and pierced head. A number of these are now threaded (*spitted*) on a thin wire, and are placed in a vise, which holds them firm and straight, so that the workman can file the heads on the top and sides, so as to remove all the burred edge. The next process is *oil tempering*, for which they are made hot, and immersed in sufficient oil to coat them thoroughly; the oil is then burned off, an operation which renders the needles brittle. They are then weighed out into lots of about 500,000 each, and after being shaken so that they lie side by side, they are laid on a square piece of strong canvas, and a quantity of sand and emery-powder being mixed with them, they are corded up very securely into a long roll from 18 in. to 2 ft. in length. A number of these rolls or bundles are placed on a movable wooden slab, in the *scouring machine*, and over them is placed another heavily weighted slab. The action of the machine, of which these slabs form part, is to move them backward and forward in opposite directions, the bundles of needles acting as rollers, the pressure upon which works the inclosed needles, sand, etc., together, so that after 8 to 10 hours, which this operation occupies, instead of the blackened appearance they had when it commenced, they are white and silvery-looking. They are now removed to an exactly similar machine, where they are polished. Here they are separated from the sand and emery, and are removed to other canvas squares; and when mixed up with a paste of *putty-powder* and oil, are again corded up, and made to roll backward and forward under the weighted wooden slab of the *polishing machine* for four hours more. The next process is to remove them from the canvas, and agitate them in a vessel with soft-soap and water, to remove the oil and putty-powder, and next to dry them in ash-wood saw-dust. They are now highly polished and well tempered, but not all of exactly the same length, nor are the eyes perfect; they are therefore passed to a person who, by nice management of a small gauge, sorts them very quickly into certain lengths (*evening*), and arranges them all in one direction (*heading*). They then pass on to be drilled, an operation requiring great nicety, as the small oval holes have to be so polished all round, as not to cause any friction on the thread in sewing with them; a clever workman will drill and polish the holes of 70,000 needles per week. The needle is now practically finished, but many minor operations are considered necessary to produce high-finish; these we purposely omit, to avoid complicating our description. It is, however, worthy of remark, that this little instrument, which costs so much labor for its formation, has by these operations acquired immense value. The wire of which the ordinarily-sized needles are made is so thin, that 5½ lbs. go to form 74,000 needles. Of ordinary sized needles, 2¼ millions weigh 3 cwt., and are worth rather more than $1000, although the steel wire of which they were made was only worth $75 at the commencement of the manufacture.

NEEDLES, The, a cluster of five rocks on the w. point of the Isle of Wight, pyramidal in form: their tops are white, and of a chalky formation; their bases black; they are curiously streaked throughout with strata of black flint; a light-house has been placed on the outer one, the light being at an elevation of 469 ft. They were probably caused by the waves beating against the sharp cliffs of the island, and their gradual washing away is attributable to the same cause. But three of the rocks are noticeable now, the tallest one, some 120 ft. in height, having fallen into the water in 1764.

NEEF or **NEEFS,** Pieter the Elder, 1570–1651; b. Antwerp. His numerous architectural paintings usually represent church interiors illuminated with the glow of torches or of candles. He was distinguished for his thorough knowledge of perspective, by which he was able to give great effect to a small canvas. His treatment was delicate, refined, and extraordinarily clear; he understood the harmonious modulation of colors and the power of chiaroscuro, but he generally intrusted the painting of the figures introduced into his pictures to Teniers, Franks, Breughel, and Van Thulden. His works are to be found in the galleries of Dresden, Vienna, Paris, and Gotha. His son, Pieter Neefs, was also a painter, but had less talent. He was a pupil of the younger Steenwijk.

NEELE, Henry, 1798–1828; b. London; studied law while quite young, but gave up that profession for literature. He was a well-known poet and critic, and published *Odes, and other Poems*, 1817; delivered *Lectures on Shakespeare*, 1819, and published *Dramatic and Miscellaneous Poetry*, 1823, and *Romance of English History*, in 3 vols., 1827. In the latter year he gave a course of lectures on English poets of the period from Chaucer to Cowper, published after his death as *Literary Remains*. He committed suicide while temporarily insane.

NEELY, Henry Adams, d.d.; b. N. Y., 1830; graduated at Hobart college 1849, and was tutor there until 1851; became assistant rector in Calvary church (Prot. Epis.), Utica, in 1852, and in 1854 rector of Christ church, Rochester. He returned to Hobart college as chaplain 1862. He was appointed assistant to Trinity church, New York, and rector of Trinity chapel two years later. In 1867 he was consecrated bishop of Maine.

NEEM-TREE. See Meliaceæ.

NEEMUCH', or Nimach, a t. of India, in the territory of Gwalior (q.v.), near the n.w. border of Malwa, 320 m. s.w. from Delhi, on a slightly elevated ridge rising from a well-cultivated plain. It is 1613 ft. above the sea. The native population is only about 6300; but Neemuch has acquired importance on account of a British cantonment established here in 1817. Prior to the sepoy mutiny of 1857–59 the officers' quarters comprised about 80 bungalows, beautifully situated among gardens; but all, except a single bungalow, were destroyed in 1857 by the mutineers, who massacred the Europeans, and kept possession of the fort for some time, till it was captured by brig. Stuart after a siege of fourteen days. The situation of Neemuch is regarded as one of the most healthy in India; the climate is agreeable, the nights cool even in the hot season, the winter seldom so cold as to make fires requisite, and frosts very rare.

NEENAH, city in Winnebago co., Wis.; on the Fox river, at the outlet of lake Winnebago, and on the Chicago and Northwestern, the Chicago, Milwaukee, and St. Paul, and the Wisconsin Central railroads; 14 miles n. of Oshkosh, the county seat. The river is navigable by steamboats between Neenah and Fond du Lac; and also affords fine water-power at the former city. Neenah contains several public parks, public library, national banks, electric light plants, daily and weekly newspapers, and lumber, saw, and paper mills; and is noted both as an important lumber mart and as a popular summer resort. Pop. '90, 5,083.

NEER, Arnould or Aart, van der, 1619–83; b. Amsterdam; sometimes called the "moonlight painter." His usual subjects are villages with fishermen's huts along the banks of canals. He is most successful in his moonlight pieces.

NEER'WINDEN, a small village of Belgium, in the n.w. corner of the province of Liege, is celebrated in history for the great victory gained by the French under Luxembourg over the English under William III. (July 29, 1693); and also for the defeat of the French under Dumouriez by the allies under the prince of Coburg (March 18, 1793).

NEES VON ESENBECK, Christian Gottfried Daniel, 1776–1858; b. Germany; educated at the Darmstadt gymnasium and the university of Jena. He studied medicine, after practicing which, for a short time, he was called to the chair of botany at the university of Erlangen. He was soon made president of the Leopoldine academy of naturalists, and professor of botany at Bonn, where he was one of the founders of a new botanical institution. In 1830 he accepted the posts of professor of botany and director of the botanic garden at Breslau. He took an active interest in the agitations which preceded the revolutionary movement of 1848, and was a prominent member of a Breslau religious organization named the *Kristkatholiken*, and aiming at various charitable and humanitarian purposes. He lived at Berlin for a time in 1848, participating in the democratic agitation then at its height throughout Europe. Returning to Breslau, he established a "fraternity of workingmen," with the object of diffusing education among laborers, maintaining harmony between them and their employers, etc. This society excited the hostility of the government, which ordered him to dissolve his connection with it. A prosecution was soon instituted against him for living with a woman without having been divorced from his wife. Both, this prosecution and his deposition from the chair of botany in 1852, were supposed to be due to political motives, and the distrust felt by the government for his democratic principles and influence with the laboring classes. Deprived of his salary, he had to sell his library and his collection of botanical specimens. In spite of his reformatory activity, and his researches in regard to spiritualism, in which he was a believer, he found time to continue his botanical studies, and became one of the first botanists of Europe. In his *Handbook of Botany*, 1821, he developed the theory advanced by Goethe in his *Metamorphosis of Plants*, that all the parts of the flower are only variations of the leaf. This work had been preceded by his *Fresh Water Algæ*, 1814; by *System of Fungi and Sponges*, 1816; and by *Plant Substance*, 1819, in which he was assisted by Rothe and Bischof. He published, in 1833, *Genera et Species Asterearum;* in 1836, *Systema Laurinarum;* and in 1841, *Floræ Africæ Australiaris Illustrationes Monographicæ*. In 1852 appeared the first volume of his *Universal Etymology of Nature*. He was a specialist on cryptogamous plants, and in this branch of botany his chief work is *Natural History of the European Water-Liverwort*, 1833–38.

NE EXEAT REGNO is the title of a writ issued by the court of chancery to prevent an individual leaving the kingdom, unless he gives security to abide a decree of that court. The writ was originally resorted to in cases of attempts against the safety of the state, but is now issued in cases where an equitable debt or demand is sought to be substantiated by a bill or proceeding in chancery. The writ is only granted where the party usually resides within the jurisdiction. It resembles the process which is known in the common-law courts as arresting and holding to bail, and in Scotland as arresting a person *in meditatione fugæ*.

NE EXEAT REPUBLICA, another name for the writ *ne exeat regno* (q.v.), the word republic or state being substituted for kingdom. The writ is rarely used in the United States, and chiefly in cases involving a breach of trust or official administration. This writ is formally abolished by statute in N. Y. and in most other states.

NEFF, Felix, 1798–1829; b. at Geneva, Switzerland. He received his early education from his widowed mother, who was distinguished for piety, and had occasional lessons from some pastor of his native canton. His favorite authors in youth were Plutarch and Rousseau, and he was fond of mathematics and natural history. At an early age he was placed with a florist-gardener, and at 17 entered the army, that he might not longer be a burden to his poor mother. His excellent character and fidelity soon raised him to the rank of sergt. His strict religious principles and the purity of his life provoked the hostility of his associates, and he decided to leave the army. Being advised to enter the ministry he resigned his commission in 1819, and offered himself as a catechist or parish missionary. The first years of his missionary life were spent in the cantons of Geneva, Neufchâtel, Bern, and the Pays de Vaud. In 1821 he went to the destitute district of Grenoble in France, and afterward to Mens in Isère. Religious scruples preventing his being ordained in the established church of Geneva, and his being a foreigner rendering it impossible to obtain ordination from the Protestant church of France, he went to England, and having been ordained in 1823 by the Congregationalists he returned to Mens, the scene of his former labors. But his heart was with the destitute on the mountains, and, turning away from those by whom he was greatly beloved, he went to the high Alps, and labored with great courage and zeal among the descendants of the Vaudois in the wild picturesque valleys of Queyras and Freyssinières. Here he preached, organized schools, dedicated churches, laboring incessantly among those lonely glens and dreary mountains. His pastoral work was performed in a poor Alpine district, comprising 17 isolated villages within a circuit of 80 miles. In one part of his parish the people were so degraded as to be scarcely removed from the condition of barbarians. As they needed education and were unable to pay a teacher, he became school-master as well as preacher. They became so much interested that they built a school-house, he directing the workmen and acting himself as architect and mason. Exhausted by these labors he visited the baths of Plombières, but returned to Geneva without permanent benefit. Companies of the poor people of the Alpine valleys made long journeys on foot through the snow to see their beloved dying pastor.

NEGAPATAM′, a t. and chief port of British India, in the presidency of Madras, and district of Tanjore, 124 m. s.s.w. from Madras, on a small estuary of one of the many small southern mouths of the Cauvery, one of the earliest Portuguese settlements on the Coromandel coast. A chief branch of industry is the expression of oil from the cocoa-nut and from oil-seeds. There is a considerable trade with Ceylon. As the depth on the harbor bar is from 2½ to 3 ft. vessels are obliged to load and discharge by lighters. Negapatam is a terminus of the Great Southern railway of India. It was the capital of the Dutch possessions in India, but was taken by the British in 1781. Pop. 50,000.

NEGATIVE, in photography, is that kind of photographic picture in which the lights and shadows of the natural object are transposed; the high lights being black, and the deep shadows transparent, or nearly so. Negatives are taken on glass and paper by various processes, and should indicate with extreme delicacy, and in reverse order, the various gradations of light and shade which occur in a landscape or portrait. A negative differs from a positive inasmuch as in the latter case it is required to produce a deposit of pure metallic silver to be viewed by *reflected* light; while in the latter, density to *transmitted* light is the chief desideratum; accordingly inorganic reducing and retarding agents are employed in the development of a positive, while those of organic origin are used in the production of a negative. Adopting the collodion process (which has almost completely replaced every other) as a type of the rest, the conditions best adapted for securing a good negative may be briefly indicated, leaving it to the reader to apply the principles involved to any process he may desire to practice.

The possession of a good lens and camera being taken for granted, and favorable conditions of well-directed light being secured, all that is necessary is to establish a proper and harmonious relation between the collodion bath, developer, and time of exposure. A recently iodized collodion will generally be tolerably neutral, in which case, if the developer be at all strong, and the weather warm, the bath should be decidedly acid, or *fogging* will be the result. Should the collodion, however, be red with free iodine, a mere trace of acid in the bath will suffice, while the development may be much prolonged, even in warm weather, without fogging. If the simple fact

be borne in mind that the presence of acid, either in the bath collodion or developer, retards the reducing action of the developer, it will suffice to guide the operator in many difficulties. The value of a negative consists in the power it gives of multiplying positive proofs. See POSITIVE PRINTING; also PHOTOGRAPHY.

NEGATIVE QUANTITIES are generally defined as quantities the opposite of "positive" or "numerical" quantities, and form the first and great point of difference between algebra as a separate science and arithmetic. In the oldest treatises on algebra they are recognized as distinct modifications of quantity, and existing apart from, and independent of, positive quantity. In later times, this opinion was vigorously combated by many mathematicians, among whom Vieta occupied a prominent place; but the more eminent analysts retained the old opinion. Newton and Euler distinctly assert the existence of negative quantities as quantities less than zero, and the latter supports his opinion by the well-known illustration of a man who has no property, and is £50 in debt, to whom £50 requires to be given in order that he may have nothing. After all, this discussion is little more than a verbal quibble, though interesting from the prominent position it for a long time held. It had its rise in the difficulty of satisfying the requirements of a constantly progressing science by the use of signs and forms retaining their original limited signification. It was soon felt that the limited interpretation must be given up; and accordingly an extension of signification was allowed to signs and modes of operation. + and −, which were formerly considered as merely symbols of the arithmetical operations of addition and subtraction, were now considered as "general cumulative symbols, the reverse of each other," and could signify gain and loss, upward and downward, right and left, same and opposite, to and from, etc. Applying this extended interpretation of signs to a quantity such as −4, we obtain at once a true idea of a negative quantity; for if +4 signifies 4 in. *above* a certain level, −4 signifies 4 in. *below* that level, and therefore, though a positive quantity in itself (a negative being, strictly speaking, an impossible existence), it may be fairly considered to be less than zero, as it expresses a quantity less by 4 than 0 inches above the level. Keeping this idea in view it has been conventionally agreed to admit the existence of negative quantities as existing *per se*. The only errors which can flow from this arise from misinterpretation of results, for the four fundamental operations of addition, subtraction, multiplication, and division are unaffected by the extended interpretation of signs. The following is an illustration of the value of an extended interpretation of the negative sign, showing at the same time how much more general are the ideas conveyed by algebraic expressions than by ordinary language: If at the present time a father is 50 years, and his son 20 years old, when will the father be three times as old as his son. This problem when solved, gives −5 as the number of years which must elapse before the father's age is three times the son's. Now, at first sight, this result appears to be absurd, but when we consider the terms of the problem, its explanation is easy. The question asked pointed to a number of years *to come*, and had the result turned out to be *positive*, such would have been the case, and the fact of its being negative directs us to look in a "contrary" direction, or backward to time *past;* and this is found to satisfy the problem as five years "ago" the father was 45 and his son 15.

Negative quantities arise out of the use of general symbols in subtraction, as in the formula $a - b$, where we may afterward find that b is greater than a. See SUBTRACTION.

NEGAUNEE, a city in Marquette co., Mich.; on the Chicago and Northwestern, the Duluth, South Shore, and Atlantic, and the Marquette and Ishpeming railroads; 10 miles w. of Marquette, the co. seat. It is in the great iron region of the State, on a ridge called the "iron mountain," and at an elevation of about 1100 feet above the level of lake Superior, which is 12 miles distant. The city contains several graded public schools, high school (cost $40,000), public and high school libraries, waterworks supplied from Teal lake, in the city limits, electric light and street railroad plants, national bank, and nearly a dozen productive iron mines within the city limits. Pop. '90, 6,078.

NEGLEY, JAMES SCOTT, b. Penn., 1826; was a student at Western university; entered the Mexican war as a private, and at the outbreak of the civil war enlisted within 8 days a brigade of volunteers for 3 months, and was appointed brig.gen. April 19, 1861; fought with the army of the Ohio in Alabama and Tennessee; was in command at Lavergne Oct. 7, 1862, where he defeated Anderson and Forrest; promoted to maj.gen. for his bravery at Stone River, Dec., 1862, and served in the Georgia campaign. As a republican, he represented Pittsburg in congress 1869–75 and 1885–87.

NEGLIGENCE, in law, such want of due diligence and caution, though unaccompanied by injurious or criminal intent, as will give ground for a civil action for damages or will justify a criminal prosecution. The obligation to exercise caution may arise from a contract, express or implied, or from a rule or presumption of law; and the degree of care and caution which must be exercised varies greatly under different circumstances. Where a contract is for any reason contrary to law, negligence in carrying out its provisions is, of course, no cause for action; and if an infant neglect to carry out a contract voidable on the score of infancy, he is not liable; though he may often be held for negligence amounting to a tort and altogether outside of contract obligations. If the negligence relate to contract, only a party to that contract can sue, whoever may be injured indirectly, while in torts it is the person receiving the actual injury who has a claim for

damages. It is not enough to constitute a valid claim that there has been a want of care; for, first, the negligent party may have been under no obligations to exercise care toward the person injured: thus, where a railway accident is brought about by the grossest negligence on the part of the company, if an individual passenger were injured who was obtaining his passage by fraud, he would have no claim, and, secondly, though the obligation might exist and negligence occur, yet it might be so slight compared with the nature of the transaction as to make it obviously unjust to hold the negligent party. Again, if the injured party has himself been negligent and has thus "contributed" to his own damage, he will have no action. This principle of "contributory negligence" is based upon public policy in part and in part upon the belief that a loss brought upon a plaintiff by his own act should not give him compensation. But it is not a good bar to an action to prove that, if the plaintiff had not done a certain act, he would not have been injured; the negligence, like that of the defendant, must have been actual, and care required of him by some legal or natural obligation. It is generally held that the burden of proof is on the defendant as to contributory negligence; that is, the plaintiff or injured party will be supposed to have acted with due care until the contrary is shown. The doctrine of contributory negligence presents many difficult questions on trial, not so much as to the law, as in determining the respective rights of the parties and the degree in which either was or both were negligent. By the common law, if death were occasioned by negligence, no action for damages could be had by the near relatives; but by an English statute and by similar enactments in most of the states of this country, suit may be brought by the administrator or executor in behalf of a husband or wife or next of kin, wherever death has been caused by negligence or wrongful act. Where the original injury has been increased by the willful act or negligence of the plaintiff, he cannot include the more remote damage in his claim. Thus, where physical injury is received and medical care is refused—the refusal resulting in permanent loss of health which would otherwise not have followed—there can be no claim for damages on that account. Every man is bound so to use his own property as not to injure another. Thus, the owner of animals which are vicious or have a contagious disease is bound to keep them under proper restraint; and the digger of a pit on his own land is liable, if it be near an unfenced highway and unprotected. Professional men are bound to exercise a fair average skill in their profession. A superior is, in general, responsible for the negligence of an agent or employee when acting in the scope of his employment, but the servant is, in turn, liable to the master. Most important decisions as to the degree of care required of railroad corporations may be seen in *Redfield on Railroads.* In general it may be said that extraordinary care is demanded of all public carriers. As to negligence by public officers in performing their official duties, see OFFICE. Three degrees of care or diligence and corresponding degrees of negligence, are usually described, apportioned to the relative circumstances and responsibilities of the parties: where one is required to use but slight care and is responsible only for gross negligence; where he is required to use ordinary care and is liable for ordinary neglect; and where he is required to use very great care and is responsible for but slight neglect. This classification is applied more especially to the subject of Bailments (q.v.). Where the bailment is for the benefit of the bailor, but slight care is required of the bailee; where the benefit is mutual, as in cases of hiring, ordinary care is required; and where the bailee is the only one who benefits by the bailment, extraordinary diligence is required and the slightest negligence will give cause for action. The exceptions to the second statement are the bailments to common-carriers and innkeepers where public policy requires that a very great degree of care should be exercised. Negligence, not coexistent with any criminal intent, may in certain cases constitute a crime. Thus, where the negligent act of one man results in the death of a second, the circumstances may make the first guilty of manslaughter. So where an officer of the law allows a prisoner to escape, not having been tampered with, but through mere carelessness, he is criminally guilty. The subject of negligence may be found treated in detail in Shearman on *Negligence,* Addison and Hilliard on *Torts,* Redfield on *Railroad Law,* and Bishop on *Criminal Law.*

NEGOTIABLE PAPER. See BILL OF EXCHANGE; EXCHANGE.

NEGRELLI, ALOYS VON, 1799–1858; b. in the Tyrol; constructed the first Swiss railroad, from the German border to Zürich, also the first Austrian railroad, completed 1841; the Austrian Northern railroad secured him as chief inspector, which position he held till 1849, when he was appointed director of public works. In 1855 he assumed full charge of all Austrian railroads, from which position he was called, two years later, by the viceroy of Egypt, to superintend the cutting of the Suez canal, at which work he spent the last year of his life.

NEGRI'TOS, or NEGRILLOS (*Spanish,* diminutive of negroes), is the name given by the Spaniards to certain negro-like tribes inhabiting the interior of some of the Philippine islands, and differing essentially both in features and manners from the Malay inhabitants of the Eastern archipelago. They bear a very strong resemblance to the negroes of Guinea, but are much smaller in size, averaging in height not more than 4 ft. 8 in., whence their appellation of Negritos, or little negroes. They are also called by the Spaniards *Negritos del Monte,* from their inhabiting the mountainous districts for the most part; and one of the islands where they are most numerous bears the name of

Isla de los Negros. These Negritos are also known by the names Aeta, Aigta, Ite, Inapta, and Igolote, or Igorote. They are described as a short, small, but well-made and active people, the lower part of the face projecting like that of the African negroes, the hair either woolly or frizzled, and the complexion exceedingly dark, if not quite so black as that of the negroes. The Spaniards describe them as less black and less ugly than the negroes—*Menos negros y menos feos.* All writers concur in speaking of them as sunk in the lowest depths of savagedom, wandering in the woods and mountains, without any fixed dwellings, and with only a strip of bark to cover their nakedness. Their only weapons are the bow and arrow; and they live upon roots, wild fruits, and any sort of animals that they can surprise in their haunts or conquer in the chase. By the Malays they are despised and hated; and the buffalo-hunters in the woods, when they meet with them, do not scruple to shoot them down like wild beasts or game. "It has not come to my knowledge," says a Spanish writer, "that a family of these negroes ever took up their abode in a village. If the Mohammedan inhabitants make slaves of them, they will rather submit to be beaten to death than undergo any bodily fatigue; and it is impossible, either by force or persuasion, to bring them to labor." The same writer, an ecclesiastic, speaks of them as gentle and inoffensive in their manners, whenever he himself came in contact with them; and although informed that some of them were cannibals, he was not inclined to believe the report. Dr. Carl Scherzer, the historian of the circumnavigation of the *Novara*, when at Manilla, had an opportunity of seeing a Negrita girl, whom he thus describes: "This was a girl of about 12 or 14 years of age, of dwarf-like figure, with woolly hair, broad nostrils, but without the dark skin and wide everted lips which characterize the negro type. This pleasing-looking, symmetrically-formed girl had been brought up in the house of a Spaniard, apparently with the pious object of rescuing her soul from heathenism. The poor little Negrilla hardly understood her own mother-tongue, besides a very little Tagal, so that we had considerable difficulty in understanding each other.

According to Spanish statements the Negritos are found only in five of the Philippine islands—namely, Luzon, Mindoro, Panay, Negros, and Mindanao—and are estimated at about 25,000 souls. Remnants of them exist, however, in the interior of some of the other islands in the Eastern archipelago; and they are scattered, also, though in small numbers, through certain islands of Polynesia. They are altogether an island people, and are hence treated of by Prichard under the designation of Pelagian negroes. By Dr. Pickering they are treated of as a distinct race, resembling the Papuan, but differing from it in the diminutive stature, the general absence of a beard, the projecting of the lower part of the face or the inclined profile, and the exaggerated negro features. The hair, also, is more woolly than that of the Papuans, though far from equaling that of the negroes in knotty closeness. By Latham the Negritos are classified under the subdivision of Oceanic Mongolidæ, C," which subdivision is further modified by him into the designation of "Amphinesians" and "Kelænonesians." The Negritos out of the Philippine islands are found for the most part in the islands embraced under the latter designation, as New Guinea, New Ireland, Solomon's isles, Louisiade, New Caledonia, and Tasmania or Van Diemen's Land. Except in the last-mentioned island, however, the Negritos, strictly speaking—that is, the blackish people with woolly hair—do not preponderate over the other native tribes less strongly marked with negro features; while in Tasmania itself the race has almost entirely disappeared, amounting at present to not more than two or three dozen souls. Dr. Pickering is of opinion that the Negrito race "once occupied more space than it does at this time, and that it has in many instances preceded the dissemination of other races." We conclude with a description of a Negrito native of Erromango (the island where the missionary Williams was murdered), supplied to Dr. Pickering by Horatio Hales, his associate in the United States exploring expedition: "He was about 5 ft. high," says Mr. Hales, "slender and long limbed; he had close woolly hair, and retreating arched forehead, short and scanty eyebrows, and small snub nose, thick lips (especially the upper), a retreating chin, and that projection of the jaws and lower part of the face which is one of the distinctive characteristics of the negro race. . . . . Placed in a crowd of African blacks, there was nothing about him by which he could have been distinguished from the rest." See PAPUA; POLYNESIA.

NE'GRO, RIO. See RIO NEGRO.

NEGROES (from the Spanish word *negro*, black; Lat. *niger*) is the name given to a considerable branch of the human family possessing certain physical characteristics, which distinguish it in a very marked degree from the other branches or varieties of mankind—more especially the so-called whites or Europeans. In Blumenbach's five-fold division of mankind the negroes occupy the first place under the variety *Ethiopian*, which likewise embraces the Kaffers, Hottentots, Australians, Alforians, and Oceanic negroes. In Latham's threefold division they are placed among the *Atlantidæ*, and form the primary subdivision of *Negro Atlantidæ* in that author's classification; while in Pickering's eleven-fold division they occupy the last place in his enumeration of the races of mankind.

Both Prichard and Latham strongly protest against the common error of looking upon the term negro as synonymous with African. "It ought to be remembered," says the

former, "that the word negro is not a national appellation, but denotes the ideal type constituted by the assemblage of certain physical characteristics, which is exemplified in the natives of Guinea in western Africa, and in their descendants in America and the West Indies." And Latham in like manner observes: "No fact is more necessary to be remembered than the difference between the negro and African; a fact which is well verified by reference to the map. Here the true negro area—the area occupied by men of the black skin, thick lip, depressed nose, and woolly hair—is exceedingly small; as small in proportion to the rest of the continent as the area of the district of the stunted Hyperboreans is in Asia, or that of the Laps in Europe. Without going so far as to maintain that a dark complexion is the exception rather than the rule in Africa, it may safely be said that the hue of the Arab, the Indian, and the Australian is the prevalent color. To realize this we may ask, What are the true negro districts? and what those other than negro? To the former belong the valleys of the Senegal, the Gambia, the Niger, and the intermediate rivers of the coast, parts of Sudania, and parts about Sennaar, Kordofan, and Darfúr; to the latter the whole coast of the Mediterranean, the desert, the whole of the Kaffer and Hottentot areas s. of the line, Abyssinia, and the middle and lower Nile. This leaves but little for the typical negro." Bearing in mind this limitation of the primitive area of the negro, we shall next proceed to speak of his prominent physical characteristics.

The negro has a black skin, unctuous and soft; woolly hair; thick lips; the lower part of the face prognathic, or projecting like a muzzle; the skull long and narrow; and a low, retreating forehead. The skull of the negro is remarkably solid and thick, so that in fighting they often butt against each other like rams, without much damage to either combatant; and it is likewise so flat that burdens are easily carried upon it. According to Camper's lateral admeasurement, the head of the negro shows an angle of 70°, while that of the European shows one of 80°, on which difference of 10°, as he considered, depends the superior beauty of the latter. There is not much dependence, however, to be placed on such a mode of admeasurement; and the same may be said of Blumenbach's vertical method. According to this, a considerable difference would appear to exist between the skull of the negro and that of the European. "But," says Dr. Prichard, "I have carefully examined the situation of the foraman magnum in many negro skulls; in all of them its position may be accurately described as being exactly behind the transverse line bisecting the antero-posterior diameter of the basis cranii. This is precisely the place which Owen has pointed out as the general position of the occipital hole in the human skull. In those negro skulls which have the alveolar process very protuberant, the anterior half of the line above described is lengthened in a slight degree by this circumstance. If allowance is made for it, no difference is perceptible. The difference is in all instances extremely slight; and it is equally perceptible in heads belonging to other races of men, if we examine crania which have prominent upper jaws. If a line is let fall from the summit of the head at right angles with the plane of the basis the occipital foramen will be found to be situated immediately behind it; and this is precisely the case in negro and in European heads." There is, in fact, neither in this respect—the conformation of the negro skull—nor in any other, solid ground for the opinion hazarded by some writers, and supported either through ignorance or from interested motives by many persons—that the negro forms a connecting link between the higher order of apes and the rest of mankind. The difference is certainly considerable between the highest European and the typical negro, but the gulf between them both and the highest of the simiæ is so nearly of the same width that the difference is scarcely distinguishable. But the skin, hair, skull, lips, maxillary profile, and general facial appearance of the negro, are not the only features that distinguish him in a great degree from the European, and seem to stamp him as a distinct variety of the human race. "In the negro," says Prichard, "the bones of the leg are bent outwards. Soemmering and Lawrence have observed that the tibia and fibula in the negro are more convex in front than in Europeans; the calves of the legs are very high, so as to encroach upon the hams; the feet and hands, but particularly the former, are flat; and the os calcis, instead of being arched, is continued nearly in a straight line with the other bones of the foot, which is remarkably broad. As to the supposed excessive length of the fore-arm in the negro, a circumstance also dwelt upon as showing an approach to the anthropoid apes, facts are altogether against the statement; there being no greater difference than is observable in individuals of any other variety of mankind. In stature the negro is very much on a par with the European, often reaching 6 ft., and rarely declining below five and a half. Into the discussion as to the cause of the blackness of the skin in the negro we have not space to enter. It is generally supposed to depend upon the greater amount of pigment cells in the *rete Malpighii*, and in the greater number of cutaneous glands, as compared with the skin of Europeans. In the skin of the negro there is much oily matter, and he perspires profusely, which serves to keep him in health. Of the hair of the negro, Dr. Prichard remarks as follows: "I am convinced that the negro has hair properly so-called, and not wool. One difference between the hair of a negro and that of a European consists in the more curled and frizzled condition of the former. This, however, is only a difference in the degree of crispation, some European hair being likewise very crisp. Another difference is the greater quantity of coloring

matter or pigment in the hair of the negro. It is very probable that this quality is connected with the former, and is its cause, though we cannot determine in what manner one depends upon another; but as these properties vary simultaneously, and are in proportion one to another, we may infer that they do not depend upon independent causes."

The negroes, in their native seat, comprise various independent tribes, which are thus classified and enumerated by Dr. Latham: 1. *Western Negro Atlantidæ*, embracing the Woloffs, Sereres, Serawolli, Mandingos, Felups, etc.; Fantis, etc.; the Ghá, the Whidah, Maha and Benin tribes, the Grebo, etc. 2. *Central Negro Atlantidæ*, embracing the Yarriba, the Tapua, Haussa, Fulahs, Cumbri, Sungai, Kissúr, Bornú, etc.; Begharmi, Mandara, Mobba, Furians, Koldagi. 3. *Eastern Negro Atlantidæ*, embracing the Shillúk, etc.; Qámamyl, Dallas, etc.; Tibboo, Gongas. This list might, of course, be still further enlarged by reference to the works of Barth, Livingstone, Speke, and other travelers, whose researches have been published since the appearance of Dr. Latham's *Varieties of Man*, in 1850. See Africa.

While these several tribes have their distinctive peculiarities, they yet bear a strong general resemblance to each other, not only in their physical appearance, but in their intellectual capacities, moral instincts, customs, and manners. The negro intellect is generally acknowledged to be inferior not only to the European, but to that of many primitive races not as yet brought within the pale of civilization, while it is superior to that of the Australians, Bushmen, and Esquimaux. Some tribes are sunk in the lowest depths of barbarism, and are either ferocious savages, or stupid, sensual, and indolent. This is the case, for the most part, according to Prichard, where the exaggerated negro type is discernible, as among the Bulloms, Papals, and other tribes on the coast of Western Guinea; also among the tribes near the slave coast, and in the bight of Benin, where the slave-trade has been carried on to the greatest extent. In other parts they show a capacity for practicing the arts of life. They are ingenious in the construction of their dwellings, they have some knowledge of the working of iron and other metals, they manufacture arms, dress and prepare the skins of animals, weave cloth, and fabricate numerous useful household utensils. Neither are they altogether deficient in a knowledge of agriculture. These marks of civilization are, for the most part, apparent in the districts either wholly or partially converted to Mohammedanism. Mungo Park, in his account of Sego, the capital of Bambarra, describes it as a city of 30,000 inhabitants, with houses of two stories high, having flat roofs, mosques in every quarter, and ferries conveying men and horses over the Niger. "The view of this extensive city," he says, "the numerous canoes upon the river, the crowded population, and the cultivated state of the surrounding country, formed altogether a prospect of civilization and magnificence which I little expected to find in the bosom of Africa." All tribes of negroes appear to be passionately fond of music, and show no little skill in the manufacture of musical instruments. They also express their hopes and fears in extemporary songs. Where Mohammedanism has not been introduced, the religion of the negroes is nothing but a debased *fetish* worship. They make fetishes of serpents, elephants' teeth, tigers' claws, and other parts of animals, at the dictation of their *fetish man*, or priest. They also manufacture idols of wood and stone, which they worship; and yet, under all this, they have some idea of a Supreme Being. They believe in good and evil spirits, and are perpetually practicing incantations to ward off the baneful influence of their spiritual enemies. Their religion, in fact, is one altogether of fear; and as this generally leads to cruelty, we find them for the most part indifferent to the sacrifice of human life. In some parts they even offer up human victims to propitiate their deities. They are cruel to their enemies and prisoners, and often shed blood for the mere savage delight they experience in seeing it flow from their victims. We need only allude to the inhuman *customs*, as they are called, of Dahomey, and the *Yam* and *Adai customs* of the Ashantees, as described by Bowdich, in support of this statement.

This same indifference to human suffering, coupled with the passion of avarice, has doubtless been the mainspring of the slave-trade carried on during so many centuries between the negroes and European traders in the western coast of Africa. Begun by the Portuguese as early as 1503, when negro slaves were first imported into the West Indies, sanctioned by Ferdinand of Aragon in 1511, and subsequently by Charles V., legalized in England under Elizabeth, and eventually practiced by every maritime nation of Europe, this infamous trade flourished under the sanction of law as late as the year 1807, when it was happily abolished by act of parliament in Great Britain, and is now treated as piracy by almost every civilized nation. Even still, however, it is practiced by lawless men, notwithstanding the humane efforts of Great Britain, France, and the United States to suppress it; and the encouragement which it has given to the petty chieftains on the slave coast, and the country behind it, to enrich themselves at the expense of their fellow-countrymen, has contributed more than anything else to retard the progress of civilization in that part of Africa. "The region mentioned," says Prichard, "has been the great seat of the exportation of negro slaves, and the tribes on the coast have been reduced to the lowest state of physical and moral degradation by the calamities and vices attendant on that traffic. Throughout negroland, and especially this part of it, the inhabitants of one district in the interior, the dwellers on one mountain, are ever on the watch to seize the wives and children of the neighboring clans, and to sell them to strangers; many sell their own. Every recess, and almost every retired

URBANA

corner of the land, has been the scene of hateful rapine and slaughter, not to be excused or palliated by the spirit of warfare, but perpetrated in cold blood, and for the love of gain."

The custom of polygamy prevails among all the negro tribes, and where these are constituted into nations or kingdoms, as in Dahomey, the sovereign has often as many as two or three thousand wives, whom he occasionally disposes of as presents to his chief officers and favorites.

The languages of the various nations and tribes of negroes are very numerous. Vocabularies of nearly 200 languages have been brought from Africa by the Rev. Dr. Koelle. "A slight examination of these vocabularies," says Mr. Edwin Norris, "seems to show that there are among the negro idioms a dozen or more classes of languages, differing from each other as much as the more remote Indo-Germanic languages do." To these negro idioms Dr. Krapf has given the name of *Nigro-Hamitic languages*. These may perhaps have affinities with some of the other African tongues, but not with any of the great well-defined families of languages. For further information upon this subject, we must content ourselves with referring to Dr. Prichard's *Natural History of Man*, and especially to a learned note by Mr. Edwin Norris, in vol. i. of that work, page 323.

Of the condition and prospects of the negroes in the various countries into which they have been imported during the prevalence of the slave-trade, we have scarcely room to speak. They are found in all the West India islands, to the number of about 3,000,000; in the United States, Brazil, Peru, and other parts of South America; also in the Cape de Verde islands, Arabia, Morocco, etc. In the British West India islands they were emancipated from slavery in 1834, and in those belonging to France in 1848. Indeed, slavery now exists nowhere in the West Indies, with the single exception of Cuba. In the United States the negroes amounted in 1880 to 6,577,497. Many of these were emancipated in the course of the late unhappy civil war, all the negroes of secession masters being *declared* emancipated by proclamation of president Lincoln and act of the federal congress; at the same time that indemnities were promised to such loyal states as of their own accord decreed emancipation. Negro slavery in the United States has been utterly destroyed, and the great problem which used to exercise philanthropic minds has been solved—the negro having become a United States citizen at a fearful cost of blood and treasure to both their possessors and their liberators.

NEGRO EXODUS, the name applied to a remarkable migration of freedmen from the southern states of America, in the beginning of 1879, and through that and the succeeding year. On April 7 in the year named, a memorial reached Washington, signed by many of the most influential citizens of St. Louis, Mo., including ex-senators and ex-representatives in congress, the mayor of the city, an ex-minister to Liberia, and others without distinction of party, setting forth the following facts: That during the two weeks preceding April 7 there had arrived by steamboat at St. Louis, having come up the Mississippi river, chiefly from the states of Louisiana and Mississippi, as many as 2,000 negroes, including men and women, old and young, with many of their children. That this multitude expressed an eager desire to reach Kansas; and without exception, so far as could be learned, refused all overtures or inducements to return south, even if their passage back was paid for them. That the condition of the great majority of them was that of absolute poverty; they being clothed for the most part in thin and ragged garments, and supported during their stay in St. Louis partly by public but mostly by private charity. The older ones in this migration had been formerly slaves in the south: all related the same story as to the causes of their departure from their homes—great privation and want from excessive rent exacted for land; murder of their colored neighbors; and personal violence threatened against themselves. The memorial was accompanied by affidavits given by the negroes, relating instances of political and other assassinations, and other cases of personal violence and outrage. This migration continued to flow steadily northward, and the colored people already living in Missouri and Kansas were embarrassed by the necessity imposed upon them of affording assistance to the emigrants, in which they were comparatively little aided by the white population of the north, although earnest calls by the press and by public speakers were made in all directions. By the middle of April it was publicly alleged that certain counties in Mississippi, and some river parishes in Louisiana, were being depopulated, so far as the negroes were concerned; also from interior points numbers had fled to St. Louis by rail. It appeared, on investigation, that this movement had been a matter of discussion among the negroes of the gulf states during several years, but the simultaneous character of the migration was not explicable on any general theory. Nor was the reason for selecting Kansas as the concluding point made clear. The climate of that state was so severe in the early spring that great suffering occurred among those who reached it; but neither this fact, nor the stories of hardships and dangers which were industriously circulated by those interested in opposing the movement, appeared to have the slightest effect in retarding it. It was alleged that local associations had been formed in the southern states for the purpose of encouraging migration northward. There was, however, no evidence of any united action by such associations. It was alleged, also, that the movement had been devised and executed partly in the interest of certain Kansas land speculators, and

partly by railroad companies. Mass meetings of colored people were held in New Orleans, Vicksburg, and other southern cities, during the spring of 1879, for the purpose of encouraging the negro migration; while meetings of planters and others employing negro labor were convened, at which the dissatisfied negroes were invited to state their grievances, with a view to redress, if practicable. A colored convention assembled at Nashville, Tenn., on May 7, at which delegates were present from Alabama, Arkansas, Georgia, Indiana, Illinois, Louisiana, Mississippi, Missouri, Nebraska, Ohio, Oregon, Pennsylvania, South Carolina, and Tennessee. The whole subject of the condition of the negro race in the south since the act of emancipation was considered in a report which was offered and adopted, and a plan to improve this condition was submitted. The following resolution was adopted: "Resolved, That it is the sense of this conference that the colored people should emigrate to those states and territories where they can enjoy all the rights which are guaranteed by the laws and constitution of the United States, and enforced by the executive departments of such states and territories; and we ask of the United States an appropriation of $500,000, to aid in the removal of our people from the South." By Aug. 1, more than 7,000 needy colored refugees had arrived in Kansas from the southern states, and the flow continued steadily during the summer. Public attention was diverted from it, however, and as an occasion for popular excitement it gradually died out. During 1880 but little was heard of the exodus, though the migration continued—not to Kansas alone, but to the older and more thickly settled states, and in bands of fewer numbers, thus avoiding notice.

NEGRO MINSTRELSY, a species of singing which originated among the negro slaves of the United States, and is now popular at public entertainments. The sentiment of the earlier of these negro melodies was of the most simple kind, the words mostly broken English, and the harmonies confined chiefly to two chords—the tonic and dominant. How the airs were composed has been a matter of curious inquiry. Some of them are believed to be broken down and otherwise altered old psalm-tunes, which had been caught up by the more musical of the negro race. In some instances, the singing of the melodies is accompanied with grotesque gestures; the effect being to give the idea of good-nature and love of fun in the dark-skinned minstrels. Negro melodies may be said to have been made known by Mr. D. Rice, who, first in New York, in 1831, and afterward in London, created a sensation by his singing of *Jim Crow.* Other songs followed, such as *Jim along Josey* and *Buffalo Gals;* and from less to more, there was created a very characteristically national music, if the Americans will allow us to call it so. Becoming extensively popular, and addressed to fashionable audiences, this negro minstrelsy now comprehends a large variety of songs, with airs of a pleasing kind, the whole much in advance of the original negro compositions. For these improvements, the world is indebted, among others, to Mr. E. P. Christy, who began as conductor of a band of minstrels at Buffalo in 1842, and who established himself in New York in 1846. At first his troupe were called the "Virginia Minstrels," but afterwards they were known as the "Christy Minstrels." Mr. Christy's great success in this species of entertainment brought other leaders and troupes into the field. In most cases, the members of the negro minstrel troupes are only negroes in name, with faces and hands blackened for the purpose. See *Christy's Minstrels' New Songs, with Music,* edited by J. Wade; and other similar collections.

NE'GROPONT. See EUBŒA.

NE'GROS, ISLA DE. See PHILIPPINE ISLANDS.

NEGUN'DO, a genus of trees of the natural order *aceraceæ* (see MAPLE), differing from the maples chiefly in the diœcious flowers, being destitute of petals, and in the pinnated ash-like leaves. The COMMON NEGUNDO or ASH-LEAVED MAPLE, is a native of North America, and now not unfrequent in Britain as an ornamental tree.

NE'GUS, a compound of either port or sherry wine and hot water sweetened with sugar and flavored with lemon-peel and spices. It is a favorite beverage in England, and derives its name from a Col. Negus, who claimed to be the inventor.

NEHEMI'AH, son of Hachaliah, probably of royal descent, is first mentioned in the Bible as cup-bearer to Artaxerxes Longimanus in his palace at Shushan about 444 B.C. Having learned the sad fate of the returned colonists in Jerusalem, he prevailed upon the king to send him to his brethren there with full powers "to seek their welfare." For twelve years (444–432), he was untiringly engaged as "governor" in works for their safety from within and without: refortifying the city walls, notwithstanding the hindrances and dangers that beset him on all sides; inducing people from the country to take up their permanent abode in the city, thus promoting its prosperity; and finally, and above all, rekindling the flame of ancient piety and enthusiasm for the observance of the law in the hearts of the rough immigrants. He then returned to Persia, trusting to the new vitality which his reforms had, as he thought, infused into the Jewish commonwealth. But not long afterwards—within a period which it is extremely difficult now to fix—he had again to obtain leave from the king, for the purpose of abolishing the many abuses that had crept in during his brief absence from Jerusalem. His energies now were chiefly directed against the foreign elements mixed up with the people, both privately and publicly. He enforced the rigorous observation of feast and

Sabbath, and rearranged the temple service in accordance with its primeval purity, procuring at the same time the means for its proper support by inducing the people to offer the tithes as of old. His second stay at Jerusalem seems to have lasted between ten and fifteen years; but the dates, as gathered from circumstantial evidence only, are exceedingly vague. He seems to have lived to an old age, but the place and year of his death are unknown. What was the part he took in the formation and redaction of the biblical canon, cannot be investigated in this place. But there can hardly be a doubt that, among the reformatory works undertaken by him, the collection, and perhaps the edition of some of the books of the Old Testament must be included.

The book known under his name (in 13 chapters) is believed only partly his own work. Recent investigation ascribes to him only the first six chapters, part of the seventh, and the last chapter and half; the rest being a compilation by other hands. Its style and character are very simple, free from anything supernatural or prophetic. Its language resembles much that of Chronicles and Ezra, and is replete with Aramaisms and other foreign, partly Persian words. Originally considered a mere continuation of the Book of Ezra, it was by the Greeks and Latins at first called "The Second Book of Ezra." Gradually, however, it assumed its present independent position in the canon after Ezra. It is supposed to have been written or compiled towards the end of Nehemiah's life.

NEHEMIAH, BOOK OF, the latest of the historical books of the Old Testament, was in some ancient Greek and Latin versions called the second book of Ezra or Esdras. This may be accounted for by the intimate official relations between Ezra and Nehemiah, and by the similarity of the circumstances in which they acted and wrote. Without the title, "The words of Nehemiah"—prefixed to the book in modern Hebrew Bibles, and retained in the English version—its first words, "And it came to pass," might appear like a continuation of Ezra. The two books, however, contain internal marks of independent authorship; and there is no more reason to doubt that Nehemiah wrote the one than that Ezra wrote the other. Some, indeed, to prove the difference of authorship, say that Nehemiah exhibits an egotism in speaking of his own actions from which Ezra is free. But to this it is replied that Ezra, in chapters viii. and ix., adopts the same style in speaking of himself in the first person which Nehemiah at greater length employs; and that both authors were led by similar circumstances to write in a similar way. While Nehemiah was doubtless the author of the book, he evidently compiled part of it from historical sources: chapter vii. 6–73, was, as he says, copied from a register which is found also in Ezra ii. The second part, chapters viii.–x., is said to be marked by a Levitical bias, different from the rest of the book, and by the use of the third person instead of the first when speaking of Nehemiah. Hence, some critics have ascribed these chapters to Ezra or some unknown writer. But critical scholars generally consider these views without force. The third part, chapters xi.–xiii., is acknowledged by all to be chiefly, if not altogether, Nehemiah's work.

The book records: Nehemiah's sorrow over the desolations of Jerusalem and his prayer to God for the opportunity to rebuild it; the permission granted him by the king to undertake the work; his arrival at the city and survey of the ruins, followed by the rebuilding of the walls; the opposition of the Jews' enemies, and the plans by which their efforts were defeated; the complaint of the people against the oppression of the nobles, and the redress of the evil; the crafty plot of their enemies, and its defeat by Nehemiah's straightforward boldness; the record of the families that returned first from Babylon, followed by an account of the offerings made by the rich and poor towards the work; the reading of the law by Ezra the scribe, accompanied with a joyful celebration of the feast of tabernacles; the mourning, fasting, and repentance of the people, expressed by a full confession of sin and by a solemn covenant sealed by princes, priests, and Levites, and confirmed with an oath by the whole multitude of the people, to observe the law, sanctify the Sabbath, sustain the services of the temple, and bring in all the tithes; the selection by lot of a tenth of the people to dwell in Jerusalem, and the distribution of the rest through the other cities of the land; the registry of the priests and Levites, and the gathering of the latter from all parts of the land to dwell in Jerusalem; the dedication of the wall of Jerusalem, accompanied with the offering of large sacrifices and the utterance of great joy which was heard afar off; the admission of heathen strangers into the temple during Nehemiah's absence in Persia, and their summary expulsion after his return; his enforcement of the broken covenant to pay the tithes, to sanctify the Sabbath day, and to refrain from marriages with the heathen around them.

NEHLIG', VICTOR, b. Paris, 1830. His instructors in painting were Abel de Pujol and Cogniet. After residing some time in Havana, Cuba, he removed to New York, where he gained a reputation by his pictures representing the romance and poetry of American history. In 1870 he was elected a member of the National Academy of Design. Among his best-known works are "Gertrude of Wyoming," "Hiawatha and Minnehaha," and "Pocahontas."

NEILGHER'RY (properly NILGIRI) **HILLS** (Skr. *nîla*, blue, and *giri*, mountain), a remarkable group of mountains in the s. of Hindustan, entirely isolated, with the exception of a precipitous granite ridge, 15 m. in width, which connects it with the high table-

land of Maisur on the north. Lat. 11°. 10′ to 11° 38′ n., long. 76° 30′ to 77° 10′. The shape of the group is that of a triangle, of which one side faces the district of Malabar on the west. Greatest length, about 40 m.; average breadth, about 15 miles. The base of the mountains is covered by a dense and unhealthy forest, swarming with wild animals, among which are the elephant and tiger; but in the higher regions of the hills wood is comparatively scanty. The surface of the group is undulating, rising, in the peak of Dodabetta, near the center, to the height of 8,760 ft., the greatest height, as yet ascertained, in India s. of the Himalayas. The hills for the most part consist of granite, covered often to the depth of upwards of 10 ft. by a richly productive black soil. There are several morasses yielding peat, which is used for fuel. The higher lands form a fine open grass country, covered with the vegetation of the temperate zone, and inhabited by a most remarkable tribe, the *Tudas* or *Toruvars* (herdsmen). This tribe numbers only about 2,000 persons. The men are tall and handsome, with Roman noses, fine teeth, and large expressive eyes; the women are singularly beautiful. Their religion is theism; they have no idols. Owing to their great elevation the Neilgherry hills have a delightfully cool climate, and are much resorted to on this account by invalided Europeans. The principal station, and the only place on the hills that deserves the name of a town, is Utakamand, situated in the center of the hills, at an elevation of 7,300 ft. above sea level. Its climate is cold and damp during the monsoon; at other times it is intensely dry, and the mean annual temperature is 58°.

NEILGHERRY NETTLE, *Girardinia Leschenaultii*, a plant of the natural order *urticeæ*, nearly allied to the true nettles, and possessing in a high degree the stinging power which is common in them. It is frequent on all the higher ranges of the Neilgherry hills. The bark yields a valuable fiber, which the natives obtain by first boiling the whole plant, to destroy its stinging properties, and then peeling the stalks.

NEILL, Thomas Hewson, b. Penn., 1826; educated at West Point, and after graduating in 1847 was assigned to the infantry. At the outbreak of the civil war he organized the 23d Penn. vols., and commanded the regiment in the peninsular campaign of 1862. The same year he was brevetted brigadier-general, and at Fredericksburg, Marye Heights, and Gettysburg commanded a brigade of the 6th corps. In 1864 he was made major with brevet rank of major-general for gallant conduct at the siege of Petersburg and battle of Winchester. At the end of the war Neill was promoted to the rank of lieutenant-colonel, did active work in the Indian warfare, and in 1875 was made commandant of West Point. He d. 1885, at Philadelphia, Pa.

NEILSON, Lilian Adelaide, the assumed name of Elizabeth Ann Brown, 1848–80; b. Leeds, Eng. She ran away from home to London, 1862; was educated through the kindness of a chance acquaintance; and made her dêbut as an actress at the Royalty theatre, London, 1865, playing "Julia" in the *Hunchback*. Her success was sufficient to secure her other engagements in London and the provinces; but it was not till 1871 that she made a pronounced hit in *Amy Robsart*. She immediately became one of the favorites of the English stage, and was equally successful in her tours through the U. S., 1872, 1876, and 1879. Her chief parts were the Shakespearean ones of "Juliet," "Rosalind," "Beatrice," and "Imogene." In 1872 she married Mr. Philip Lee, but the marriage was not a happy one, and she obtained a divorce, 1877.

NEI'RA. See Moluccas.

NEIS'SE, a t. of Prussian Silesia, and a fortress of the second rank, is situated in a broad valley on the Neisse, an affluent of the Oder, 46 m. s. by e. of Breslau. It consists of the town proper on the right bank, of the Friedrich's town, and of the Preussen fort on the left bank. It contains two great squares, has Catholic and Evangelical churches, a hospital, theater, etc. It is an important railway center, carries on manufactures of machinery, and has establishments for spinning and weaving. The entire pop. in '95 was 24,359. Neissé has frequently been the scene of conflict, especially in the Thirty Years' war. It was taken by assault by the French in 1807.

NEJIN' or Nyezhin, an ancient t. of Little Russia, in the government of Tchernigof, on the Oster, an affluent of the Dnieper, about 80 m. n.e. of Kiev. It fell into the hands of the Lithuanians in 1320, and of the Poles in 1386, but was annexed to Russia in 1654. Nejin is an industrious town of ('91) 44,915 inhabitants, many of whom are descendants of Greek immigrants who settled here in the reign of Catherine II. The principal branch of industry is the cultivation of tobacco. Great quantities of leaf tobacco are sent hence to St. Petersburg, Riga, and Mittau. The chief institutions are monasteries, churches, and a lyceum.

NÉLATON', Auguste, 1807–73; b. Paris; studied with Dupuytren, graduated in medicine in 1836, practiced surgery in several hospitals, and was adjunct professor of the faculty of Paris from 1839 to 1851, and professor of clinical surgery till 1867; became a senator in 1868; was member of the academy, and surgeon to Napoleon III.; made several improvements in surgery, one of which was for the extraction of stone of the bladder. A probe, having an unpolished porcelain knob at its end, much used in military surgery for reaching for lead bullets, is called Nélaton's probe. In conjunction with Velpeau he published *Rapport sur la Progrès de la Chirurgie* in 1867; but his principal work is *Elémens de Pathologie Chirurgicale*, in 5 vols. 2d ed., 1867–70.

NELLORE', a t. of British India, capital of a district of the same name, in the presidency of Madras, situated on an elevation on the right bank of the northern Pennar, 20 m. from its mouth, and 96 m. n.n.w. from Madras. It is irregularly built and the population in some places much crowded: but there are some good streets. The abundant supply of water contributes to the health of the town. Nellore was formerly an important fortress. It is a curious circumstance that, in the end of last century, a pot filled with Roman gold coins and medals—chiefly of Trajan, Adrian, and Faustina—was found under the ruins of a small Hindu temple at Nellore. Pop. '91, 29,300.

NELSON, a co. in central Kentucky, traversed by the Louisville and Nashville railroad; drained by Salt river. Pop. '90, 16,417, includ. colored. The surface is slightly hilly and largely covered with forests, the soil fertile, good limestone being found in several parts. Area, 380 sq. m. Co. seat, Bardstown.

NELSON, a co. in n.e. North Dakota, organized 1883. It is drained by the Sheyenne and Goose rivers, and contains some large lakes; 1008 sq. m.; pop. '90, 4293. Co. seat, Lakota.

NELSON, a co. in central Virginia, extending from the Blue ridge on the n.w. to the James river on the s.e., and drained by the Tye and Rock rivers and Rockfish creek, and intersected by a canal leading to Richmond; 375 sq. m.; pop. '90, 15,336. Co. seat, Lovingston.

NELSON, a municipal borough (since 1890) of Lancashire co., in the diocese of Manchester, England. It has besides coal, considerable manufactures of cotton, worsted and silk. It contains a handsome market-hall and technical school. Pop. '91, 22,700.

NELSON, the capital of a province of the same name, in New Zealand, is situated at the n. end of South island. The harbor has a depth on bar of from 15 to 19 ft. The railway wharf can be reached only by vessels drawing 18 ft. and under. The center of the town is a hill rising 40 ft. above the surrounding streets, and laid out as a square with an Episcopal church in its center. Nelson is the seat of a bishop. The city was founded in 1841. Pop. 6,600. The manufactures of the town comprise cloth and leather.

NELSON, David, 1793–1844; b. Tenn.; graduated at Washington college, Va.; studied medicine in Danville, Ky., and in the Philadelphia medical school; returned to Kentucky at the age of 19, intending to practice his profession, but the war of 1812 having commenced, he joined a Kentucky regiment as a surgeon, and went to Canada. Returning he came near losing his life from hunger and fatigue, but was found and saved by his relative, Col. Allen. He resumed his medical practice at Jonesborough, his native town. Religiously educated, he had early made a profession of religion, but while in the army he became an infidel. He soon, however, became convinced of the truth of the Bible, and determined to enter the ministry. He was licensed to preach in April, 1825. He preached three years in Tennessee, and published also at Rogersville the *Calvinistic Magazine*. In 1828 he succeeded his brother Samuel as pastor of the Presbyterian church in Danville, Ky. In 1830 he removed to Missouri and established Marion college, near Palmyra, of which he was the first president. Earnestly advocating the cause of emancipation he found it expedient to leave Missouri, and in 1836 he removed to Illinois, where he established at Oakland, near Quincy, a school for the education of young men for the ministry. He exhausted his pecuniary means and the institution failed. In 1836 he published a work of great interest—*Cause and Cure of Infidelity*—which had an extensive circulation and passed through several editions in America and England. He wrote a work entitled *Wealth and Honor*, but the manuscript was lost in passing from his hands.

NELSON, Horatio, the greatest of Britain's admirals, was b. on Sept. 29, 1758, at Burnham Thorpe, Norfolk, of which place his father, Edmund Nelson, was rector. His mother's maiden name was Suckling, and through her he could claim a collateral kinship with the celebrated sir Robert Walpole. As a child he was feeble and sickly; and throughout life his small, frail, and attenuated frame seemed to consort but poorly with the daring and impetuous spirit which "stirred and lifted him to high attempts." At the age of 13 he entered the royal navy, commencing his career in the *Raisonnable*, 64 guns, commanded by his uncle, Capt. Suckling. Then, even more than now, promotion in the first stages of the profession was determined by admiralty interest; and fortunately for him and for England, his uncle, shortly afterward becoming comptroller of the navy, was able to facilitate his rise. His promotion was nearly as rapid as it could be, and before he was quite 21 he had attained the rank of post-captain, which fairly opened the way for him to the higher honors of the service. Up to this time no opportunity had been afforded him of achieving any marked distinction, but to all who were brought into contact with him he had already approved himself a bold and capable officer. Henceforward, for some years, he was nearly constantly employed in a variety of harassing services; and in all, his conduct was such that in no long time he had made for himself a brilliant reputation. His growing fame was as yet, however, chiefly confined to professional circles, no very signal exploit having brought his name prominently before the public. But with the advent of the war with revolutionary France the time had come when he was to "flame amazement" on the world by a series of noble deeds, in the luster of which all other naval glory looks pale. In his obscurer years, he seems to have been cheered under what pained him as unmerited neglect by that prescience of a grand destiny, which has so often preluded to a career of exceptional splendor. Thus, on one

occasion, he writes: "They have not done me justice. But never mind. One day I'll have a gazette of my own." And subsequently the same confidence is expressed with something like the depth of a religious conviction: "One day or other I will have a long gazette to myself. I *feel* that such an opportunity will be given me. I cannot, if I am in the field of glory, be kept out of sight; wherever there is anything to be done, *there Providence is sure to direct my steps.*" In 1793 appointed to the *Agamemnon*, 64 guns, he took a distinguished part, among other services, in the sieges of Bastia and Calvi, in Corsica, losing an eye at the last of these; and in the celebrated action of sir John Jervis off cape St. Vincent with the Spanish fleet, to a maneuver of extreme and masterly daring, executed by Nelson in defiance of orders, that officer was mainly indebted for the splendid success obtained, and the peerage with which it was rewarded. Though in the interval an expedition which he commanded against Teneriffe had failed disastrously, with loss to himself of his right arm in the assault, it was on all hands admitted that everything was done on the occasion which skill and valor in their highest combination could effect, and Nelson on his return to England in 1797, was received with general acclamation. He was invested with the order of the bath, and a pension of £1000 a year was voted to him. Being next year intrusted with a fleet, he signalized this his first independent command of any magnitude by the stupendous victory of the Nile, memorable in naval annals as the completest annihilation of an enemy on record. See ABOUKIR. Finding the French fleet—to which his own was considerably inferior in force—skillfully moored so as to defy ordinary attack, he adopted the novel expedient of doubling on the enemy's ships, and was rewarded with success the most consummate. Of the French line of battle, two ships only escaped to be afterward captured; and it was considered that solely to a wound in the head, which in the heat of the action prostrated Nelson, did even these owe their temporary safety. Honors were now from all quarters showered upon him; and in particular the gratitude and enthusiasm of his countrymen were signified by the title bestowed on him of Baron Nelson of the Nile, and a grant of £2000 a year for his own life, and the lives of his two immediate successors. For his services immediately subsequent, in effecting the expulsion of the French from Naples, the Neapolitan king rewarded him with the dukedom of Bronte and a domain of £3000 a year. These last honors, however, were in one sense dearly purchased. The single suspicion of a blot on his public fame is in regard of his relations with the corrupt court of Naples, and of certain questionable acts into which by these he was led. The only flaw in his private character was his infatuated attachment to Lady Hamilton, the wife of the English ambassador, a woman of questionable antecedents, but perilous fascination, with whom he was here thrown in contact. The influence which she now obtained over him, she continued to the end to exercise. Early in life he had married, and married happily. If to the charms of an impure adventuress he sacrificed, on his return to England, the wife to whom before he had been tenderly devoted, it is not necessary to indulge in comment. Let us compassionate the one cruel frailty of a man in all else and in his proper nature, as gentle and generous as he was brave.

His next magnificent exploit was the battle of Copenhagen in 1801, in which, after a struggle of terrible severity, he shattered the naval power of Denmark, and along with it the dreaded coalition against England of the three northern kingdoms. Never were the characteristic and heroic qualities of the man more brilliantly displayed than on this most trying occasion. In the moral courage to accept responsibility at all hazards, no man ever surpassed him. In the heat of the battle, his chief, sir Hyde Parker, in deadly anxiety as to the issue of what at a distance seemed to be a hopeless conflict, signaled him to discontinue action. "Damn the signal!" said Nelson, when this was reported to him. "*Keep mine for closer battle flying.* That's the way I answer such signals. Nail mine to the mast." And with the certainty of professional disgrace and ruin staring him in the face in case of failure, he worked out his grand triumph.

Had Nelson's services here ceased, his fame would still have been assured as the greatest of England's naval heroes. But a crowning glory awaited him. In the earlier part of 1805, glowing with fierce ardor and impatience, he had chased half round the world a French fleet of nearly double the force of his own, scared by the very terror of his name; and on the morning of the memorable Oct. 21 of that year, the desire of his eyes was satisfied, when in the Bay of Trafalgar he saw before him the combined navies of France and Spain moving to meet him in frank fight. Of the glorious consummation which followed we need not speak in detail. Ere night, the power of France upon the seas was annihilated, and her threatened invasion of England had become an abortive dream. But Nelson was no more. He died as such men wish to die, amid the thunders of his mightiest victory.

The character of Nelson was, for a man of his greatness, unusually simple and transparent. A more absolute singleness of aim and aspiration than his it is difficult even to conceive of. Literally on fire with that ardor and passion of enthusiasm without some tincture of which scarce any man perhaps has ever yet achieved distinction, he was driven by it imperiously in one direction. The greatest of sailors—he was a sailor and little else. Of his genius for command it would be idle at large to speak. In coolness, foresight, promptitude, instant intuitive decision, and a daring which, even when it seemed at times to touch temerity, was yet regulated throughout by the nicest calculations of reason, he has perhaps never been quite equaled on the element. His nature

was most noble and humane. He had but to be known to be beloved; and of the tender chivalry of his relations with his gallant brethren in arms it is touching to read. See *Life* by Mahan (1897).

NELSON, Samuel, ll.d., 1792–1873; b. N. Y.; educated at Middlebury college, and admitted to the bar in 1817. He was a presidential elector for New York in 1820, and a circuit judge 1823–31. In 1844 he was appointed an associate justice of the state supreme court, which office he retained till 1872. He was a member of the N. Y. constitutional convention in 1846, and of the joint high commission for the settlement of the Alabama claims in 1871.

NELSON, Thomas, 1738–89; b. Va.; son of William Nelson, president of the Virginia colonial council. He was educated at Trinity college, Cambridge, England. Returning to this country in 1761, he took up his residence at Yorktown on the family estates. In the disputes with Great Britain he warmly advocated the colonial cause, both privately and in the house of burgesses. He served in the first provincial convention of 1774, and in the second of 1775. In the latter year he became colonel of the 2d Va. regiment, but resigned in 1776 upon his election to the constitutional convention. In this body he introduced a resolution instructing the Va. congressional delegation to bring before congress proposals for a declaration of independence. He was elected to congress in time to sign the declaration, but resigned in May, 1777, on account of ill-health. In August of the same year, when a British squadron under Admiral Howe was off the Virginia coast, he became commander-in-chief of the state troops, and soon after, at the call of congress, led a cavalry battalion to Philadelphia. After the alarm occasioned by the approach of Howe had subsided, he returned to the legislature, where he resisted the proposed confiscation of British property, maintaining that it was unjust to make private persons suffer for public wrongs. Early in 1779 he was again a member of congress, and was again forced by ill-health to resign. In May the same year, he organized the state militia, for protection against a British foraging and plundering expedition then invading Virginia. In 1780, when congress had asked for contributions to pay for the expenses of the French contingent, Virginia attempted to raise a loan of $2,000,000. In the depreciated condition of the public credit, there was little hope of negotiating that sum, but a large amount was advanced by Nelson, who made himself personally responsible. He also paid two Virginia regiments, which had refused to go south till they had received the arrearages of their pay. In 1781 he succeeded Jefferson as governor. The British were ravaging the state, and Nelson opposed them with what militia he could muster. He was forced to exercise extra legal powers, but his acts were afterward sanctioned by the legislature. In command of the state militia at the siege of Yorktown, he ordered the bombardment of his own house, the most valuable in the town. He was already financially embarrassed by his loans to the government, and in his last days his property was sold to pay his debts. He resigned in Nov., 1781.

NELSON, William, 1825–62; b. Ky.; brother of Thomas Henry, minister to Chili 1861–66; joined the navy in 1840, and in 1847 commanded a battery in the fleet which bombarded Vera Cruz, keeping up a continuous cannonade and seconding the movements of the army under Scott, resulting in the capture of the city and fort. He served in the Mediterranean and south Pacific, and in 1854 was promoted to master, in 1855 to lieut. In 1858, when the slave ship *Echo* was required to discharge her cargo of negroes into the keeping of the *Niagara*, for the purpose of restoring them to African soil, he was ordered to the latter vessel. In 1861 he was on ordnance duty at Washington, and at the outbreak of the civil war he was placed in command of the gunboats on the Ohio, with the rank of lieut.commander. Soon after, he left the navy, and entering the military service, was ordered to Kentucky. He there established recruiting stations, and organized camp "Dick Robinson," near Danville, and a similar rendezvous at Washington, in Mason county. He was promoted to brigadier-general, Sept. 1861. At the battle of Shiloh, April, 1862, he commanded the 2d division under Gen. Buell, whose forces, united with Gen. Grant's, were attacked by the confederate General Beauregard. He was wounded at the battle of Richmond, Ky. In 1862, when Louisville was threatened with an attack of the confederates under Gen. Bragg, he commanded the union forces, ordered earthworks to be constructed, pressing private citizens into the service, and defending the position until the arrival of Gen. Buell with the army. In 1862 he was commissioned major-general of volunteers, and in September was fatally shot at the Galt House, Louisville, by the union general, Jefferson C. Davis, of Indiana, in a personal quarrel.

NELSON, Wolfred, 1792–1863; b. Montreal; son of an English officer; in 1811 he began the practice of medicine in St. Denis. In the war with the United States, 1812, he served as surgeon. He was chosen representative of Sorel in the Canadian parliament of 1827. In the revolution of 1837 he was prominent, and was in command at the victory obtained by the insurgents at St. Denis, on the Richelieu river, but was captured and sent to Bermuda as an exile. In the next year he settled at Plattsburg, N. Y., and in 1842 returned to Montreal, a general amnesty having been declared. He was again elected to parliament from his former district in 1844 and 1845, and in 1851 was made inspector of prisons, a position which he held for several years. He served as mayor of

Montreal two terms and was at the head of the Lower Canada College of Physicians and Surgeons.

NELSON RIVER, British North America, rising in the n. extremity of lake Winnipeg in the North-West territory, a branch of the Saskatchawan, after passing through a number of lakes runs n.e. into Hudson's Bay, where it is sometimes called Katchawan. It is deep, wide, and swift, and in its course makes many abrupt turns, and has many rapids and falls that render it almost unnavigable. That part of the area e. of the Lake of the Woods and Lake Winnipeg, is a rough country with a soil of Laurentian formation except for 100 m. of the river's course through the Silurian plain of Hudson's Bay. In the former region one-quarter is arable land, about one-half is too cold for cultivation, and about 70,000 sq.m. of timber constitute the remainder. The area of its basin is 360,000 sq.miles. West of lake Winnipeg it traverses a fertile country adapted to wheat culture. Its length to the head of the south fork of the Saskatchawan is 1732 m., and at its mouth is York, a town and fort, one of the principal trading-posts of the Hudson's Bay fur company.

NELUM'BO, *Nelumbium,* a genus of aquatic plants similar to water-lilies, and often included under that name, as well as by some botanists in the natural order *nymphæaceæ* (q.v.); although by others constituted into a distinct order, *nelumbiaceæ,* differing in the want of albumen in the seed, and in the distinct carpels, which are one-seeded, and buried in the cavities of a large fleshy receptacle; which eventually becomes a broad hard bed, full of holes, with the large seeed half buried in them. The flowers and leaves are very similar to those of water-lilies. The species are few, and are found in the warm parts of Asia, in the n. of Africa, and in North America. They are all distinguished by the beauty of their flowers. *N. speciosum* is the Egyptian Bean of Pythagoras, the *lotus* (q.v.) of the Hindus, held sacred by them and by the people of Thibet. It is also much esteemed and cultivated in China, and elsewhere in the e., for its seeds, roots, leaf-stalks, and flower-stalks, all of which are eaten. It has been used as food by the Egyptians from remote antiquity. The seeds are in size and shape like acorns, with a taste more delicate that that of almonds. The root contains much starch, and *Chinese arrowroot* is said to be obtained from it. Slices of it are often served up at table in China. Great quantities are pickled with salt and vinegar, and eaten with rice. The powdered root makes excellent soup with water or milk. The flowers are generally rose-colored, seldom white. The ancient Egyptian mode of sowing this plant, by inclosing each seed in a ball of clay and throwing it into the water, is practiced at the present day in India.—*N. luteum* is a North American species, extending almost as far north as Philadelphia; with yellow flowers. The seeds are sought after by children and by Indians, and the farinaceous roots are agreeable when boiled.

NE'MAHA, a co. in n.e. Kansas, having the state line of Nebraska for its n. boundary, drained by the Nemaha and Delaware rivers and by Vermilion creek; 720 sq.m.; pop. '90, 19,249, chiefly of American birth, with colored. It is intersected by the Kansas City, Northwestern, and the St. Joseph and Grand Island railroads. Its surface is somewhat hilly and its soil is very fertile, producing large crops of wheat, corn, oats, potatoes, and dairy products. It is a fine country for stock-raising, and its rivers furnish excellent water-power. Its mineral products are limestone, much used for building-purposes, sandstone, coal, and gypsum. It has for that section a good supply of timber, appearing along the streams, and on the bluffs, in groves of oak, hickory, walnut, and cotton-wood. Co. seat, Seneca.

NE'MAHA, a co. in s.e. Nebraska, having the Missouri river for its e. boundary, separating it from Missouri; intersected by the Burlington route and the Missouri Pacific railroads; 391 sq. m.; pop. '90, 12,930, chiefly of American birth. Its surface is hilly and drained by the Little Nemaha river, Muddy Creek, and other small streams. A large proportion is prairie land with groves of ash, elm, cotton-wood, and hickory, which grow along the river bottoms where the soil is fertile, having a limestone foundation, and producing the staple products of the western states. It is eminently fitted for stock-raising. Limestone, found in abundance, is used for building-purposes, and coal is mined. Co. seat, Auburn.

NEMATEL'MIA (derived from the Gr. words *nema* a thread, and *helmins,* an intestinal worm), is the term given by recent zoologists to a large and important class of the subdivision *vermes* of the *articulata.* The worms belonging to this class are of a more or less elongated cylindrical form. Their skin is thick and strong, and is usually wrinkled in such a manner as to give the body an annulated appearance, which, however, disappears if the animal is placed in water. The nervous system in the higher forms (as the *ascarida*) consists of two lateral ganglia at the anterior extremity, which are united by a slender nervous ring, and from which two lateral nervous trunks proceed to the posterior part of the body; while in the lower forms no distinct nervous system can be recognized. No special organs of the senses are met with; but a general sense of touch is probably present. The digestive organs are extremely simple. In one order (the *acanthocephala*) no trace of an intestinal canal can be detected; in another order (the *gordiacea*), there is a mouth, but no anus; while the higher forms are provided with mouth, intestinal canal, and anus. In the higher forms, a kind of vascular system is developed in the skin, in

the shape of canals, in which the nutrient fluid is propelled by the movements of the body. No distinct respiratory organs can be detected; but in some genera there are glands whose object is not clearly known. These worms are uninsexual; but the males are comparatively rarely found, and are always smaller than the females. With the exception of two families—the *urolabea* and *anguillulidæ*, or paste and vinegar eels—all the animals of this class are parasitic; indeed, Carus, in his *Handbuch der Zoologie* (1863), vol. ii. p. 458, goes so far as to say that "probably all the nematelmia live as parasites, either during their whole lives or during certain stages of their existence."

The nematelmia are sometimes termed *round-worms*, just as the platyelmia (tape worms, flukes, etc.) are called *flat-worms*. Most commonly, however, the term round-worm is restricted to the *ascaris lumbricoides*, the most common of the human entozoa.

This class is divisible into three very distinct orders—viz., the *acanthocephala*, which are destitute of an intestinal canal; the *gordiacea*, which possess an intestinal canal, but no anus; and the *nematoidea*, which possess a perfect intestinal canal, provided with two orifices.

NEMATOI'DEA constitute the highest order of the nematelmia, and indeed of intestinal worms generally, inasmuch as they present a distinct nervous system, a complete intestine provided with mouth and anus, and distinct sexual organs. The history of their development is not fully known; but there is no reason to believe that these animals undergo any remarkable metamorphoses, although some perforate the intestinal walls, and become encysted in parenchymatous organs. The great majority of the nematoidea are parasitic. The nematoidea are divided by Carus into twelve families, all the members of which are known only in a parasitic state of existence, excepting certain genera of the first and second family.

Although the intestinal canal is the most common residence of these worms, some, as *trichina spiralis*, are found chiefly in the muscles; others, as *filaria medinensis*, in the subcutaneous cellular tissue, and others in the kidneys, lungs, etc. See ENTOZOA. For further information regarding these worms, the reader is referred to Eberth's *Untersuchungen uber Nematoden* (4to, 1863).

NEM CON. An abbreviation (Latin), for *nemine contradicente*, no one contradicting.

NE'MEA, anciently the name of a deep and well-watered valley of Argolis, in the Peloponnesus, between Cleonæ and Phlius. It lies n. and s., and is from 2 to 3 m. long, and more than half a mile broad. It possessed a sacred grove, with a magnificent temple of Zeus, and was celebrated for the games called the *Nemean games*, which took place four times in two olympiads in an adjacent woody valley. This was one of the great national festivals of the Greeks, and, according to one legend, was founded by the seven princes who were combined against Thebes: according to another, by Hercules after his victory over the Nemean lion. The games consisted partly of exercises of bodily skill and strength—such as chariot-racing, quoit-throwing, wrestling, running in armor, horse-racing, boxing, throwing the spear, and archery, and partly of musical and poetical competitions. The prize was originally a crown of olive twigs, afterwards of parsley. We have eleven odes by Pindar in honor of victors in the Nemean games.

NEMER'TÉS, a genus of marine *annelida*, the type of a family, *nemertidæ*, remarkable for the prodigious length which some of the species attain, which, in their most extended state, is 30 or 40 feet. But the animal which stretches itself out to this length, is capable of suddenly contracting itself to 3 or 4 feet. The structure is similar to that of leeches, but there is no sucker. These annelids feed upon molluscs by sucking them out of their shells. They generally lurk in the mud or sand of the sea-coast, and are sometimes drawn up with the nets or lines of fishermen. They twine themselves into knots and coils, apparently inextricable, but without any real entanglement. The life history of the *nemertidæ* is curious. The embryo has at first a ciliated, non-contractile, oval body; from which there issues a small actively contractile worm, leaving behind it the oval skin, and this worm grows to the size already mentioned. The larval state, however, exhibits a cleft with raised edges, which becomes the mouth of the perfect animal.

NEM'ESIS, according to Hesiod, the daughter of Night, was originally the personification of the moral feeling of right and a just fear of criminal actions—in other words, of the conscience. Afterwards, when an enlarged experience convinced men that a divine will found room for its activity amid the little occurrences of human life, Nemesis came to be regarded as the power who constantly preserves or restores the moral equilibrium of earthly affairs—preventing mortals from reaching that excessive prosperity which would lead them to forget the reverence due to the immortal gods, or visiting them with wholesome calamities in the midst of their happiness. Hence originated the latest and loftiest conception of Nemesis, as the being to whom was intrusted the execution of the decrees of a strict retributive providence—the awful and mysterious avenger of wrong, who punishes and humbles haughty evil-doers in particular. Nemesis was thus regarded as allied to Até (q.v.) and the Eumenides (q.v.). She was sometimes called Adrastēa and Rhanmusia, the latter designation being derived from Rhanmus, a village of Attica, where she had a temple. She was represented in the older times as a young virgin, resembling Venus; in later times, as clothed with the tunic and pep-

lus, sometimes with swords in her hands and a wheel at her foot, a griffin also having his right paw upon the wheel; sometimes in a chariot drawn by griffins. Nemesis is a frequent figure on coins and gems.

NEME'SIUS, b. Syria about the middle of the 4th c.; bishop of Emessa in the reign of Theodosius the Great, though the time is uncertain, and little is known about his life. He left a treatise in Greek on *The Nature of Man,* which treats of the soul and body. The observations and theories of Nemesius on the latter subject show considerable ingenuity and learning. His description of the glands, nerves, and spleen show him to have been thoroughly acquainted with the physiological learning of his time; and, in regard to the motion of the pulse and the object of the bile, have given rise to the supposition that he was acquainted with the circulation of the blood and the functions of the bile and liver. In regard to the motion of the pulse, he says: "It takes its rise from the heart, and chiefly from the left ventricle of it; the artery is with great vehemence dilated and contracted, by a sort of constant harmony and order. While it is dilated, it draws with force the thinner part of the blood from the next veins." The soul was considered by Nemesius as formed of two parts: the rational part, composed of will, memory, and thought; and the irrational part, consisting of the passions and desires. He believed in the Platonic teaching as to the pre-existence of the soul.

NEMI, a lake in Italy, having on its margin a temple of Diana famous among antiquities. It was called *Lacus Nemorensis* and also Speculum Dianæ, mirror of Diana, and is now known as Lago di Nemi. It is 17 m. s.e. of Rome. The place was celebrated throughout Italy on account of its sacred temple, grove and lake, and given the surname of Nemoralis. The n.e. margin is the site of the ancient town of Nemus, now occupied by the village of Nemi, overlooked by a feudal castle. It is less than 6 m. in circumference, lying between lake Albano and the town of Velletri, on the Appian Way, in the midst of steep high hills. Its altitude is 1225 ft. It fills the crater of an extinct volcano, and has no known outlet except a passage made by the ancients, which still serves its original purpose. It is a favorite resort for tourists and artists. In 1897 the two long-buried vessels of the emperor Caligula were discovered embedded in the bottom of the lake.

NEMOURS, Louis Charles Philippe Raphael d'Orléans, Duc de, b. Paris, 1814; 2d son of Louis Philippe. In 1831 he was elected king of the Belgians, but declined, as he did a subsequent offer of the throne of Greece. He served in the two Belgian campaigns, and in Algeria, and was made lieut.-general. After the death of his elder brother, the duc d'Orléans, a bill was passed conferring the regency upon the duc de Nemours; but it was not sanctioned by public opinion, and he left France in 1848, and did not return till 1870. He married in 1840 Victoire-Auguste-Antoinette, duchess of Saxe-Coburg, by whom he has 2 sons and 2 daughters.

NE'NAGH, a market t. of Tipperary co., Ireland, distant 95 m. s.w. from Dublin; pop. '91, 4,722, of whom the Roman Catholics were far in excess of the Protestants of the Episcopalian church. Nenagh is the assize town of the North Riding of Tipperary, and is a place of more than ordinary pretensions in its public buildings. The ancient keep, called Nenagh Round, is a striking object, and the court-house, jail, barrack, and union workhouse are imposing edifices. There is a free school, and three national schools. Among the not very numerous articles manufactured at Nenagh, are woolens, tobacco, soap, and candles. It is, however a place of very considerable inland trade, and contains slate quarries.

NENA SAHIB. See Nana Sahib.

NENNIUS, a monk of Bangor, in Wales, who is believed to have lived early in the 9th century. Others, but without authority, place him in the early part of the 7th century. He calls himself, in his history, a Briton, and not a Saxon, and a pupil of bishop Elbodus, or Elvodug. He is known only from the history of Britain ascribed to him, *Historia Britonum,* or *Eulogium Britanniæ.* The work begins with a mythical genealogy of Brut, grandson of Æneas, and first king of Britain. After a description of the Pictish emigration to n. Britain, and the Scottish settlement of Ireland, and a brief account of the Roman conquest and rule in Britain, he treats of the Anglo-Saxon invasion and conquest down to 655. The author says at the beginning that the work was compiled "from the annals of the Romans, and the chronicles of the fathers, from the writings of the Scots and Angli, and the traditions of our ancestors." His book is confused and often untrustworthy. Its chief value is the collection of legends contained in it, such as those of King Arthur and Merlin. It is in dispute, indeed, if Nennius ever lived, and if the history which bears his name be not a later forgery. The name of Nennius was not connected with it till the 13th century. The manuscript contains many interpolations, the work of a copyist who admits that he omitted portions of the work of Nennius, and added passages of his own.

NEOLOGY, a term signifying new doctrine or new statement, and first used in Germany about the middle of the 18th c. to denote the new statement of Christian doctrine and new explanations of biblical facts which, in their developments, became widely known as rationalism. The Neologists at first, professing to regard Christianity as an inestimable blessing to men and the Scriptures as the rule of faith, proceeded to explain

the doctrines of the former and the facts of the latter according to what they called the increasing intelligence supplied by education and culture. Without affirming that anything in the Bible was false, they asserted that many things in it had been misunderstood. Without assailing the historical character of the miracles they attributed them entirely to natural powers and means. Beginning with explaining away the less important facts, they gradually applied the same process to the most vital doctrines. Thus, students of the Bible and of theology, as well as congregations and the people generally, were prepared for the absolute "rationalism" which denies a special divine revelation in the Bible. See RATIONALISM.

NE'OPHYTE (Gr. *neophutos*, from *neos*, new, and *phuo*, to grow), the name given in early ecclesiastical language to persons recently converted to Christianity. The word is used in this sense by St. Paul (1 Tim. iii. 6), and is explained by St. Gregory the Great as an allusion to "their being newly planted in the faith" (Epp. b. v. ep. 51). It differed from catechumen (q.v.), inasmuch as it supposed the person to have not only embraced the doctrines of the church, but also to have received baptism. St. Paul, in the passage referred to, directs Timothy not to promote a neophyte to the episcopate; and this prohibition was generally maintained, although occasionally disregarded in very extraordinary circumstances, such as those of St. Ambrose (q.v.). The duration of this exclusion was left for a time to the discretion of bishops; but several of the ancient synods legislated regarding it. The third council of Arles, 524, and the third of Orange in 538, fix a year as the least limit of probation. In the modern Roman Catholic church the same discipline is observed, and extends to persons converted not alone from heathenism, but from any sect of Christians separated from the communion of Rome. The time, however, is left to be determined by circumstances. The name neophyte is also applied in Roman usage to *newly ordained priests*, and sometimes, though more rarely, to the *novices* of a religious order.

NEOPLA'TONISTS, the name given to an illustrious succession of ancient philosophers who claim to found their doctrines and speculations on those of Plato. Strictly speaking, however, the Platonic philosophy—that is, in its original and genuine form—expired with Plato's immediate disciples, Speusippus and Xenocrates. Arcesilaus (q.v.), the founder of the new academy, and at a later period Carneades (q.v.), introduced and diffused a skeptical *Probabilism*, which gradually destroyed that earnest and reverent spirit of intellectual inquiry so characteristic of the great pupil of Socrates. The course of political events in the ancient world also largely assisted in bringing about the same result. The triumphs of the Roman power had been accomplished at the expense of national liberties, and had issued in a general deterioration of moral character, both in the east and the west. Public men, especially, sought, above all things, material gratifications, and came to look upon philosophy itself as only a more exquisite kind of luxury. It was quite natural, therefore, that skepticism and eclecticism should become the prevalent forms of philosophy. Besides, the speculations of the older philosophers were felt to be unsatisfactory. When men began to review the long succession of contradictory or divergent systems that had prevailed since the time of Thales the Milesian, in the gray dawn of Greek history, a suspicion appears to have sprung up that reality, certainty, truth, was either not attainable, or could only be attained by selecting something from every system. Moreover, the immensely extended intercourse of nations, itself a result of Roman conquest, had brought into the closest proximity a crowd of conflicting opinions, beliefs, and practices, which could not help occasionally undergoing a confused amalgamation, and in this way presented to view a practical eclecticism, less refined and philosophical indeed than the speculative systems of the day, but not essentially different from them. This tendency to amalgamation showed itself most prominently in Alexandria. Placed at the junction of two continents, Asia and Africa, and close to the most cultivated and intellectual regions of Europe, that celebrated city naturally became a focus for the chief religions and philosophies of the ancient world. Here, the east and the west, Greek culture and oriental enthusiasm, met and mingled; and here, too, Christianity sought a home, and strove to quell, by the liberality of its sympathies, the myriad discords of paganism. "Greek skepticism," says Mr. Lewes, "Judaism, Platonism, Christianity—all had their interpreters within a small distance of the temple of Serapis." It is not wonderful, therefore, that a philosophy, which so distinctly combines the peculiar mental characteristics of the east and the west, as that promulgated by the Neoplatonists, should have originated in Alexandria. Yet, at the same time, it is but right to notice, as does M. Matter, in his *Histoire de l'Ecole d'Alexandrie*, that it soon ceased to have any local connection with the city. Its most illustrious representatives were neither natives of Alexandria, nor members of the famous museum, and they had their schools elsewhere—in Rome, in Athens, and in Asia.

It is not easy to say with whom *Neoplatonism* commenced. Scholars differ as to how much should be included under that term. By some it is used to designate the whole new intellectual movement proceeding from Alexandria, comprising, in this broad view, the philosophy, 1st, of Philo-Judæus and of Numenius the Syrian; 2d, of the Christian fathers (Clemens Alexandrinus, Origen, etc.); 3d, of the gnostics; and 4th, of Ammonius Saccas and his successors. Others, again, would exclude the second of these (though the Alexandrian divines frequently Platonize); while a third party is disposed

to restrict the application of the term to the fourth. The last of these modes of regarding Neoplatonism is the one most current, and is perhaps the most convenient and definite; yet Bouterwek, Tennemann, Lewes, etc., agree in considering Philo-Judæus (q.v.) an Alexandrian Jew, and (in part) contemporary of Jesus Christ, as the first of the Neoplatonists—that is to say, as the first who endeavored to unite the mysteries of oriental belief with the dialectics and speculations of the Platonists. A similar course was at least partially pursued by the Christian fathers of Alexandria, partly from a predilection for the philosophy in which they had been reared, and partly from a desire to harmonize reason and faith, and to make their religion acceptable to thoughtful and educated pagans; hence, they too may, not without reason, be classed along with Philo, though their spirit and aim are distinctively and even strongly Christian. In gnosticism, on the other hand, speaking generally, the lawless mysticism of the east predominated, and we see little either of the spirit or logic of Plato. They may, therefore, be dismissed from the category of Neoplatonists. Regarding Philo-Judæus and the Alexandrian divines, it must be noticed that they wrote and taught in the interests of their own religion, and had no idea of defending or propagating a heathen philosophy. It is this which strikingly distinguishes them from the school founded by Ammonius Saccas, and also from an independent group of pagan teachers and authors who likewise flourished in the first and second centuries after Christ, and whose main object was to popularize and diffuse the ethics and religio-philosophic system of Plato, by allegorically explaining the ancient mysteries of the popular belief in harmony with the ideas of their master, but, at the same time, blending with these many Pythagorean and Aristotelian notions. The best-known names of this group are Plutarch (q.v.) and Appuleius (q.v.). These men have a better claim to the title of Neoplatonists than any of the others. They adhered far more closely to their great master, and were, in fact—to the best of their ability—simply popular expounders of his philosophy. Living at a time when paganism was in a moribund condition, they sought to revive, purify, and elevate the faith in which their fathers had lived. Christianity, a young, vigorous, and hostile system, was rooting itself in the hearts of men deeper and deeper every day, and these disciples of Plato—tenderly attached to their ancestral religion—felt that something must be done to preserve from going out the fires that were feebly burning on the altars of the ancient gods.

But these commentators and expositors of Plato were not remarkable for their philosophical power; a fresh stream of life was first poured into the old channels of Platonic speculation by Ammonius Saccas (q.v.) and Plotinus (q.v.), and it is this fact which gives the school which they established its best claim to the exclusive title of *Neoplatonist.* "In no species of grandeur was the Alexandrian school deficient," as M. Saisset justly observes: "genius, power, and duration have consecrated it. Reanimating during an epoch of decline the fecundity of an aged civilization, it created a whole family of illustrious names. Plotinus, its real founder, resuscitated Plato; Proclus gave the world another Aristotle; and in the person of Julian the apostate, it became master of the world. For three centuries it was a formidable rival to the greatest power that ever appeared on earth—the power of Christianity; and if it succumbed in the struggle, it only fell with the civilization of which it had been the last rampart" (Lewes's *Biog. Hist. Phil.* p. 259). The essence of *all* the Alexandrian speculations, we have stated, consists in the blending of Platonic ideas with oriental mysticism; the peculiarity of the *Neoplatonists,* strictly so-called, lies simply in the novelty, audacity, and ingenuity of their reasonings. They aimed at constructing a religion on a basis of dialectics. They strove to attain a knowledge of the highest, and the way in which they endeavored to accomplish this was by assuming the existence of a capacity in man for passing beyond the limits of his personality, and acquiring an intuitive knowledge of the absolute, the true—that which is beyond and above the fluctuations and dubieties of "opinion." This impersonal faculty is called *ecstasy.* By means of it, man—ceasing, however, it should be observed, to be individual man, i.e., *himself*—can identify himself with the absolute (or infinite). Plotinus, in fact, set out from the belief that "philosophy" (i.e., "absolute truth") is only possible through the identity of the thinker, or rather of the subjective thought, with the thing thought of, or the objective thought. This intuitive grasp or "vision" of the absolute is not constant; we can neither force nor retain it by an effort of will; it springs from a divine inspiration and enthusiasm, higher and purer than that of poet or prophet, and is the choicest "gift of God."

The god of Plotinus and the other Alexandrians is a mystical trinity, in the exposition of which they display a dialectical subtlety that even the most ingenious of the schoolmen never reached. The divine nature contains within it three hypostases (substances); its basis, if we may so speak, is called unity, also poetically primitive light, etc. This unity is not itself any *thing,* but the principle of all things; it is absolute good, absolute perfection; and though utterly incapable of being conceived by the understanding, there is that in man that assures him that it—the incomprehensible, the ineffable, *is.* "It has neither quantity nor quality; neither reason nor soul; it exists neither in motion nor repose; neither in space nor time; it is not a numeric unity nor a point; . . . . it is pure esse without accident; . . . . it is exempt from all want or dependency, as well as from all thought or will; it is not a thinking being, but thought itself—the principle and cause of all things." To the skeptic this "primitive light," we are afraid, will not seem very luminous. From "unity," as the primordial source of all things, emanates "pure

intelligence" (*nous*—the *vernunft* of modern German metaphysics); its reflection and image, that by which it is intuitively apprehended; from pure intelligence, in turn, emanates the "soul of the world" (*psyche tou pantos*), whose creative activity produces the souls of men and animals, and "nature" and finally, from nature proceeds "matter," which, however, is subjected by Plotinus to such refinement of definition that it loses all its grossness. Unity, pure intelligence, and the world-soul thus constitute the Plotinian triad, with which is connected, as we have seen, the doctrine of an eternal emanation, the necessity of which he endeavors to demonstrate by the most stringent logic. Human souls, whose source is the pure intelligence, are—by some mysterious fate—imprisoned here in perishable bodies, and the higher sort are ever striving to reascend to their original home. So Plotinus, when in the agonies of death, said calmly to his friends: "I am struggling to liberate the divinity within me."

The most distinguished pupil of Plotinus was Porphyrius (q.v.), who mainly devoted himself to expounding and qualifying the philosophy of his master. In him we see, for the first time, the presence of a distinctively antichristian tendency. Neoplatonism, which can only be properly understood when we regard it as an attempt to place paganism on a philosophical basis—to make the Greek religion philosophical, and Greek philosophy religious—did not *consciously* set out as the antagonist of Christianity. Neither Ammonius Saccas nor Plotinus assailed the new faith; but as the latter continued to grow, and to attract many of the most powerful intellects of the age into its service, this latent antipathy began to show itself. Porphyry wrote against it; Iamblichus (q.v.), the most noted of his pupils, did the same. The latter also introduced a theurgic or "magical" element into Neoplatonism, teaching, among other things, that certain mysterious practices and symbols exercised a supernatural influence over the divinities, and made them grant our desires. Magic is always popular, and it is therefore not wonderful that Iamblichus should have had numerous followers. Ædesius succeeded to his master's chair, and appears to have had also a considerable number of disciples. To the school of one of them the emperor Julian belonged, whose patronage for a moment shed a gleam of splendor over Neoplatonism, and seemed to promise it a universal victory. After a succession of able but not always consistent teachers, we reach Proclus (q.v.), the last great Neoplatonist, who belongs to the 5th c., a man of prodigious learning, and of an enthusiastic temperament, in whom the pagan-religious, and consequently antichristian, tendency of the Neoplatonic philosophy culminated. His ontology was based on the Triad of Plotinus, but was considerably modified in detail; he exalted "faith" above "science" as a means of reaching the absolute unity; was a believer in Theurgy, and so naturally laid great stress upon the ancient Chaldean oracles, Orphic hymns, mysteries, etc., which he regarded as divine revelations, and of which he considered himself—as, indeed, he was—the last great "interpreter." His hostility to the Christian religion was keen; in its success he saw only the triumph of a vulgar popular superstition over the refined and beautiful theories of philosophy; it was as if he beheld a horde of barbarians defacing the statues and records of the Pantheon. The disciples of Proclus were pretty numerous, but not remarkable for high talent. Perhaps the ablest of his successors was Damascius, in whose time the emperor Justinian, by an arbitrary decree, closed the schools of the heathen philosophers. "The victims," says Cousin (*Cours d'Histoire de la Philosophie Moderne*), "of fierce retaliation, and of an obstinate persecution, these poor Alexandrians, after having sought an asylum in their dear east, at the court of Chosroes, returned to Europe (533 A.D.), were dispersed over the face of the earth, and the most part extinguished in the deserts of Egypt, which were converted for them into a philosophic Thebais." See Fichte, *De Philosophiæ Novæ Platonicæ Origine* (Berl. 1818); Bouterwek, *Philosophorum Alexandrinorum ac Neo-Platonicorum, recensio Accuratior* (Gött. 1821); Matter, *Essai Historique sur l'Ecole d'Alexandrie* (2 vols. Par. 1820); Simon, *Histoire de l'Ecole d' Alexandrie* (2 vols. Par. 1845); Barthélemy St. Hilaire, *De l'Ecole d'Alexandrie* (Par. 1845); Lewes, *Biographical History of Philosophy* (1857); and Ueberweg's *History of Philosophy* (Translation, Hodder and Stoughton: 1872).

NEO'SHO, a co. in s.e. Kansas; drained by the Neosho river; 576 sq.m.; pop. '90, 18,561. Co. seat, Erie.

NEOSHO RIVER, rises in e. central Kansas, in Morris co., and after flowing about 450 m. in a generally s.e. direction, empties into the Arkansas near fort Gibson. It passes through Morris, Lyon, Coffey, Allen, Neosho, and Labette counties, in Kansas, and then enters the Cherokee reservation in Indian territory, changing its direction to s.w.

NEOTTIEÆ: a tribe of orchidaceous plants having the pollen-masses powdery, granular, elastically cohering, and fixed to a gland or retinaculum; the anther parallel to the stigma, and persistent; the cells approximate. They are terrestrial plants, with fibrous or tuberous roots, occasionally leafless, or supposed to be parasitic; chiefly inhabitants of temperate Asia, Australia, and Madagascar, but rare in Africa and beyond the tropics. There are 16 principal cultivated genera, three of which—Goodyera, Listera, and Spiranthes—are represented in the U. S.

NEOZO'IC (Gr. new life), a term introduced by Edward Forbes to include all the strata from the trias to the most recent deposits. They are generally divided into the two great groups of secondary and tertiary rocks. This division is, however, quite arbitrary—the chief point of difference depending on the occurrence in the tertiary deposits of species supposed to be the same as some still living. There is no paleontological

nor petralogical break similar to that which exists between the permian and trias. Forbes accordingly suggested the obliteration of the division between the secondary and tertiary series, and the division of all geological time into epochs—the paleozoic and the neozoic.

NEPAUL' or **NEPAL**, an independent kingdom of Hindustan, lying on the southern slope of the Himalayas, is bounded on the n. by Thibet, on the s. and w. by British India, and on the e. by Sikim, a protected state. Long. 80° 6′ to 88° 14′ e. It is 500 m. in length by about 150 m. in average breadth. Area, 54,000 sq. m.; pop. estimated at from 2,000,000 to 3,000,000. The kingdom is separated from the plains of India by the long narrow strip of land, resembling an English down, but unhealthy, called the Terai, which extends along the whole southern border. North of this, and running parallel with it, is the great forest of Nepaul, from 8 to 10 m. broad. North of this strip is a tract of hilly country, and above that are two tracts of greater elevation, the first of which may be called mountainous, while the second might appropriately be called alpine if it did not comprise, among its mountains, peaks which like mount Everest and Dhawalagiri, attain almost twice the elevation of Mont Blanc. The principal rivers are Kurnalli, the Gogra, the Gundak with its tributaries, and the Kosi. The climate, most unhealthy in the Terai, is healthy and pleasant in the hilly and mountainous districts, suggesting that of southern Europe. The soil is extremely rich and fruitful, the mountain slopes being terraced and carefully irrigated. Barley, millet, rice, maize, wheat, cotton, tobacco, sugar-cane, pineapple, and various tropical fruits are cultivated. Iron and copper mines are worked, the minerals being found near the surface. The inhabitants consist mainly of two tribes — the Ghurkas, whose chief occupation is war, and the Newars, who are principally artisans. The capital of the country is Khatmandu, with a population of about 50,000.

NEPENTHE, a name derived from two Greek words meaning absence of grief, and applied to a narcotic drug employed by the Egyptians. Homer relates that Helen of Troy acquired from them the art of compounding the potion. Diodorus Siculus states that the women of Thebes were acquainted with the secret method of preparing it. William Smith, author of *Greek and Roman Antiquities*, says of nepenthe, "Among the ancients, an Egyptian drug, which had an exhilarating effect, and which was supposed to obliterate all sorrow from the memory of those who partook of it—thought by many to have been opium."

NEPENTHĒS, the only known genus of a natural order of exogenous plants called *Nepenthaceæ*, consisting of herbaceous or half-shrubby plants with diœcious flowers, natives of swampy ground in India and China, chiefly remarkable for their leaves. Each leaf consists of a dilated foliaceous petiole, prolonged beyond its foliaceous part, as if it were the prolongation of the midrib of a leaf, and terminating in a pitcher (*ascidium*), from which the name PITCHER PLANT has been very generally given to the species of this order. The pitcher is terminated by a lid, which is regarded as the true blade of the leaf. The fluid found in these pitchers is a secretion of the plant itself. Insects often enter the pitcher, and are apparently there dissolved and absorbed; so that the nepenthes would rank amongst the plants called "insectivorous" by Mr. Darwin.

NEPHELITE (Gr., *nephelê*), a cloud, from its appearance. A unisilicate mineral, scapolite group, occurring in six or twelve-sided columnar, schorly crystals, with or without pyramidal point; white, transparent, luster glassy and greasy; when in masses, greenish, bluish-gray, brownish, or brick red. Angles: $O \wedge 1 = 135° 55'$; $a = 0.839$. Analysis (about), aluminum one-third, rather more silicon, rather less sodium, traces of carbon and potassium, with more hydrogen; atomic combination. Nephelite occurs both in ancient and modern volcanic rocks, mostly in grains or glassy crystals, and in metamorphic rocks allied to granite and gneiss, mostly in stout crystals. The former is sommite, the latter, eleolite. Eleolite occurs at Litchfield, Me., with cancrinite; in the Ozark mountains, Ark., with brookite and schorlomite; in a boulder, with sodalite, at Salem, Mass. The earliest name for nephelite is sommite, Delametherie, 1797, from the place where found on Vesuvius, then called fettstein by Werner, 1808, and eleolite (Gr. *elaion*, oil), from its greasy look, by Klaproth. The name of Haüy, 1801, has survived, and is owing to its becoming cloudy when immersed in strong acid. It is also called nepheline, and nefelina. (Dana, sys. of mineralogy, 1880.)

NEPHE'LIUM. See LITCHI.

NE'PHRITE, a mineral which is not unfrequently called jade (q.v.), and of which axe-stone (q.v.) is very generally considered a variety. It is composed of silica, magnesia, and lime; is compact, with a coarse splintery fracture, very tenacious, sometimes translucent, greasy to the touch, and of a green or greenish color. It is found in granite, gneiss, greenstone, etc., in many parts of the world. Very fine specimens are brought from Persia, Siberia, and China, and are known as *oriental jade*. The kind called *Indian jade* is olive green, and strikes fire with steel; that from China is whitish, and does not strike fire. Nephrite is used for ornaments. The Turks make it into handles for sabers and daggers. Many imaginary virtues were once ascribed to it, such as the cure of epileptic fits and of nephritic (Gr. *nephros*, kidney) complaints; hence its name.

NEPHRI'TIS, (Gr. *nephros,* kidney), inflammation of the kidneys (q.v.).

NEPI, a t. in Italy, 40 m. from Rome; pop. 2,382. It was of Etruscan origin, but came under Roman control in 400 B.C. Many interesting archæological remains are found in the vicinity.

NEPOMUC. See JOHN OF NEPOMUK.

NE'POS, CORNELIUS, a Roman historian, born in the 1st c. B.C., but the place and precise time of his birth are unknown. He was the friend of Cicero and Catullus. The only work of Nepos's which has survived (if indeed it be his), is a series of twenty-five generally brief biographies of warriors and statesmen, mostly Greeks. These biographies are distinguished by the purity of their Latinity, the conciseness of their style, and their admirable exhibition of character, but sufficient care has not been exercised in the examination of authorities, nor is the relative importance of things duly regarded. Until the middle of the 16th c., these biographies, on the strength of the titles given in the various MSS., were generally ascribed to Æmilius Probus, a writer who lived in the latter part of the 4th c.; but in 1569, an edition was put out by the famous Dionysius Lambinus, who pronounced the so-called *Lives* of Æmilius Probus to be in reality the lost work of Cornelius Nepos, *De Viris Illustribus.* His weightiest argument is drawn from the excellence of the Latin, and the chastity of the style, so unlike the corrupt and florid language of the decline. Many critics hold that these lives ought to be regarded as an abbreviation of the work of Nepos by Probus. This hypothesis is not without its difficulties, but it is perhaps the least objectionable of any. There are many editions, among which may be mentioned those of Van Staveren (Leyd. 1773), of Tzschucke (Gott. 1804), and of Flagg (N. Y. 1895); and the book is in general use as a school-book. It has been very frequently translated into English and other languages.

NEPOTISM (Lat., *nepas, nepotis,* a nephew), means literally a *fondness for nephews,* and is used to denote an undue attachment for relatives, that shows itself by a bestowal of patronage by reason of relationship, rather than for merit. Much was said on this subject in England during the time of Sir Robert Walpole. In 1871 and '72, it was made the basis of an attack, in the United States, on President Grant, by the late Senator Sumner.

NEPTUNE, an ancient Italian god. It is doubtful whether he was originally a marine deity at all, for the old Italians were the very opposite of a maritime people, yet his name is commonly connected with *nato,* to swim; hence, at an earlier period he may have borne another designation, afterwards forgotten. When the Romans became a maritime power, and had grown acquainted with Grecian mythology, they, in accordance with their usual practice, identified him with the Greek god whom he most resembled. This was *Poseidōn,* also *Poteidan* (connected with *potos,* a drink, *pontos,* the sea, and *potamos,* a river). Poseidon appears in his most primitive mythological form as the god of water in general, or the fluid element. He was the son of Cronos (Saturn) and Rhea, and a brother of Jupiter. On the partition of the universe amongst the sons of Cronos, he obtained the sea as his portion, in the depths of which he had his palace near Ægæ, in Eubœa. Here also he kept his brazen-hoofed and golden-maned steeds, in a chariot drawn by which he rode over the waves, which grew calm at his approach, while the monsters of the deep, recognizing their lord, made sportive homage round his watery path. But he sometimes presented himself at the assembly of the gods on Olympus, and in conjunction with Apollo, built the walls of Troy. In the Trojan war he sided with the Greeks; nevertheless he subsequently showed himself inimical to the great sea-wanderer Ulysses, who had blinded his son Polyphemus. He was also believed to have created the horse, and taught men its use. The symbol of his power was a trident, with which he raised and stilled storms, broke rocks, etc. According to Herodotus, the name and worship of Poseidon came to the Greeks from Libya. He was worshiped in all parts of Greece and southern Italy, especially in the seaport towns. The Isthmian games were held in his honor. Black and white bulls, boars, and rams were offered in sacrifice to him. Neptune was commonly represented with a trident, and with horses or dolphins, often along with Amphitrite, in a chariot drawn by dolphins, and surrounded by tritons and other sea-monsters. See illus., MYTHOLOGY.

NEPTUNE. See PLANETS.

NEPTUNE, a tp. in Monmouth co., N. J.; formed 1879 from part of Ocean tp.; including Asbury Park and Ocean Grove, which have become very popular watering-places. Pop. '90, 8333.

NEPTUNI'AN, a term formerly applied to the geologists who maintained the aqueous as against the igneous theory of the origin of rocks.

NÉRAC, a t. in the s.w. part of Lot-et-Garonne, a French department · situated on the river Baïse, 15 m. s.w. of Agen; pop. '91 (comm.), 6909. It is divided into two parts; the old town on the right bank, picturesque but in decay; joined by bridges to the new town on the left bank. Ruins of a temple, aqueduct, and baths, indicate that a Roman city once occupied the site, but no information in regard to it is extant. There are also remains of a monastery of about 1250 A.D.; in latter times changed into a castle. Nérac took the Calvinist side in the first part of the 17th c., but was overcome by the duke of

Mayenne in 1621. It has a large corn-market, and a good trade in cardboard, pigments, pâtés de foie gras, and earthenware.

NERAZ, John Claudius, d.d., b. Anse, France, 1828; was educated in the seminaries of Lyons; became a Rom. Cath. missionary priest and labored in Texas; was called to San Antonio, Texas, 1873, to take charge of the parish of San Fernando; and was consecrated bishop of San Antonio, 1881. He d. in 1894.

NERBUD'DAH, or Narbadá, a river of Hindustan, rises in the Vindhya mountains, at a height of from 3000 to 4000 ft. above sea-level, in lat. 22° 40′ n., long. 81° 52′ e. It is navigable about 200 m. w. of Jabalpur (190 m. from its source), from which point navigation is prevented by rocky rapids. The other principal towns on its banks are Hoshangabad, Burwani, and Barneh. At Hoshangabad it is 900 yards wide, and from 5 to 6 feet in depth. At Barneh it begins to expand into a wide estuary. Length, 735 m.

NERCHINSK', an important mining t. of Russia, eastern Siberia, in the trans-Baikal territory on the Nercha, a tributary of the Shilka, 178 m. e. of Chita, 4707 m. from St. Petersburg. It was founded in 1658, and has 4900 inhabitants. The district of which Nerchinsk is the center yields a good deal of gold yearly, together with large quantities of silver, lead, and iron, and precious stones. In the neighborhood are important tin mines.

NE'REIDS, in mythology. See Nereus; Nymphs.

NE'REIS, a genus, and Nerei'dæ, a family of *annelida*, having a long, slender body, a distinct head, with tentacles and eyes; the whole body covered with tubercles, and the gills lobed and tufted. They are all marine, and generally hide under rocks or in the sand. They swim actively, by rapid and undulating inflections of the body, and by the aid of numerous oars arranged along the sides; each formed of a stout footstalk, numerous bristles, and a flap. The proboscis is thick, strong, and armed with two jaws.

NE'REITES, the name given to animals which have left their impress on the Silurian rocks, and which exhibit a form similar to the modern Nereis. They occur on the surface of the laminæ of fine shales, over which, when it was soft, the creature moved, leaving a long and tortuous trail, which is generally found to terminate in a more defined representation produced apparently by the body itself, although every trace of it has disappeared. See Ichnology.

NEREUS, in mythology, a sea-god, son of Pontos and Gê, and father, by Doris, of the Nereïds. He had the gift of prophecy, and forewarned Paris of the destruction which the elopement of Helen would bring to Troy. Hercules, when seeking the golden apples of the Hesperides, was directed by the nymphs to the cave of Nereus, whom he found asleep. Nereus, on waking, transformed himself into a multitude of shapes, but was held fast by Hercules, whom he was obliged to instruct as to his quest.

NERI, Philip de, a saint of the Roman Catholic church, and founder of the congregation of the oratory (q.v.), was b. of a distinguished family of Florence, July 22, 1515. His character, even in boyhood, foreshadowed the career of piety and benevolence to which he was destined, and he was commonly known among his youthful companions by the name of "good Philip." On the death of his parents, he was adopted by a very wealthy uncle, with whom he lived for some time at San Germano, near Monte Cassino, and by whom he was recognized as his destined heir. But he relinquished all these prospects for a life of piety and charity, and having come to Rome in 1534, he there completed his philosophical and theological studies, and won the esteem and reverence of all by his extraordinary piety, and his benevolence and activity in every good work, whether of charity or of religion. Although he did not receive priest's orders till 1551, he had already been for years one of the most earnest and devoted in all the pious works of Rome for the instruction of the poor, the care of the sick, and the reclamation of the vicious; and in 1550, in unison with several of his friends, he established a confraternity for the care of poor pilgrims visiting Rome, and other houseless persons, as well as of the sick generally, which still subsists, and which has numbered among its associates many of the most distinguished members of the Roman Catholic church. This confraternity, however, is chiefly noteworthy as having been the germ of the far more celebrated congregation of the oratory (q.v.), which was founded by St. Philip in concert with his friends Baronius and Tarugio, both afterwards cardinals, Sabriati, and some others. Besides the general objects above indicated, and the spiritual duties designed for the personal sanctification of the members, the main object of this association was the moral instruction and religious training of the young and uneducated, who were assembled in chapels or oratorios, for prayer and for religious and moral instruction. As a further means of withdrawing youth from dangerous amusements, sacred musical entertainments (thence called by the name of *oratorio*) were held in the oratory, at first consisting solely of hymns, but afterwards partaking of the nature of sacred operas or dramas, except that they did not admit the scenic or dramatic accompaniments of these more secular compositions. Religious and literary lectures also formed part of his plan, and it was in the lectures originally prepared for the oratory that, at the instance of Neri, the gigantic *Church History* of Baronius had its origin. The personal character of Neri, the unselfish devotedness of his life, his unaffected piety, his genuine love of the

poor, his kindly and cheerful disposition, and, perhaps, as much as any of the rest, a certain quaint humor, and a tinge of what may almost be called drollery which pervaded many of his sayings and doings, contributed to popularize his institute, and to engage the public favor for himself and his fellow-laborers. He himself enjoyed the reputation of sanctity and of miracles among his fellow-religionists almost beyond any of the modern saints; and he may still be described as emphatically the popular saint of the Roman people. He lived to an extreme age in the full enjoyment of all his faculties, and in the active discharge to the last of all the charitable duties to which his life had been devoted. He died at the age of 80, May 25, 1595. He was canonized by Gregory XV. in 1622. His only literary remains are his *Letters* (8vo, Padua, 1751); the *Constitutions* of his congregation, printed in 1612; some short spiritual treatises, and a few sonnets, which are printed in the collection of *Rime Oneste.*

NE'RIUM. See OLEANDER.

NE'RO, Roman emperor from 54 A.D. to 68 A.D., was b. at Antium, on the coast of Latium, Dec. 15, 37 A.D., and was the son of Cn. Domitius Ahenobarbus and of Agrippina, the daughter of Germanicus Cæsar, and sister of Caligula. His mother, becoming the wife of the emperor Claudius, Claudius adopted him (50 A.D.), and his name, originally L. Domitius Ahenobarbus, was changed to Nero Claudius Cæsar Drusus Germanicus. After the death of Claudius (54 A.D.), the Pretorian guards, at the instigation of Afranius Burrhus, their prefect, declared him emperor, instead of Claudius's son Britannicus, and their choice was acknowledged both by the senate and the provinces. His reign began with the semblance of moderation and good promise, under the guidance of Burrhus and his tutor Seneca the philosopher; but the baleful influence of his mother, together with his own moral weakness and sensuality, frustrated their efforts, and he soon plunged headlong into debauchery, extravagance, and tyranny. He caused Britannicus, the son of Claudius, to be treacherously poisoned at the age of 14, because he dreaded him as a rival, and afterwards (59 A.D.) caused his own mother Agrippina (with whom he was latterly on bad terms) to be assassinated, to please his mistress Poppæa Sabina (the wife of his principal boon-companion Otho, afterwards emperor), in order to marry whom he also divorced and afterwards put to death his wife Octavia (aged 20), the sister of Britannicus. The low servility into which the Roman senate had sunk at this time, may be estimated from the fact that it actually issued an address congratulating the hateful matricide on the death of Agrippina. Nero himself, on the other hand, confessed that he was ever haunted by the ghost of his murdered mother. The affairs of the empire were at this time far from tranquil. In 61 A.D. an insurrection broke out in Britain under Queen Boadicea, which was, however, suppressed by Suetonius Paulinus. The following year saw an unsuccessful war against the Parthians in Armenia. At home, matters were not much better. The emperor was lampooned in verse; the senate and priesthood, alike venal, were also satirized by audacious malcontents; Burrhus, a valuable friend, died; and even Seneca, though not a great moralist, out of his books, thought it only decent to remove from court. In July, 64, occurred a great conflagration in Rome, by which two-thirds of the city were reduced to ashes. Nero himself is usually believed to have been the incendiary. It is said that he admired the spectacle from a distance, reciting verses about the burning of Troy, but many scholars are doubtful whether he really had any hand in it. At all events he laid the blame on the Christians—that mysterious sect, who, like the Jews in the middle ages, were the cause of all otherwise inexplicable calamities, and persecuted them with great fury. Moreover, he rebuilt the city with great magnificence, and reared for himself on the Palatine hill a splendid palace, called, from the immense profusion of its golden ornaments, the *Aurea Domus*, or Golden House; and in order to provide for this expenditure, and for the gratification of the Roman populace by spectacles and distributions of corn, Italy and the provinces were unsparingly plundered. A conspiracy against him failed in the year 65, and Seneca and the poet Lucan fell victims to his vengeance. In a fit of passion he murdered his wife Poppæa, by kicking her when she was pregnant. He then proposed to Antonia, the daughter of Claudius, but was refused, whereupon he caused the too fastidious lady to be put to death, and married Statilia Messallina, after killing her husband. He also executed or banished many persons highly distinguished for integrity and virtue. His vanity led him to seek distinction as a poet, a philosopher, an actor, a musician, and a charioteer, and he received sycophantic applauses, not only in Italy, but in Greece, to which, upon invitation of the Greek cities, he made a visit in 67. But in 68, the Gallic and Spanish legions, and after them the Pretorian guards, rose against him to make Galba emperor, and Nero fled from Rome to the house of a freedman, Phaon, about four miles distant. The senate, which had hitherto been most subservient, declared him an enemy of his country, and the tyrant ended his life by suicide, June 11, 68. One is sorry to learn that such a wretch had a taste for poetry, and was skilled in painting and modeling.

NER'VA, MARCUS COCCEIUS, a Roman emperor, elected by the senate after the murder of Domitian, Sept. 18, 96. He was born 32 A.D., of a family belonging to Narnia, in Umbria, and twice held the honor of consulship before his election to the dignity of emperor. He displayed great wisdom and moderation, rectified the administration of justice, and diminished the taxes; but finding himself, upon account of his advanced age, not vigorous enough to repress the insolence of the Pretorian guards, he adopted M. Ulpius Trajanus, then at the head of the army of Germany, who succeeded him on his death, Jan. 27, 98. After his decease, he obtained an apotheosis.

NERVE. See NERVOUS SYSTEM.

NERVE CELL. See HISTOLOGY.

NERVE-STRETCHING. An enlarged or exacerbated condition of the nervous system, or any portion of it, readily detectable with the æsthesiometer. It is—strange to say—often accompanied by muscular contraction. Sciatica is its most frequent and marked form. In neuralgia it is less often apparent. Anæsthesia is generally present in the parts which are or have been the seats of pain. An extension of the nerve or nerves affected is, perforce, an inseparable accompaniment of this ailment. Persons at an advanced age are particularly susceptible of it. There are, however, endemic causes, such as malaria, which predispose to this disorder. The spasmodic extensions, contractions, and relaxations which this malign cause alternately gives rise to, always entail supersensitiveness of the nervous system. They lower the vitality of the entire organism, and consequently that of the nerves. There may be, however, and very often is a remote factor among the causatives of nerve-stretching or tension whether slightly felt, severely acute, or of a chronic inflammatory nature. Indication pointing to malaria, syphilis, rheumatism or gout (and either of the latter two arthritic indications are particularly hazardous) are to be regarded as of the utmost importance in treatment. To ascertain whether there is, or is not, a constitutional taint is obviously necessary. But it has been the general experience of practitioners that in diseases of the peripheral nervous system (neural hyperæsthesia) that a lack of general stamina and a consequent diminution in vital energy of the nerve structure generally is the source of trouble. To rehabilitate this by effectual restorative measures in addition, if necessary, to special medication is a wise therapeutic measure. Sciatica, lumbago, neuralgia, and brachialgia are not the only apparent forms of nerve-stretching in consequence of inflammation. Trousseau designates "tic pitepliform" as peculiar to forms in advanced life. The pain excited by a touch, however slight, upon the muscles of the face is excruciating. The advisability of using topical applications in the various forms of peræsthesia is at least doubtful.

NERVII, an ancient tribe in Belgica, n. of the Ambiani. In the time of Cæsar, who first mentions them, they were a warlike people, who prohibited trade with their neighbors, forbade the introduction of luxuries, and attempted to make an alliance of the surrounding tribes against the Romans.

NERVOUS DISEASES OF AN OBSCURE NATURE AND **NERVOUSNESS.** Although the most important affections of the nervous system, as chorea, convulsions, epilepsy, hydrophobia, hypochondriasis, hysteria, neuralgia, paralysis, spasms, and tetanus, have been considered in special articles, there is an infinite variety of (often evanescent) forms which the diseases of the nervous system assume, some of which we propose now to consider.

These nervous affections are almost solely confined to women, and most of them may be regarded as modified forms of hysteria. *Simulated pregnancy*, or, as the French physicians term it, *nervous pregnancy*, is an affection of not very rare occurrence. The abdomen gradually enlarges, the catamenia are suppressed, and sickness, enlargement of the breasts, with the other symtoms of pregnancy, supervene (as far as they can be recognized by the non-professional observer), and it is only the non-appearance of the infant at the expected period that leads to a suspicion of the true nature of the case. The diagnosis of such a case is extremely difficult, and the most celebrated accoucheurs have been deceived. We commence with this extreme instance, as being singularly illustrative of the power which a perverted action of the nervous system may impress upon certain persons. The somewhat allied cases in which patients persist in fancying themselves pregnant in opposition to the opinion of their medical adviser (as the well-known case of Queen Mary, so admirably drawn by Froude), are far more numerous. The intestines are often implicated in cases of a deranged condition of the nervous system. The excretion of gas from the intestinal mucous membrane is often much increased in the class of patients commonly called nervous. The rattling sounds produced by the movement of the gas—scientifically known as *borborygmi*—are sometimes so loud as to prevent the patient from entering into society with comfort; and sometimes the mere fear of the occurrence of these sounds is sufficient to induce them. A depraved appetite, scientifically known as *pica*, is a common symptom of deranged nervous system both in chlorotic young women, in whom the catamenial discharge is not well established, and in pregnant women.

Passing on to the special modifications which an abnormal state of the nervous system impresses on the organs of circulation, we have nervous palpitation of the heart, which may readily be distinguished from palpitation dependent on change of structure by due attention to symptoms. There is a peculiar form of abdominal pulsation, due solely to nervous influence, which may not very unfrequently be felt on pressing the hand on the patient's abdomen. It has in many cases been mistaken for aneurism.

The nervous symptoms implicating the respiratory organs are not only the most common of any, but are alarming and urgent, and may be readily mistaken for indications of serious inflammatory or organic disease. Nervous asthma, which is supposed to depend upon a spasmodic constriction of the bronchial tubes, is too well known to require comment. Women suffering from a deranged condition of the nervous system sometimes present symptoms of what may be termed nervous catarrh—such as a copious flow of tears,

free discharge from the nostrils, and constant sneezing. Such cases are often periodic. They may be treated with preparations of iron, and are sometimes at once checked by a pinch of snuff. There are various forms of cough due mainly to nervous irritation, the difference in the character of the cough probably depending on the spot which is the seat of irritation. Thus, we hear of *spasmodic* cough, which is often accompanied by much straining and convulsive agitation, and somewhat resembles whooping-cough; *ringing* cough, accompanied by dyspnœa and hoarseness, or loss of voice; *barking* cough, often arising from irritation of the ovaries, etc. Such coughs as these are aggravated by depleting measures, ordinary cough medicines, etc., and usually disappear under the use of tonics.

The nervous affections of the motor system are conveniently grouped by Dr. Laycock under three heads—(1) the first including those cases in which there is paralysis or spasm without distortion; (2) those in which distortion follows cessation of muscular equilibrium, as in the various forms of club-foot; and (3) paroxysmal affections. The best example of the *first* class is hysterical paralysis of the lower extremities, of which sir Benjamin Brodie long ago wrote as follows: "I have known not a few, but very numerous, instances of young ladies being condemned to the horizontal posture, and even to the torture of caustic issues and setons, for several successive years, in whom air, and exercise, and cheerful occupations would probably have procured a cure in the course of a few months." A notice of such cases as these may be found in the article HYSTERIA. Paralysis of a lateral half of the body, or of one limb only, may also be merely a manifestation of hysteria. The *second* class is well illustrated by the following case, which is reported by Mr. Shaw. A young lady who had suffered from a train of symptoms indicative of a disturbed nervous system, had the ankle so turned round that she walked on one side of the foot. The knee was also bent outward, and the spine was becoming distorted. Sir Charles Bell, who saw her in consultation, regarded the case as one of willful deception, and in a year's time his diagnosis was completely established, scarcely any trace of lameness being apparent. Many of the joints—as the knee, hip, etc.—may be the seats of purely neuralgic symptoms, which so closely simulate organic disease of the cartilages, as to lead to the removal of the limb. Carmichael, Brodie, and others have recorded cases in which this terrible mistake has been made by experienced surgeons. Spinal irritation, or spinal tenderness, is a mysterious affection, whose diagnostic value is not very definite, as it may arise from a large number of distinct conditions, as, for example, disease of some part of the spinal cord, uterine disease, chronic disease of the intestinal viscera, etc.

One of the most anomalous affections of the nervous system ever recorded is described by Mr. Holden in the *St. Bartholomew's Hospital Reports*, 1867, vol. iii., pp. 299–305. The patient was a bright-looking boy about 12½, who, as he lay reading in bed, presented every appearance of perfect health: all that he complained of was what he called his "bump," which was about the size of a hen's egg, and lay on the right side of the neck, just above the shoulder. If the "bump" were touched, even most gently, the boy instantly lost all consciousness, and became deaf, dumb, and blind, while his body became arched like a bow, and was supported only by the back of the head and the heels, while his arms were rigidly extended. He might be pinched or pricked, but showed no sign of sensation. After remaining in this state for somewhat less than a minute, he drew a deep long breath, which was followed by a deep sigh. Instantly the spasm ceased, and the body fell, seemingly lifeless, on the bed. After two other similar sighs, which occurred in a few seconds, the boy awoke as if from profound sleep, and in a few minutes was none the worse for what he had gone through. Whenever the bump was touched—even when the boy was fast asleep—the same phenomena occurred. (It was found that, on touching the backbone in the dorsal region, the same series of events happened.) By continuous gentle manipulation of the bump, the boy was kept unconscious for twenty minutes. Another and even more remarkable phase of the boy's affection was his crowing and barking fit, which took place every day at the same time, almost to a minute. See the reports above cited.

With this illustration, we close our remarks on what may be termed *anomalous nervous affections*. With regard to *nervousness*, which also stands at the head of this article, we may observe, that it is a word pertaining rather to the vocabulary of the patient (and pre-eminently of the female patient) than of the physician.

NERVOUS SYSTEM, THE, is composed in all vertebrated animals of two distinct portions or systems—viz., the *cerebro-spinal* and *sympathetic* or *ganglionic*.

The *cerebro-spinal system* includes the brain and spinal cord (which form the *cerebro-spinal axis*), and the cranial and spinal nerves. It was termed by Bichat the nervous system of animal life, and comprises all the nervous organs concerned in sensation, volition, and mental action.

The *sympathetic system* consists essentially of a chain of ganglia connected by nervous cords, extending from the cranium to the pelvis, along each side of the vertebral column, and from which nerves with large ganglionic masses proceed to the viscera and blood-vessels in the cavities of the chest, abdomen, and pelvis. It was termed by Bichat the nervous system of organic life, since it seems to regulate—almost or quite independently of the will—the due performance of the functions of the organs of respiration, circulation, and digestion.

The essential parts of the *cerebro-spinal axis* are described in the articles BRAIN; CEREBRUM—CEREBELLUM; SPINAL CORD. The brain and spinal cord are covered and protected by three membranes or *meninges*, as they are frequently termed—viz., the *dura mater*, the *arachnoid*, and the *pia mater*. The *dura mater* is a strong fibrous membrane, which supplies the cranial bones with blood in early life, and adheres firmly to their inner surface. It is less closely attached to the bony walls of the spinal canal. Inside the cranium it gives off processes (such as the *falx cerebri*, *tentorium cerebelli*, and *falx cerebelli*) which divide and support different parts of the brain; it gives a strong fibrous sheath to every nerve; and by splitting into two layers at certain points, it forms receptacles for venous blood, which are termed SINUSES (q.v.). The *arachnoid* (so called from its being supposed to be as thin as a spider's web) is a serous membrane, and, like all serous membranes, is a closed sac, consisting of a parietal and visceral layer. The parietal layer adheres to the inner surface of the *dura mater*, to which it gives a smooth, polished appearance; while the visceral layer somewhat loosely invests the brain and spinal cord, from direct contact with which, however, it is separated by the intervention of the *pia mater* and some loose areolar tissue. In most regions there is an interval between the visceral layer of the *arachnoid* and the *pia mater*, which is called the *sub-arachnoid cavity*, and is filled during life by the *cerebro-spinal fluid*. This fluid, which varies in quantity from two to ten ounces, keeps the opposed surfaces of the arachnoid in close contact, and affords mechanical protection to the nervous centers which it surrounds, and guards them against external shocks. It is accumulated in considerable quantity at the base of the brain, where it serves for the protection of the large vessels and nerves situated there. In fracture of the base of the skull, the draining away of this fluid, often in very large quantity, through the external auditory meatus, is often one of the most significant symptoms. It is doubtless secreted by the *pia mater*, which is the immediate investing membrane of the brain and spinal cord. This membrane consists of minute blood-vessels, held together by an extremely fine areolar tissue. It dips down between the convolutions and fissures of the brain, and is prolonged into the interior, forming the *velum interpositum* and the choroid plexuses of the fourth ventricle. It is by means of this membrane that the blood-vessels are conveyed into the nervous substance.

We now proceed to notice the nerves connected with the cerebro-spinal center or axis. These are usually described in two classes—the *spinal* and the *cranial* or *encephalic*. The former class consists of all those which arise from the spinal cord, and emerge from the spinal canal through the inter-vertebral foramina; while the latter includes those which arise from some part of the cerebro-spinal center, and emerge through foramina in the cranium or skull.

The *spinal nerves* (exclusive of the spinal accessory nerve, which, from the fact that it emerges from the skull, is usually ranked among the cranial nerves) are thirty-one on either side, there being a pair for each pair of intervertebral foramina (whose formation is described in the articles SKELETON and SPINAL COLUMN), and for the foramina between the atlas (the first or highest vertebra) and the occipital bone at the base of the skull. Every spinal nerve arises from the cord by two roots, an anterior and a posterior, of which the latter is distinctly the larger. Each root passes out of the spinal canal by a distinct opening in the *dura mater*. Immediately after its emergence, a ganglion is seen on the posterior root, and in the anterior surface of this ganglion the anterior root lies imbedded. Just beyond the ganglion, but not at all previously, the nervous fibers of both roots intermingle, and a compound nerve results. The trunk thus formed separates immediately after it has passed through the intervertebral canal into two divisions—the anterior and posterior—each of which contains filaments from both roots, and possessing, as will be immediately shown, perfectly different functions. These divisions, of which the anterior is considerably the larger, proceed to the anterior and posterior parts of the body respectively, and are distributed to the skin and the muscles. The anterior branch communicates with the sympathetic nerve, as is shown in the figure. The mode of connection of the roots of the nerves with the cord is noticed in the article SPINAL CORD. These nerves are arranged in classes, according to the regions of the spine in which they originate, and we thus speak of eight cervical, twelve dorsal, five lumbar, and six sacral nerves on either side.

The discovery of the separate functions of the anterior and posterior roots of the spinal nerves, which has been characterized as the first important step towards a right understanding of the physiology of the nervous system, was made by the distinguished neurologist, Sir Charles Bell, although there is reason to believe that Magendie, without any knowledge of Bell's experiments, arrived at similar conclusions at nearly the same time. The original experiments consisted in laying open the spinal canal in rabbits, and irritating or dividing the roots of the spinal nerves. It was observed that irritation of the anterior roots caused muscular movement, and that the posterior roots might be irritated without giving rise to any muscular action; while division of the posterior roots did not impair the voluntary power over the muscles. Hence it was inferred that the anterior roots were motor (or conveyed motive power to muscles), and the posterior roots not motor; but it was not fully determined what degree of sensibility remained in parts supplied from the divided roots. Numerous physiologists arrived at similar results to those of Bell; but the most conclusive experiments are those of Müller, who operated on

frogs, in which, from the great width of the lower part of the spinal canal, the roots of the nerves can be exposed with great facility. In these experiments, it was found that irritation of the anterior root always excited muscular contraction, while no such effect followed irritation of the posterior root; that section of the anterior root caused paralysis (or loss of power) of motion, while section of the posterior root caused paralysis of sensation; and that when the anterior roots of the nerves going to the lower extremity were cut on one side, and the posterior roots on the other, voluntary power without sensation remained in the latter, and sensation without voluntary motion in the former. The obvious conclusion to be derived from these experiments is, that the anterior root of each spinal nerve is *motor*, and the posterior *sensitive*. (In place of the terms *sensitive* and *motor*, the terms *afferent* and *efferent* are now frequently used. The functions of the nerves being to establish a communication between the nervous centers and the various parts of the body, and *vice versâ;* an *afferent* nerve communicates the impressions made upon the peripheral nervous ramifications to the centers, while an *efferent* nerve conducts the impulses of the nervous centers to the periphery.)

The *cranial nerves*, although twelve in number on either side, were arranged by Willis (*Cerebri Anatome; cui accessit Nervorum Descriptio et Usus*, 1664), whose system is still generally adopted, in nine pairs, which, taken from before backwards in the order in which they are transmitted through the foramina at the base of the skull, stand as follows: 1st, olfactory; 2d, optic; 3d, motores oculorum; 4th, pathetic; 5th, trifacial; 6th, abducentes; 7th, portio dura or facial, portio mollis or auditory; 8th, glossopharyngeal, par vagum or pneumogastric, spinal accessory; 9th, hypoglossal.

They may be subdivided into three groups, according to their functions—viz. *nerves of special sense*—the olfactory (see Nose), optic (see Eye), and auditory (q.v.); *nerves of motion, or efferent nerves*—the motores oculorum, pathetic, abducentes, facial, and hypoglossal; and *compound nerves*—the trifacial, glossopharyngeal, pneumogastric, and spinal accessory.

The reason why no nerve of taste is included in the above arrangement amongst the nerves of special sense will be subsequently seen; and we proceed briefly to notice the functions of the motor cranial nerves.

The 3d, 4th, and 6th pairs—the *motores oculorum*, *pathetic*, and *abducentes*—together make up the apparatus by which the muscles of the orbit (the four recti, the superior and inferior oblique, and the levator palpebræ) are called into motion, and are sufficiently noticed in the article Eye.

The *facial nerve*, or the *portio dura* of the 7th pair, is divisible into three stages. The first stage is the intercranial, from its origin to its exit from the cranial cavity, in association with the *portio mollis* or *auditory nerve* (q.v.), at the internal auditory meatus. The second stage is contained in the *aqueduct of Fallopius*, a bony canal lying in the petrous portion of the temporal bone. In this stage it anastomizes with other nerves, and thus *sensory* fibers are introduced into it from the 5th pair and other sources, which make irritation of some of its branches to cause pain. The third stage commences with the emergence of the nerve through the stylo-mastoid foramen. The nerve now lies in the parotid gland, and after giving off the *posterior auricular*, and a few smaller branches, finally divides into the *temporal*, *facial*, and *cervical* branches. This diverging distribution of the nervous branches over the face forms the *pes anserinus* of the older anatomists, from the supposed resemblance to the expanded foot of a goose. Careful dissection of this nerve shows that the great majority of its fibers are distributed to muscles; and indeed, if we except the muscles of mastication, which receive their motor power from the 3d division of the 5th pair, this may be regarded as the general motor nerve of the face. "The muscles which are supplied by the facial nerve are chiefly those upon which the aspect of the countenance and the balance of the features depend. The power of closing the eyelids depends upon this nerve, as it alone supplies the orbicularis palpebrarum; and likewise that of frowning, from its influence upon the corrugator supercilii. Anatomy indicates that this nerve is the motor nerve of the superficial muscles of the face and ear, and of the deep-seated muscles within the ear. This conclusion is abundantly confirmed by comparative anatomy. For wherever the superficial muscles of the face are well developed, and the play of the features is active, this nerve is large. In monkeys it is especially so. That extremely mobile instrument, the elephant's trunk, is provided with a large branch of the facial as its motor nerve. In birds, on the other hand, it is very small."—Todd and Bowman, *Physiological Anatomy and Physiology of Man*, vol. ii. p. 107.

Before sir Charles Bell commenced his experiments on the functions of the nerves, it was believed that the facial was the nerve of sensibility of the face, and it was on several occasions divided with the view of relieving tic douloureux, of which it was supposed to be the seat. But the operation, of course, yielded no relief, and always inflicted a permanent injury, since it was succeeded by paralysis of the facial muscles, with total loss of control over the features and over the closing of the eye, on the side on which the operation was performed.

The treatment of facial palsy, which is often, especially if it arises from cold, a very temporary affection, although usually a very alarming one to the patient and his friends, is described in the article Paralysis.

The *hypoglossal nerve* (derived from the Greek words *hypo*, under, and *glotta*, the

tongue) escapes from the cavity of the skull by the anterior condyloid foramen, and passes outward and forward around the pharynx to the interior surface of the tongue, where it breaks up into its terminal branches, which supply the muscular structure of that organ with motor power. This nerve communicates with the pneumogastric nerve, with the sympathetic (by branches derived from the superior cervical ganglion), and with the cervical plexus, soon after its emergence from the cranium; and subsequently, as it curves round the occipital artery, it gives off the long anastomosing branch known as the *descendens noni*.

Experiments on living animals, comparative anatomy, and pathological investigations alike indicate that this is the motor nerve of the tongue. In cases of paralysis of this nerve the power of articulation is much injured or totally destroyed; and this is often one of the first symptoms which lead the physician to apprehend serious cerebral lesion.

We now proceed to the consideration of the *compound nerves*, beginning with the *trifacial* or *fifth nerve*. This nerve, as was first pointed out by sir Charles Bell, presents a remarkable resemblance to the spinal nerves in its mode of origin; for it arises by two roots, one large and the other small, and on its larger root, as on the posterior and larger root of the spinal nerves, is a distinct ganglion; the two roots being quite distinct until after the formation of the ganglion, when the lesser one coalesces with the lowest branch, which emerges from the ganglion to form the inferior maxillary nerve. This ganglion, which is known as the gasserian ganglion, and which is formed upon the larger root of the nerve, lies upon the upper surface of the petrous portion of the temporal bone, and is of a somewhat triangular form, with its base directed forward and outward. From this base there proceed three nerves—viz., the ophthalmic, on the inside; the superior maxillary, in the middle; and the inferior maxillary, externally. The first two of these nerves consist exclusively of fibers from the ganglionic root, while the third—the inferior maxillary—is composed of fibers from both roots, and is, therefore, a compound nerve. From the mode of distribution, as well as from that of origin, it is inferred that the ophthalmic and superior maxillary are purely sensory, while the inferior maxillary is a motor and sensory nerve. Experiments on living animals confirm the inference, that have been drawn on anatomical grounds. Division of the ophthalmic or of the superior maxillary nerve induces loss of sensibility, without any serious impairment of muscular power; but when the inferior maxillary nerve, on either side, is divided, the power of mastication is destroyed on that side, and the sensibility of the tongue and of the lower part of the face on that side is lost.

The lingual or gustatory branch of the inferior maxillary is distributed to the mucous membrane and papillæ at the fore part and sides of the tongue, where it acts both as a nerve of common sensibility and of taste. (The consideration of the respective parts which this nerve and the glossopharyngeal play in the sense of taste, is considered in the articles Tongue and Taste.)

The trifacial nerve is the seat of the affection known as tic douloureux, and described in the article Neuralgia. It is in the dental branches of this nerve that toothache is situated; and in the process of teething in young children, the irritation of these branches, consequent upon the pressure of the teeth, often gives rise to convulsions, by being conveyed to the medulla oblongata, and exciting motor nerves by reflex action.

The *glossopharyngeal nerve* is principally an afferent or sensory nerve, but has a small motor root. It escapes from the cranium in association with the pneumogastric and spinal accessory nerves, through the same foramen as that through which the jugular vein emerges. It then descends by the side of the pharynx, and after anastomising with the facial and pneumogastric nerves, and giving off a branch to the tympanum of the ear, terminates in branches to the mucous membrane of the base of the tongue, of the palate, tonsils, and pharynx, and in twigs to the digastric and stylopharyngeal muscles; so that its distribution is almost entirely to sentient surfaces. From a careful examination of the investigations of Dr. John Reid and others regarding the functions of this nerve, Todd and Bowman arrive at the following conclusions: 1. "It is the sensitive nerve of the mucous membrane of the fauces and of the root of the tongue, and in the latter situation it ministers to taste and touch, as well to common sensibility; and being the sensitive nerve of the fauces, it is probably concerned in the feeling of nausea, which may be so readily excited by stimulating the mucous membrane of this region." 2. "Such are its peripheral organization and central connections, that stimulation of any part of the mucous membrane in which it ramifies, excites instantly to contraction all the facial muscles supplied by the pneumogastric and the facial nerves; and the permanent irritation of its peripheral ramifications, as in the case of sore throat, will affect other muscles supplied by the facial nerve likewise. It is, therefore, an excitor of the movements necessary to pharyngeal deglutition."—*Op. cit.* vol. ii., p. 119.

The *pneumogastric nerve*, or *par vagum*, is distributed to so many important organs (the larynx, heart, lungs, stomach, etc.), and is of such great physiological importance, that a special article is devoted to its consideration.

The *spinal accessory nerve* is more remarkable for its peculiar course than in any other respect. It rises from the spinal cord at the level of the fifth or sixth cervical nerve, passes upwards between the anterior and posterior roots of the cervical nerves into the skull, and emerges from the cranial cavity with the two preceding nerves. It is chiefly distributed to the trapezius muscle.

In the above remarks on the cranial nerves, we have omitted all notice of their points of origin, as that subject is sufficiently noticed in the article BRAIN.

We shall now briefly notice the mode in which the extremities receive their nerves. These nerves are derived from the spinal nerves, through the intervention of what is termed in anatomy a *plexus*. Four or five nerves proceed from the spinal cord for a certain distance, without any communication with each other. They then divide, and from the conjunction of the adjacent branches new nerves result, which again subdivide and interchange fibers. From the net-work or plexus thus formed nerves emerge, each of which is composed of fibers derived from several of the original branches. The most important of these plexuses are found in the regions of the neck, the axilla, the loins, and the sacrum, and are known as the cervical, brachial, lumbar, and sacral plexuses.

The *brachial plexus* is formed by communication between the anterior roots of the

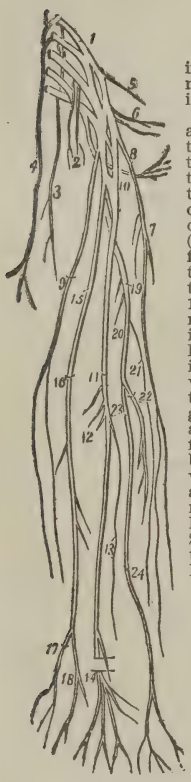

FIG. 1.—A diagram showing the brachial plexus of nerves of the left side, with its branches. Front view.

1, the brachial plexus; 2 and 3, the anterior and posterior thoracic nerves; 4, the phrenic nerves going to the diaphragm; 7 and 9, the external and internal cutaneous nerves; 10, the origin of the median nerve (which receives its name from taking a course along the middle of the forearm to the palm of the hand); 12 and 13, branches of this nerve; 14, the point at which it passes under the annular ligament, and divides into its terminal branches, which are distributed to the thumb and to all the fingers except the little finger and the outside of the ring finger, which are supplied by (15) the ulnar nerve, whose terminal branches are shown at 18; 19, the musculo-spiral nerve (the largest of the plexus); 23, 24, the radial nerve, one of the branches of the musculo-spiral.

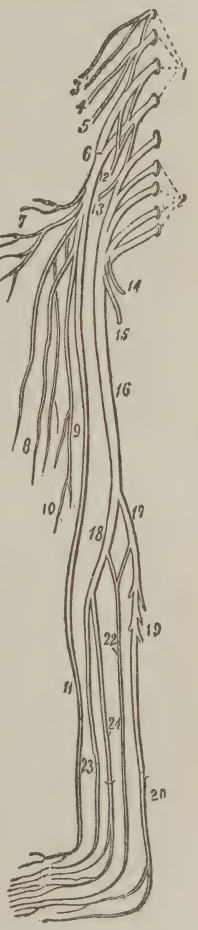

FIG. 2.—A diagram showing the lumbar and sacral plexuses, with the nerves of the lower extremity.

1, the first four lumbar nerves which, with the branch from the last dorsal, form the lumbar plexus; 2, the four upper sacral nerves, which, with the last lumbar, form the sacral plexus; 6, the anterior crural or femoral nerve; 7, 8, 9 10, its branches; 11, its terminal branch, the long or internal saphenous; 13, the gluteal nerve; 15, the lesser ischiatic nerve; 16, the greater ischiatic or sciatic nerve (the largest nerve in the body), dividing at about the lower third of the thigh, into 17, the popliteal nerve, and 18, the peroneal nerve; 19, muscular branches of the popliteal, given off in the posterior region of the knee; 20, the posterior tibial nerve, dividing, at 21, into the internal and external plantar nerves, which are distributed to the sides of the toes in precisely the same manner as the median and ulnar nerves are distributed to the fingers; 22, the external saphenous nerve; 23 and 24, the two terminal branches of the peroneal nerve—viz., the anterior tibial and the musculo-cutaneous nerves.

last four cervical nerves and the first dorsal nerve. These nerves are nearly equal in size, and their mode of distribution is sufficiently explained by the diagram. The branches emerging from this plexus supply the shoulder and the arm; and the names of the most imporant of these branches are given in the description attached to the figure.

The *lumbar* and *sacral plexuses*, with the nerves of the lower extremity, are shown in Fig. 2. The description attached to the diagram sufficiently explains the mode of formation and the distribution of the branches of these plexuses.

The general arrangement of the *sympathetic system*, or, as it is sometimes termed, the *sympathetic nerve*, has been already noticed at the beginning of this article. Its cephalic portion consists of four ganglia on either side—viz., (1) the ophthalmic, or lenticular ganglion; (2) the spheno-palatine, or Meckel's ganglion; (3) the otic, or Arnold's ganglion; and (4) the submaxillary ganglion. They are all closely connected with the branches of the trifacial nerve. The cervical portion contains 3 ganglia, the dorsal 12, the lumbar 4, the sacral 5, and the coccygeal 1, which, instead of lying on the side of the vertebral column, is placed in front of the coccyx, and forms a point of convergence for the two ganglionated cords which run from the cervical to the sacral region parallel to one another. Each ganglion may be regarded as a distinct nervous center, from which branches pass off in various directions. In addition to the cords of communication

between the ganglia, certain sets of nerves may be usually traced—viz., (1) *visceral* nerves, which generally accompany branches of arteries to the viscera (the lungs, heart, kidneys, liver, spleen, and intestines, etc.); (2) *arterial* branches, distributed to arteries in the vicinity of the ganglia; and (3) branches of *communication* with the cerebral and spinal nerves.

The only sympathetic nerve that our limited space will permit us to notice is the *great splanchnic*. This nerve arises by separate roots from the 5th, 6th, 7th, 8th, and 9th thoracic ganglia. These roots unite to form a large round cord, which passes obliquely downwards and forwards, and after entering the abdomen by piercing the diaphragm, ends in a large and complex ganglion, the *semilunar ganglion*, which lies upon the side and front of the aorta, at the origin of the cœliac axis. The semilunar ganglia, with the nerves entering and emerging from them, combine to form the *solar plexus*, which, from the mass of nervous matter which it contains, has been termed the *abdominal brain*. It is in consequence of the existence of this great nervous center, that a blow in the region in which it lies always inflicts a severe nervous shock, and not unfrequently causes death.

Experiments and clinical observations lead to the conclusion that the sympathetic system supplies motor power to many of the internal viscera, especially the heart and the intestinal canal; that it also contains sensitive fibers, as is shown by the sufferings of patients during the passage of a gall-stone or a renal calculus through a duct, whose sole nervous energy is derived from this system; that it presides over the process of secretion in the most important glands; and that it operates on the blood-vessels in causing them to contract, while the cerebro-spinal nerves produce the opposite effect.

On examining different parts of the nervous system under the microscope, we find that the nervous matter is distributed in two forms, the *vesicular* and the *fibrous*. The vesicular matter is gray in color, and granular in texture, contains nucleated nerve cells, and is largely supplied with blood; it is immediately associated with mental actions, and is the seat in which the force manifested in nervous action originates. The fibrous matter is, in most parts, white and composed of tubular fibers, though in some parts it is gray and consists of solid fibers; it is less vascular than the former, and is simply the conductor of impressions made upon it. When these two kinds of matter are united together into a mass they form a *nervous center*, such as the brain or spinal cord, while the *nerves* passing to and from them are composed of threads of fibrous matter. The nervous matter of both kinds is a soft, unctuous substance, with very slight tenacity; the softness being in a great measure due to the large quantity of water which it contains.

The *fibrous* form is the most extensively diffused throughout the body. It forms a large portion of the nervous centers, and is the main constituent of all the nerves. It occurs in two varieties, viz., as the *tubular fiber*, or the *nerve tube*, and the *gelatinous fiber*, the latter being of comparatively rare occurrence, and being found chiefly in the sympathetic system.

When a *tubular fiber* is viewed by reflected light, it presents a beautiful pearly luster, and appears to be homogeneous. But if viewed by transmitted light, with a sufficient magnifying power, indications of structure become visible. Externally, there is the *tubular membrane*, a homogeneous and probably very delicate elastic tissue, according to Todd. Within the edge of the tubular membrane, on either side are seen two thicker and darker lines, which appear to mark the outer and inner limits of the structure known as the *white substance of Schwann*, which forms a tube within the tubular membrane; and within the white substance of Schwann is a transparent material occupying the axis of the nerve tube, and commonly known as the *axis cylinder*. By the application of reagents, it is seen that the chemical composition of the white substance is different from that of the axis cylinder, and hence the functions of these two parts are doubtless different; the latter is in general soft and pulpy. The nerve-tubes are cylindrical in form, and lie parallel to one another, without any inosculation, if we except their frequent terminations in loops. Their average diameter is about $\frac{1}{3000}$th of an inch.

The *gelatinous fibers* are flattened, soft, and homogeneous in appearance, and contain numerous round or oval nuclei. Their diameter is about $\frac{1}{5000}$th of an inch. In appearance they much resemble the fibers of unstriped muscle.

The *vesicular* form of nervous matter is of a dark reddish-gray color, is found only in the nervous centers, is always well supplied with capillaries, and consists essentially of nucleated cells or vesicles, which are most commonly globular or ovoidal, but often present one or more tail-like processes, when they are termed *caudate*. These caudate vesicles present great difference in shape and size. The processes are very delicate, and readily break off close to the vesicle. They probably either serve to connect distant vesicles or else become continuous with the axis cylinders of the tubular fibers.

We may now consider the way in which the nerves and nervous centers are made up of these anatomical elements.

A *nerve* is composed of a bundle of tubular fibers surrounded and connected by areolar tissue, which forms a sheath known as the *neurolemma*, whose office is to protect the delicate tubes, and to support the capillaries from which they derive their nourishment.

The *nervous centers* exhibit a union of the vesicular and fibrous textures, which may be variously arranged. In the Brain (q.v.) the vesicular matter lies externally, forming the gray or cineritious substance; in the spinal cord, on the other hand, the vesicular or

gray matter lies in the central portion, and the fibrous or white matter is external to it; while in the ganglia the two structures are more or less uniformly associated.

From the observations which have been made in an earlier part of this article on the functions of individual nerves, it is sufficiently obvious that it is through the instrumentality of the nervous system that the mind influences the bodily organs, as when volition or emotion excites them to action; and that, conversely, impressions made on the organs of the body affect the mind, and excite mental perceptions through the same channel. "In this way," to quote the words of Dr. Todd, "the nervous system becomes the main agent of what has been called the life of relation; for without some channel for the transmission of the mandates of the will to the organs of motion, or some provision for the reception of those impressions which external objects are capable of exciting, the mind, thus completely isolated, could hold no communion with the external world." The nature of the connection between the mind and nervous matter is, and must ever be, the deepest mystery in physiology, and one into which the human intellect can never hope to penetrate. There are, however, many actions of the body in the production of which the mind has no share. Of this kind are the nervous actions, which are associated with the functions of organic life, such as digestion, respiration, and circulation. Again, there is another class of actions for which two nerves (an afferent or excitor, and a motor) and a nervous center are necessary. These are the actions known as *reflex* or *excito-motory*, for the full investigation of which physiology is especially indebted to the labors of the late Dr. Marshall Hall. For example, the movement of the œsophagus in propelling the food onwards to the stomach, is caused by the stimulus of the food acting on the excitor or afferent nerves, which, through the spinal cord, excites the motor or afferent nerves, and thus give rise to the necessary muscular action. When the edge of the eyelid is touched, the excitor nerve (a branch of the ophthalmic division of the fifth or trifacial nerve) conveys the impression of the stimulus to the nervous center, and the eye is at once closed by the motor influence, which is transmitted by a branch of the facial nerve to the orbicular muscle. In such cases as these—and they form a very numerous class—the mind takes no part. In some of them it is conscious of the application of the stimulus, as well as of the muscular act which follows; but even in these cases no effort of the will could modify or interrupt the sequence of the phenomena.

It has been already shown that the stimuli, by which the action of nerves is commonly excited, are of two kinds, mental and physical, and the change which these stimuli produce in a nerve develops the power known to physiologists as the *vis nervosa*, or nervous force. "The nervous force," says Dr. Sharpey, in his *Address on Physiology* in 1862, "has long been likened to electricity, but rather through a vague perception of analogy than from any rigorous comparison. It is true that electric force is developed in the nerves, and even exhibits modifications connected with different conditions of nervous action. Still, it must be borne in mind that the evolution of electricity is a common accompaniment of various processes involving chemical change, whether within the living body or in external nature; and the tendency of recent speculation is not towards the identification of the nerve force with electricity, but rather to suggest that the two stand related in the same way as electricity and other physical forces are related to each other—that is, as manifestations of a common force or energy, of which they, severally, are the special modifications." The velocity with which impressions are transmitted by the nerves has been recently made the subject of investigation, but it is doubtful how far the observations are to be depended on, in consequence of the various sources of fallacy by which such experiments are beset. According to Hirsch, the velocity is 34 meters, or about 112 ft. per second in man; while Helmholtz fixes it at 190 ft. per second in the frog.

The description of the nervous system given in the foregoing pages is applicable, with slight modifications, to all the vertebrates; the main differences being in the degree of the development of the brain—a point which has been already noticed at the commencement of the article BRAIN. For a sufficient notice of the plan of the nervous system in the invertebrate animals, the reader is referred to the articles ARTICULATA, MOLLUSCA, and RADIATA. It is only in the lowest subdivision of the animal kingdom, the PROTOZOA, that no traces of a nervous system can be detected.

For further information on the subject of this article, the reader is referred to Dr. Carpenter's works on *Human* and *Comparative Physiology*, to Dr. Todd's article on "The Nervous System" in *The Cyclopedia of Anatomy and Physiology*, to Todd and Bowman's *Physiological Anatomy and Physiology of Man*, and to Funke's *Lehrbuch der Physiologie*.

NESHO'BA, a co. in e. Mississippi, intersected in the n. by the Pearl river; 560 sq.m.; pop. '90, 11,146, chiefly of American birth. Its surface is hilly, a large proportion covered with forests and uncultivated. The soil is fertile, and especially in the n. yields good crops of cotton, corn, wool, sweet potatoes, tobacco, and sorghum. Much attention is given to stock-raising, and large numbers of cattle, sheep, and swine are raised. Co. seat, Philadelphia.

NESS (identical with Eng. *nose*, A.-S. *næse*, Ger. *nase*, Ice. *nes*, Lat. *nasus*, Fr. *nez*), a geographical termination, signifying promontory. Names in *-ness* abound among the

Orkney and Shetland islands, and on the coast of Caithness; and they occur, though less frequently, along the e. coast of Great Britain, as far as Dungeness in Kent. As the corresponding Scandinavian termination *-naes* prevails in the names of promontories in Norway, Sweden, and Denmark (e.g., Lindesnaes, in s. of Norway), the existence of names in -ness in Britain is held as an evidence of Scandinavian and Danish colonization. Grisnez, on the n. coast of France, points to the same source.

NESS, a co. in central Kansas, drained by the North fork, the South fork, and Walnut creek, all affluents of the Arkansas river; 1080 sq.m.; pop. '90, 4944, chiefly of American birth, inclu. colored. Its surface is mostly prairie land, furnishing good pasturage for cattle all the year round, and sheep are extensively raised. Its soil is productive, and it is thinly timbered. Co. seat, Ness city.

NESS, Loch, a long narrow lake in Inverness-shire, Scotland, extends n.e. and s.w., and is 23 m. in length, and 1¼ m. in average breadth. Its n.e. extremity reaches a point 6 m. s.w. of the town of Inverness. It receives the Morriston, the Oich, the Foyers, and other streams, and its surplus waters are carried off to the Moray firth by the river Ness. It lies in the valley of Glenmore, and is enclosed by mountain masses averaging 1000 ft. in height; but the scenery on its banks is not strikingly picturesque. In many places it is about 130 fathoms in depth, and owing to the length of time which this immense body of water takes to cool down to the freezing point, ice never forms to any considerable extent.

NESSELRODE, Karl Robert, Count, one of the most eminent diplomatists of modern times, was b. Dec. 14, 1780, at Lisbon, where his father, a descendant of an ancient noble family on the lower Rhine, was then Russian ambassador. He early devoted himself to a diplomatic career, gained in a high degree the esteem and confidence of the emperor Alexander, and in 1813 was one of the representatives of Russia in the important negotiations which took place between the powers who combined against France. In 1814 he accompanied the Russian emperor to France, and on Mar. 1 signed the treaty of the quadruple alliance at Chaumont. He was also one of those who concluded the treaty with Marshal Marmont for the surrender of Paris. He continued to take a principal part in all the negotiations which ended in the peace of Paris; and was one of the most prominent and active of the plenipotentiaries in the congress of Vienna. He was one of the most active diplomatists of the holy alliance, and accompanied the emperor Alexander to the congresses of Aix-la-Chapelle, Troppau, Laibach, and Verona. The emperor Nicholas reposed in him the same confidence, and under his reign he conducted the Russian policy in the affairs of Greece and Turkey. Amidst the European convulsions of 1848 and 1849, Russia, under his guidance, refrained from interference, till opportunity occurred of dealing a deadly blow to the revolutionary cause in Hungary; and, at the same time, of bringing Austria very much under Russian influence. Being one of the chiefs of the German or moderate party in Russia, Nesselrode is supposed to have exerted himself strenuously to preserve peace with the western powers; and after the war had broken out in 1854, and the ill success of Russia was manifest, he undoubtedly strove for the re-establishment of peace, and for the assembling of a congress to settle all disputes. After the accession of Alexander II. he retired from the direction of foreign affairs, and was succeeded in that department by prince Alexander Gortchakov, but retained the dignity of chancellor of the empire, and a seat in the ministerial council. He died at St. Petersburg, Mar. 23, 1862.

NESSLER, Victor, composer, b. in Baldenheim, Alsace, Jan. 28, 1841; d. in Strasburg, May 28, 1890. He received his musical education in Leipsic, where he conducted several singing societies. His latter years were spent in Strasburg in composition. He wrote several operas, the best-known of which is *Der Trompeter von Säckingen*, which is universally popular in Germany.

NESSUS, in Greek mythology, a centaur who carried travelers over the river Evenus, and who insulted Deïanara, the wife of Hercules, and was killed by the latter. In revenge he told the woman to collect the blood from his wound and use it as a love philter, and when she afterwards poured it on Hercules's tunic, the poison communicated to the blood by the arrow dipped in the hydra's venom so tortured the hero that he sought death on a funeral pile. Hence the use of the word to denote a fatal present or that from which there is no escape, as "the Nessus-shirt of ridicule."

NES'TOR, according to ancient Grecian legend, the son of Neleus and Chloris, b. in the Messenian Pylos, escaped destruction when Hercules slew all his brothers, being then a dweller among the Geronians, with whom he was brought up. He married Eurydice, by whom he became the father of a numerous family. In his youth he was distinguished for valor in wars with the Arcadians, Eleians, and the centaurs, and in his advanced age for wisdom. Although he was an old man when the expedition against Troy was undertaken, he joined it with his Pylians in sixty ships. Homer makes him the great counselor of the Grecian chiefs, and extols his eloquence as superior even to that of Ulysses. His authority was even considered equal to that of the immortal gods. Nestor returned in safety to his own dominions after the fall of Troy, along with Menelaus and Diomedes, and continued for long to rule over the people of Pylos.

NESTOR, 1056–1114; b. Russia; entered a convent at Kiev in 1072. He wrote, in the old Slavic dialect, the chronicles of Russia, from about 850 to his own times.

NESTORIANS claim to have existed as a sect long prior to Nestorius (q.v.), and date their conversion to the preaching of the apostle Thomas. They have also a tradition that they are descended from the patriarch Abraham, and hence are sometime called Chaldeans. It is admitted that they are the oldest of the oriental Christian sects. And though they have some superstitions and doctrinal errors, yet they retain many of the doctrines and authorized usages of the early church of Christ. Notwithstanding the deposition of Nestorius, his writings and those of Theodore of Mopsuestia were translated into Syriac, were circulated in Assyria and Persia; and made many converts. When emperor Theodosius II. expelled from his dominions all who refused to accept the Ephesian decision, Nestorianism was transferred to those countries where it has held its ground to the present day. In 435 was established the famous school of Edessa, and from it went many disciples of the new doctrine. Of these the most celebrated was Barsumas, bishop of Nisibis, who did much to propagate Nestorian views in Persia. He and Maanes, bishop of Ardaschir, prevailed upon the Persian king Feroze to expel those Christians who favored the decision of Ephesus, and establish the Nestorians as the national church for the Christians in Persia. Thus patronized by the state, they made Seleucia the seat of their patriarchate, which from that time to the present has been held by the patriarch of the Nestorians. They also established a theological seminary at Nisibis. So great were the zeal and success of Barsumas that the Nestorians now in Chaldea, Persia, Assyria, and the adjacent countries, regard him as their founder. Mosheim says, "It appears from unquestionable documents still existing that there were numerous societies in all parts of Persia, in India, in Armenia, in Arabia, in Syria, and in other countries under the jurisdiction of the patriarch of Seleucia during the 6th century." Of the 7th c., he says, "The Christian religion was in this century diffused beyond its former bounds, both in the eastern and western countries. In the east the Nestorians, with incredible industry and perseverance, labored to propagate it from Persia, Syria, and India, among the barbarous and savage nations inhabiting the deserts and the remotest shores of Asia. In particular the vast empire of China was enlightened by their zeal and industry with the light of Christianity." Considering it necessary to express fully their views, a system of doctrine was adopted at a synod convened by the patriarch Badæus in 496 at Seleucia. The characteristics of this were that in Christ there were two persons, the divine Logos, and the man Jesus; that these two hypostases had only one outward appearance; that the union between the Son of God and the Son of man took place at the moment of the Virgin's conception, and is never to be dissolved; that these two persons are united by no other connection than that of will and affection; that Christ on that account ought to be clearly distinguished from God; that Mary is to be called the mother of Christ. *Christotokos*, and not the mother of God, *Theotokos*. They asserted also that these tenets had not been derived from Nestorius, but had been held by the church from the beginning. Another peculiar opinion was that it was lawful for bishops and presbyters to marry. At the end of Cavades's reign in the 6th c., a schism occured among the Nestorians, which lasted 12 years, when two patriarchs, Nerses and Elisæus, were elected by the opposing factions, each of whom appointed bishops from his own followers. After the death of Nerses in prison and the deposition of Elisæus, the bishops elected Mar Aba I., or *the great*, a Magian convert, 536–552. He translated the liturgy of the Nestorians from the Greek into Syriac, making the version now in use among the Nestorians. He was very active in restoring discipline in the church, and held a synod in 544 which declared that the patriarchs and bishops should thenceforth not be allowed to marry, a regulation ever since observed. He also ordered that while conforming to the Nicene creed, the system of Theodore of Mopsuestia should form the basis of biblical interpretation. Nestorianism was regarded with favor, or at least with toleration under the Saracens, Arabs, and Tartars, the successive masters of Persia. The Nestorians spread not only in Arabia, Syria, and Palestine, but under Mar Aba II., 742–752, a bishop was appointed for them in Egypt. He was subject to the see of Damascus: in later times they had a metropolitan of Egypt. After Bagdad became the abode of the caliphs the patriarch also resided there in A.D. 762. The patriarch was called *yazelich*, i.e. *catholicos*, and in the 13th c., he had 25 metropolitans under his supervision. A historian says: "The Nestorians had now become widely extended. They occupied almost to the exclusion of other Christian sects the region which forms the modern kingdom of Persia, in all parts of which they had churches. They were numerous in Armenia, Mesopotamia, and Arabia. They had churches in Syria and in the island of Cyprus. They had churches among the mountains of Malabar in India. They had numerous churches in the vast region of Tartary from the Caspian sea to mount Imaus, and beyond, through the greater part of what is now known as Chinese Tartary, and even in China itself." Early in the 11th c. Unkh Khan, a Tartar prince on the northern borders of China, invited Nestorian missionaries among his people, and himself became the famous Prester John. Genghis Khan and several of his sons and grandsons, who conquered China and almost all Asia and a part of Europe, were connected with Prester John by marriage. Several of them had Christian wives, and one of them professed himself a Christian. Under some of this dynasty central Asia was comparatively civilized and enlightened; and Christian travelers passed with safety from the banks of the Euphrates to Samarcand and Pekin. Some of the Chinese emperors favored Christianity and ordered the erection of numerous churches. Meanwhile the sword of Moslem

fanaticism advancing eastward Bagdad fell before it, and all the country on the Euphrates, then Persia and the regions to the north. The Nestorian church was crushed, and its missions languished; and about the year 1400 Tamerlane swept like a whirlwind over the remains of Nestorian Christianity. The missions in China languished for want of support, and were weakened by controversies with missionaries from Rome; but some of the churches still existed, and in 1502 four bishops were sent to China.

In the 16th century a great schism took place among the Nestorians of central Asia, of which a portion renounced their distinctive doctrine, and placed themselves under the jurisdiction of the Roman pontiff, to whom, under the title of Chaldean Christians, they have since remained faithful. The others still maintain their old creed and their ancient organization. Their chief seat is in the mountain ranges of Kurdistan. They are at present a poor and illiterate race, numbering about 140,000, and subject to a patriarch residing at Diz (who is always chosen from the same family, and takes invariably the name of Schamun, or Simon) and 18 bishops. All these are bound to observe celibacy, but marriage is permitted to the priests and inferior clergy. Their liturgical books recognize seven sacraments, but confession is infrequent, if not altogether disused. Marriage is dissoluble by the sentence of the patriarch; communion is administered in both kinds; and although the language of the liturgy plainly implies the belief of transubstantiation, yet, according to Layard, that doctrine is not popularly held among them. The fasts are strict and of very long duration, amounting to very nearly one-half of the entire year. They pray for the dead, but are said to reject the notion of purgatory, and the only sacred image which they use or reverence is that of the cross. The Nestorians of Kurdistan, like the Christians of the Lebanon, have suffered much from time to time through the fanaticism of the wild tribes among whom they reside. In a massacre in 1843, and again in 1846, many fell victims, and even still they owe much of their security to the influence exercised in their favor by the foreign representatives at the Turkish and Persian courts.

The Syrian or Nestorian Christians of St. Thomas profess to be his disciples, and say that he preached the gospel in Malabar and other parts of India. However that may be, there is evidence that the Syrian or Nestorian churches in Malabar were founded as early as the 5th or 6th century. The first notices of this people in recent times are found in Portuguese histories. When they arrived in India in A.D. 1500, they found not only a Christian king, but many professing Christians, and more than 100 churches. The popes claiming universal spiritual supremacy endeavored to bring them into subjection, and directed the Portuguese to use all their power to convert them. In 1545 a Franciscan friar was sent out who opened schools to educate the youth in the doctrines of their church. The Syrian bishop, Mar Joseph, was taken a prisoner to Goa, and thence sent to Portugal. Mosheim says, "The finishing stroke was put to the violence and brutality of these attempts by Don Alexis de Menezes, archbishop of Goa, who at the close of the 16th century, calling the Jesuits to his assistance, compelled this unhappy people to embrace the religion of Rome, and to acknowledge the pope's supreme jurisdiction." The result of these efforts was that the priests and churches on the sea-coast submitted to the pope, insisting, however, on retaining their language and liturgy. These are called the *Syrio-Roman Christians*. But those in the interior would not yield. After a brief show of submission they proclaimed war against the inquisition, hid their books, fled to the mountains, and sought the protection of the native princes. These retain their ancient rites, liturgy, and ministry, and are called by their former name *the Syrian Christians of Malabar*. Little was known concerning them in Europe and America until Dr. Buchanan published his account of them in 1807. He found near Travancore the Syrian metropolitan and his clergy, and there were 55 churches. They used the liturgy of Antioch in the Syrian language. They had many old and valuable copies of the Scriptures, one of which, a Syrian manuscript of great antiquity they presented to him. He describes their doctrines as few in number, but agreeing in essential points with those of the church of England. The church missionary society subsequently had a mission among them, but without much success. The Syrio-Roman Christians are said to number about 100,000, the others 50,000.

In 1830 Messrs. Smith and Dwight, missionaries of the American Board, visited the Nestorians of Persia. From their *Researches* we learn that they occupy a wild range of the Koordish mountains on the borders of Turkey and Persia. They are governed by *meliks* or kings chosen from their own people by a popular vote. Every melik or head of a small clan is perfectly independent, except as they yield a voluntary obedience to their patriarch, Mar Simon, who resides near Joolamerk, and styles himself "patriarch of the East." The Turkish government has long sought to subdue them. They are very poor, and in the summer many descend to the plain of Oroomiah at the foot of the Kurdistan range, where now dwell a large body of Nestorians, numbering about 40,000. They are bold, generous, and kind. The patriarch professes only spiritual power, but among the mountaineers his word is law in all things. He seldom visits those of Oroomiah. Under him are 18 bishops, 4 of whom reside in Oroomiah. Celibacy is not required of the inferior clergy, who generally are poor, eking out a living by cultivating the ground, or teaching a few scholars. Some of them can scarcely read, but they have improved since the distribution freely among them of the Syriac bible. Religion is very

low. Lying, intemperance, profanity, and some other vices, are common. Sunday is a holiday. Roman Catholic agents seek to seduce the Nestorian Christians, and. even the patriarchs, to submission to the pope. A Jesuit a few years ago offered the patriarch $10,000 if he would acknowledge the Roman supremacy. The Mohammedans also endeavor to proselyte. These poor people are greatly oppressed with taxes, and are the victims of spoliation, and have no redress even in the courts. A Nestorian is not allowed a place in the bazaar, cannot engage in commerce, and in the mechanic arts cannot rise to a higher position than that of a mason or carpenter. In 1843 they rebelled and a general massacre took place. The Nestorians acknowledge the supreme authority of the Holy Scriptures, and hold that no doctrine or practice is essential to salvation, which cannot be proved from them. They have no pictures or images in their churches. The only symbol among them is a plain Greek cross, which they highly venerate.

In efforts to reach pagan and Mohammedan people with Christian truth, it is often found that the remnants of ancient Christian churches existing among them, and sometimes in political subjection to them, have substituted the forms of religion for its reality, and are in almost as much need of enlightenment as those by whom they are overborne. It has seemed that the renewal of those churches in moral and spiritual life, would provide the best means of Christianizing the races with whom they are in contact. With these aims the Rev. Mr. Perkins and his wife were sent in 1833 by the American board to Persia to begin mission work among the Nestorians. Dr. Grant and his wife joined them in 1835. The bishops and priests of the Nestorian church for the most part received the missionaries cordially, and encouraged their efforts for the reformation, admitting that their people had wandered far from the right way. They even in some instances put themselves under instruction, and prepared to co-operate with them, following their example in giving expositions of Scripture, which they had never ceased to consider the ultimate standard of truth. Mrs. Grant by her school awakened great interest in the education of women. Dr. Grant not only was highly useful as a physician and surgeon, but gained great influence for the truth through this means. A boarding school for girls under the care of Miss Fidelia Fisk and a high school for boys under that of Professor Stoddard, where hundreds of the young men and women received a Christian training, were highly useful. The Mohammedans seeing what was undertaken for the Nestorians, said, "Are we to be passed by," and claimed a share in the generous labors of the missionaries. Eighteen ordained missionaries and their wives, 3 missionary physicians and the wives of two of them, and 1 male and 8 female assistant missionaries, have been employed in this work, and the success has been most gratifying. They had no printed Scriptures, now they have the Bible in both the ancient and vernacular. Spelling-books, geographies, arithmetics, and religious books, in all, 11,000 volumes have been printed, and 3 periodicals are circulated. Far and wide oral Christian instruction has been given. The benefit of spiritual religion is evinced in the daily life of many, and their example makes a most favorable impression. Seventy have become preachers of the gospel. The missionary spirit is growing, and several hundred dollars are contributed annually to carry the gospel to other peoples, the Nestorians themselves engaging in this work, and laboring among Moslems, Jews, Armenians, and Malakans of Russia. One of these Nestorian preachers has gained among the latter 1200 converts. Five are pastors of self-supporting churches. It was not the design of the American missionaries to interfere with the established church organizations, but there have been formed "reunions on the apostolic basis," which include 1,976 members.

See Perkins's *Residence of Eight Years in Persia among the Nestorian Christians* (Andover, 1843); Anderson's *Oriental Churches* (1872); and Dean Stanley's *History of the Eastern Church.*

NESTO'RIUS, a native of Germanicia, a city of northern Syria, in the patriarchate of Antioch, was probably a disciple of the celebrated Theodore of Mopsuestia; and having received priest's orders at Antioch, became so eminent for his fluency, if not eloquence, as a preacher, and for grave demeanor and exemplary life, that on occasion of a dispute about the election of a patriarch of Constantinople he was selected by the emperor, in 428 A.D., to fill the vacant see. Soon after his consecration a controversy arose as to the divine and human natures of our Lord, in which Nestorius took a leading part. One of the priests, who followed Nestorius to Constantinople, Anastasius, having in a sermon, which was by some ascribed to Nestorius himself, denied that the virgin Mary could be truly called the "mother of God," being only in truth the mother of the man Christ, Nestorius warmly defended Anastasius, espoused this view, and elaborated it into the theory which has since been known by his name, and which equivalently, if not in formal terms, exaggerated the distinction of two natures in our Lord into a distinction of two persons—the human person of Christ and the Divine Person of the Word. An animated controversy ensued, which extended from Constantinople to the other patriarchates, and drew from Cyril, patriarch of Alexandria, a formal condemnation of the doctrine of Nestorius in twelve anathemas, still preserved, and a similar condemnation, accompanied by a threat of deposition and excommunication, from Celestine, bishop of Rome, unless he would withdraw the obnoxious doctrine. Nestorius remaining firm in his opinions, a general council was convened at Ephesus in 431, at which Cyril took the most active

and prominent part, and in which, notwithstanding the absence of the patriarch of Antioch and his bishops, Nestorius was condemned and deposed. Considerable opposition was offered to this judgment for a time, but ultimately Nestorius was confined in a monastery near Constantinople, whence, after four years, still persisting in his views, he was banished to the greater oasis in upper Egypt, and after several changes of his place of confinement, died in exile. The account given by Evagcius, that his death was caused by a disease in which his tongue was eaten by worms, rests, according to Evagcius himself, on a single and unnamed authority. The more probable narratives ascribe his death to the effects of a fall. The date of this event is uncertain. It was after 439, when Socrates wrote his history (*Hist. Ecc.* vii. 34), but there is little doubt that he was already dead in 450, when the Eutychian controversy first began to attract notice. The Monophysite Jacobites are accustomed annually to cast stones on the site of his supposed grave, and they also assert that it has never yet been moistened by rain from heaven. The emperor, although he had formerly been his friend, turned entirely against him and caused all his writings to be collected and burned in the public square, and named his followers *Simonians*. In modern times, however, much sympathy has been expressed for Nestorius, while Cyril has been much censured for his barbarities. Gieseler, Neander, and Milman all write in favor of Nestorius, while Petavius, Baur, Ebrard, and Hefele as positively affirm Cyril to be in the right, not as to his conduct, but as to his views upon the question involved. Another writer, Dorner, finds truth and error on both sides, and says Nestorius and Cyril represent two equally one-sided conceptions that complement each other. He considers Nestorius to be in the right from the ethical and practical standpoint, and Cyril equally right from the religious and speculative side. Still another writer considers it nearest the truth to admit that while Nestorius might have been actuated by an honest and pious zeal, yet he was lacking in both prudence and moderation. See also Wright, *Early Christianity in Arabia;* Neale, *History of the Holy Eastern Church.*

NESTS (Lat. *nidus*, Gael. *nead;* allied to Ger. *nähen*, Sax. *nestan*, Lat. *nectere*, to sew, bind, or tie) are the structures which animals prepare for the rearing of their young. They are very different, not only when the creatures which construct them belong to widely separated divisions of the animal kingdom, but often when the animals are of the same class, or even when they are nearly allied; and whilst some construct very simple nests, and those of others are very curious and elaborately framed, some make no nest at all. Among MAMMALS the only nest-builders are certain rodents, as mice, dormice, squirrels, etc. The structures of some of the species are as artfully contrived and as beautiful as the nests of birds. It is among BIRDS that nest-making is most general; although there are not a few species which merely scrape a hole in the ground, and many sea-fowls lay their eggs on ledges of naked rock. The situations chosen by birds for their nests are very various, each species affecting some particular kind of situation, as each species also exhibits a uniformity in choice of materials and in form and mode of structure; these particulars, however, being all liable to modification—within certain limits—according to circumstances. Some birds' nests consist merely of a few straws or leaves collected together; some of such materials as twigs, straws, moss, hair, etc., very nicely interwoven, and often with a lining finer than the frame-work; some, as those of swallows, are made of clay or other soft material, which hardens as it dries. Birds' nests are generally open at top, but some, as those of swallows, are so placed under a projection of rock or of a building as to be covered, and have the opening at the side; whilst others are vaulted, and have the opening at the side. Some are situated in holes excavated in clayey, loamy, or sandy banks. The nests of troupials, baltimores, weaver-birds, etc., are remarkable for the ingenious contrivance displayed in them; and a very singular nest is that of the tailor-bird, made by sewing together the edges of leaves. These are noticed in the articles on these birds. Many birds are as solitary as possible in their nidification; whilst others, as rooks and herons, congregate in large communities.—No REPTILES are known to construct nests; their utmost approach to it being to make a hole for their eggs in sand, or in some other suitable situation.—The nests of FISHES have recently attracted much attention of naturalists. It is supposed that the ancients were acquainted with the nest-building instinct of some fishes; but it was unknown to modern naturalists till 1838, when Mr. Edwards discovered it in a species of stickleback (q.v.). It now gives interest to many a fresh-water aquarium. Not many fishes are yet known as nest-builders. Among them are gobies and the goramy. Many are known not to construct nests. The salmon and others exhibit an approach to the nest-building habit in making a place for their eggs in the sand or gravel which they choose for a spawning-bed.—Many INSECTS—a small proportion, however, of the whole number, and mostly *hymenoptera*—construct nests, as bees, wasps, and ants. The nests of the social bees and wasps are also their ordinary habitations, but the nests of solitary bees are entirely devoted to their young. A few insects, not hymenopterous, as some weevils, may also be said to make nests; but among insects provision for the wants of the young is usually made in very different ways. Certain spiders, amongst which may be named the water spider, construct nests.—The instinct of nest-making, connected as it is with the instinctive care for their young which the Creator has made so important a part of the nature of so many animals, is by no means an index either of that care or of the affection with which, in many cases, it is conjoined; and some of the animals which construct no nest

are among those in which affection for their young is exhibited in the highest degree.—The nest-making instincts of animals seem to be a very essential part of their constitution; and even in the most perfect domestication are still retained and exhibited; although the accommodation to circumstances which is also manifested shows something—and that not inconsiderable—of reason. Some of the most beautiful images in the Bible are those having the nests of birds as their subject. The exiled Psalmist envies the swallow and sparrow safely building in the very courts of Zion (Psa. lxxxiv., 2, 3); the prophet Obadiah reproving Edom for her haughty spirit and belief in the security of her rock-hewn dwellings, likens her to the eagle with her nest "among the stars" (Obad. 4); and Jeremiah (xlix., 16), predicting the destruction of Bozrah, declares that though her nest be as high as that of the eagle, it shall be brought down. The same writer (xxii., 23) appropriately describes the dwellers on Lebanon as making their nests among the cedars, and in another place (xlviii., 28) advises Moab to make her nest like the dove, "in the sides of the hole's mouth." The Mosaic law forbade the finder of a bird's nest to take the mother-bird, but at the same time did not, in general, allow either eggs or young ones to be taken.

This subject of nests is usually confined to the nests of birds, and most notices are based on *The Architecture of Birds* (Charles Knight, London, 1831), the original observations in which are by Professor J. Rennie. The subjects of his treatment include ground-nesters, squatters, and miners; builders of mounds, of umbrellas, of domes; masons; carpenters; platform-makers; basket-makers; weavers; tailors; felters; cementers. But if we look at these divisions from the point of scientific classification, it will immediately be seen that the shape, size, and locality of the nest of any given species depend on its capacities, which will appear in its beak, wings, and claws; and on its habits, which may have been modified by a thousand considerations of climate, of companionship, or imitation. General influences as to the practice of particular species may be best drawn by the following classification, based on Cuvier, but partly Reichenbach, partly Willoughby.

1. Robbers	*a.*	Swoopers.	Eagles, hawks, vultures.
	b.	Stealers.	Owls, etc., etc.
2. Climbers		Woodpeckers.	Parrots, etc.
3. Scratchers	*a.*	Perchers.	Doves, etc.
	b.	Roosters.	Domestic fowl, partridge, etc
4. Songsters	*a.*	Pinchers.	Fly-catchers, warblers, etc.
	b.	Swallowers.	Goat-suckers, swallows.
	c.	Crackers.	Larks, linnets, rooks.
	d.	Suckers.	Hoopoes, humming-birds, etc.
5. Stalkers	*a.*	Runners.	Ostrich, emu, etc.
	b.	Walkers.	Bustards, plovers, etc.
	c.	Fishers.	Herons, storks, cranes.
	d.	Pryers.	Curlews, snipe, woodcock, etc.
	e.	Scooters.	Rails, coots, flamingoes, etc.
6. Swimmers	*a.*	Divers.	Auks, penguins, etc.
	b.	Hoverers.	Petrels, gulls, cormorants, albatross, etc.
	c.	Waddlers.	Swans, geese, ducks.

But the desire of birds to build nests corresponds to that of men to make houses, or beasts to construct lairs. They are a shelter for the young, or a refuge for the old; as with mammals, the higher the order of intelligence, the more protection is needed by the young, so that the young eagle must have its food torn up for the first few weeks, while the young ostrich scuttles out of the sand almost ready to take care of itself from birth. Nor do birds' nests differ in shape, material, or adjustment from the works of insects, beasts, even crustaceans. The following is a summary of nest-builders, disregarding the minute divisions of the list of Rennie:

First, *Burrowers.*—First of mammals is the mole, so voracious, active, and fierce that if the creature had the size of one of the tropical *ferœ*, it may be questioned whether any animal has existed which could conquer it. The burrow is most complex of all, and the nest separate from the house. Then come shrews and musk-rats, the fox, all the weasels and badgers, chip-squirrels and woodchucks, and the rabbit. All have a distinct nest within the hole, and generally means of escape by extra passages. Burrowing birds: The sand-martin, the kingfisher, puffins, jackdaws, and sheldrakes; the stormy petrel, like all fish-eating birds, living in the midst of filth and stench; woodpeckers, the starlings and the creepers; the toucan, large of beak but small of strength, unable to excavate its hole in the knot of a tree. Reptiles, tortoises, crocodiles, and snakes, with all the crab kind of crustaceans, and the whole horde of boring mollusks. Scorpions and spiders, who have tunnels, towers, and trap-doors; insects, beetles, including the curious mole-cricket and the ant-lion; and all the numberless insects that bore into every article not made of metal or stone.

Second *Hang-nests.*—The beautiful little harvest-mouse, one of the smallest mammals in the world, builds a true pensile nest, round, and, curiously enough, without opening. So does the squirrel, when he hangs his summer nest (for he makes two) from the end of

some slender bough, but these are almost the only animals light and active enough to rival the birds in this peculiar industry. Hanging-nests of all shapes—bottles, scoops, extinguishers; with tails, with concealed openings—belong in enormous variety to the tropical species; and in this country we all know the humming-birds, the orioles, the fly-catchers, and all the warblers. Among insects the best-known are the wasps; but many ants, the moths, and some spiders come into this category. There is one fish, but it seems wrong to include here the pupæ of insects.

Passing to the creatures which build, rather than burrow or weave, we have: Building mammals. Two Australian species only and our own musk-rat; but the birds are very numerous. The oven-bird, the blackbird, and the song-thrush, martins of all kinds, swallows of all kinds, the curious birds of Australia which hatch their eggs in mounds of rotting leaves and twigs; the titmice, wrens, the eastern lyre and bower birds. Among insects we have white ants and mud-building wasps. But a whole class of buildings may be separated and called sub-aquatic. Here belong fishes, the little stickleback and the hassar; but the most wonderful of all such creations may be seen in the depths of a pool. The water-spiders, caddis-flies, all pupa-cases and larvæ-nests; and here may be added corals, serpulæ and terebellæ. Social habitations, communities of creatures, whether all of the same species or mixed, by sufferance and by intrusion, are very common. The beaver, emblem of quietness and industry, is an example from mammals; but in birds we have the curious sociable-weaver of South Africa. Among insects, bees, hornets, some moths, some butterflies, and several curious kinds of ants, mostly from Africa. Parasitic nests, inhabited by the cuckoo and the cow-birds, the sparrow-hawk and the kestrel, crow-blackbirds, occasionally the sparrow and the stork. Among insects, whole families of flies pursue the luckless moths and caterpillars, making of their cocoons, or their living bodies, nests for the generation of a swarm of destroyers. Here come most of the gall-insects, the leaf-miners, and the parasite breeze-flies, and the curious companion of the snail, the drilus. Branch-builders are represented, as may be imagined, mostly by birds, yet we have among animals the dormouse and the loir; among birds, rooks, crows, herons, all finches, the eagle, the chat, the mocking-bird, the water-hen, some warblers, some humming-birds, some shrikes, and the hedge-sparrow. These all make open, usually round nests, on the fork of a branch, and woven of twigs or of miscellaneous trash. Here come also some spiders, many moths, and several species of strange nest-building insects. To sum up, a nest, visibly so, and for that purpose only, strikes us more commonly in birds than elsewhere, though upwards of one-half of them make no nest, and many others steal places already fitted to their use; but the fact is, many mammals have distinct and real nests; crustaceans and reptiles commonly construct them, and they are and must be the rule with all insects when undergoing the changes necessary to their development.

NESTS, Edible, an important article of commerce between the eastern islands and China, and of luxury in China, are the nests of several species of swallow (q.v.), of the genus *collocalia.* The best known of these birds, *C. esculenta,* is about 4½ in. in length, 11 in. expanse of wing, dusky black above, pale ash-color beneath. The nest is shaped like that of the common swallow, and adheres to a rock; vast numbers being found together—often in absolute contiguity—in caves of the eastern archipelago; as those of the same and allied species are in other islands of the East Indies. The nests themselves are formed of grass, sea-weed fibers, small leaves, etc., and are attached to the rock by a sort of bracket, made of a gelatinous substance, which is the part really eaten. This was formerly thought to be made of sea-weeds, but is now known to consist of saliva, which the swallow exudes from the salivary glands under the tongue. The nests are collected by means of ladders, and often by means of ropes, which enable the gatherers to descend from the summit of a precipice, like the rock-fowlers of the north. The gathering of the nests takes place after the young are fledged, thrice in a year. In the Chinese market the nests are sold for from $10 to $35 per lb., according to the quality, and they are, of course, used only by the most wealthy, chiefly for thickening rich soups. The imports at Canton are reckoned at 1200 piculs, or 168,000 lbs., representing about 8,400,000 nests. The nests are very wholesome and nourishing, but quite devoid of the peculiar properties which the Chinese ascribe to them. Five caverns at Karang, Bollong, in Java, contain 330,000 swallows, and yield annually about 500,000 nests. The Dutch export them to China. The nests weigh about half an ounce each.

NETH'ERLANDS, The Kingdom of the, lies between 50° 46′ and 53° 32′ n. lat. and 3° 23′ and 7° 12′ e. long., is bounded on the n. by the North sea, e. by Hanover, and the western part of Prussia, s. by Belgium, and w. by the North sea. Its greatest length from north to south is about 195 miles, and its greatest breadth from the west, on the North sea, to the extremity of Overyssel on the east, about 110 miles. It contains 12,648 sq.m., with a population, in 1895, of 4,859,451, and an average density to a sq. m. of 384. The following table, taken from the *Statesman's Year-book* of 1897, gives the area and population of the eleven provinces according to the censuses of Dec. 31, 1889, and Dec. 31, 1895, respectively, with the density per sq. m. in each province.

Provinces.	Area, English square miles.	Population.		
		Dec. 31, 1889.	Dec. 31, 1895.	Per sq. mile.
North Brabant	1,980	509,628	533,477	269
Guelders	1,965	512,202	540,937	275
South Holland	1,166	949,641	1,061,828	911
North Holland	1,070	829,489	912,511	859
Zealand	690	199,234	209,546	304
Utrecht	534	221,007	238,282	446
Friesland	1,282	335,558	338,911	264
Overyssel	1,291	295,445	314,805	244
Groningen	790	272,786	288,885	366
Drenthe	1,030	130,704	141,225	137
Limburg	850	255,721	272,044	320
Total	12,648	4,511,415	4,859,451	384

The population has nearly doubled since the census of 1829 and the average annual rate of increase between 1880 and 1895 was between one and two per cent. The division of the population, according to sex at the census of 1895, was 2,404,556 males and 2,454,895 females. In that same year, 33.6 per cent. of the total population was resident in the 21 large cities, the proportion of urban to rural population having steadily advanced since the census of 1869. The increase of the population has been due to excess of births over deaths and not to immigration. At the census of 1889 there were only 47,888 persons of foreign birth living in the country. Nor is emigration important. In 1895 only 15,919 emigrants, including foreigners as well as natives, sailed from Dutch ports. On Dec. 31, 1895, there were 21 towns in the Netherlands with a population of over 20,000, and of these Amsterdam had 456,324; Rotterdam, 276,337; the Hague, 185,744, and Utrecht, 94,305. Other leading towns are Groningen, Haarlem, Arnhem, Leyden, Tilburg, Maastricht, Nymwegen, Dordrecht, Nieuwer-Amstel, Leeuwarden and Delft.

Physical Aspect.—The land is generally low, much of it being under the level of the sea, rivers, and canals, especially in North and South Holland, Zeeland, the southern part of Gelderland, and Friesland. Along the west coast, the low lands are protected from the sea by a line of sand-hills or dunes; and where that natural defense is wanting, strong dikes have been constructed, and are maintained at great expense, to keep back the waters. The greatest of these dikes are those of the Helder and of West Kapelle, on the east coast of Walcheren (q.v.). Engineers, called the officers of the Waterstaat, take special charge of the dikes and national hydraulic works. A hilly district stretches from Prussia through Drenthe, Overyssel, the Veluwe or Arnhem district of Gelderland, the eastern part of Utrecht, into the Betuwe, or country between the Maas and the Waal. This tract of country has many pretty spots, is of a light, sandy soil, well watered, and, when not cultivated, is covered with heath or oak-coppice. The greatest part of the Netherlands is very fertile, the low lands and drained lakes, called polders (q.v.), being adapted for pasturing cattle, and the light soils for cereals and fruits.

Islands, Rivers, Canals, Etc.—The islands may be divided into two groups, of which the southern, formed by the mouths of the Schelde and Maas, contains Walcheren, South and North Beveland, Schouwen, Duiveland, Tholen, St. Philipsland, Goeree, Voorne, Putten, Beyerland, Ysselmonde, Rozenburg, and the island of Dordrecht. The northern group contains the islands at the entrance of the Zuyder Zee and along the coasts of Groningen and Friesland, as Wieringen, Texel, Vlieland, Terschelling, Ameland, Schiermonnikoog, and Rottum. In the Zuyder Zee are Marken, Urk, and Schokland.

The chief rivers are the Rhine, Maas, and Schelde. Important branches of these are the Waal, Lek, Yssel, Roer, etc.

Water-ways are more numerous than in any other European country, the immense tracts of meadow-land and the fertile polders being girdled by large canals, and cut in all directions by smaller ones for drainage and communication. Those of most importance to the national trade are, the North Holland canal, constructed 1819 to 1825, to connect the port of Amsterdam with the North sea; the Voorne canal, from the n. side of Voorne to Hellevoetsluis, which shortens the outlet from Rotterdam; the South Willemsvaart, through North Brabant, Dutch and Belgian Limburg, from 's Hertogenbosch to Maastricht. Besides these, there are numerous important canals, connecting rivers, and cutting the kingdom into a network of water-courses. To improve the entrance to the Maas, the Hoek of Holland has been cut. A canal through the Y and peninsula of Holland was opened Nov. 1, 1876. Other important canals are the Willemsvaart in Overyssel, the Dedemsvaart, the Damsterdiep, the Ems canal, the Winschoterdiep, the City canal in Groningen, the North Willems canal, etc.

Railways have been constructed to the extent of 1674 miles, which were open to traffic in 1895, affording communication between the principal cities and villages of the Netherlands with Prussia and Belgium. Part of the railways belong to private companies and part to the state, the latter owning 886 miles in 1895. Most of the telegraph lines are owned by the state, the length of state lines on Dec. 31, 1895, being 3,500 miles.

CLIMATE, AGRICULTURE, PRODUCE, ETC.—The climate of the Netherlands is mild in winter and comparatively cool in summer, but exceedingly damp, owing to the proximity of the sea. There are heavy rains, especially in the latter part of the summer. During the dry season the exhalations from the canals and bodies of standing water are injurious to health, especially in parts of North Holland, South Holland, Friesland and Zealand. The climate of the interior provinces is more healthful than that of the provinces on the coast. Northwesterly and southwesterly winds prevail and in the winter season are charged with moisture and are stormy.

The majority of the farms are small and worked by the owners. In the provinces of Zealand; Groningen, South Holland and North Holland, the large estates are numerous, but petty culture prevails in North Brabant, Gelderland, Limburg, and Overyssel. The land is highly cultivated, and though formerly rude methods were employed, important improvements in recent years have brought about a great advance in agricultural production. In 1889 over 34 per cent. of the surface was employed as pasture land, and in the raising of tobacco, hemp, flax, flowers, etc., and only 25.8 per cent. was employed in the raising of food products. Nearly 7 per cent. of the surface was under forests. The chief cereal and vegetable crops are wheat, rye, oats, barley, buckwheat, potatoes, beans, peas, hemp, hops, various grasses, flax, tobacco, beetroot, chicory, seeds, etc. Market gardening is followed with success, especially in Utrecht, North Holland, South Holland, and parts of Gelderland, Friesland, and North Brabant. Apples, cherries, and pears are raised in abundance in various parts of the country; and the floriculture of the Netherlands has been famous for centuries. The last named industry is followed especially in North Holland, South Holland, and in the neighborhood of Utrecht, Breda and Arnhem. Cattle raising is one of the most important sources of wealth. Good strong breeds of horses are raised as well as large numbers of sheep, swine, and goats. Bee raising is an important industry, and dairy products, especially cheese, which is exported largely to England, yield a considerable income.

MINERALS.—Owing to the lack of wood, coal and turf are used for fuel. In regard to coal, the Netherlands are chiefly dependent on foreign supplies, importing largely from England, Prussia, and Belgium; though in some parts of the country, as for example in Limburg, enough is produced for local needs. There are extensive turf moors in the provinces of North Brabant, Zealand, Overyssel, Utrecht, North Holland, and South Holland. The production in 1864 amounted to 42 million tons. Soon afterwards the tax on turf was abolished, and though exact statistics are lacking, it is certain that the annual amount has greatly increased. Five-sixths of the turf is obtained from the four northern provinces. The country is poor in metals. There are a few blast furnaces in Gelderland and Overyssel, the latter province having some deposits of iron ore which is smelted at Deventer.

MANUFACTURES, INDUSTRY, ETC.—The statistics of the manufactures in the Netherlands are deficient, but there is evidence that their importance has greatly increased in recent years. At the close of 1895 there were 4,812 steam engines employed in manufactures as compared with only 507 in 1853. The statistics of 1895 show that there were 530 distilleries, 507 breweries, 11 sugar refineries, 30 beetroot sugar manufactories, 96 vinegar manufactories, and 50 salt works in the country in that year. Among the leading manufacturing towns are Amsterdam, Haarlem, Rotterdam, Schiedam, Leyden, Dordrecht, Hilversum, Zaandam, Zaandijk, Wormerveer, Utrecht, Amersfoort, Tilburg, 's Hertogenbosch, Maastricht, Roermonde and the cities and villages in the eastern part of Overyssel. There are large iron foundries and machine shops in Amsterdam, The Hague, Leyden, and Delftshaven. There are important paper manufactories, oil refineries, distilleries, breweries, sugar refineries, salt works, tanneries, dyeworks, and manufactures of cigars, tobacco, silk, cotton, woolen goods, shoes, and gold and silver articles. Formerly the motive power was supplied by windmills, but steam is becoming yearly of more importance as a motive power. The hydraulic works in the Netherlands are the most complete in the world. Many people are employed in the immense inland shipping trade, which the numerous canals have fostered. The Dutch have always been distinguished as active and successful fishermen. The herring fishery is especially important, its produce being valued, in 1895, at 6,151,777 guilders. There are productive oyster beds, oysters being an important article of export. Anchovies are obtained in large numbers in the Zuyder Zee, and there are besides important fisheries of cod, ling, turbots, flounders, shrimp, haddock, as well as salmon, eels, etc., in the rivers of the interior.

The government has made efforts to improve the condition of the working man, and to promote harmony in his relations with the employer. In the spring of 1897, an important measure was passed, creating labor bureaus for the purpose of watching the interests of masters and working men, by collecting statistics, giving advice, framing rules and regulations in the interest of, and at the request of interested parties, and preventing and settling difficulties; the bureau to consist of one-half masters, elected by the masters of trades represented, and the other half of working men. As to wages, the rate is much lower than in the United States, but the exact statistics are hard to obtain. It would appear, from a report in 1897, that laborers received $7\frac{1}{5}$ cents per hour, and worked on an average 66 hours per week, thus earning $4.75 a week. The pay of mechanics was of course higher, carpenters, masons, stone-cutters, and plumbers receiving on an average $9\frac{1}{5}$ cents per day, and working on an average 11 hours a day. Factory operatives received from $3.40 to $7.00 a week, but women workers received only from $2.40 to $4.00 a week. Gratuities, or "tips," play a much more important part in the remuneration of employees than in the United States, being often given even to painters, gasfitters, carpenters, etc.

COMMERCE, SHIPPING, ETC.—The Netherlands is peculiarly a mercantile as well as an agricultural country, its merchants not only importing and exporting the products of their colonies and the surplus of their own country, but also those of other lands. Only a few duties are levied, and these have merely a fiscal character. The duties amount usually to only 5 per cent. of the value of manufactured articles, and only 2½ per cent., if these articles are used for the industries of the country. Foreigners doing business in the Netherlands have the same privileges and must pay the same taxes as the natives, but are subject to no special tax. Formerly patents or licenses had to be taken out on entering into trade, but this is no longer required. In respect to the importance of commerce with the Netherlands, Prussia stands at the head of all nations dealing with that country. In 1895 the value of the imports from Prussia was 18.9 per cent. of the whole value, and the value of the exports to Prussia 48.8 per cent. The countries next in importance were Great Britain, Belgium, Russia, and the United States. During the year ended June 30, 1896, the United States imported from the Netherlands merchandise to the value of $13,295,767, and exported to the Netherlands merchandise to the value of $39,022,899. The trade of the Netherlands with the Dutch East Indies is very important, the value of the imports being 13.7 per cent. of the total for home consumption, in 1895. The figures for 1895–96, however, are based on estimates, for the practice of publishing statistics of imports and exports was discontinued after 1872, mere quantities being given since that date. Among the leading imports to the Netherlands are iron and steel wares, cereals, flour, chemicals, wood, copper, seeds, textiles, coal, coffee, sugar, rice, and skins; and among the exports from the Netherlands are cereals and flour, chemicals, metal wares, textiles, coffee, vegetables, cheese, flax, margarine, etc. The Netherlands import large quantities of commodities for re-exportation. From the colonies the imports include coffee, sugar, rice, tobacco, indigo, etc. Manufactured articles and coal are derived largely from England, Prussia, and Belgium; grain is extensively imported from the east; building wood from Norway and the Rhineland; yarn from England; wine from France; hops from Bavaria and Alsace. As to the destination of the exports, large supplies of beef and dairy products go into the London market; fish is sent to Belgium and Germany, and cheese to England, France, Belgium, and Hamburg. The exports to the United States consist largely of refined sugar, coffee, spices, distilled liquors, and wine. From Amsterdam there has been a large exportation of diamonds to the United States, but, owing to the establishment of the diamond cutting and polishing factories in the latter country, and to the hard times there prevailing in 1896, the diamond trade showed a falling off.

The merchant marine of the Netherlands at the end of 1895, included 405 sailing vessels, with a tonnage of 102,660, and 162 steamers, with a tonnage of 188,682. The tonnage of vessels that entered the ports of the Netherlands in 1895, was 6,785,472, and the tonnage of vessels that cleared was 6,770,604. In respect to tonnage, the most important port is that of Rotterdam, which received 57.5 per cent. of the total. Next in importance was Amsterdam, with 17 per cent., and next Flushing, with 9.9 per cent.

RELIGION, LANGUAGE, EDUCATION, ETC.—The constitution grants perfect freedom of worship and social equality to the members of all religious sects, but the royal family and the majority of the population belong to the Reformed church, which, in form of government, is Presbyterian, having a synod as its administrative head. This synod, which is composed of 19 members, with a president, vice-president, secretary, and quæstor, holds yearly meetings in the Hague. The Roman Catholics are under an archbishop and four bishops. The members of the Dutch Reformed church, in 1889, numbered 2,194,649; the Roman Catholics, 1,596,482; various Protestant bodies, 522,608, and Jews, 97,324.

There are five dialects, spoken respectively in Groningen, Friesland, Gelderland, Holland, and Zealand. These differ considerably from each other, and the Frisian is not at all understood by natives of the other provinces. The written language is the Dutch, that branch of the great Teutonic stock which preserves more of its original character than the rest of the same family. It possesses numerous words the same as Lowland Scotch, and bears a strong affinity to the old Saxon English, as the following Dutch proverb shows:

Als de wyn is in den man,
Is de wysheid in de kan.

The kingdom of the Netherlands has produced many great names in all branches of literature and science. Coster (q.v.), according to his countrymen, invented printing, Leeuwenhoek the microscope, and Huygens applied the pendulum. Out of a long list of distinguished names, may be mentioned those of Erasmus, Scaliger, Heinsius, Hugo de Groot (Grotius), Huygens, Leeuwenhoek, Vitringa, Boerhave, and the poets Hooft, Vondel, and Cats; whilst the writings of Van der Palm, Van Lennep, Des Amoire, Van der Hoeven, Haafner, Stuart, Van Kampen, and those of the poets Bilderdyk, Da Costa, De Bull, Van den Berg, ter Haar, and Hofdyk, show that literature is not waning. Leading painters of the old Dutch school were Rembrandt, Gerrit (Gerard) Dou, Gabriel Metzu, Jan Steen, Paul Potter, Ruysdael, Van der Helst; and among those of the present century, Ary Scheffer, Koekkoek, Schelfhout, Pieneman, Kruseman, Van Os, Craeyvanger, Ten Kate, Israels, Bles, Louis Meyer, Roeloff, Springer, etc., have distinguished themselves.

There are four universities; three of them, namely those at Leyden, Utrecht, and Groningen, supported by the state, and one maintained by the city of Amsterdam. Education is not compulsory, but is largely under state direction and inspection. Primary instruction is regulated under the act of 1857, supplemented and modified by the acts of 1878 and 1889. The expense of public primary education is borne jointly by the

state and the communes. At the head of the school system are three inspectors, under whom are school officers in the districts and arrondissements, and local school committees in the communes. Institutions for intermediate instruction include classical schools, secondary day and evening schools, navigation schools, "middle class" schools, and a polytechnicum,—the last named at Delft. The army and navy have institutions for special instruction at Breda and Willemsoord, and there are various other schools for special or technical instruction. The number of illiterates is not large. In 1895 5.4% of the conscripts could neither read nor write. In respect to the number of children receiving elementary instruction, the decade from 1884–94 showed a considerable improvement. At the former date 12.7% of the children of school age received no elementary instruction, at the latter date only 9%.

Army, Navy, etc.—Few fortresses protect the frontiers of the Netherlands, and the most effective means of defence now, as formerly, consists in inundating the land by piercing the dikes. The army consists of a regular force, and a militia, which is divided into an "active" and a "resting" militia. Besides these there is a *Landstorm*, consisting of all who are able to bear arms. Between the ages of 25 and 30 all men belong to the militia, and between 30 and 35 to the reserve. The army is under the regulation of the law of 1861, and is formed in part by conscription, and in part by voluntary enlistment. The regular army on a war footing comprised in 1896, about 68,000 men and on a peace footing at the same date 19,774 and about 1850 officers. See the article Armies, Modern. In 1896 the Dutch navy consisted of 28 port defence ships, 79 cruisers, and 37 torpedo craft. See the article Navies, Modern.

Revenue, Expenditure, etc. The budget estimates of expenditure for 1897 were 137,272,941 guilders and of revenue 133,924,965 guilders. A large share of the revenue is derived from the excise. Next in importance are the direct taxes, the indirect taxes, and the customs duties. There is a separate budget for the East Indian colonies, and, in 1897, the total revenue of the East Indies was calculated at 126,444,105 guilders. In 1897 the total debt was placed at 1,109,616,343 guilders, most of which was funded at 2½ and 3% interest.

Colonies.—The colonial possessions of the Netherlands comprise an area of about 783,000 sq. miles, with a population estimated at 34,000,000. They include islands in both the East and the West Indies. In the former the most important colonies are Java, Sumatra, Borneo, Celebes, Papua, or New Guinea, the Moluccas or Spice Islands, and the Timor Archipelago; in the West Indies, Surinam or Dutch Guiana, and Curaçoa and its dependencies. In general, the government of the Dutch over their colonies has been maintained by peaceful means, but in the case of the sultanate of Acheen (q. v.) in the northern part of the island of Sumatra (q. v.) there has been a marked exception to this rule. Before the close of the 18th century, the sultan of Acheen was robbed of his possessions on the other islands and, early in the 19th century, a Dutch protectorate was established over Acheen itself. The fierce Malay inhabitants, however, did not accept the Dutch rule. Frequent acts of hostility on their part led to a Dutch invasion in 1873, and though the capital was captured in the following year, the country was not subdued, and for many years there were revolts and wars. The rigorous rule of General van der Heyden kept the natives in check until 1881, when a new rebellion broke out. From that time on, the Dutch held a small triangular section of the country, but outside of this it was unsafe for them to go. One of the fiercest and ablest chieftains of the Acheenese was Toekoe Oemar, whose treachery and outrages constantly harassed the Dutch. In 1893, however, he declared himself on the side of the rulers, and aided in subduing a revolt, but the peace which followed was of short duration, for in the spring of 1896 a very formidable rebellion broke out, and, though Toekoe Oemar was avowedly on the side of the Dutch, it was soon apparent that he was planning to betray them to the rebels. His treachery was discovered in time to save the Dutch from disaster, but a savage war followed, in which many of the Dutch were killed. The fighting continued for several months and, though it resulted in the dispersion of the rebels, the country was by no means fully subdued. Permanent military stations were established in Acheen, with the evident intention of completing the conquest of the territory.

Monetary System.—The government mint is open to the coinage of gold alone, but the amount of silver in circulation is greater than that of gold. The great bulk of the currency consists of bank notes, which the bank of the Netherlands alone is privileged to issue. The per capita circulation on Dec. 31, 1895, was estimated at $25. In 1816 the Netherlands changed from the single silver standard to the double standard, but in 1847 returned to the silver standard. In 1875, however, a law was passed providing that the mint should issue gold coins to the value of 10 and 5 florins, but free coinage of silver had already been stopped, and in 1884 it was provided by law that upon the demand of the mint, the government could withdraw 25,000,000 florins ($10,500,000) worth of silver, melt it down and sell it. Nominally the Netherlands have a double standard, but the monetary system of the country is in reality on a gold basis. The value of the florin or guilder in United States currency is 40.2 cents.

Government. The government of the Netherlands is a limited constitutional monarchy, hereditary in the male line, and by default of that, in the female. The crown-prince bears the title of prince of Orange, and attains his majority at eighteen, when he takes his seat in the council of state. The executive is vested in the queen with a council of state composed of twelve members, nominated by her majesty, and the ministers of the interior, foreign affairs, finance, war, the colonies, public works and commerce, marine, and justice, the last named taking charge of ecclesiastical affairs through

two administrators, or under-secretaries of state, for the Protestant and Roman Catholic churches. The legislative power is shared by the queen and the two chambers of the states-general; the first chamber having 50 members elected for nine years, by the provincial states, one-third of their number retiring every three years. The second chamber has 100 members, elected for four years, one-half of the chamber retiring every two years.

History.—Nothing is known regarding the original inhabitants of the Netherlands; but about a century and a half before our era the people known as the Batavi came out of Hesse, where they were living in hostility with their neighbors, and settled down between the Rhine and the Waal. At this time the Frisians occupied the country n. of the Rhine to the Elbe. The Batavi and Frisians differed little in appearance, manner of life, and religion. They clothed themselves with skins, lived by fishing, hunting, and pasturing cattle, possessing horses, cows, and sheep; were faithful, open-hearted, chaste, and hospitable. The songs of the bards composed their literature and history. Warlike and brave, they selected their leader for his courage and prowess, were armed with the bow and a short spear. They worshiped the sun and moon, and held their meetings in consecrated woods.

The Romans having subdued the Belgæ, next attacked the Frisians, who agreed to pay a tribute of ox-hides and horns, but continued restless and rebellious. The Batavi became allies of Rome, paying no tribute, but supplying a volunteer contingent, chiefly of cavalry, which decided the battle of Pharsalia in favor of Cæsar, and formed a gallant band of the Roman armies in all parts of the empire. About 70 A.D. Claudius Civilis, a Batavian, whose original name has not been preserved, made a bold effort to overthrow the Roman power in Rhenish or Germanic Gaul, but he was finally compelled to sue for peace. Towards the close of the 3d c. began the inroads of the Franks, followed by the Saxons and other races; and in the 5th c. the Batavi had ceased to exist as a distinct people. The Franks continued to spread, and with them the Christian religion, Dagobert I., one of their princes, erecting a church at Utrecht, which, 695, became the seat of a bishopric. The Frisians were opposed to and the last to embrace Christianity, to which they were forcibly converted by Charles Martel. At the end of the 8th c. all the Low Countries submitted to Charlemagne, who built a palace at Nymegen, on the Waal. The feudal system now began to develop itself and expand into dukedoms, counties, lordships, and bishoprics, which the dukes, counts, and bishops, especially the counts of Holland and bishops of Utrecht, endeavored to enlarge and to rule over with as little submission to their superior as possible. The crusades weakened the power and drained the resources of the nobles and priesthood, so that, during the middle ages, cities began to assume importance, strengthen themselves with walls, choose their own rulers, and appear in the state meetings. In 1384 the county of Flanders passed, through marriage, to the duke of Burgundy, whose grandson, Philip the Good, made it his special life-effort to form the Netherlands into a powerful kingdom. He bought Namur, inherited Brabant with Limburg, and compelled Jacoba of Bavaria to resign Holland and Zealand. Charles V., as heir of the house of Burgundy, inherited and united the Netherlands under his scepter, and the country attained to prosperity through the encouragements which he gave to commerce and shipping. Philip II., who succeeded his father, 1555, by his harsh government and persecution of the reformers excited the Netherlands to rebellion, which after a struggle of 80 years resulted in the firm establishment of the republic of the United Provinces. The founder of the independence of the Netherlands was William of Nassau, prince of Orange, called in history the silent, who freely sacrificed his own property, and put forth every effort to unite the discordant states of the south with those of the north in resisting the Spanish yoke. Retiring to Holland, and banding together several provinces for mutual defense, by an agreement made at Utrecht, 1579, he perseveringly opposed the efforts of Spain; and in 1609 the independency of the United Provinces (the boundaries of which nearly coincided with those of the present kingdom of the Netherlands) was virtually acknowledged by the Spanish king, an armistice for twelve years being signed at Antwerp, April 9 of that year. The struggle was renewed and carried on till 1648, when all the powers acknowledged the independence of the United Provinces by the treaty of Munster, while the Belgic provinces, divided among themselves, remained submissive to Spain and to the Roman Catholic church.

Prince William the Silent did not live to see his efforts for freedom crowned with success. Excited by religious fanaticism, and the hope of a great reward, Balthazar Gerard, or Guion, 1584, shot the prince in his house at Delft, from a narrow passage, as he was stepping from the dining-room to ascend an adjoining stair which led to the second floor. With the 17th c. the United Provinces began to advance in power and wealth, their ships visiting all parts of the world. Meanwhile the contest between the Arminians and Calvinists broke out, and raged with fury for many years; Grotius and others fleeing to other lands, and the statesman Oldenbarneveld suffering on the scaffold at the age of 72. The United Provinces were presided over by the princes of Orange till the troubles at the end of the 18th c. began the long European war, which the battle of Waterloo brought to a close. The national convention of France having declared war against Great Britain and the stadtholder of Holland, 1793, French armies overran Belgium, 1794; and being welcomed by the so-called patriots of the United Provinces, William V. and his family, Jan., 1795, were obliged to escape from Scheveningen to

England in a fishing-junk, and the French rule began. The United Provinces now became the Batavian Republic, paying eight and a half millions sterling for a French army of 25,000 men, besides giving up important parts of the country along the Belgian frontier. After several changes, Louis Bonaparte, June 5, 1806, was appointed king of Holland, but four years later was obliged to resign because he refused to be a mere tool in the hands of the French emperor. Holland was then added to the empire, and formed seven departments. The fall of Napoleon I., and dismemberment of the French empire, led to the recall of the Orange family, and the formation of the southern and northern provinces into the ill-assorted kingdom of the Netherlands, which in 1830 was broken up by the secession of Belgium In 1839 peace was finally concluded with Belgium; but almost immediately after national discontent with the government showed itself, and William I., in 1840, abdicated in favor of his son. The Netherlands being moved by the revolutionary fever of 1848, king William II. granted a new constitution, according to which new chambers were chosen, but had scarcely met when he died, March, 1849, and William III. ascended the throne.

A bill for the emancipation of the slaves in the Netherlands West India possessions passed both chambers Aug. 8, 1862, and received the royal assent. It decreed a compensation of 300 guilders for each slave, except those of the island of St. Martin, who were to be compensated for at 30 guilders each. The freed negroes may choose the place to labor, but must be able to satisfy the government officers that they are employed somewhere. This surveillance to continue during ten years. The law came into force July 1, 1863, and in Surinam and all the other colonies the day passed quietly over. Those, however, interested in agriculture have sent an address to the minister of the colonies, protesting against the high-wages tariff as hostile to the successful carrying on of their operations. The rate, however, is not higher than the planters in the neighboring British colony of British Guiana are accustomed to pay. In the budget for 1863 provision was made for the extraordinary expenses connected with the emancipation to the amount of $5,326,830, of which $4,335,000 as compensation for the slaves of Surinam, and $116,250 as premiums for free labor. For Curaçoa and its dependencies, $830,000 of compensation money, fully $60,000 being for various other outlays connected with the change. The number of slaves set free may be stated in round numbers to be 42,000.

On July 16, 1863, a treaty was signed at Brussels by all the naval powers for the buying up of the toll levied, under treaty arrangements, by the king of the Netherlands, on vessels navigating the Scheldt (q.v.), the king of Belgium binding himself also to reduce the harbor, pilot, and other charges on shipping within that kingdom.

The Netherlands have suffered much from floods, either caused by the breaking in of the sea or by the descent of masses of water from Germany, while the rivers of the Rhine delta were blocked up with ice. The Zuider Zee (q.v.), which contains 1365 sq.m., was of trifling extent till the flood of All Saints' day, 1247, when the North sea swallowed up a large tract of country. In 1277 the Dollart gulf, in Groningen, was formed at the mouth of the Ems, by floods in the spring and autumn of that year, which destroyed 33 villages and 100,000 people. The immense waste of waters known as the sunken South Holland Waarde, or Biesbosch, arose out of the breaking of one of the dykes, 1421, by which 72 villages were laid under water, only 34 of them reappearing. In modern times great floods, but fortunately with only temporary results, have occurred in 1809, 1825, and 1855. That of 1855, which placed the town of Veenendaal, in Gelderland, and an extensive tract of country under water, was caused by a rapid thaw in the high lands of Germany pouring down torrents of water into the Netherlands while the rivers were ice-locked after a winter of unusual severity.

In 1890 king William died and his daughter Wilhelmina (b. 1880) was proclaimed queen, the queen dowager Emma to act as regent during her minority. As the direct male line became extinct in the king, the grand-duchy of Luxemburg (q. v.) which had been connected with the House of Orange by personal union only, and which is restricted to the male line, passed to the grand-duke Adolf of Nassau in accordance with the Treaty of London. Considerable fear was felt in political circles lest the death of the young queen Wilhelmina or her marriage with a German prince would lead to the absorption of Holland in the German empire. In 1896 a new election law was passed conferring the right to vote upon all male citizens 25 years of age who pay a direct tax to the state of a little over a florin, or who can prove that they have paid a certain small rent for houses or lodgings during a fixed term, that they have been in regular employment during a certain period, and receiving a certain small salary, or that they own or lease boats of not less than 24 tons' burden. Practically the design of this measure is to extend the suffrage to all who can prove themselves self-supporting. Under the old law the great majority of the working men had not possessed the right to vote. The first election under the new law was held on June 15, 1897.

See *Dutch Language and Literature*, *Political Parties*, *Dutch*, and the articles on JAVA, and the other Dutch colonies; also Wood, *Through Holland* (1877); *Staatsbegrooting voor het Dienstjaar 1891* (Hague, 1891); *Algemeene Statistiek van Nederland* (Leyden, 1882); *Statesman's Year-book* (London, 1891); Havart, *The Heart of Holland;* id., *Picturesque Holland;* id., *The Dead Cities of Zuyder Zee;* D'Amicis, *Holland* (Eng. trans., 1888); Motley, *The Dutch Republic;* Schneider, *Geschichte der Niederl. Literatur* (Leipzig, 1888); Ditchfield, *The Church of the Netherlands* (1892), *Staatsalmanak voor het Koningrijk der Nederlander* (1896), *Commercial Relations with the United States* (1895–96), *U. S. Consular Reports* (1896–97), *Money and Prices in Foreign Countries* (Special Consular Reports, 1896).

NETS are fabrics in which the threads cross each other at right angles, leaving a comparatively large open space between them; threads are also knotted at the intersections. In this respect netting differs essentially from weaving, where the intersecting threads simply cross each other. The open spaces in nets are called *meshes*, and these correspond in size with an instrument used in net-making, consisting of a flat piece of wood or other hard substance, usually about the shape and size of a common paper-knife. In addition to this, a peculiar kind of needle is used, upon which a large quantity of the thread is placed by winding it from end to end between the forked extremities; the holes are used to insert the end of the thread, to prevent it slipping off at the commencement of the winding. The art of net-making has been practiced from the earliest times by the most savage as well as the most civilized nations. Even where the art of weaving was quite unknown, as in some of the South Sea islands when first discovered, that of netting was well understood; and it is easy to see that the human race could not help learning the value of this art from seeing how frequently land and water animals get entangled in the shrubs and weeds through which they attempt to pass; hence we find amongst savage tribes, almost universally, nets are used not only for fishing, as with us, but also for entrapping land animals. We have ample illustrations of the uses of nets for both purposes in the bas-reliefs of Assyria, Greece, and Rome, and in the mural paintings of Egypt.

Until recently nets have been always made by hand, and generally the thread has been a more or less thick twine of hemp or flax, the thickness of the twine and the size of the mesh depending upon the kind of fish for which it was made; recently, however, great improvements have been made in the manufacture of nets, and machinery of a most beautiful automatic kind has been introduced. Hemp is the chief material used; and in order to prepare it, it is first passed in long rolls through a machine consisting of two rollers with blunt ridges, the upper of which is kept down on the material by means of a hanging weight, consisting of a loaded box suspended to a chain from the axle of the roller. After the fiber has passed through this, it is much more supple than before, and is then *hackled;* this process is also done by machinery, which was first introduced into this manufactory for hemp-hackling, and succeeds admirably. It subsequently passes through the carding, roving, and spinning processes, as in all other kinds of yarn, and is finally twisted into threads or twines of the required thickness.

A great variety of nets are in use amongst fishermen, but the principal are the *seine, trawl,* and *drift nets.* The seine is a very long but not very wide net, one side of which is loaded with pieces of lead, and consequently sinks; the other, or upper, is buoyed with pieces of cork, and consequently is kept up to the surface. Seines are sometimes as much as 190 fathoms in length. When stretched out they constitute walls of net-work in the water, and are made to inclose vast shoals of fish. The trawl is dragged along the bottom by the fishing-boat; and the drift-net is like the seine, but is not loaded with lead; it is usually employed for mackerel fishing.

Various kinds of nets are used in bird-catching, one of which is noticed in the article CLAP-NET. Nets are used in catching quadrupeds, chiefly for the purpose of inclosing spaces within which they are, but sometimes also for throwing upon them to confuse and entangle them.

Nets are used by gardeners to protect crops from birds; also to protect the blossoms of trees from frost, and it is wonderful how well this object is accomplished, even when the meshes are pretty wide, and the sun's rays have very free access.

NETSCHER, GASPAR, or KASPAR, 1639–84; b. Germany; adopted by the physician Tullekens, who placed him under the instruction of Koster, a painter of poultry and objects of still life. He afterwards studied under Gerard Terburg at Deventer. He set out for Italy, where he intended to complete his studies, but having married at Bordeaux, he returned to Holland, and established himself at the Hague. He now took up portrait painting, having previously painted only small cabinet pieces. His best works are his musical and conversational pieces. He was a brilliant colorist, a master of light and shade, and very skillful in his treatment of accessories and draperies. Many of his pictures are in Louvre, at Dresden, Munich, or Florence. His eldest son, THEODOR, 1661–1732, b. Bordeaux, was for many years a portrait painter in Paris, imitating his father's style, but inferior to him. He went to London in 1715, as paymaster of the forces, and being introduced at court, painted many of the principal persons in England, where he remained for six years. Kaspar's second son, CONSTANTINE, 1670–1732, was also a painter of some reputation, who followed closely the manner of his father.

NETSUKÉ, from the Japanese *ne* (wood or root) and *tsuké* (to suspend), a button of wood, crystal, or porcelain, but usually of ivory, by which the Japanese smoker suspends his outfit of tobacco, flint and steel, pipe, etc., from his girdle. Generally the netsuké is an elaborate work of art in carving, and is among the most characteristic products of native skill, portraying the fun, humor, grotesque or pathetic traits in human and animal nature, and illustrating the national legendary and historic lore. The best specimens have engraved on them the mark of the carver, and are very costly.

NETT (also written NET), (Lat., *nitidus,* Fr., *net,* Span., *neto*), is an expression denoting whatever is left after all deductions have been made, as net profits, net income, etc.

NETTING, Naval. A *boarding-netting* is formed of strong rope, and stretched above the bulwarks of a ship, over the port-holes, etc., to a considerable height, for the purpose of preventing the entrance of boarders from hostile boats. In positions where boat attacks are feasible, ships are thus protected at night, and at other times when attempts at boarding are anticipated.

The *hammock-netting* is in the bulwarks of a ship, usually in the waist, and its purpose is to keep the hammocks of the crew when stowed there during the day; thus netted together, the hammocks form a valuable barrier against bullets.

Hatchway-nettings are of inch rope, and are placed over the open hatchway during fine weather, to prevent persons from falling through.

NETTLE, *Urtica*, a genus of plants of the natural order *Urticeæ*, having unisexual flowers, the male and female on the same or separate plants; the male flowers with a 4-parted perianth, and four stamens; the female flowers with a 2-parted perianth and a tufted stigma; the fruit an achenium. The species are herbaceous plants, shrubs, or even trees, many of them covered with stinging hairs, which pierce the skin when touched, and emit an acrid juice, often causing much inflammation and pain. When a nettle is grasped in such a way as to press the hairs to the stem, no stinging ensues; but the slighest inadvertant touch of some of the species produces very severe pain. The stinging of the native nettles of Europe is trifling in comparison with that of some East Indian species. *U. crenulata* is particularly notable for the severity of the pain which it produces, without either pustules or apparent inflammation. The first sensation is merely a slight tingling, but within an hour violent pain is felt, as if a red-hot iron were continually applied, and the pain extends far from the original spot, continues for about twenty-four hours and then abates, but is ready to return in its original intensity on the application of cold water, and does not cease for fully eight days. Cold water has a similar effect in increasing or renewing the pain of all kinds of nettles. Still more formidable than this species is *U. urentissima*, the *Devil's Leaf* of Timor. Of British species, the most venomous, but the most rare, is the Roman Nettle (*U. pilulifera*); next to it is the Small Nettle (*U. urens*), frequent about towns and villages, and in waste and cultivated ground; whilst the least venomous is the most common and only perennial species, the Great Nettle (*U. dioica*), everywhere abundant, but particularly near human habitations, or their former sites, the desolation of which it may be said to proclaim. The roots of nettles, boiled with alum, afford a yellow dye; and the juice of the stalks and leaves has been used to dye woolen stuffs of a beautiful and permanent green. The young shoots of *U. dioica* are used in some parts of Scotland and other countries as greens, and their peculiar flavor is much relished by some, although, in general, the use of them is confined to the poor; which, however, is probably the result of mere prejudice. Whatever it is that gives nettles their stinging power, is dissipated by boiling. The high value of nettles as food for swine, is well known to the peasantry of many countries; the great Nettle is cultivated in Sweden for fodder of domestic animals; nettles are also highly esteemed as food for poultry, particularly for turkeys. The seeds are extremely nutritious to poultry; and are given to horses by jockeys, in order to make them lively when they are to be offered for sale. The stalks and leaves of nettles are employed in some parts of England, for the manufacture of a light kind of beer, called *Nettle beer*, which may be seen advertised at stalls, and in humble shops in Manchester and other towns. The *bast* fiber of nettles is useful for textile purposes. Yarn and cloth, both of the coarsest and finest descriptions, can be made of it. The fiber of *U. dioica* was used by the ancient Egyptians, and is still used in Piedmont and other countries. When wanted for fiber, the plant is cut in the middle of summer, and treated like hemp. The names *Nettle Yarn* and *Nettle Cloth* are, however, now commonly given in most parts of Europe to particular linen and cotton fabrics.—The fiber of *U. cannabina*, a native of the south of Siberia and other middle parts of Asia, is much used; and from that of *U. Whitlawi*, both fine lace and strong ropes can be manufactured. The fiber of *U. Japonica* is much used in Japan, and that of *U. argentea* in the South Sea islands; that of *U. Canadensis* is used in Canada.—The seeds and herbage of *U. membranacea* are used in Egypt as emmenagogue and aphrodisiac; and somewhat similar properties are ascribed to *U. dioica.*—*U. tuberosa* produces tubers, which are nutritious, and are eaten in India, raw, boiled, or roasted.—Australia produces a magnificent tree-nettle, *U. gigas*, abundant in some parts of New South Wales, ordinarily from 25 to 50 ft. high, but sometimes 120 or 140 ft., with trunk of great thickness, and very large green leaves, which, when young, sting violently. In some places, it forms *scrub* forests, and its stinging leaves form a great impediment to the traveler.

NETTLE-BUTTERFLY, a popular English name for several species of butterfly whose eggs are laid upon the leaves of nettles, namely, *Pyrameis atalanta*, *P. cardui*, and *vanessa urticæ*, the last, as its scientific name shows, being an especial frequenter of these plants.

NETTLE-GERANIUM, a name sometimes given to the *coleus Blumei*, a labiate plant indigenous in Java, but well known in our flower gardens by reason of its showy foliage.

NETTLE-RASH, or Urtica'ria (Lat., *urtica*, a nettle), is the term applied to a common form of eruption on the skin. The eruption consists of wheals, or little solid eminences of irregular outline, and either white or red, or most commonly both red and

white, there being a white centre with a red margin. The rash is accompanied with great heat, itching, and irritation; the appearance on the skin and the sensation being very much like the appearance and feeling produced by the stinging of nettles; and hence the origin of its names.

The disease may be either acute or chronic. In the acute form, feverishness usually precedes the rash by a few hours, although sometimes they commence together. The disorder is always connected with some derangement of the digestive organs, and it may often be traced to the imperfect digestion of special articles of food, such as oatmeal, the kernels of fruit, strawberries, cucumbers, mushrooms, and especially oysters, mussels, and crabs, which are eaten with perfect impunity by most persons. An hour or two after the offending substance has been swallowed, there is a feeling of nausea, with oppression about the pit of the stomach; the patient often complains of giddiness, and the face frequently swells; the skin then begins to tingle, and the eruption breaks forth; vomiting and diarrhea often supervene, and act as a natural cure; but even when they do not occur, the violence of the rash usually subsides in a few hours, and the disorder altogether disappears in a day or two.

The chronic form is often very troublesome; and frequently comes on periodically in the evening. Cases are reported in which persons have been afflicted for ten years continuously by this form of the disease. Patients have left off all their customary articles of diet, one by one, without in all cases meeting with relief; and hence it may be inferred, that although the disease depends in all cases on a disordered condition of the digestive organs, it is not always the consequence of some special offending article having been swallowed.

The main treatment of the acute form consists in expelling the offending matter by an emetic and by purgatives, and the cure is thus usually completed. In the chronic form, the patient should, in the first place, determine whether the rash is caused by any particular article of diet, and if this seems not to be the case, an attempt must be made to improve the state of the digestive organs. A few grains of rhubarb taken daily, just before breakfast and before dinner, will sometimes effect a cure. If this simple remedy fails, Dr. Watson recommends the trial of a draught composed of the infusion of serpentaria (about an ounce and a half), with a scruple each of the carbonates of magnesia and soda. He adds, that although external applications are usually of little avail, he has found that dusting the itching surface with flour sometimes affords temporary relief; and that a still more useful application is a lotion composed of a dram of the carbonate of ammonia, a dram of the acetate of lead, half an ounce of laudanum, and eight ounces of rose-water. See Hives.

NETTLESHIP, Henry, an English classical scholar; born in Kettering, Northamptonshire, England, May 5, 1839. He was educated at private schools, the Cathedral School, Durham, and at Charterhouse. He gained a scholarship at Corpus Christi College, Oxford, and at the Hertford University, and the Gaisford Prize for Greek Prose. He was elected Fellow of Lincoln, and gained the Chancellor's Latin Essay Prize. From 1868 to 1873 he was assistant master at Harrow, and in 1870 married the eldest daughter of Rev. T. H. Steel, his colleague at Harrow. In 1873 he was appointed Fellow and Tutor of Corpus, and Classical Lecturer at Christ Church, Oxford, which appointments he resigned on being made Corpus Professor of Latin Literature in the University of Oxford, 1878. Professor Nettleship published and edited many classical works, among them a commentary on *Æneid* X. and XII., a revised edition of Conington's *Virgil*, and *Lectures and Essays on Subjects connected with Latin Literature and Scholarship* (1885). He died in 1893.

NETTLETON, Asahel, D.D., 1783–1844; b. Conn.; graduated at Yale college in 1809; studied theology at New Haven; was licensed to preach in 1811 by the West Congregational association of New Haven; ordained as an evangelist in 1817 by the South consociation of Litchfield county. He commenced study with the view of being a missionary, but his services being in great demand, and his preaching very successful, he was led to consider it his duty to remain at home. For several years he preached in some of the largest and most important towns in Connecticut with great effect. In 1822 he had an attack of typhus fever, from the effects of which he never entirely recovered. In 1827 he visited Virginia for his health, and on his return in 1829, preached for two years in New York and New England. In 1831 he visited England, preaching there, and in Scotland and Ireland. After his return he was appointed in 1832 professor of pastoral theology in East Windsor (Conn.) theological seminary. He declined the professorship, but resided in the place, and lectured for several years to the students. His sermons were extemporaneous, and generally doctrinal and argumentative, but with fervent appeals to the conscience. His style and manner are deeply solemn, to which impression his various methods in the conduct of his meetings contributed. He was a decided opponent of Dr. Taylor's (New Haven) theological views. He published a small hymn-book, entitled *Village Hymns*, which was very popular and widely used. His *Remains and Sermons* were edited by Dr. B. Tyler, who published also a *Memoir*, which was republished in Edinburgh, and revised by Dr. A. A. Bonar.

NETTLE-TREE, *Celtis*, a genus of deciduous trees of the natural order *ulmaceæ*, with simple and generally serrated leaves, considerably resembling those of the common net-

tle, but not stinging. The genus is distinguished chiefly by its fruit, which is a fleshy, globose, or sub-globose 1-celled drupe. The common or European nettle-tree (*C. Australis*) is a native of the s. of Europe, the w. of Asia, and the n. of Africa. It grows to the height of 30 to 40 ft., and is a very handsome tree, often planted along public walks in the s. of France and n. of Italy. The wood is very compact, very durable, and takes a high polish. It was formerly much imported into Britain for the use of coachmakers. It is used in Italy by musical instrument makers for flutes and pipes. The flowers are inconspicuous, axillary, and solitary; the fruit black, resembling a small wild cherry, not eatable till after the first frosts, and then very sweet. The kernel yields a useful fixed oil. The tree succeeds well in the s. of England.—*C. occidentalis* is a native of North America from Canada to Carolina, sometimes there called the nettle-tree, sometimes the Sugar Berry. Its leaves are much broader than those of *C. Australis*, its fruit very similar. It is a much larger tree, attaining a height of 60 to 80 feet.—Another American species, *C. crassifolia*, often called Hackberry or Hagberry, and Hoop Ash, is very abundant in the basin of the Ohio and westward of the Mississippi. It grows to a great height, but the trunk is not very thick. The wood is not much valued, but is said to make very fine charcoal. The fruit is black, and about the size of a pea.—The inner bark of *C. orientalis*, consisting of reticulated fibers, forms a kind of natural cloth, used by some tribes of India.—A number of other species are natives of the warm parts of America and of Asia.

NEU-BRAN'DENBURG, a t. of Mecklenburg-Strelitz, the prettiest, and after the capital, the largest in the duchy, is situated on lake Tollens, 17 m. n.n.e. of Neu-Strelitz. It is regularly built, contains three churches, a castle, etc., is the center of a picturesque district, and the seat of considerable industry. Pop. '95, 9720. About half a league from Neu-Brandenburg, on a rock overlooking lake Tollens, stands the ducal pleasure-castle of Belvedere, commanding, it is said, the most beautiful prospect in Mecklenburg.

NEU'BURG, an ancient t. of Bavaria, is picturesquely situated on the right bank of the Danube, 29 m. n.n.e. of Augsburg. It contains a handsome palace, the château of the dukes of Bavaria of the line of Pfalz-Neuburg, who resided here from 1596 to 1742. The palace contains a collection of ancient armor. Brewing and saw-milling are carried on, and there is a considerable commercial trade on the Danube. Pop., including garrison, '95, 8204.

NEU-CHWANG, or Ying-tsze, a t. of the Chinese empire, in Manchuria. It stands on the left bank of the river Liaou, about 25 m. from its mouth, and in lat. 41° n., and long. 122° 30′ e. The Liaou, which falls into the gulf of Liaou-tong, at the head of the Yellow sea, is navigable for sea-going vessels to Neu-Chwang; and Neu-Chwang is therefore regarded as a seaport, and is one of those opened to foreign trade by the treaty of Tientsin. A number of consuls reside here; but the trade is as yet inconsiderable, and only to Chinese ports.

NEUFCHATEL', or Neuchatel, known also as *Neuenburg*, a canton in the w. of Switzerland, between lake Neufchatel and the French frontier. Area, 312 sq. miles. Pop. '94, 111,928. Most of the families speak French, and only a part German. Neufchatel lies in the midst of the Jura mountains, four chains of which, running from n.e. to s.w. traverse the canton, and are separated by elevated longitudinal valleys. The most easterly of these is a broken chain, running parallel to the lake of Neufchatel, on whose banks, and on the second and lower ranges beyond it, the vine is carefully cultivated. This second chain has five principal passes, the highest of which, La Tourne, has an elevation of about 4,000 feet. The third and fourth ranges, abutting on France, consist for the most part of barren hills, separated by elevated valleys; but here and there these high lands are well wooded and fruitful, producing corn, good pasture, fruits, etc. The greater number of the numerous streams which water the canton flow into the Rhine. Among these mountain torrents the principal are the Reuse, the Seyon, and the Serriere, the two former of which, together with the rivers Orbe and Broie, are the feeders of the lake of Neufchatel, known also as the lake of Yverdun. The Thiele serves as its outlet, and carries its waters into the neighboring lake of Bienne, and into the river Aar. The lake is 25 m. long and from 3 to 5½ m. wide. Its level above the sea is 1420 ft., and it has a depth of 400 or 500 feet.

The natural products are iron ores, coal, asphalt, fruit, including grapes — from which good red and white wines are made — timber and corn, although the latter is not grown in sufficient quantity for the demands of the home consumption. The rearing of cattle constitutes an important branch of industry, and large quantities of cheese are exported, but the specialty of the canton is watch-making, which occupies about 20,000 persons, and is prosecuted in detail at the homes of the workpeople, in the rural districts, where some families manufacture only special parts of the machinery, while others are engaged solely in putting together the separate portions that have been manufactured by others; and the watches thus prepared are exported in large quantities to every part of Europe and America. Lace is extensively made by the country-women of the Val de Travers, while the manufacture of jewelry and electric apparatus and the production of asphalt and absinthe employs many.

The climate of Neufchatel varies greatly with the locality; being temperate on the shores of the lake, cooler in the valleys, and severe on the mountain-sides. Four-fifths of the population belong to various Protestant denominations.

The history of Neufchatel was identical with that of Burgundy till the 11th c.; and after the principality had been for a time incorporated with the territories of the counts of Chalons, to whom it had been granted in 1288 by Rudolph of Hapsburg, it passed to the house of Longueville. In 1707, on the extinction of the Neufchatel branch of the latter family, 15 claimants came forward to advance more or less valid pretensions to the Neufchatel territory. Frederick I. of Prussia, who based his claim to the principality of Neufchatel on the ground of his descent from the first prince of Orange, a descendant of the house of Chalons, was the successful candidate; and from his time it continued associated with Prussia till 1806, when Napoleon bestowed it upon gen. Berthier; but in 1814 it was restored to the house of Brandenburg. This connection with the Prussian monarchy has been wholly dissolved since 1857, and Neufchatel is now a member of the Swiss confederation.

NEUFCHATEL, or NEU'ENBURG, is the chief t. of the canton, and occupies a magnificent site on the n.w. shore of the lake of Neufchatel, and is noted for its many charitable institutions, and for the beauty of its charmingly situated environs. Pop. '96, 18,000.

NEU'HAUS, a t. of Bohemia, on the Nescharka, about 70 m. s.s.e. of Prague. Its palace, belonging to count Czernin, is a splendid edifice. Woolen goods and silks are manufactured, and brewing and distilling are carried on. Pop. '90, 8502.

NEU'HAUSEL (Hung., *Ersekujvár*), a t. of Hungary, on the right bank of the Neutra, 74 m. n.w. of Pesth, by the Vienna and Pesth railway. It was formerly strongly fortified, and played an important part in the Turkish wars. No traces of its fortifications now remain. Pop. '90, 11,299, chiefly engaged in agriculture and the rearing of cattle.

NEUHOF, THEODOR VON, Baron, 1686–1756; b. in Metz, Westphalia; became a lieut. in an Alsace regiment, but soon left on account of his poverty, indebtedness, and, it is said, a duel. From this time he wandered about Europe, making use of his title and address to contract new debts. In Spain he met with some success, was offered a colonel's commission, and was engaged to marry one of the queen's ladies of honor. Finding that her dowry was less than represented, he fled with her jewels. In 1735 he became interested in the Corsican movement to assert the independence of Genoa, and in the following year persuaded the dey of Tunis to intrust to his command two regiments, with supplies and ammunition. Landing in Corsica in March, he was received with enthusiasm. Exaggerated and totally false ideas as to his rank in nobility and his influence with the governments of Europe were promulgated, and in April he was elected king under the title of Theodore I. His reign lasted but eight months, during which time he made great display personally and formed a new order of knighthood. His promises of foreign assistance were not realized, though the Netherlands made some vague treaty of alliance; and when in 1738 the French came to the aid of the Genoese, the Corsican cause was lost and Neuhof fled. After the departure of the French, 1741–42, Neuhof found that his popularity had vanished and that his life was in danger. He fled again to England, where he was imprisoned for debt by his Dutch creditors (he had in 1738 mortgaged two Corsican cities for funds to carry on the war), and was released in 1756, a few months before his death, by the assistance and intercession of Horace Walpole.

NEUILLY (sometimes called NEUILLY-SUR-SEINE, to distinguish it from several much less important places of the same name), a t. of France, in the department of Seine, on the right bank of the river Seine, 4 m. n.w. by w. of Notre Dame. Neuilly may now be regarded as a suburb of Paris, for it is just outside of the city wall. Here, near the Seine, and in a large and beautiful park, formerly stood the château de Neuilly, built by Louis XV., and the favorite residence of Louis Philippe, which was burned at the revolution in 1848. The park was also then divided into lots for sale, the consequence being a rapid increase of the number of houses in Neuilly. Neuilly has manufactures of porcelain and starch, chemical works and distilleries. Pop. '96, 32,730. When Louis Philippe abdicated, and took refuge in England, he assumed the title of count de Neuilly.

NEUKOMM, SIGISMUND, 1778–1858; b. Austria; studied under Michael and Joseph Haydn, and in 1804 became leader of the German opera. In 1816 he went to Rio Janeiro, and was appointed music teacher to the court. He returned in 1821, and lived at Talleyrand's house in Paris. He composed many cantatas, symphonies, sonatas, etc., and two successful oratorios, *Mount Sinai* (1831), and *David* (1834).

NEUMANN, KARL FRIEDRICH, 1798–1870; b. in Bavaria; educated at the universities of Heidelberg, Munich, and Göttingen; afterwards studied in Paris and Vienna. Of Jewish birth, he became converted to Christianity and joined the Lutheran sect. In 1829 he traveled in China and India, making a very large collection of books in the native languages. From 1831 to 1852 he was professor of oriental languages at the university of Munich; but his political views caused his dismissal. It was after this that he wrote his *Geschichte der Vereinigten Staaten von Nordamerika*, and *Hoein Schein*, an account of the alleged discovery of America by Buddhist monks. He also published very many pamphlets and papers, relating for the most part to oriental languages and literature, especially those of the Armenians.

NEU'MÜNSTER, a prosperous manufacturing and market town of Schleswig, on the Schwale, one of the head-waters of the Stoer, and on the railway between Altona and

Kiel, 18 m. s.s.w. from Kiel. There are large woolen and linen factories, tanneries, dye-works, and machine shops. Pop., with garrison, '95, 22,492.

NEURAL'GIA (Gr. *neuron*, a nerve; *algos*, pain) is a term employed to designate pain of a purely nervous character, usually unaccompanied by inflammation, fever, or any appreciable change of structure. The pain, which occurs in paroxysms, usually followed by complete remissions, is of every possible degree and character, being described in different cases as piercing, tearing, burning, etc. These paroxysms may occur at intervals of a few seconds only, or they may take place daily or on alternate days, or they may be separated by much longer intervals, which are often, but by no means always, of a regular length. With the pain there is frequently spasmodic twitching of the adjacent muscles. The duration of the disease is very uncertain. The patient may have only a single attack, or he may be liable to recurring attacks for months, years, or even for his whole life; it is, however, very seldom that the disease occurs but once. Death scarcely ever results directly from this affection, but the pain may, by its severity and persistence, gradually undermine the constitution.

The disease may attack any part of the body where there are nerves; but in no part does it occur so frequently as in the face, when it is popularly known as *tic-douloureux;* its seat being in the facial branches of the fifth pair of nerves (the trifacial nerves). The following graphic description of the ordinary varieties of this form of neuralgia is borrowed from Dr. Watson's *Lectures on the Principles and Practice of Physic:* "When the uppermost branch of the trifacial nerve is the seat of the complaint the pain generally shoots from the spot where the nerve issues through the supercilary hole; and it involves the parts adjacent, upon which the fibrils of the nerve are distributed—the forehead, the brow, the upper lid, sometimes the eyeball itself. The eye is usually closed during the paroxysm, and the skin of the forehead on that side corrugated. The neighboring arteries throb, and a copious gush of tears takes place. In some instances the eye becomes blood-shotten at each attack; and when the atttacks are frequently repeated, this injection of the conjunctiva may become permanent.

"When the pain depends upon a morbid condition or morbid action of the middle branch of the nerve it is sometimes quite sudden in its accession, and sometimes comes on rather more gradually; being preceded by a tickling or pricking sensation of the cheek, and by twitches of the lower eyelid. These symptoms are shortly followed by pain at the infra-orbitary foramen, spreading in severe flashes (so to speak) over the cheek, affecting the lower eyelid, ala nasi, and upper lip, and often terminating abruptly at the mesial line of the face. Sometimes it extends to the teeth, the antrum, the hard and soft palate, and even to the base of the tongue, and induces spasmodic contractions of the neighboring muscles.

"When the pain is referrible to the inferior or maxillary branch of the fifth pair of nerves it darts from the mental foramen, radiating to the lips, the alveolar processes, the teeth, the chin, and to the side of the tongue. It often stops exactly at the symphysis of the chin. Frequently it extends in the other direction, to the whole cheek and to the ear. During the paroxysm the features are liable to be distorted by spasmodic action of the muscles of the jaw, amounting sometimes to tetanic rigidity, and holding the jaw fixed and immovable.

"The paroxysms of suffering in this frightful disease are apt to be brought on by apparently trival causes—by a slight touch, by a current of air blowing upon the face, by a sudden jar or shake of the bed on which the patient is lying, by a knock at the door, or even by directing the patient's attention to his malady by speaking of it or asking him questions about it. The necessary movements of the face in speaking or eating are often sufficient to provoke or renew the paroxysm. At the same time, firm pressure made upon the painful part frequently gives relief, and causes a sense of numbness to take the place of the previous agony" (vol. i. pp. 723–24).

Tic-douloureux in the form of severe neuralgia which is by far the most commonly met with; the reason probably being that the trifacial nerve lying superficially, and being distributed over a part of the surface which is usually unprotected by any artificial covering, is very liable, for that reason, to be affected by exposure to atmospheric influences, which are undoubtedly to be included among the exciting causes of this disease. Amongst other seats of neuralgia may be mentioned the arm, especially the fore-arm, the spaces between the ribs, especially between the sixth and ninth, and the lower extremity, where it most frequently affects the sciatic nerve, giving rise to the affection known as SCIATICA, which, however, not always being pure neuralgia, will be noticed in a separate article.

The causes of neuralgia are various. Excluding inflammation of the nervous trunk or *neuritis*, the pain may be excited by a tumor pressing on the nerve, or originating in its substance; or by roughness of a bony surface with which the nerve may be in contact, as when it passes through a foramen; or it may be due to tumors within the cranium, or a morbid state of the spinal cord. Sometimes, again, irritation applied to *one* branch of a nerve will give rise to pain at the extremity of *another* branch of the same nerve, the sensation being reflected along the branch which is not directly exposed to the irritation. In this way we may explain the pain in the shoulder which often accompanies

disease of the liver; the pain in the thigh which is often associated with irritation of the kidney; the pain in the left arm which is often coincident with disease of the heart, etc. Persons suffering from debility, anæmia, and a gouty or rheumatic constitution, are so especially liable to neuralgia that these conditions—as also exposure to malarious influences—must be placed among the the predisposing causes. Amongst the exciting causes, exposure to cold and wet, or to a cold dry east wind, is the most frequent; but fatigue, strong mental emotions, the abuse of tea, coffee, tobacco, and alcholic drinks, a wound or bruise, the retrocession of gout, rheumatism, or cutaneous eruptions, etc.. occasionally suffice to excite the disease.

The resources of the materia medica have been exhausted in searching for remedies for this cruel disease. Dr. Elliotson believes that "in all cases of neuralgia, whether exquisite or not, unaccompanied by inflammation, or evident existing cause, iron is the best remedy;" and there can be no doubt that, when the disease is accompanied with debility and paleness, no remedy is likely to be so serviceable. If the digestive organs are out of order, the neuralgia may not unfrequently be removed or alleviated by correcting their unhealthy state. "Dr. Rigby tells us that having suffered in his own person an intense attack of tic-douloureux, which opium did not assuage, he swallowed some carbonate of soda dissolved in water. The effect was almost immediate; carbonic acid was eructed, and the pain quickly abated. In this case, the pain depended upon the mere presence of acid in the stomach. More often the cause of offense appears to lie in some part of the intestines; and purgatives do good. Sir Charles Bell achieved the cure of a patient upon whom much previous treatment had been expended in vain, by some pills composed of cathartic extract, croton oil, and galbanum. He mixed one or two drops of the croton oil with a dram of the compound extract of colocynth; and gave five grains of this mass, with 10 grains of the compound galbanum pill, at bedtime. Other cases have been since reported, both by sir Charles and by others, in which the same prescription was followed by the same success."—Watson, *op. cit.* p. 727.

When the disease occurs in a rheumatic person, iodide of potassium (from three to five grains taken in solution three times a day before meals) sometimes gives great relief. When the paroxysms occur periodically—as, for example, with an interval of 24 or 48 hours—sulphate of quinine in doses of from 10 to 20 grains between the paroxysms, will usually effect a cure; and if the disease resist comparatively small doses, the quantity may be increased to half a dram, or a dram if necessary. Arsenic acts in the same manner as quinine in these cases, but usually less effectually.

The inhalation of chloroform will sometimes give permanent relief, and always gives temporary ease, and shortens the period of suffering.

The injection of a certain quantity of a solution of muriate of morphia, by means of a sharp-pointed syringe, into the cellular tissue beneath the skin over the painful spot, very often gives immediate relief. For the discovery of this mode of treating neuralgia, we are indebted to Dr. Alexander Wood of Edinburgh. At one time—about half a century ago—it was a common practice to divide the trunk of the painful nerve, with the object of cutting off the communication between the painful spot and the brain; but in many instances the operation signally failed, and it is now never resorted to. A much simpler operation, namely, the extraction of a canine tooth, has often been found to give permanent relief in cases of facial neuralgia, and in such case a careful examination of the teeth should usually be made.

Local applications can be of no permanent service in cases where the pain results from organic change, or from general constitutional causes; they will, however, often give considerable temporary relief. Amongst the most important local applications may be mentioned laudanum, tincture of aconite (or aconitina ointment, in the proportion of one or two grains to a dram of simple ointment or cerate), belladonna plaster, and chloroform (which should be applied upon a piece of linen saturated with it, and covered with oiled silk, to prevent evaporation).

Lastly, neuralgia being a purely nervous affection, is often influenced by means calculated to make a strong impression on the mind of the patient; and hence it is that galvanic rings, electric chains, mesmeric passes, with hand or magnet, and other applications, which, like these, act more upon the mind than upon the body of the patient, occasionally effect a cure.

NEURI'TIS is the term applied to inflammation of the nerves. The disease is rare and not very well defined. The symptoms closely resemble those of neuralgia. Rheumatism seems, in most cases, to be the cause of the disease, which must be treated by bleeding, leeching, purging, and low diet. Anodynes are also required for the relief of the pain; and of these, Dover's powder, in tolerably full doses, is perhaps the best.

NEUROP'TERA (Gr. nerve-winged), an order of mandibulate insects, having four nearly equal and membranous wings, all adapted for flight, divided by their nervures into a delicate net-work of little spaces, and not covered with fine scales, as in the *lepidoptera*. The wings are often extended horizontally when at rest, nearly as in flight; but the position is various. The form of the wing is generally somewhat elongated. The body is generally much elongated, particularly the abdomen. The head is often large, the compound eyes very large, and there are often also simple or stemmatic eyes. The habits are predaceous, at least in the larva state; often also in the pupa and perfect

states, the food consisting of other insects, often caught on the wing. The power of flight is accordingly great in many. The larvæ and pupæ are often aquatic. The females have no sting, and only a few have an ovipositor. The metamorphosis is complete in some, incomplete in others. Dragon flies, May flies, scorpion flies, ant-lions, and termites, or white ants, belong to this order.

NEUROSIS (Gr., *νεῦρον*, a nerve.—Synon., Fr., *Névrose ;* Ger., *Nervenleiden*). Any affection of the nervous organism unattended with inflammation or phenomena accompanied with structural change. The term applied more strictly to functional derangement of the nerves than to any alteration of the physiological condition perceptible at the nerve centres. Hysteria, insomnia, neuralgia, convulsions, are some of the common forms in which neurose manifests itself. Consequently, medical practitioners usually can, and very wisely do, content themselves with treating the disorder as if it were purely functional, until it is apparent that there is mischief existing in some central, radiating point of the nervous system. Morbid changes associated with other complaints often attend these indicia. When the cause of neurosis is a recondite one, then only is it safe to take those therapeutic measures, the necessity and advisability of which justifies their adoption. There is little or no reason to doubt that many nervous diseases now regarded as functional, will, as more light is thrown upon their origin by scientific research, be found symptomatic of structural changes in the organs affected. Classification.—The various types of neurosis are classified under this head, as the importance of the functions or organs they involve rank in importance. *Mental Disorders:* Melancholia, insomnia, hypochondriasis, and other troubles which affect the brain. *General Neurosis*—viz.: Tetanus, choua, catalepsy, hysteria, and kindred ailments. *Disorders affecting the nerves at large.* Rheumatism and neuralgia, including the trigeminal, cervico-occipital, sciatic, and crural forms of the latter. *Visceral Neurosis:* That of the digestive respiratory or circulatory organs. *Paralysis of a local Character*, such as affect the facial nerves. Involuntary facial or other movements, such as facial spasm and the cramp occasionally contortive of the fingers of professional writers.

Addenda. In cases of chorea in children, favorable developments are reported by *Moncorvo.* (*Rev. Gen. de Clin. et de Therap.*, 1889, No. 36, p. 576.) He relates his previous favorable experience in 1888 with antipyrin (q.v.). In the number of the *Revue* cited he records his subsequent experience with four other children. Other means had been vainly tried in three of the latter cases, and in one of which the disease had lasted over three years. Full doses of antipyrin were given, seventy-five to ninety grains daily. The ages of patients were from ten to fourteen years. The direct results were excellent and prompt. At the same time the general health of the patients improved. It is by no means probable that this potent and serviceable remedy, either administered alone or in conjunction with other remedies, may take a very important place in the treatment of all cases where neurosis is ascertained, either as functional or structural. The tendency of physicians to recommend the conjunction of this admirable specific (for its general efficacy has yet to be determined) with chloral or quinine has led to the recording by M. Blamville, a distinguished pharmacist of Paris of an experience of a useful and cautionary kind. He was called upon to put up a prescription of sixty grains antipyrin and seventy-five grains of chloral in half an ounce of water. An oily precipitate resembling neither ingredient was thrown down with a flavor resembling that of coriander seed. Quinine—often given as a tonic in aneurosis—is also highly incompatible with antipyrin, both substances forming a speedy precipitate from the solution.

NEUROT'ICS (Fr., *névrotique ;* Gr., *νεῦρον*, a nerve), a word recently come into use to specify such drugs as tend to affect principally and specifically the nerves of thought and motion. Alcohol, ether, chloral, opium, potassium, bromide, amyl-nitrate, strychnine, quinine, aconite, and digitalis are examples of drugs to which this name may be applied.

NEU'SATZ (also *Neoplanta* or *Uj-Vidék*), a t. of the Austrian empire, in the Hungarian province of Bács, is situated on the left bank of the Danube, opposite Peterwardein. Its origin dates from the year 1700, and by the year 1849 it numbered nearly 20,000 inhabitants. A bridge extends between Neusatz and the town and fortress of Peterwardein. Neusatz is the seat of the Greek-Oriental bishop of Bács, and has 14 churches. On June 11, 1849, it was taken from the Hungarian insurgents by the imperial troops, and was almost wholly destroyed. It has been rebuilt in excellent style. Neusatz is a station for steamers on the Danube, and carries on an important and active trade. Pop. '90, 24,717.

NEUSE, a river of North Carolina, rises near the middle of the northern boundary of the state, and, after a south-easterly course of 280 m., falls by a broad channel into Pamlico sound, which communicates by several inlets with the Atlantic ocean. It forms the harbor of Newbern.

NEUSS, a fortress and flourishing manufacturing t. of Rhenish Prussia, near the left bank of the Rhine, with which it is connected by the river Erft, 3½ m. s.w. of Düsseldorf. Its church of St. Quirinus, a beautiful edifice, and a noble specimen of the transition from the round to the pointed style, was begun in 1209. Neuss is the principal grain-market of the province, and carries on manufactures of paper, machinery, ironware, leather, etc. It is supposed to be the *Novesium* of the Romans, sacked by Attila in the year 451. Pop. '95, 25,032.

NEU'STADT (Polish, *Prudnitz*), a t. of Prussian Silesia, 29 m. s.w. of Oppeln. It is the seat of considerable manufacturing industry, woolen and linen fabrics being the staple goods manufactured. Damask-weaving and bleaching employ 3000 hands. Pop. '95, with garrison, 19,244.

NEUSTADT, or WIENER-NEUSTADT, one of the most beautiful t. of lower Austria, called, from its loyalty, "the ever-faithful town" (*ewig getreue Stadt*), is situated 28 m. s. of Vienna, on the Vienna and Gloggnitz railway, and is also connected with the capital by a canal. It is surrounded by a broad and deep ditch, and by a fortified wall pierced by four gates. The town is overlooked by the large old castle of the dukes of Babenberg, now a military academy founded by Maria Theresa for the preparatory instruction of officers of the line. The castle contains a fine Gothic chapel (date, 1460), rich in painted windows. It is the burial place of the emperor Maximilian I. On Sept. 14, 1834, the whole town, with the exception of 14 houses, was destroyed by a dreadful conflagration, which involved the loss of many lives. The new town has been laid out with great taste and regularity. The canal (40 m. in length) and the railway to Vienna, and the converging roads from Styria and Hungary, are the sources of the prosperity of the town. In Neustadt, machinery is extensively constructed; and flour-milling and manufactures of brass goods, iron goods, faïence, etc. are carried on. Pop. '90, 25,040.

NEUSTADT AN DER HARDT, a small t. of Rhenish Bavaria, charmingly situated on the Speyerbach, at the foot of the Hardt mountains, 12 m. n. of Landau. Its church, with several curious monuments of the counts palatine, and with some ancient fresco-paintings, was finished in the 14th century. It carries on manufactures of paper, cloth, soap, brandy, etc. Pop. '95, 16,005.

NEUSTADT-E'BERSWALDE (since 1876 called officially *Eberswalde* only), a t. of Prussia, in the province of Brandenburg, 27 m. n.e. of Berlin. It is well known on account of its mineral springs, and carries on extensive manufactures of steam-engines and an active trade in grain and coal. Pop. '90, 16,114.

NEUSTETTIN', a t. of Prussia in the province of Pomerania, 92 m. s.w. from Dantzic, on the southern shore of the Vilm See. It is the capital of a circle, and a place of some importance. Pop. '95, 9226.

NEU-STREL'ITZ, the capital and the residence of the court of the grand-duchy of Mecklenburg-Strelitz, pleasantly situated in a hilly district, between two lakes, 60 m. n.n.w. of Berlin. It was built 1768–78 in the form of an eight-rayed star, and contains the ducal palace, with a collection of Slavonic antiquities, and having magnificent gardens attached. Pop., with garrison, '95, 10,345.

NEU'STRIA, or WEST FRANCE (*Francia occidentalis*), the name given in the times of the Merovingians and Carlovingians to the western portion of the Frank empire, after the quadruple division of it which took place in 511. Neustria contained three of these divisions. It extended originally from the mouth of the Scheldt to the Loire, and was bounded by Aquitania on the s. and by Burgundy and Austrasia (*Francia orientalis*), on the east. The principal cities were Soissons, Paris, Orleans, and Tours.

NEUTERS, an Indian tribe, so named by the French from the neutrality observed by them in the wars between the Hurons and Iroquois tribes, between which they were situated. They lived on the banks of the Niagara. In 1649 the Neuters were conquered by the Iroquois, the larger part killed, and the rest incorporated in the Five nations. Early efforts to establish missions among them were not successful.

NEU'TRAL AXIS, the name given to an imaginary line through a body which is subjected to a transverse strain; and separating the forces of extension from those of compression. If the ratio of the resistances to extension and compression were the same for all substances, and depended merely on the form of the body, then in all bodies of the same form the neutral axis would have a definite geometrical position; but it has been satisfactorily proved by Mr. Eaton Hodgkinson that this ratio has a separate value for each substance. In wood, where the ratio is one of equality, the neutral axis in a beam supported at both ends, whose section is rectangular, passes lengthwise through the centre of the beam; while in cast-iron, in which the resistance to compression is greater than that to extension, it is a little above, and in wrought-iron, in which the contrary is the case, it is a little below, the centre.

NEUTRAL SALTS. See SALTS, THEORY OF.

NEUTRALS, nations who, when a war is being carried on, take no part in the contest, and evince no particular friendship for or hostility to any of the belligerents. As a general rule neutrals should conduct themselves with perfect impartiality, and do nothing which can be considered as favoring one belligerent more than another.

The duties and obligations of neutrals at sea have given rise to many complicated questions. It is allowed on all hands that a neutral state forfeits her character of neutrality by furnishing to either belligerent any of the articles that come under the denomination of contraband of war (q.v.). If she does so, the other belligerent is warranted in intercepting the succors, and confiscating them as lawful prize. Contraband of war, besides warlike stores, has sometimes been held to include various other articles, a supply of which is necessary for the prosecution of the war; and it has been doubted how far, in some circumstances, corn, hay, and coal may not come under that category.

An important question regarding the rights of neutrals is, whether enemies' goods not contraband of war may be lawfully conveyed in neutral bottoms. The principle that free ships make free goods was long resisted by this and other maritime countries; and the general understanding has been that belligerents have a right of visiting and searching neutral vessels for the purpose of ascertaining—first, whether the ship is really neutral, as the hoisting of a neutral flag affords no absolute security that it is so; second, whether it has contraband of war or enemies' property on board. Neutral ships have therefore been held bound to provide themselves with passports from their government, and such papers as are necessary to prove the property of the ship and cargo; and it is their duty to heave to when summoned by the cruisers of either belligerent. It has been considered that a neutral ship which seeks to avoid search by crowding sail or by open force may be captured and confiscated. When a merchant-ship is sailing under convoy of a vessel of war, it has been said that the declaration of the officer in command of the convoy that there is no contraband of war or belligerent property on board is sufficient to bar the exercise of the right of search.

A declaration having important bearings on the rights of neutrals was adopted by the plenipotentiaries of Great Britain, Austria, France, Prussia, Russia, Sardinia, and Turkey, assembled in congress at Paris on April 16, 1856. By its provisions, 1. Privateering is abolished. 2. A neutral flag covers enemies' goods, with the exception of contraband of war. 3. Neutral goods, with the exception of contraband of war, are not liable to capture under the enemy's flag. 4. Blockades, in order to be binding, must be effective—that is, maintained by a force sufficient really to prevent access to the coast of the enemy.

It has sometimes been proposed to exempt private property at sea from attack during war. Such a project, however, seems inexpedient. There may be a propriety in respecting the property of individuals on land in a time of war, because its destruction, however injurious to the persons immediately concerned, can have little influence on the decision of the contest. But at sea private property is destroyed, because those from whom it is taken, being purveyors or carriers for the community at large, its loss must seriously affect the public, and have no small influence in bringing the contest to an end. See Blockade, Privateer.

NEU'WIED, a t. of Rhenish Prussia, on the right bank of the Rhine, 7 m. below Coblenz. It is the capital of the principality of Wied, now mediatized and attached to Prussia, and is the seat of the princes of Wied, with a beautiful castle and has a natural history collection of Americana. It was founded in the beginning of the eighteenth century by prince Alexander of Wied-Neuwied, who, offering perfect toleration in religious matters as an inducement, invited colonists of whatever persuasion to settle here. The town contains the churches of Protestants, Catholics, Jews, Herrenhuters, etc. The inhabitants are well-conditioned, and industrious. Pop. '95, 10,593, who carry on manufactures of chicory, soap, matches, iron and tin wares, etc.

NEVA, a river of Russia, in the government of St. Petersburg, flows westward from the s.w. corner of lake Ladoga to the bay of Cronstadt, in the gulf of Finland. Its length, including windings, is about 40 m., 9 m. of which are within the limits of the city of St. Petersburg; and in some places it is 1950 ft. broad and about 59 ft. deep; although at Schlusselburg it is shallow, a new canal, 22 ft. deep, now allows ships to avoid the shallow bar at the mouth of the Neva. From Cronstadt, goods are brought to St. Petersburg in lighters or in small steamers. By the Ladoga canal the N. communicates with the vast water-system of the Volga, and thus it may be said to join the Baltic with the Caspian sea. Its current is very rapid, and the volume of its waters is immense. It is covered by drift ice for an average of 147 days every year. An extensive traffic is carried on on its waters, both from the interior and the Baltic.

NEVADA, a Pacific slope state, and the 23d in order of admission; lying between lat. 35° and 42° n.; long. 114° and 120° w.; bounded on the n. by Oregon and Idaho; on the e. by Utah and Arizona; on the s. by Arizona and California; on the s.w. and w. by California; extreme length from n. to s., 483 m.; extreme breadth, 423 m.; land area, 109,740 sq. m.; gross area, 110,700 sq. m., or 70,848,000 acres.

History.—N. is a portion of the territory acquired by the U. S. from Mexico under the treaty of Guadalupe Hidalgo, belonging previous to its transfer to the "department of Alta California," and after that to Utah. Prior to its acquisition by the government it was inhabited only by the aboriginal races, there being no settlement of civilized people—not even a mission—within its borders. The first immigrants, in 1848, were Mormons, some of whom, in passing back and forth between California and Salt lake, observing the excellence of the land, located in the Carson and Washoe valleys. The following year they were joined by a few adventurers, who, attracted by the gold discoveries in California, had made the journey overland, but stopped on finding here the object for which they had set out. From this time the population gradually increased, until, in 1859, when silver was discovered, it had swelled to about 1000 people. It was constituted a territory in 1861, Mar. 2, and was admitted into the union as a state, Oct. 31, 1864. In May, 1866, its area was increased; parts of Arizona and Utah being added.

UNIVERSITY OF ILLINOIS
URBANA

Topography.—Viewed as a whole, the state, in common with the great American basin, of which it forms a part, may be considered an elevated plateau, having a general altitude of more than 4000 ft. above tide-water. Traversing this lofty plain are numerous chains of mountains, separated by valleys having a width varying from five to twenty miles, and usually about equal to that of the adjacent mountains measured through their bases. The course of these valleys is, as a general thing, parallel to the main axis of the mountains, which have for the most part a northerly and southerly strike. These mountains vary in height from 1000 to 5000 ft. above the common level of the country, having therefore an absolute elevation of from 5000 to 12,000 ft. above the sea. For a distance of nearly 300 m. the Sierra Nevadas form a natural barrier along its western and southwestern border, the boundary line between this state and California running partially upon its summit and partially along or near the eastern base of this range, which, though not here attaining its greatest altitude, has nevertheless within the limits of N. a general height of more than 7000 ft., a few of the loftier peaks reaching a height of 12,000 ft. In the extreme e. lies the Snake range, and in the s.w. angle, a detached range, the White Mts. The highest elevation in the state, Wheeler peak, is 13,036 ft. The Humboldt, the longest and largest river in the state, is usually fordable in many places; and the Reese river, though having a length of nearly 150 m., is not over 10 or 15 feet wide, nor has it an average depth of more than 2 ft. Like the other rivers of the state, these terminate in small lakes and pools.

The Truckee, rising in lake Tahoe and emptying into Pyramid lake, and several tributaries of the Snake river, are among the streams in the northern part; on the southeast the Colorado forms a part of the boundary line, and is navigable to Callville.

The principal lakes are Pyramid, 33 m. long, and about 14 m. wide, without any outlet, and situated 4000 m. above sea level; Tahoe, only a portion of which is in the state, 6247 ft. above the sea, 30 m. long and 1500 ft. deep; Winnemucca, 18 m. long; Carson, Walker, and the numerous mud lakes or marshes, some of which cover 100 sq.m. Hot, sulphur, salt, and other springs are very common.

Geology and Mineralogy.—The periods represented by the mountains range from the azoic to the late jurassic. The volcanic character of the state is seen in ancient and modern eruptive rocks, and in the lava beds of the n.w. Some ranges are largely composed of limestone; others of syenite, porphyry, granite, slate, and quartzite. Gold is commonly found associated with other ores, but silver is the chief product, being obtained from nearly every section. The Comstock lode, discovered in 1859, was for years the most valuable silver-bearing lode in the world, yielding annually ore worth $16,000,000. Other minerals are lead, copper, magnetic, spathic, and specular iron, iron pyrites, platinum, tin, zinc, cinnabar, manganese, plumbago, nickel, cobalt, antimony, lignite or brown coal, kaolin, fire clay, etc. Beds of pure sulphur, gypsum, rock salt, borax, nitrate of potassa, and carbonate of soda are extensive. Marble, granite, slate, sandstone, and limestone are quarried, and agates, amethysts, carnelians, tourmalines, etc., are found.

Zoölogy.—This heading includes several species of deer, the antelope, mountain sheep, mountain goat, grizzly bear, Mexican bear, wild-cat, cougar, lynx, coyote, badger, wild hare; the crane, bittern, pelican, swan, mallard, brant, teal, plover, snipe, sage cock, grouse, quail, woodcock, pheasant, partridge, western meadow-lark, robin, cañon wren, and artemisia sparrow; also the salmon, and lake, river, and brook trout.

Botany.—Oaks and hard woods of any size are wanting. The mountains generally are covered with white or yellow pine, spruce, and fir of great size. The foot-hills and valleys produce mountain mahogany, dwarf cedar, nut pine, cottonwood, willow, wild cherry, and birch. The marshes are filled with tulé, the plains and slopes of the south with yuccas and cacti, and the abundance of sage brush in the north has given Nevada the popular name of "the Sage Brush State."

Climate.—The winters are free from heavy snows, except in the mountains; the days are sunny and the air dry, but the nights are cold in general. In the s and s.e. the climate is less severe, and frosts rarely occur. During the spring months and even in June rains fall, accompanied by thunder, but a dry season follows, lasting till Oct. Excessive heat prevails during May and June. The mean annual temperature is 45° in the n. and 70° in the s.

Agriculture.—In the valleys and basins watered by streams the soil is arable; elsewhere there is scarcely any land that is naturally adapted to farming. While the state will never be largely agricultural, the introduction of irrigation has greatly increased the amount of available land, and has made it possible to raise alfalfa and some other crops requiring moisture. The most valuable crop is hay (nearly $2,000,000), and the chief cereal crops are wheat, oats, and barley. Apple, peach, pear, and plum trees flourish and bear excellent fruit; also berries and small fruits. Stock raising and dairy farming is increasing, and farm and ranch animals, principally cattle and sheep, exceed $6,500,000 in value. Cotton and sugar-cane have been cultivated in the extreme south.

Industries.—Mining and the smelting and reduction of ores are the leading industries. The apparent exhaustion of the famous Comstock lode caused many to leave Nevada, but in recent years new and valuable deposits have been uncovered and improved methods introduced. The Sutro tunnel, which drains the lode to a depth of 1650 feet, is nearly four miles long, and cost over $4,000,000. The output of gold, 1895, was valued at

$1,552,200; of silver, $1,236,290—total, $2,788,490, an increase over several preceding years.

Railroads.—The principal roads are the Southern Pacific (450 m.); Union Pacific; Virginia and Truckee; Nevada Central; Carson and Colorado; and Eureka and Palisade; total mileage, about 925 m.; capital stock, $11,920,000; funded debt, $4,540,000; cost of road and equipment, $16,639,254; gross earnings, $500,000.

Banks.—In 1896 there was one national bank in operation, with capital $82,000, and deposits $151,400, besides two private banks, with capital $250,000, and deposits $434,000.

Religious Denominations, Education, etc.—The leading denominations are the Methodist Episcopal, Protestant Episcopal, Roman Catholic, Presbyterian, and Baptist. The Mormon faith has a large number of adherents. Education is compulsory, but the law is not strictly enforced. The school population is about 9,500; enrollment, 7,000; average attendance, 5,200; amount of permanent school fund, $1,250,000. The schools on the Indian reservations are well attended. There is a state univ. at Reno, Protestant Episcopal schools at Reno and Eureka, and a Roman Catholic school at Virginia City. In 1896 there were 6 libraries of 1,000 volumes each and upward, and 26 periodicals.

Government, etc.—The capital is Carson city. The governor (salary $4000) and all state officers are elected for four years. The legislature, composed of 15 senators elected for four years, and 30 representatives elected for two years, meets biennially on the first Monday in January. The supreme court consists of a chief-justice, and two associates. All are elected for four years; salary of each, $4,500. The state has an Orphans' Home and a State Prison at Carson City; the Insane Asylum is at Reno. The organized military force aggregates about 400 officers and men; unorganized but available for military duty, about 6,000. The legal rate of interest is seven per cent., but any rate is allowed by contract, and there is no penalty for usury. Judgments and notes outlaw in six years; open accounts in four years. The property of a married woman remains solely hers. The registration of voters is required in this state. New ballot laws based on the Australian system were adopted in 1893. Wilful desertion, or neglect of husband to provide for one year, extreme cruelty, habitual drunkenness, are the principal causes for divorce. Either party may remarry; residence required, six months.

The electoral votes have been cast as follows: 1864, Lincoln and Hamlin, 3; 1868, Grant and Colfax, 3; 1872, Grant and Wilson, 3; 1876, Hayes and Wheeler, 5; 1880, Hancock and English, 3; 1884, Blaine and Logan, 3; 1888, Harrison and Morton, 3; 1892, Weaver and Field, 3; 1896, Bryan and Sewall, 3.

Finances.—According to the eleventh United States census report, the assessed valuation of real and personal property was $24,663,385; per capita, $538.96. The state debt was $509,525; county debt, $812,696; school district debt, 15,300; total combined debt, less the sinking fund, $1,337,501; 1896, state debt, $638,500.

Population.—In 1859, 1000; 1860, 6,857; 1880, 62,266—25,653 foreign born. Pop. 1890, 45,761. There are 14 cos.; for pop. 1890, see Census Tables, Vol. XV. The largest cities, 1890, were Virginia City, 8511; Carson City, 3950; Reno, 3,563. The Indians (Pi Ute, Pah Ute, and western Shoshone) numbered 1552 in 1890. Of these 1460 were on reservations. About 900 speak English, and about 400 can read.

NEVADA, a co. in s.w. Arkansas, bounded on the n. and n.e. by the Little Missouri river, and drained by Terre Rouge creek and Cypress bayou; about 616 sq. m.; pop., '90, 14,832, includ. colored. The surface is diversified and heavily wooded, and the soil in the valleys fertile. The principal productions are cotton and Indian corn. It was set off from Ouachita and Columbia cos. Co. seat, Prescott.

NEVADA, a co. in n.e. California, adjoining Nevada, bounded on the n.w. by the Middle Yuba river, drained by Bear creek and the South Yuba river, and crossed by the Southern Pacific railroad; 1000 sq. m.; pop. '90, 17,364. Co. seat, Nevada City.

NEVADA CITY, a city in California, the terminus of the Nevada co. narrow gauge railroad from this point to Colfax, connecting there with the Central Pacific; pop. '90, 2524. It is the county seat of Nevada co., in the midst of a mountainous region containing valuable gold mines, supplying the quartz mills. It is on Deer creek, 5 miles northeast of Grass Valley, 33 m. e. of Marysville, and 65 m. n.e. of Sacramento. Its climate is considered very healthful, especially for consumptives, and its natural scenery attracts many visitors. It has churches, several hotels, and the county hospital, and is well built, mostly of brick. It has newspapers, good public schools, a court-house, a bank, a masonic hall, and places of meeting for all the secret orders, and an iron foundry. The principal occupation is the cultivation of fruit and vines, and considerable wine is made.

NEVADA, Emma (stage name of Emma Wixom), b. Cal., 1861; studied vocal music in Italy; first appeared in opera in London, 1880, with Marie Van Zandt; subsequently sustained leading parts in Trieste, Pesth, Prague, Milan, Rome, Naples, and Paris, and made her first professional tour of the United States, 1884–85.

NEVERS, a t. of France, capital of the department of Nièvre, and formerly the capital of the province of Nivernais, is built on a hill in the midst of fertile plains, at the confluence of the Loire and the Nièvre, 140 m. s.s.e. of Paris. Highly picturesque as seen from a distance, its interior shows steep, winding, and badly paved streets. It contains

a beautiful cathedral of the 13th to 16th c., and a fine public garden; the triumphal arch, erected in 1746, to commemorate the battle of Fontenoy, is worthy of mention. The mineral springs, Pougues-les-Caux, lie to the north. Nevers is the see of a bishop, contains a public library, and has numerous educational, scientific, and benevolent institutions, and an arsenal. There is here an important cannon-foundry and oil mills, and the principal manufactures are porcelain and earthenware, iron cables and chains, anvils, and agricultural implements. Pop. '91 (comm.), 26,436.

Nevers, the *Noviodunum* of the Romans, existed prior to the invasion of Gaul by Julius Cæsar. It has been the seat of a bishop since the beginning of the 6th c., when it was called Nevirnum, became a co. in the 10th c., and was erected into a duchy by Francis I. in 1538.

NEVIANSK', a t. of Russia, in the government of Perm, 50 m. n. from Ekaterinburg. It is on the eastern or Siberian side of the Ural mountains, and stands on the Neiva, the waters of which flow by the Tobol and the Irtish to the Obi. The district around Neviansk is famous for its mineral wealth, particularly for its productiveness of gold, copper, and iron. The Neviansk iron works and gold mines are connected by rail with Ekaterinburg, 56 miles distant. Pop. of town, about 16,000.

NE'VILLE'S CROSS. See BRUCE, DAVID.

NEVIN, JOHN WILLIAMSON, D.D., LL.D., b. Penn., 1803; graduated at Union college 1821; studied in the theological seminary at Princeton, and remained there some time as an instructor, and wrote *Biblical Antiquities* (2 vols). In 1829–39 he was professor of Hebrew and Biblical literature in the Presbyterian theological seminary at Allegheny City; in 1840 became professor of theology and president of the German Reformed theological seminary at Mercersburg, Penn., and also, 1841, president of Marshall college at the same place; in 1843 published *The Anxious Bench*, which produced much discussion on the subject of revivals; in 1844 translated Dr. Schaff's inaugural address, *The Principle of Protestantism*, which was viewed as containing the germ of what was afterward called "Mercersburg theology" (q.v.), and was followed by *The Mystical Presence; History and Genius of the Heidelberg Catechism*, and *Anti-Christ, or the Spirit of Sect and Schism*. Dr. Nevin also edited the *Mercersburg Review*, 1849–53; in 1851 he resigned the presidency of the seminary, and, in 1853, of the college, on its removal to Lancaster to be consolidated with Franklin college. He was afterward chosen president of Franklin and Marshall college. He d. 1886.

NE'VIS, a small island of the West Indies, belonging to Great Britain, forms one of the group of the Leeward Islands, and lies immediately s. e. of St. Christopher's, from which it is separated by a strait, called the *Narrows*, 2 m. wide. It is circular in form, rises in a central peak (an extinct volcano) to the height of 3000 ft., and has an area of 50 sq. m. Pop. '91, 13,087, of whom very few are white. Charlestown, a seaport, with a tolerable roadstead, situated on the s.w. shore of the island, is the seat of government of St. Christopher as well as of this island, consisting of a legislative council of 10 official and 10 nominated unofficial members. The soil is fertile, and the principal products are sugar, molasses, and rum.

NEW, JOHN CHALFANT, b. Ind., 1831; educated at Bethany college, West Virginia; a graduate of the class of '53; studied law, but turned his attention to politics and never became a practitioner. He has served his native state in the capacity of state senator, and filled the office of adjt.-gen. of Indiana; was cashier of the first national bank of Indiana; and in 1875 was appointed U. S. treasurer under President Grant. In 1879–80 he was chairman of the Indiana republican committee; 1882–84, assist. sec. U. S. treasury.

NEW ALBANY, city and co. seat of Floyd co., Ind., on the north bank of the Ohio river, 2 miles below the falls, and opposite Louisville, Ky. It has a large river trade, and is entered by the Louisville, New Albany and Chicago, the Baltimore and Ohio Southwestern, and other railroads. It is connected with Louisville, Ky., by a cantilever bridge, 2453 feet long, that cost $2,000,000. New Albany is a handsome city, built upon two river terraces; was laid out in 1813, and incorporated as a city in 1839. It has a fine city hall and court-house, large fair grounds, De Pauw college for women, churches, manufactories of cars, engines, and boilers, rolling, planing and flour mills, iron foundries, plate-glass works pork-packing establishments, ship-yards, national and state banks, public, college, and other libraries, electric lights and street railroads, and several newspapers. In one of the suburbs there is a national cemetery. Pop. '90, 21,059.

NEW'ARK, a municipal borough and market town of England, in the co. of Notts, on the Great Northern and Midland railways, and on a navigable branch of the river Trent, 16 m. s.w. of Lincoln. The parish church, a large and elegant edifice, though often rebuilt, still shows traces of its original Norman character. Newark is approached from the n. by a causeway a mile and a half long, carried over the flat island formed by the Trent on the w. and the Newark branch on the east. The castle of Newark, in which King John died in 1216, was built early in the 12th century and is now in ruins. Newark is said to be the greatest malting town in England, there are flour-mills, breweries, and trade in corn, malt, flour, and agricultural implements. The corn market is one of the largest in the kingdom. Pop. '81, 14,019; '91, 14,459.

NEWARK, city, port of entry and co. seat of Essex co., N. J., is on the west bank of the Passaic river, four miles from Newark bay; latitude, 40° 45′ north; longitude, 74° 10′ west; nine miles from New York city. Newark was settled in 1666 by families from Milford and New Haven, Conn., joined in 1667 by a colony from Guilford and Branford, led by Rev. Abraham Pierson, the members of which were dissatisfied with the union of the New Haven and Connecticut colonies. It was a strictly religious settlement, as only members of the Congregational Church were permitted to vote or hold office. The town, which was named after Pierson's English home, soon extended its limits, and included the present towns of Belleville, Bloomfield, Clinton, and Orange. In 1745–6 the English grantees of East Jersey attempted to invalidate the titles of the settlers, and riots ensued, which were suppressed with difficulty. Newark received its first charter in 1713, and in 1777 it was occupied, together with all that section of New Jersey, by the British, who plundered and nearly destroyed the town. A new charter was granted in 1798, and in 1836 it was incorporated as a city.

Newark occupies a level plain, the central part of which is thirty feet above high-water; westward the ground rises to the height of 230 feet, overlooking the city and bay, and affording delightful villa sites for the opulent citizens. The average summer temperature is 71.4°; winter, 30.6°. The streets are regularly laid out and beautifully shaded with fine old elms, that give the city an appearance of being embowered in trees. Broad Street, the principal thoroughfare, is 132 feet wide, and runs the whole length of the city, bordering three parks, one of which contains statues of Gen. Kearny, and Frederick T. Frelinghuysen; another, one of Seth Boyden, the inventor, and a bronze bust of Abraham Coles, M.D., LL.D.; and the third, a bronze Indian group. The suburbs of Newark are filled with the most picturesque residences, a perfect network of electric railways connecting it with the Oranges, Montclair, Belleville, and Irvington. Thomas A. Edison has his home and laboratory on Orange mountain, in the neighborhood. The streets are lighted with electricity and gas, and present a lively appearance at noon and at night from the many thousands of factory operatives who crowd them at these times. In 1892 a new water-supply was introduced by the city from the Pequannock watershed, at a cost of $6,000,000. The supply is pure and abundant. Of the many cemeteries, Mount Pleasant and Fairmount are the largest.

The finest public buildings are the new United States government structure of Indiana stone, accommodating the Custom House and Post Office; the home of the Prudential Life Insurance Company, at the corner of Broad and Bank streets, constructed in elegant style, of gray stone, thirteen stories high, fire-proof, and equipped with the latest devices for convenience and luxury; the Fidelity Title and Deposit Company's building, of red granite; the Free Library, the Peddie Memorial, and many handsome churches.

Newark's educational advantages are unsurpassed, with fine public school buildings in each of the fifteen wards, and a high school, the annual expense of the system being over $5,000,000. Of the many private schools, the Newark Academy is the oldest and best known, founded in 1792. There is a public library, and at the rooms of the New Jersey Historical Society may be found a large collection of books and relics. There are daily and weekly newspapers and periodicals, some of which are printed in German. More than 100 churches of all denominations are located here, and Newark has the reputation of being a very orderly city. It has many benevolent institutions, including hospitals, an extensive insane asylum, an eye and ear infirmary, orphan asylum, homes for aged men and women, societies for the prevention of cruelty to children and animals, a soldiers' home, supported by the government, a bureau of associated charities, a Christian Association, City Home, Female Charitable Society, Foster Home, and Woman's Exchange. There are national and state banks, savings institutions, life insurance companies, industrial and credit system companies etc.

Manufactures are the chief source of the wealth to be found here, and they embrace every variety and find markets in all parts of the world. They include jewelry, brass, iron castings, leather and leather goods, india rubber, celluloid, carriages, enamelled cloth, machinery, varnish, chemicals, hats, sewing-silk, thread, trunks, harness, cotton goods, clothing, boots and shoes, sewing-machines, agricultural implements, cutlery, ale and beer. The number of establishments in 1890 was 2490; capital invested, $62,552,752; hands, 46,848; wages, $26,857,170; total receipts, $93,476,652. The leather interest, patented, enamelled, tanned, and curried, amounted to $7,706,877; liquors, $6,901,297; hats and caps, $3,506,976. The railroads passing through Newark are the Pennsylvania; New Jersey Central; Delaware, Lackawanna and Western; New York, Lake Erie and Western; and the Lehigh Valley. Pop. '90, 181,830.

NEWARK, city and co. seat of Licking co., O.; situated at the union of three branches of the Licking river; pop. '90, 14,270. It is on the Ohio canal, and the Baltimore and Ohio, and Pittsburg, Cincinnati, Chicago, and St. Louis railroads. It is built on an extended plain, surrounded by a fertile and productive country, and is laid out attractively, with broad streets. It has a graded public school system. In the neighborhood are sandstone quarries, a coal mine, and petroleum refineries. There are railroad car shops, and glass, machine, boiler, and stove works.

NEWAY'GO, a co. in w. Michigan, intersected by the Chicago and West Michigan railroad; 860 sq. m.; pop. '90, 20,476. Co. seat, Newaygo.

NEW BEDFORD, city, port of entry and one of the co. seats of Bristol co., Mass.; on the shore of Buzzard's bay and on the w. bank of the Acushnet river, near its mouth; lat. 41° 38′ n.; long. 70° 56′ w.; 55 m. s. of Boston. New B. was set off from Dartmouth in 1787, and was incorporated in 1847. Since 1755 it has been the chief center of the American whale fishery, but the industry, which was most thriving between 1818 and 1857, has greatly declined, owing chiefly to the scarcity of whales and the discovery of petroleum, but hastened by disasters in 1865 and 1871. In 1778 the British destroyed much property here, in retaliation for the damage done by New B. privateers. The city was formerly the most wealthy of its size in the U. S. The mouth of the Acushnet forms a fine harbor, which is defended by a granite fort on Clarke's point. New B. is connected with New York by lines of propellers, with Martha's Vineyard by steamers, with Boston by two branches of the Old Colony railroad, and with Fall River by another. The city is 11 m. in length, and 2 m. in width, and is regularly laid out, with streets at right angles, shaded by ancient trees. The land slopes towards the water, and its elevated portion offers fine sites for the erection of the elegant private residences for which the city is noted. The river is crossed by two very fine bridges connecting the city with Fairhaven. There is a beautiful drive around Clarke's Point, commanding an unobstructed view of the harbor and far out to sea. There are several small parks, one containing a soldiers' monument. Among notable buildings are the custom house, city hall, county court-house, Roman Catholic and Unitarian churches, Y. M. C. A. building, St. Luke's hospital, and St. Mary's home. The manufactures include Prussian blue, soap and candles, oil, flour, paint, glass, cordage, shoes, photographers' materials, curried leather, woolen goods, fertilizers, lubricating oil, shipbuilding, soap and candles, watches and clocks, furniture and clothing. The Wamsutta mills produce cotton cloth; the Potomska mills, print cloths; the Morse factory, twist drills; and the Gosnold mill, iron; estab. 1890, 413; cap., $20,132,683; hands, 11,422; wages, $4,985,016; val. products, $17,025,779. New Bedford's numerous cotton mills have an output which makes the city rank second among the cotton manufacturing cities of the U. S.; the Wamsutta plant alone operating over 30 factories and employing more than 12,000 persons. Among exports are corn, wheat, flour, and manufactures of cotton. There are national and savings banks, many churches, an orphan asylum, St. Joseph's hospital (R. C.), a high school, an academy under the direction of the Friends, a magnificent free public library, established 1802, and the first of its kind in the U. S. Several newspapers, including a shipping list, are published. There are waterworks supplied from Middleboro ponds, electric street railroads and gas, oil, and electric lights. The city has an assessed property valuation of over $56,000,000, and in 1897 imported foreign merchandise to the value of over $500,000. Pop. '90, 40,733.

NEWBERN, city, port of entry of Pamlico district, and co. seat of Craven co., N. C., on the s.w. bank of the Neuse, at its confluence with the Trent, and 40 m. from its mouth; 107 m. by rail s.e. of Raleigh. It was settled by Swiss in 1710, and was for a time the cap. of the province of North Carolina. It was strongly fortified during the civil war, but was captured by Gen. Burnside, Mar. 14, 1862, after a severe engagement. It is situated on the Atlantic and North Carolina, and the Wilmington, Newbern, and Northern railroads, has direct communication with the sea by way of Ocracoke inlet, and is connected by steamships with New York, Baltimore, and Norfolk. It exports tar, turpentine, fish, cotton, lumber, naval stores, and vegetables. It has turpentine distilleries, grist and saw mills, foundries, manufactories of agricultural implements, carriages, tobacco, etc. It has a free academy, several national and state banks, public library, newspapers, and about 15 churches. Its foreign commerce has greatly decreased, but it has a large coastwise and interstate trade and increasing shipments of early vegetables to northern markets. Pop. '90, 7843.

NEWBERRY, a co. in central South Carolina, having the Saluda river for its s. boundary, the Ennowee and Tiger rivers for its n., and the Broad river for its e. boundary; 600 sq. m.; pop. '90, 26,434, chiefly of American birth, includ. colored. It is intersected by the Southern and the Columbus, Newberry and Laurens railroads. Its surface is undulating, in some portions rising into considerable elevations, and timber is abundant. It has extensive granite ledges, and the soil is fertile, especially the alluvial soil near the rivers. Cattle, sheep, and swine are raised; and wheat, corn, oats, sweet potatoes, and cotton are the chief products. It has steam saw-mills and a few manufactories. Co. seat, Newberry.

NEWBERRY, John Strong, M.D., LL.D.; b. Conn., 1822. In 1824 his father emigrated with his family to Ohio, and founded the town of Cuyahoga Falls. Newberry graduated from Western Reserve college in 1846, and from the Cleveland medical college in 1848. After two years of study and travel abroad he settled down to the practice of medicine in Cleveland, but his growing fondness for natural science led him to accept the appointment of assistant surgeon and geologist on Lieut. Williamson's survey of northern California and Oregon in 1855. Newberry's researches were published in a separate quarto volume, as well as in the Pacific railroad reports. In 1857–58 he accompanied Lieut. J. C. Ives's expedition to the Colorado river, taking out an iron steamer in sections and navigating that stream for 500 miles. Newberry's portion of the report was acknowledged by his commander to constitute "the most interesting material gathered by the expedition." He assisted, in 1859, Capt. Macomb's exploration of the

upper Colorado and San Juan rivers, opening up an interesting region of immense mineral resources, and published a report on it. During the rebellion his administrative capacity was demonstrated by his superintendence, as secretary, of the affairs of the sanitary commission throughout the Mississippi valley. In 1866 he was appointed to, and long continued to hold, the professorship of geology and paleontology in the School of Mines of Columbia college. He was also state geologist of Ohio since 1869, and completed an exhaustive geological survey of the state within five years, the final reports of which, now in process of publication, will make eight volumes, besides a map. Prof. Newberry made very many contributions to the literature of fossil fishes and plants, and geology in general. He was a member of numerous American and European scientific societies, and president of the New York Academy of Sciences. D. 1892.

NEWBERRY, OLIVER, 1789–1860; b. East Windsor, Conn.; pioneer steamboat builder. He served in the war of 1812 and in the Black Hawk war; settled in Detroit in 1820, and obtained government contracts for supplies for the military and Indian trading-posts in the Northwest; and became a boat-builder there through inability to secure suitable transportation. Subsequently he built many steamboats for the lake traffic, and was known as the " commodore of the lakes."

NEWBERRY, WALTER LOOMIS, 1804–68; b. East Windsor, Conn.; merchant and brother of Oliver. He bequeathed half of his real estate, or more than $2,000,000, for the founding of a public library in the north division of Chicago.

NEW BRIGHTON, a borough in Beaver co., Pa.; on the Pittsburg, Fort Wayne and Chicago and other railroads. It is on the e. bank of the Beaver river, which furnishes very extensive and valuable water-power, and is 28 m. n.w. of Pittsburg, and 21 m. s. of New Castle. The Beaver river empties into the Ohio 3 m. below. It has churches, banks, a public art gallery, Beaver Valley general hospital, Y. M. C. A. with public library, high school, and public park. It is connected with the town of Beaver Falls by a bridge across the river, and is in a coal and clay region. Its manufactures are important; among its industries may be numbered the manufacture of chairs, woolen goods, twine, nails, pottery, lead-kegs, coffee-mills, rivets, wire, etc. It has a variety of stores and an extensive greenhouse. Pop. '90, 5,616.

NEW BRITAIN, city in Hartford co., Conn.; on the New York and New England, and the New York, New Haven, and Hartford railroads; 10 miles s.w. of Hartford. It contains the State normal school, Roman Catholic cathedral, high school, public library, New Britain institute, hospital, gravity system of waterworks, electric light and street railroad plants, about 20 churches, and several banks and newspapers, public park, Y. M. C. A. building, and manufactories of hosiery, hardware, cutlery, electrical supplies, brick, steam engines and boilers, gas and water motors, malleable castings, butts and hinges, machine needles, plain and fancy locks, pumps, wood screws, etc. New Britain was formed in 1850 from a portion of the town of Berlin, and organized as a city in 1870. Pop. '90, 19,007.

NEW BRITAIN, the name of one principal and of several subsidiary islands of the Bismarck Archipelago, now called New Pomerania, in the Pacific ocean. The principal island, 300 m. in length, and having an area of 12,000 sq. m., lies e. of New Guinea, from which it is separated by the Dampier strait. The surface is mountainous in the interior, with active volcanoes in the north, but along the coast are fertile plains. Forests abound in the island, and palms, sugar-cane, bread-fruit, etc., are produced. The inhabitants, the number of whom is unknown, are good agriculturists, but practice cannibalism. Many of them, however, have been induced to work as laborers on the cotton plantations started by the Germans. These islands, discovered by Dampier in 1699, since 1885 have been all included in the German protectorate of the New Guinea Company.

NEW BRUNSWICK, city and co. seat of Middlesex co., N. J.; on the Raritan river, the Delaware and Raritan canal, and the Pennsylvania railroad; 32 miles s.w. of New York. It is the seat of the Reformed church and of Rutgers college, with which is connected the State agricultural and mechanical college and the State model farm, and is principally engaged in the manufacture of rubber goods, wall paper, hosiery, and carpets. Pop. '90, 18,603.

NEW BRUNSWICK, a province of the Dominion of Canada, is bounded on the n.w. by Quebec and the bay of Chaleur, on the n.e. by the gulf of St. Lawrence and the strait of Northumberland, on the s. by Nova Scotia and the bay of Fundy, and on the w. by the state of Maine. It has an area of 27,322 sq. m., or 17,686,000 acres (rather more than the area of Scotland), and a population, in '91, of 321,263. The coast line is 500 m. in extent, and is indented by spacious bays, inlets, and harbors, which afford safe and commodious anchorage for shipping. The chief are Fundy, Chignecto, and Cumberland bays, the last two being merely extensions of the first; Passamaquoddy bay in the s.; Verte, Shediac, Cocaigne, Richibucto, and Miramichi bays on the n.e.; and the bay of Chaleur, 90 m. long by 12–25 broad, in the n.w. The province of New Brunswick abounds in rivers. The principal are the St. John and the St. Croix, the former

450, and the latter 100 m. in length, and both falling into the bay of Fundy; and of the rivers that flow eastward into the gulf of St. Lawrence, the Richibucto, the Miramichi, and the Restigouche. The province contains numerous lakes, one of which, Grand lake, is 100 sq.m. in area. Most of the others are much smaller. The surface is for the most part flat or undulating. With the exception of the district in the n.w. bordering on Canada and the river Restigouche, no portion of New Brunswick is marked by any considerable elevation. Here, however, the country is beautifully diversified by hills of 500 to 800 ft. in height. These elevations, which form an extension of the Appalachian range, are interspersed with fertile valleys and table-lands, and are clothed almost to their summits with lofty forest-trees. In this district the scenery is remarkably beautiful. In the s. of the colony the surface is broken up by great ravines, and the coast is bold and rocky. The shores on the e. coast, and for 12 m. inland, are flat. The soil is deep and fertile. Of the whole acreage, 14,000,000 acres are set down as good land, and 3,600,000 acres as poor land. New Brunswick contains a rich and extensive wheat-producing district; but the inhabitants, dividing their time between farming, lumbering, fishing, ship-building, and other pursuits, and following no regular system of tillage, have not till quite recently attempted to keep pace with modern agricultural improvements. The farming has not been judicious; many parts of the country have been allowed to become exhausted; and, although signs of improvement begin to be manifest, still there is prevalent a deplorable lack of knowledge of the principles of scientific agriculture. Several cheese factories have been established in the province within the last few years. In one year one of these has manufactured as much as 25,000 lbs. The crown lands are at present being disposed of under the act 31 Vict. cap. 7, 1868. This act provides that certain portions of eligible land shall be reserved for actual settlers, and not be disposed of to speculators, or for lumbering purposes. A male of 18 years of age or upwards may obtain 100 acres, either by payment, in advance, of $20 (£4), to aid in the construction of roads and bridges in the vicinity of his location, or upon his performing labor on such roads and bridges to the value of $10 a year, for three years. He must also, within two years, build a house on his land of not less dimensions than 16 ft. by 20, and clear two acres. After a residence for three years in succession he receives a deed of grant if he has paid the $20 in advance or cultivated ten acres. By act of 1872, a single man obtains 100 acres; a married man with children, 200. It is estimated that there are about 7,000,000 acres of crownlands in New Brunswick, still open to settlement, in manner described. The climate is remarkably healthy, and the autumn—and especially the season called the Indian summer—is particularly agreeable. In the interior the heat in summer rises to 80°, and sometimes to 95°; and in winter, which lasts from the middle of December to the middle of March, the mercury sometimes falls as low as 40° below zero. At Fredericton, the capital, situated on St. John river, 65 m. from the s. and 130 m. from the n. coast, the temperature ranges from 35° below to 95° above zero, and the mean is about 42°. Principal exports, fish, lumber, iron, coal, and hay; imports, grain, provisions, tobacco, and cotton, woolen, and silk goods.

The north-western portion of the province is occupied by the upper Silurian formation. Next are two belts of lower Silurian. Small patches of the Devonian, Huronian, and Laurentian systems are found on the bay of Fundy. A large part of the province is occupied by carboniferous strata. The mineral coal is for the most part impure or in thin seams, and is hardly worked; but the so-called Albertite of Albert county is the most valuable of bituminous matter on the American continent. It yields 100 gal. of crude oil per ton. Salt springs are numerous. Copper and iron ore are found, as also antimony and manganese; gypsum, plumbago, and limestone are very abundant, and the freestone of the province, unsurpassed for beauty and durability, commands a high price in the states. Wild animals abound in the province; the lakes and rivers are well stocked with fish, and along the coasts, cod, haddocks, salmon, and other fish are caught in great plenty. The forests of pine, cedar, and spruce supply timber for export and shipbuilding purposes, and are one of the chief sources of wealth in New Brunswick. There are over 1,400 miles of railway in the province. Around the coasts and along the banks of the rivers there are excellent public and coach roads. There are a provincial university, a normal school, and common schools ranging from the primary to the high school grade. Chief towns, St. John, and Fredericton, the political capital. New Brunswick sends 10 senators and 16 representatives to the Dominion parliament. The provincial government is administered by a lieutenant-governor and council of 7, a legislative council of 18 members, and an assembly of 41 members elected every four years.

The province of New Brunswick, together with that of Nova Scotia, originally formed one French colony, called Acadia, or New France. It was ceded to the English in 1713, and was first settled by British colonists in 1764. In 1784 it was separated from Nova Scotia, and erected into an independent colony. It joined the Dominion of Canada in 1867.

NEWBURG, city and one of the co. seats of Orange co., N. Y.; on the Hudson river and the Erie, the West Shore, the New York Central and Hudson river, the New England, and the Newburg, Dutchess, and Connecticut railroads; 60 miles n. of New York. It is built on a steep, terraced slope, rising about 300 feet above the river, and is bounded on three sides by mountains. The river here expands into Newburg bay, about 8 miles long, giving the city a deep-water front of nearly 2 miles, and exceptional facilities for trade by

water. Grain from the west is transshipped here for distant points, and large quantities of coal from Pennsylvania are transferred to barges and coasting vessels. The city contains a public library, St. Luke's hospital, an academy and several grammar schools, Downing park, electric light and street railroad plants, gravity system of waterworks, national and savings banks, Home for the Friendless, Home for Children, and Y. M. C. A. Newburg's first white settlers were, in 1709, Germans from the Palatinate of the Rhine, and they named it the "Palatine Parish of Quassaic." In 1752 the name was changed to the "Parish of Newburg," from its resemblance to Newburgh, Scotland. During the most critical period of the Revolutionary war it was the headquarters of General Washington, who occupied the Hasbrouck residence, an old stone house now owned by the state, and containing a museum of revolutionary relics. Near headquarters building is an imposing stone structure erected by the U. S. and the state governments to commemorate the close of the war and the disbanding of the army. The city was incorporated in 1865. Pop. '90, 23,087.

NEWBURY, a municipal borough and market t. of Berkshire, England, on both banks of the Kennet, 17 m. w.s.w. of Reading. The church, a specimen of the perpendicular style, was built in the reign of Henry VII.; but the tower was built by John Winchcombe, a clothier and famous citizen of Newbury in the reign of Henry VIII. Since 1862 an annual wool-market has been held here. In 1862 a new corn exchange was built. Newbury is best known for two hard-fought battles between the royalists and parliamentarian forces which took place—the first in September, 1643, the second in October, 1644. In the former, victory was undecided; in the latter the advantage was on the side of the parliamentarians. Pop., '80, 10,143; '91, 11,002.

NEWBURYPORT, city, port of entry, and one of the co. seats of Essex co., Mass.; on the Merrimac river and the Boston and Maine railroad; 37 miles n.e. of Boston. It was settled about 1635; was a part of Newbury till 1764, when it was incorporated as a town; and was chartered as a city in 1851. The city contains several villages, and is connected with Amesbury, Haverhill, Lawrence, and Lowell by electric street railroad. The harbor, opening into the Atlantic ocean, is safe and spacious, and accommodates a large number of ships, steamboats, and vessels engaged in the cod and mackerel fisheries. Among the noteworthy buildings and objects of interest are the Putnam free school, high school, Anna Jaques hospital, public library, the old South church containing the remains of Whitefield, house in which William Lloyd Garrison was born, the Dexter house, chain suspension bridge, the first of its kind in New England, Y. M. C. A., memorial building, marine museum, and old ladies' home. The principal industries are the manufacture of cotton goods, machinery, boots and shoes, hats, collars and cuffs, fiber braid, silverware, and combs and brushes, and there is some shipbuilding. The city is lighted by electricity, and has several national and savings banks, and daily and weekly newspapers. Pop. '90, 13,947.

NEW CALABAR RIVER. See CALABAR.

NEW CALEDONIA, an island of the South Pacific ocean, belonging to France, and lying about 720 m. e.n.e. of the coast of Queensland, in Australia, in lat. 20°—22° 30′ s., long. 164°—167° e. It is about 240 m. in length, 25–35 m. in breadth, and has a population estimated at 63,000. It is of volcanic origin, is traversed in the direction of its length, from n.w. to s.e., by a range of mountains, which in some cases reach the height of 5,400 ft., and is surrounded by sandbanks and coral reefs. The principal harbors are at Balad, Numea and Canala. In the valleys the soil is fruitful, producing the cocoanut, banana, mango, breadfruit, etc. The sugar-cane is cultivated, and the vine grows wild. The coasts support considerable tracts of forest, but the mountains are barren. The inhabitants, who resemble the Papuan race, consist of different tribes, some of which are cannibal. New Caledonia was discovered by Capt. Cook in 1774. In 1853 the French took possession of it, and it has since 1872 been used by the French authorities as a penal settlement and now contains 10,000 convicts; here many of the Paris communards of 1871 were sent. The islands are sometimes visited by terrible hurricanes. A submarine cable from Numea on the north connects with the Queensland telegraph. Mission stations have been established. In 1878 some of the natives rose in insurrection and massacred a number of the white residents.

The missions are conducted by Roman Catholic priests, and several thousands of the islanders have embraced Christianity. The mineral products of the island are very rich and include coal, copper, nickel, and cobalt. Much attention is given to the breeding of cattle. The trade is chiefly in French, English, and Australian hands. See PINES, ISLE OF.

NEWCASTLE, a co. in n. Delaware, having the Delaware river for its e. boundary, the state line of Pennsylvania for its n. and n.w., bounded by the state of Maryland on the w.; 430 sq. m.; pop. '90, 97,182, chiefly of American birth, includ. colored. It is intersected by the Philadelphia, Wilmington and Baltimore, the Baltimore and Ohio, and the Wilmington and Northern railroads. It is drained by the Brandywine and Christiana rivers and Red Clay and Duck creeks, emptying into the Delaware. Its surface is broken, rising into hills in the w. portion, furnishing good pasturage. Co. seat, Wilmington.

NEW CASTLE, city and co. seat of Lawrence co., Pa.; at the junction of the Shenango and Neshannock rivers, and on the Erie, the Pennsylvania, the Pittsburg and Lake Erie, the Pittsburg and Western, and the Western New York and Pennsylvania railroads; 50 miles n.e. of Pittsburg. It is in a region containing bituminous coal, limestone and sandstone, fire clay, and iron ore, and has manufactories of iron, glass, sewer-pipe, fire brick, steel, wire nails, boilers, machinery, tin plate, coke, etc. There are gas and electric lights, electric street railroads, over 25 churches, several national banks, the Shenango Valley hospital, Y. M. C. A. building with library, waterworks supplied by basins and reservoirs, and several daily and weekly newspapers. Pop. '90, 11,600.

NEWCASTLE, town and co. seat of Northumberland co., New Brunswick; on the Miramichi river and the Intercolonial railway; 130 miles n.n.e. of St. John. It has stone quarries, brick yards, branch banks, and weekly newspapers, and is principally engaged in the lumber trade, river commerce, and export of fresh fish. Pop. '91, 4,006.

NEWCASTLE, Duke of, THOMAS PELHAM HOLLES, minister of the first two Georges, b. 1693, and representative of the noble family of the Pelhams, played a prominent, but by no means illustrious part in the political history of his time. While a very young man, he succeeded to the family peerage by the death of his father, lord Pelham, and George I. rewarded his attachment to the house of Brunswick by creating him first, earl of Clare, and afterwards duke of Newcastle. He was made secretary of state when but thirty years old, although the king declared that he was not fit to be chamberlain to the smallest court in Germany. There was much of the absurd and grotesque in his character. Macaulay says of him, that "his gait was a shuffling trot; his utterance a rapid stutter; he was always in a hurry; he was never in time; he abounded in fulsome caresses, and in hysterical tears." Yet this man was during thirty years secretary of state, and for near ten years first lord of the treasury! He served under sir R. Walpole, retained his secretaryship in the "broad-bottomed administration" in 1744, and in 1754 succeeded his brother, Mr. Pelham, as head of the government. In 1757 he was compelled to take the first William Pitt (afterwards earl of Chatham), into his ministry, and to give him the lead in the house of commons, and the supreme direction of the war and of foreign affairs. A succession of brilliant victories followed—Newcastle being only nominal head of the administration—and the great commoner had almost brought the war to a successful termination, when the accession of George III. led to the resignation of Mr. Pitt, and the replacement of Newcastle, in May, 1762, by lord Bute, as head of the ministry. Newcastle declined a proffered pension, with the remark that if he could no longer serve he would not burden his country. In the Rockingham ministry, formed in 1765, Newcastle filled the office of privy seal. He died August, 1768. His title descended to Henry, ninth earl of Lincoln, whose great-grandson,

HENRY PELHAM-CLINTON, fifth duke of NEWCASTLE, and twelfth earl of Lincoln, was b. 1811, and educated at Christ Church, Oxford. He represented South Notts in parliament from 1832 to 1846, when he was ousted by the influence of his father, the fourth duke, for supporting sir R. Peel in his free-trade measures. He adopted politics as a profession; was a lord of the treasury in the brief conservative administration of 1834–35; and first commissioner of woods and forests in the Peel administration, from 1841 to 1846. He was then made chief secretary to the lord-lieutenant of Ireland, but went out of office with his chief a few months afterwards. He succeeded to the dukedom in 1851, and returned to office in 1852, filling the post of secretary of state for the colonies (which formerly included the department of war) in the Aberdeen government. The war with Russia broke out, and in June, 1854, it was found necessary to create a secretary of state for war, and the new office was assigned to Newcastle. The "horrible and heart-rending" sufferings of the British army before Sebastopol in the winter months of 1854 raised a storm of popular discontent, and when the house of commons determined to inquire into the conduct of the war, the duke resigned. Yet, as is now acknowledged, no blame was attributable either to the minister for war or his subordinate, Mr. Sidney Herbert. They were called upon to administer a vicious system of military organization which broke down under the strain brought to bear upon it. Newcastle was reappointed colonial secretary in the second administration of lord Palmerston, and held the seals with general approval from 1859 to the year of his death, 1864. In 1860, as secretary of state for the colonies, he accompanied the youthful prince of Wales during a tour in Canada and a portion of the United States, and on his return received the order of the garter from the queen. He died Oct., 1864.

NEWCASTLE, a city of New South Wales, is situated at the mouth of the Hunter river, and is situated in lat. 32° 55′ s. and long. 151° 50′ e., about 60 m. n.e. by e. from Sydney, with which it is connected by two lines of steamers. It is the principal port for the northern part of New South Wales and is the greatest coaling port in the southern hemisphere. There are twenty-five collieries opened in the district employing about 7,000 persons, and the total export of coal in 1895 was 1,920,378 tons. The wool trade is also large and in the same year the value of shipments was $2,849,846. Newcastle has some 5 miles of wharves at which vessels of the largest tonnage may load and discharge. The area of the harbor, which is protected by two forts and two breakwaters, will amount to 540 acres when the recent comprehensive scheme of improvements, costing over $600,000, has been completed. The width of the channel at the entrance of the harbor is 1,200 ft. and the depth of water on the bar 25½ ft., and of the harbor 27 ft. at high and 23 ft. at low water. The industries of Newcastle include a steam biscuit

factory, copper smelting works, a brewery, shipbuilding yards, foundries, carriage factories and a boot factory. Pop. estimated, '95, at 13,500.

NEWCASTLE, William **CAVENDISH**, Duke of. See Cavendish William.

NEWCASTLE-UNDER-LYME, a parliamentary and municipal borough of England, in the county of Stafford, 15 m. n.n.w. of the town of that name. A branch railway connects it with the North Staffordshire line, and a branch canal with the Grand Trunk Navigation. One of its churches, rebuilt early in last century, has a very old square tower of red sandstone. The free grammar school has an income of about £100 a year, and was founded in 1602. Hats were formerly the principal branch of manufacture, but the army clothing factory is now the chief establishment. Newcastle-under-Lyme is surrounded by famous potteries, and coal-mines are worked in the vicinity. Pop. of municipal borough, '91, about 18,500; of parliamentary borough, 54,200.

NEWCASTLE-UPON-TYNE, an episcopal city, a parliamentary and municipal borough and the chief t. of Northumberland, a county of itself. Gateshead, which stands upon the opposite side of the river, being connected by 3 large bridges, is virtually a part of Newcastle. According to the census of 1881, Newcastle contained a pop. of 145,228, Gateshead 65,873, making together 211,101 inhabitants. In 1896 the pop. was estimated at 212,223. Within the 19th century the city has increased its pop. by fourfold.

The Romans had a stationary camp here, called Pons Ælii—one of the chain of forts by which the wall of Hadrian was fortified. On the withdrawal of the Romans, the deserted camp became the residence of a colony of monks, and the town was called Monkchester. Robert, eldest son of the conqueror, commenced to build a castle here in 1079 or 1080. Hence the modern name of New Castle. William Rufus built his brother's castle, surrounded the town with a wall, and gave the inhabitants peculiar privileges. The present castle, which displays better than any other in England the genius of Norman military architecture, was erected by Henry II. between the years 1172 and 1177. Newcastle being made the rendezvous of the vast armaments which the first three Edwards led into Scotland, it was in their time surrounded with new walls of unusual strength and magnitude; portions of them yet remain.

The town stands partly upon an elevated platform, and partly upon the n. bank of the river. The more ancient houses in the lower part of the town are chiefly built of timber; those in the center of the town are mostly of stone; but the houses generally are of brick. Chiefly through the instrumentality of one man of humble origin—Richard Grainger—Newcastle has in modern times received the addition of many elegant streets, squares, and public buildings. The river is crossed by three bridges—the High-level bridge, the Redheugh Bridge, and a swing bridge (completed in 1874) at a cost of nearly £500,000, one of the largest structures of the kind in the world. The High-level bridge forms one of the engineering triumphs of Robert Stephenson. It consists of six cast-iron arches, supported upon tiers of masonry. The length of the viaduct is 1337 feet, and the height of the railway above high-water mark, 112. It has a broad carriage-way, by which the ordinary traffic avoids the precipitous streets on both sides of the river, with passenger path on each side, and the railway above.

In 1882 Newcastle became a bishopric including the whole of Northumberland. The mother church (St. Nicholas) is a noble edifice, chiefly in the decorated style; its steeple, which is singularly light and bold, is early perpendicular. In the Guildhall, an old and somewhat inconvenient building, situated beside the river, the town assizes are opened, and the quarter sessions held. Under the Guildhall proper there is an exchange for the merchants, ship-owners, and brokers of the quay-side. In the Moot Hall, a modern and very handsome Grecian building overlooking the swing-bridge, the town and county assizes are held. The spacious town-hall, a modern building, stands on a block of ground facing St. Nicholas' church; associated with it are a corn market and offices for the transaction of the town business. The market for the sale of butcher-meat and vegetables is one of the most spacious and commodious in the kingdom. All the railways entering the town terminate in a large station near its center. The jail, a heavy and costly mass of building, occupies a low and confined situation. The central police station, police court, and offices, built in 1873, are comprised in a large and handsome structure in Pilgrim street. The new postal and telegraph office, begun in 1873, is one of the largest and finest of the public buildings in the town. There are two theaters—the Royal (the great ornament of Grey street, the handsomest street in the town), and the Tyne theater in Westgate street. There is also a natural history museum, built in 1884, and a public library. There are beside the colleges of medicine and of science, both connected with the university of Durham. Newcastle has two monuments—a column surmounted by a statue of earl Grey, to commemorate the passing of the reform bill, and a bronze statue to George Stephenson.

A very large market is held every Thursday morning for the sale of butter, bacon, cheese, eggs, and other articles of country produce. General market days are Tuesdays and Saturdays, and the revenue is £3500. Newcastle is well supplied with surface water, the chief place of collection being Hallington, about 20 miles n.w. of the town.

The trade of Newcastle consists chiefly in coal, and in those articles in the production of which great heat is required. The Newcastle coal trade had its origin in the reign of Henry III., and in 1615 400 colliers sailed from here, one-half to supply London. This branch of industry is not now confined to Newcastle, but is spread over the greater

part of the sea-board of Northumberland and the whole of Durham. Large quantities of lead, the produce of the mines of Alston Moor and Weardale, are brought to Newcastle for manufacture. A very large quantity of unrefined lead is also imported from Spain. Having been refined and desilverized, the lead is rolled into sheets and pipes, or converted into shot, litharge, red and white lead. Copper is got from the copper pyrites used at the chemical works of the Tyne.

At Newcastle the railway system had its origin. Here, as might be expected, locomotive and engineering establishments are found upon a great scale, the machine shops alone employing over 7,000 workmen. The ordnance works of sir William Armstrong at Elswick, the western part of Newcastle, are well known. Iron shipbuilding and various branches of engineering are extensively carried on upon the Tyne. Since 1882 several men-of-war have been constructed on the Tyne. Newcastle occupies an important position in the manufacture of soda, bleaching-powder, vitriol, and other chemical products. There are made in the district large quantities of salt per annum. Earthenware is largely manufactured, window glass and flint glass have declined; impressed glass is largely manufactured, and plate glass is made. Glass-staining has attained great perfection. The firebrick trade is a new industry, which has attained gigantic proportions, and there are important manufactures of gas-retorts and sanitary pipes, which are sent all over the world. Immense numbers of grindstones leave the Newcastle quarries annually. Portland and other cements are made to the extent of 11,000 tons in a year.

The river Tyne from the sea to Newcastle, forms a natural dock for the accommodation of shipping, and the tonnage of all vessels entered at the united Tyne ports amounted, in 1895, to 4,601,408. Four artificial docks have, however, been constructed, the largest of them being nearly a mile long—£3,250,000 having been spent on the improvement of the Tyne—and including two piers at its mouth. The entrance to and many parts of the river have been deepened by dredging, and, though 8 miles from the mouth of the Tyne, the tidal river is as much a port for Newcastle as the Thames is for London. The value of imports amounted in 1894 to £6,977,328, and of the exports £3,919,433, consisting chiefly of iron, copper, lead, alkali and machinery. The imports embraced fruits, grain, butter, sugar, metals and petroleum. The total exports from Newcastle to the U. S. in 1896 amounted to $18,102,067.

Of the benevolent institutions established in Newcastle there are an infirmary, a dispensary, asylums for the blind, the deaf and dumb, and two orphanages. The literary and philosophical society, the society of antiquaries, the natural history society, the mechanics' institution, and the institution of mining engineers (to which has been added a large hall, as a memorial of Nicholas Wood, an engineer of celebrity) successfully cultivate their several fields of labor. A college of physical science, with four professorships (geology, experimental philosophy, chemistry, and mathematics) was established in 1871 in connection with the university of Durham; and there is also in Newcastle, associated with the same university, a college of medicine.

Lords Stowel, Eldon, and Collingwood, Mark Akenside, and Hutton, the mathematician, were natives of Newcastle. Intimately connected with it, though not born in it, were Thomas Bewick, the engraver; Robert Morrison, the Chinese scholar; and George and Robert Stephenson. For a history of Newcastle see Boyle (1890).

NEW CHRISTIANS, the name given to Jews who, 400 years ago, were compelled by the Spanish inquisition to embrace Christianity in order to escape torture and death. Many outwardly complied, while their secret attachment to their own religion was unchanged. But their persecutors, not satisfied with outward professions, and finding that Jewish services were still secretly held and Jewish customs rigidly maintained, resolved to seize the property of the obstinate ones even if they could not gain possession of their minds and hearts. They consequently ordered the arrest of several of the suspected converts and the confiscation of their goods, and denounced excommunication against all who favored or helped them. The Dominican convent at Seville, where the inquisition was held, being soon crowded with the prisoners, the tribunal was removed to the castle of Triana in the vicinity of the city. A second edict commanded every person, under penalty of excommunication for mortal sin, to inform against all who had relapsed into Judaism or were suspected of having done so. Sentences of death were soon pronounced. In that year about 300 New Christians were burned alive in Seville, 2,000 in other districts of Andalusia, and 17,000 were subjected to minor penalties. The property of all who were put to death was seized. The terror thus excited induced a large number of "New Christians" to flee into Portugal, where many Jews resided, and were treated with unusual justice. They had consequently become well educated, and filled, to some extent, the places of the expelled Moors as the authors, merchants, and physicians of the land. From their academy in Lisbon went out skillful mathematicians, grammarians, poets, theologians, botanists, and geographers. By steadfastness and united action, combined with native talent, they acquired great influence through the kingdom. But their superiority aroused popular jealousy, which at length produced an edict for their expulsion from Portugal. Soon the storm burst severely on the New Christians. In 1506 the plague raged violently in Lisbon and was aggravated by famine. During these combined calamities, while the people were offering up prayers for divine interposition, on Sunday, April 19, a brilliant light illuminated the figure of Christ. While many doubted the genuineness of the miracle one of the New Christians was bold enough to express publicly his unbelief. This arousing the populace, they seized the man and burned him at the stake. This one death was like a spark that kindles a conflagra-

tion. Within three days more than 2,000 persons were put to death; old men, women, and children were burned in the fire that raged in the public squares. The king was absent from Lisbon, but on hearing of the outrage, with righteous indignation, inflicted summary justice on the leaders of the massacre and on the magistrates who had failed to resist and stop it. Terrified by such calamities many both of the Jews and New Christians fled to Holland, where those of their nation enjoyed complete toleration. The king, anxious to keep all he could of such valuable citizens, commanded that children under the age of 14 should be retained and instructed in Christianity. This was a cruel order, but it doubtless impelled many Jews to profess Christianity. The Jewish historians affirm that the exodus of their people was complete both from Portugal and Spain; but Jewish physiognomy and family traditions alike prove that the movement was not universal. There certainly are many Jews in Portugal, and Jewish blood flows in the veins of many noble Roman Catholic families there. In modern times the descendants of New Christians have gradually lost all traces of their national faith. Family names alone point them out. But in remote provinces some traces of the ancient worship remain, especially in observing the great day of atonement. A few families abstain from eating bread during the passover, and many retain the sacred Jewish prayer.

NEWCHURCH, a very thriving t. of Lancashire, England, 19 m. n. from Manchester, in Rossendale, not far from the source of the Irwell. It has recently and rapidly risen to its present importance. There are numerous cotton and woolen manufactories, employing many operatives. Coal is also wrought in the neighborhood, and there are numerous large quarries of excellent freestone. Pop. of parish, 26,200. The neighborhood is very populous, abounding in manufactories and other public works.

NEW CHURCH. See SWEDENBORG, SWEDENBORGIANS.

NEW COLLEGE, OXFORD. The college of St. Mary of Winchester, in Oxford, commonly called New College, was founded by William of Wykeham, bishop of Winchester and lord high chancellor, in 1386. The buildings are magnificent, and the gardens of great beauty. The most remarkable peculiarity of New College is its connection with Winchester school, another noble foundation of Wykeham. After the kin of the founder (to whom a preference was always given), the fellows were to be taken from Winchester. The late practice was that "two founders," as they were called, were put at the head of the roll for Winchester, and two others at the head of the roll for New College. In 1851, the college consisted of a warden and 70 fellows (elected in this way from Winchester), 10 chaplains, 3 clerks, and 16 choristers. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were introduced, but the connection of the college with Winchester was in great measure preserved. The number of fellows was fixed at 30. Of these, 15 are open only to those who have been educated at Winchester, or who have been for 12 terms members of New College. The other 15 are open without restriction. The value of the fellowships is not to be more than £200 per annum, so long as their number is less than 40. There are also to be 30 scholarships, tenable for 5 years, of value not less than £80 per annum, inclusive of rooms, to be appointed by the warden and fellows of New College, by the election of boys receiving education at Winchester school. No conditions of birth are to be regarded in the election either of fellows or scholars. By a subsequent statute, the chaplains are made three in number, and from 8 to 10 choral scholars are added, to be upon an equality with the other scholars. This college presents to 40 benefices, and elects the warden of Winchester college.

NEWCOMB, HARVEY, D.D., 1803–63; b. Vt., taught school for 8 years at Alfred, N.Y.; in 1823 became editor and publisher of the *Western Star*, Westfield, N. Y., and two years later was editor of the *Buffalo Patriot*. In 1830–31, he published the *Christian Herald* at Pittsburg, Penn., and for several years was engaged by the American Sunday School Union in the preparation of books for the young. In 1840 he was licensed to preach, and in 1841 became pastor of the Congregational church at West Roxbury, Mass., and afterward of the churches at West Needham and Grantville. In 1849 he was for a year assistant editor of the Boston *Daily Traveller*, and in 1850–51 of the *New York Observer*. He spent several years after this in establishing Sunday schools in Brooklyn, N. Y., and supplied the Park st. mission church of that city, and in 1859 was installed pastor of the Congregational church in Hancock, Penn. He was a regular contributor to the *Boston Recorder* and other religious papers. Dr. Newcomb was a copious writer, being the author of 178 volumes, most of which were designed for children and youth, and had a large circulation. His largest work was *Cyclopedia of Missions*, a book of great value at the time.

NEWCOMB, SIMON, LL.D.; b. Nova Scotia, 1835, came to the United States when a boy and here received his education, graduating at the Lawrence Scientific School, Cambridge. From an early age he displayed remarkable proficiency in the higher mathematics and astronomy. For some years he taught school in Maryland, and in 1857 took part in the preparation of the *Nautical Almanac* for that year. He now began to attract the notice of the scientific world by his original investigations in astronomy, and in 1861 was appointed mathematical professor in the naval department and placed in charge of the naval observatory. In this position he made the contract and supervised the details of the purchase, construction, and mounting of the great telescope. In 1871, he was

secretary of the commission created by congress to arrange for the thorough scientific observation of the transit of Venus of Dec. 9, 1874. He was made a foreign associate of the English royal astronomical society in 1872, and two years later a gold medal was bestowed upon him by the same society for his tables of Neptune and Uranus. He is also a member of the French Institute and of many American societies. In addition to his scientific attainments he has given attention to finance and political economy, and has delivered a course of lectures at Harvard College on kindred topics. Besides many scientific papers he has published *Popular Astronomy* (1878); *The A. B. C. of Finance* (1877); treatises on *Algebra* (1881), *Geometry* (1881), *Trigonometry* (1882); *The Problem of Economic Education* (1894), etc. He received the Copley medal for original scientific research, 1890; was elected an honorary member of the Royal institute of London, 1892, and an associate of the French academy of sciences, 1895; was professor of mathematics in Johns Hopkins university, 1884–93; and became director of the *Nautical Almanac*, 1894. He died in 1897.

NEWCOME, William, D.D., 1729–1800; b. Berkshire, Eng.; educated at the grammar school and the university of Oxford; first a student at Pembroke College, and then a fellow and tutor of Hertford. He suddenly and rapidly rose to preferments. In 1765 he was appointed chaplain to the earl of Hertford, lord-lieutenant of Ireland. In 1766 he was made bishop of Dromore, Ireland, and afterward of Ossory and Waterford, and in 1785, archbishop of Armagh. He faithfully performed his official duties, securing the respect of all parties. He was a diligent Biblical student, and published several valuable works, of which the first was, *The Harmony of the Gospels*, containing much important critical information. His other works are, *The Duration of our Lord's Ministry particularly considered, Observations on our Lord's Conduct as a Divine Instructor, and on the Excellence of His Moral Character;* a new version with critical remarks on the *Twelve Minor Prophets and Ezekiel.* His next work was, *A Historical View of the English Biblical Translations.* His last work, except an episcopal *Charge*, was, *An Attempt toward Revising our English Translation of the Greek Scriptures.* This was published after his death.

NEWDIGATE, Sir Roger, 1719–1806; b. England, patron of the Newdigate prizes at the university of Oxford, where he was educated at Westminster school and University college, and became distinguished as a classical scholar, of refined taste and brilliant attainments. He was a member of the house of commons for Middlesex 1751–80, representing the university of Oxford. He established the prizes for the best English verses on the arts of painting, sculpture, and architecture; having given to that institution Piranesi's works on architecture and antiquities, and the candelabra in the library founded by Dr. John Radcliffe.

NEWELL, Harriet (Atwood), 1793–1812; b. Mass. She was the first American woman who went as missionary to India. She sailed for India with her husband Samuel Newell, and Adoniram Judson and wife, Feb. 19, 1812. They were forbidden by the East India company to remain in Calcutta, and sailed Aug. 4 for the Isle of France. "Their passage was long and perilous. After having been driven about for a month in the bay of Bengal during which Mrs. Newell was sick of a fever, the ship put in to Coringa in distress. They left that port and early in November arrived at the place of their destination. About three weeks before their arrival, Mr. and Mrs. Newell committed to the deep the body of an infant daughter, five days old. From this time Mrs. Newell rapidly declined. Her disease, the consumption, baffled medical skill, and on Nov. 30 at Port Louis she was released from the toils and sorrows of this mortal life." A volume containing her life and writings was published by the American Sunday School Union. A memoir of her by Dr. Woods has been widely circulated in several languages. She was much beloved at home, and many hearts were touched by the example of her early consecration. It may be that her death causing the knowledge of this example to be so widely diffused, and calling attention to the great missionary work, effected more for the heathen than a long life of labor would have done.

NEWELL, Robert Henry, b. New York, 1836; engaged in business in his early life, but when about 21 entered upon the career of a journalist and literary man. He was connected with the *Mercury* of New York, 1858–63, and there first published the humorous articles in burlesque style under the pseudonym of Orpheus C. Kerr (office-seeker), on which his literary reputation mainly rests. Several volumes of these papers were published, and had a large sale. In 1863 Mr. Newell visited California, and has since published several volumes of prose and poetry. He has been a contributor to the *New York World* and editor of the *Hearth and Home.*

NEWELL, Samuel, 1785–1821; b. Maine; graduated at Harvard college 1807. While engaged in the study of theology at Andover, he with five other students signed a paper addressed to the general association of Massachusetts (Congregational), expressing their desire to go as missionaries to the heathen and asking advice. It was this appeal that led to the formation of the American board. He married Harriet Atwood, and Feb. 19, 1812, sailed for Calcutta. Arriving there they were forbidden by the East India company to remain within their jurisdiction, and sailed for the Isle of France. After being driven about for a month in the bay of Bengal, the ship put in at Coringa in distress. Again sailing, their little daughter died, and was buried in the ocean. Soon after their

arrival Mrs. Newell also died and was buried on the island. Mr. Newell went to Ceylon, and afterward to Bombay, where he died of cholera. He was greatly endeared to the friends of missions by his devotedness and peculiarly amiable character. He wrote with Mr. Hall while at Andover, *The Conversion of the World, or Claims of Six Hundred Millions*, a work of thrilling interest which had great effect in churches in awakening a missionary spirit.

NEW ENGLAND, a collective name given to the six eastern states of the United States of America—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, and Connecticut—including an area of 65,000 sq. miles. The people, distinctively known as Yankees, and mostly descended from an English Puritan and Scottish ancestry, are engaged in commerce, fisheries, and manufactures, and are celebrated for industry and enterprise. This region was granted by James I. to the Plymouth Company in 1606, under the title of North Virginia, and the coast was explored by Capt. John Smith in 1614. See accounts of the several states.

NEW FOREST, the name of a district in Hampshire (q.v.), triangular in shape, and bounded on the w. by the river Avon, on the s. by the coast, and on the n.e. by a line running from the borders of Wiltshire along the Southampton water. Area, 92,000 acres, of which 64,000 acres are crown demesnes. This triangle appears to have been a great wooded district from the earliest times, and its present name dates from the Norman conquest, when it was regularly afforested. Since that period it has remained a possession of the crown, subject to rights of "pannage," vert (greenwood), and turf-cutting, claimed by various estates in or near the forest. It is now managed by the court of Verderers as a public pleasure-ground. The principal town within its borders is Lyndhurst. Formerly this district was the haunt of numerous "squatters," but their huts are now rarely to be seen. Gypsies, however, still congregate here in considerable numbers. In 1854 a commission was appointed to examine the extent and nature of the rights of pannage, etc., claimed by the foresters and borderers, and in a large majority of cases the claims were confirmed. The principal trees in the forest are the oak and beech, valuable on account of the nearness of Portsmouth harbor. The oaks have been much used as timber for the British navy. Tracts of exquisite woodland scenery are everywhere to be met with, and the forest is now a favorite resort of artists and naturalists. The afforestation of this district by the Conqueror, enforced by savagely severe forest laws, was regarded as an act of the greatest cruelty, and the violent deaths met by both of his sons, Richard and William Rufus — both of whom were killed by accidental arrow-wounds in the forest — were looked upon as special judgments of providence. A small breed of pony lives wild under its shelter.

NEWFOUNDLAND, an island and British colony of North America, not yet incorporated with the Dominion of Canada, lies at the mouth of the gulf of St. Lawrence, separated from Labrador on the n. by the strait of Belle Isle (about 12 m. broad), and extending in lat. from 46° 38′ to 51° 40′ n., and in long. from 52° 35′ to 59° 35′ w. In shape it resembles an equilateral triangle, of which cape Bauld on the n., cape Race on the s.e., and the cape Ray on the s.w. form the angles. The extreme length and breadth are each about 316 miles; area, 42,000 sq. miles; pop. '91, 197,934; with Labrador 202,040.

The island, as seen from the sea, presents a wild and sterile appearance. Its surface is diversified by mountains, marshes, barrens, ponds, and lakes. The mountains in the Avalon peninsula (stretching s.e. from the main portion of the island, and connected with it by an isthmus of only about 3 m. in width) rise, in some cases, to 1400 ft. above sea level; while both here and along the western shore the height of 1000 ft. is frequently reached. The number of the lakes and "ponds" (the latter name being used indiscriminately for a large or a small lake) is remarkable, and it has been estimated that about one-third of the whole surface is covered with fresh water. The "barrens" occupy the top of hills. The coast line is everywhere deeply indented with bays and estuaries, many of which are spacious enough to contain the whole British navy. Of these inlets, the principal, beginning from the northern extremity of the island, are Hare, White, Notre Dame, Bonavista, Trinity, Conception, St. Mary's, Placentia, Fortune, St. George's, and Bay of Islands. These bays vary in length from 25 to 70 m., are of great breadth, and are lined — as indeed the whole coast is — with excellent harbors. The rivers, none of which are navigable for any distance, communicate between the lakes of the interior and the shore, and are narrow and winding. The main streams are the Humber, River of Exploits, Gander, and Great Codroy. Much of the soil is sterile and unproductive, although there is considerable cultivation along the sea-board of the settled districts, limited principally to the s.e. coast; exploration has shown that the best land and the best timber are in the interior. The great body of the people being employed either in the fisheries or in establishments connected with them, little attention used to be paid to the culture of the soil; but very considerable improvements in this respect have latterly been made by the enterprising islanders. In the neighborhood of many of the lakes and rivers there are valuable alluvia. Potatoes of excellent quality yield well; green crops thrive in many districts; wheat has been known to yield 30 bushels to the acre; and apples, plums, cherries, gooseberries, strawberries, and raspberries are cultivated successfully. The island possesses some minerals, among which are marble, limestone, gypsum, roofing-slate, and coal — the last found only in

small quantities; also copper, nickel, lead, and iron. One rich copper mine is worked, though mining is still in its infancy here. Trees, of which the chief are pine and fir, birch, and willow, thrive only in the more fertile districts.

The fisheries are of two kinds—the "shore fishery" and the "bank fishery;" the former comprises the shores and bays of Newfoundland; the latter comprises a great tract known as the "banks" of Newfoundland, from 500 to 600 m. in length, and about 200 m. in breadth. The banks form the greatest submarine plateau known; the depth of the water is from 20 to 108 fathoms, and the most productive "ground" is said to extend between lat. 42° and 46° north. Great variety of valuable fish is found in the waters around the colony, as the cod, salmon, herring, etc. The principal articles of export are fish, comprising dry cod, herring, and salmon, cod-liver oil, copper and regulus, iron pyrites, asbestos, and lumber. The Labrador fisheries employ about 20,000 persons; the "banks" fisheries have steadily declined for several years; and the lobster fisheries are obtaining great importance. The imports are chiefly provisions, as bread, butter, tea, etc.—cordage and cables, and manufactured goods. The imports and exports for 1894 amounted in value to $7,164,738 and $5,811,169 respectively. The revenue of Newfoundland in 1894 was $1,641,035; and the public funded debt, $9,116,535. The registered shipping of the colony amounted to 108,180 tons, in 2,339 vessels, and the vessels owned there exceeded 1,725.

The seal affords one of the most important fishing interests of Newfoundland. This industry may commence any day from Feb. 25th to March 5th, according to the winds —a n.e. wind blocking up the coast with ice, which the first strong westerly wind clears away. At the beginning of the present century, the seal-fishing was carried on with vessels of from 30 to 40 tons, manned by 8 or 10 men. Vessels of from 70 to 180 tons, manned by from 25 to 90 men, were substituted for these, the most suitable being vessels of from 120 to 140 tons. About 1866, steamers were introduced into the seal-fishing and they have proved very serviceable. In 1895 the industry employed 20 large steam vessels with 4,686 men, and the catch was 270,058. In proportion to the population of Newfoundland, its religious institutions are ample, while education is within reach of all classes, government grants to the district school being liberal.

The colony has a railway between St. John's and Placentia, 83½ miles long; another between Whitbourne and Exploits, 200 miles long; and a third, 17 miles long—all of narrow gauge. Important extensions have been projected. There is regular steamship communication between the island and Canada and Liverpool, and St. John's, the capital, is in telegraphic connection with Canada, the United States, Europe, and all the important places on the island.

The early history of Newfoundland is involved in obscurity. It was discovered, June 24, 1497, in the reign of Henry VII., by John Cabot; and the event is noticed by the following entry in the accounts of the privy-purse expenditure: "1497, August 10, To hym that found the New Isle, £10." It was visited by the Portuguese navigator, Gaspar de Cortereal, in 1500; and within two years after that time, regular fisheries had been established on its shores by the Portuguese, Biscayans, and French. In 1578, 400 vessels, of which 50 were English, were engaged in the fishery. Sir Humphrey Gilbert, with his ill-fated expedition, arrived in St. John's harbor, August, 1583, and formally took possession of the island in the name of Queen Elizabeth. In the return voyage, the expedition was scattered by a storm, and the commander lost. In 1621, sir George Calvert (afterward lord Baltimore) settled in the great peninsula in the s.e., and named it the *Province of Avalon*. The history of the island during the 17th and part of the 18th centuries, is little more than a record of rivalries and feuds between the English and French fishermen; but by the treaty of Utrecht (1713), the island was ceded wholly to England; the French, however, retaining the privilege of fishing and drying their fish on certain portions of the coast. A governor was appointed in 1728. The present form of government, established in 1855, consists of the governor, a legislative council (appointed by the crown), and a general assembly (elected by the people). The coast of Labrador on the mainland, and the island of Anticosti, have been included, since 1809, within the jurisdiction of the governor of Newfoundland. Cap. St. John's. Pop. '91, 29,007.

NEWFOUNDLAND DOG, one of the most sagacious and esteemed of the large kinds of dog. It is said to have been originally derived from Newfoundland, where it is used chiefly as a beast of draught, to convey light loads of wood or provisions, on sledges, over rugged tracks. Multitudes of these dogs, in St. John's and elsewhere, are left to shift for themselves during the fishing season; and are again called to service when required by their masters. There are several varieties of Newfoundland dogs, particularly a smooth breed, with rather small head, white and spotted with black, which seems now to be extinct; a very large breed, with broad muzzle, head raised, noble expression, waved or curly hair, very thick and bushy curled tail, black and white color; and a smaller almost black breed. Some of the breeds seem to be crossed with hounds and other dogs. The Newfoundland dog is remarkable for memory, and for patience and forbearance of temper. It is, however, apt to become irascible in confinement, and will then bite even its master. Some of the most interesting anecdotes of the affection and sagacity of the dog, relate to the Newfoundland dog. No dog excels it as a water-dog. Its paws are half-webbed. Its power of endurance in swimming is very great.

NEWGATE, a celebrated London prison, stands at the western extremity of Newgate street, opposite the Old Bailey. It is the chief criminal prison for the city and county. The exterior presents high dark stone walls, without windows, and with entrances from the side next the Old Bailey, in front of which public executions take place. The earliest prison here was in the portal of the *new gate* of the city, as early as 1218; and hence the name. About two centuries afterwards, it was rebuilt by the executors of sir Richard Whittington, whose statue with a cat stood in a niche, till its destruction by the great fire of London in 1666. Shortly after it was reconstructed, from which time, till 1780, the date of the erection of the present edifice, its condition was, in a sanitary point of view, horrible. Mr. Akerman, one of the keepers, in his evidence before the house of commons in 1770, stated, as a proof of this, that in the spring of 1750, the jail distemper, spreading to the adjoining sessions house, caused the death of "two of the judges, the lord mayor, and several of the jury and others, to the number of 60 persons and upward." The place, however, is now kept in the cleanest possible condition. The cells for condemned prisoners are at the n.e. corner, next to Newgate street. The *Newgate Calendar* contains biographical notices of the most notorious murderers, burglars, thieves, and forgers who have been confined within its walls.

NEWGATE PRISON, a copper mine in Simsbury, Conn., which from 1773 to 1827, when the state prison at Wethersfield was completed, was used for the confinement of burglars, horse-stealers, counterfeiters and (during the revolution) of Tories. The convicts were employed in making nails out of iron brought from Canaan and Salisbury, in digging and smelting copper, and, after the suspension of mining, in making shoes and other articles.

NEW GRANADA. See COLOMBIA, REPUBLIC OF.

NEW GUINEA. See PAPUA.

NEW HAMPSHIRE, a New England state, and one of the original 13; between lat. 42° 40′ and 45° 18′ n.; long. 70° 37′ and 72° 37′ w.; bounded on the n. and n.n.w. by the province of Quebec, Canada; on the e. by Maine and the Atlantic ocean; on the s.s.e. and s. by Massachusetts, and on the w. by Vermont, the Connecticut river intervening. Length from n. to s., 180 m.; average breadth, 45 m.; greatest breadth, 100 m.; land area, 9005 sq. m.; gross area, 9305 sq. m., or 5,955,200 acres.

The ARMS of the state show a ship on the stocks flying American flags in the foreground; in the background, a sunburst. It is called "the Granite State."

HISTORY.—The first Europeans to visit this region were Martin Pring, who in 1603 sailed into the Piscataqua; Champlain, who discovered the Isles of Shoals in 1605, and Capt. John Smith, in 1614. After them came Capt. John Mason and Sir Ferdinand Gorges, to whom in 1622 all the territory between the Merrimac and Kennebec was granted. They divided their patent, Mason taking the territory w. of the Piscataqua. The patentees and first immigrants were churchmen and royalists, and their settlements were Little Harbor (Rye), Dover, and Strawberry Bank (Portsmouth), all begun in 1623. In some of the early histories, the tract which Mason, a native of Hampshire, England, named N. H., is called Laconia, and in others, Piscataqua. In 1638 Exeter was settled, but troubles with the Indians, Mason's death in 1635, and the jealousy of Massachusetts, hindered the growth and peace of the settlements, and the claim of Massachusetts that nearly the whole of N. H. was within her charter limits was followed by the annexation of the latter, in 1641. In 1679, however, Charles II. made it a separate royal province, with a president and council appointed by the Crown, and an assembly chosen by the people. This plan was changed when Joseph Dudley became governor of New England, 1685; but there was a separate provincial government, 1692–1774. The settlements were gradually extended further w. than the original patent prescribed, and it was believed until 1764 that the territory at present included in Vermont formed part of the grant—a mistake that led to a vexatious controversy with New York, which lasted many years. In Dec., 1774, the fort at New Castle was captured by the friends of liberty; in 1776 the state declared its independence, and a temporary government was established that continued during the revolutionary war, in which its people were among the most active and noted participators. The state was represented in the continental congress, and ratified the constitution of the U. S. on June 21, 1788. At a convention in Oct., 1783, a constitution was prepared similar to that of Massachusetts. This was adopted in the following year and has been revised several times since. Portsmouth was the capital of the province; Concord became the state capital, 1805.

TOPOGRAPHY.—New Hampshire is a state of mountains and lakes, and widely celebrated for some of the most beautiful scenery in the world. The Appalachian range forms here a lofty plateau occupying most of the surface, to which belong the White Mts., covering an area of about 1400 sq. m., with peaks varying from 2000 to over 6000 ft. in height, headed by Mt. Washington, 6285.4 ft. Isolated peaks, such as Kearsarge and Monadnock, lie in the southern part of the state, and everywhere are found deep gorges or beautiful valleys. The average elevation of the state is 1200 ft. above the sea, and it inclines gradually toward the south. The Connecticut river rises in the extreme northeastern corner, in a group of beautiful small lakes, and runs southerly through a valley remarkable for its beauty and fertility. The Merrimac is the second river in size, and is noted for turning more mill-wheels than any other river in the world. The Piscataqua, on the southeastern boundary, is, in its lower course, a broad,

deep estuary, forming one of the best harbors on the Atlantic coast. At Kittery, opposite Portsmouth, is the United States Navy Yard. Other streams are the Ammonoosuc, Sugar, Contoocook, Androscoggin, and Saco, all noted for their pure waters abounding with fish. Winnipiseogee, the largest lake, covering seventy-two square miles, contains two hundred and sixty islands. Next in size are Umbagog, covering eighteen square miles; Sunapee, eleven square miles, and many others, all of which are more or less popular as summer resorts. Sunapee particularly, with an altitude of eleven hundred feet, is noted for its summer villages and its fishing camps. The state has only eighteen miles of seacoast, including the well-known resort of Hampton and Rye beaches.

Geology and Mineralogy.—The rock strata are chiefly Eozoic, Laurentian, Atlantic, Labradorian, and Huronian, with small areas of Cambrian slates. Terminal moraines and boulders abundantly illustrate the glacial period. Magnetic and specular iron ores are found in Grafton and Carroll cos., and bog iron nearly everywhere. Copper is mined at Lyman and Monroe, and gold and silver are obtained from quartz at Lisbon and other places. Gold is washed from brook sands as well. Granite is quarried at Concord and elsewhere; soapstone at Francestown and Oxford, and mica, in large plates, at Grafton and Alstead.

Zoölogy.—The moose, elk, and beaver are occasionally seen in the extreme n. The deer, bear, wolf, panther, lynx, and wild-cat are found in the mountains, but the only common animals are the mink, otter, sable, raccoon, hare, skunk, rabbit, woodchuck, muskrat, and gray squirrel. The game birds are the plover, rail, ruffed grouse, quail, etc. Besides the species found in the adjacent states, the bobolink, oriole, blue jay, robin, humming-bird, etc., there are many birds peculiar to more northern latitudes, such as the Canada jay and crossbill. The lakes and streams furnish a great variety of valuable fish, including several varieties of trout, bass, salmon, etc., with which they have been stocked in recent years by the State Fish Commission The state hatcheries are located at Sunapee and Plymouth, and send out annually millions of young fish.

Botany.—The common trees and shrubs are the white, red, and pitch pine, hemlock, spruce, larch, red and white oak, red and sugar maple, beech, birch, elm, chestnut, butternut, hickory, poplar, cherry, ash, mountain ash, moosewood, etc.

Climate, Soil and Agriculture.—The climate is healthful, but the winters are long and severe. The yearly mean temperature at Hanover is 42.49°; at Manchester, 48.72°. The average annual rainfall at Hanover is 40.32 ins.; for the entire state it is 47.16 ins. The soil, except in the valleys, is better adapted to pasturage than culture, and much of the land which was once productive has become worn out by long use. In recent years attention has been turned to stock-raising, and large numbers of fine horses, cattle, and sheep are the result. Their total valuation is over $8,000,000. Much attention has also been paid to dairy-farming and many large creameries established. Large quantities of maple sugar and syrup are produced. The other principal crops are potatoes, corn, wheat, oats, rye, and buckwheat. The College of Agriculture connected with Dartmouth College has a farm of over 350 acres.

Manufactures.—In the line of industries, New Hampshire is noted for the extent and variety of its manufactures. The U. S. census of 1890 reported 3,229 establishments, employing $79,375,160 capital and 63,361 persons, paying $24,248,054 for wages and $47,754,152 for materials, and having an output valued at $85,770,549. The most important manufacturing interest, according to value of output, was that of cotton goods, which had 27 plants, $6,429,084 capital, and $21,958,002 in value of output. Then followed boots and shoes, with over 60 plants and $12,000,000 output; woolen goods, over 45 plants and $8,000,000 output; lumber products of various kinds, over 550 plants and $6,000,000 output; hosiery and knit goods, nearly 40 plants and $3,500,000 output; and leather, foundry and machine shop products, worsted goods, flour and grist mill products, men's clothing, paper, and furniture. The first cotton mill in the state was built in 1804; the largest plant in New England is at Manchester (q.v.). Berlin is noted for its manufactures of lumber and wood pulp, Dover for its woolen mills, Farmington for its boots and shoes; and Enfield, Franklin Falls, Hinsdale, Keene, and Winchester are important manufacturing places.

Commerce.—In the early days of the colony the maritime commerce was considerable, and consisted chiefly of the exchange of fish and lumber with the West Indies for rum, sugar and molasses, and the shipment of pine-tree masts and spars to England. Shipbuilding was also an important occupation; but the wars with England destroyed both these industries, and they have never been revived. Portsmouth is the only port of entry, and the amount of imports amounts annually to only about $30,000.

Railroads.—The first railroad charter was granted in 1835, and there are now nearly 1,200 miles of track in the state. The Boston and Maine railroad crosses the southern section of the state with several lines, one reaching northward into the mountain and lake region, and so on to Montreal. Another line through the heart of the White mountains is the Maine Central from Portland to Lake Champlain. The tracks of this road through the Notch are laid along galleries cut in the sides of the mountains at great heights above the valley, and giving wonderful views of the mountains round about. The first cog rail mountain railroad in the world was built up Mt. Washington in 1868, and is a remarkable piece of work. It is a little less than four miles in length, and in its steepest part ascends 1980 feet to the mile. The cost of the railroads and equipments was about $23,000,000.

BANKS AND INSURANCE.—In 1896 there were 50 national banks in operation, with a combined capital of nearly $6,000,000, deposits nearly $10,000,000, and reserve nearly $3,000,000; and 67 mutual savings banks, with over 162,000 depositors, $63,000,000 deposits, and $68,000,000 resources. There were about 80 local and foreign fire insurance companies, and over 30 life companies.

FINANCES.—The state debt, according to the last United States census reports, amounted to $2,691,019; the total combined debt less the sinking fund was $8,148,362. The net state debt, 1896, was $1,827,741; equalized valuation for taxation, $286,756,618.

RELIGION, EDUCATION, ETC.—The Roman Catholic Church is most largely represented in the state, owing to the large number of French Canadians and Irish in the manufacturing towns. It is followed numerically by the Congregational, Methodist Episcopal, Regular Baptist, Freewill Baptist, Unitarian, Protestant Episcopal and Universalist. The first meeting house was built in Exeter in 1638. The other principal orthodox denominations are well represented in the state. New Hampshire has always fostered education. In early colonial days it had the same laws as Massachusetts, and when the two colonies became separate, these laws were revised only to better them. Exeter also lays claim to being the first town to establish free schools, having had one in 1635. In 1885 the "district system" of common schools was abolished and the "town system" established instead. This affords better facilities for students in the remote neighborhoods. Phillips' Exeter Academy, one of the most noted preparatory schools in the country, was founded in 1781 by Samuel Phillips, who originated the academy system as a preparatory school for college. The state has public school property valued at over $3,000,000, and expends about $1,000,000 annually for public education. The higher institutions are Dartmouth college (q.v.); the New Hampshire college of agriculture and the mechanic arts, formerly connected with Dartmouth, but removed to Durham in 1893; the New Hampshire conference seminary and female college at Tilton; New Hampshire state normal school at Plymouth; the McGaw normal school at Reeds Ferry; and a large number of seminaries and academies. There are a state industrial home for both sexes at Manchester and a State orphans' home and school at Franklin. In 1896 there were 122 libraries of 1000 volumes and upward each, with an aggregate of about 600,000 volumes, and only 35 towns were without free public libraries, the organization of which is greatly encouraged by acts of the legislature. The periodicals numbered over 110, of which about 15 were daily, 80 weekly, and 13 monthly publications.

GOVERNMENT, ETC.—The capital is Concord. The governor is elected for two years, and receives a salary of $2000. According to the constitution, the governor and members of the legislature must be Protestants. All the judicial officers, such as the attorney-general, solicitor, sheriffs, coroners, registers of probate, and general field officers of the militia, are appointed by the governor. The legislature, consisting of 24 senators and 357 representatives, meets biennially on the first Wednesday in Jan. Each receives $200 per annum. State elections occur on the Tuesday after the first Monday in Nov. The right of suffrage is given to every male citizen who is 21 years of age, and who has resided in one town six months previous to election, excepting paupers and persons who are excused from paying taxes. New ballot laws based on the Australian system were adopted in this state in 1891. The registration of voters is required. The divorce laws are similar to those of Massachusetts. The legal rate of interest is six per cent. Judgments outlaw in twenty years, notes and open accounts in six years. The state prison and the asylum for the insane are at Concord. The National Guard of the state consists of three regiments of infantry, a troop of cavalry and a battery. The state camp ground is opposite Concord.

The electoral votes have been cast as follows: 1788, Washington and Adams, 5; 1792, Washington and Adams, 6; 1796, Adams and Ellsworth, 6; 1800, Adams and Pinckney, 6; 1804, Jefferson and Clinton, 7; 1808, Pinckney and King, 7; 1812, Clinton and Ingersoll, 8; 1816, Monroe and Tompkins, 8; 1820, Monroe and Tompkins, 7; 1820, Adams and Rush, 1; 1824, Adams (for president), 8; Calhoun (vice-president), 7; Jackson (vice-president), 1; 1828, Adams and Rush, 8; 1832, Jackson and Van Buren, 7; 1836, Van Buren and Johnson, 7; 1840, Van Buren and Johnson, 7; 1844, Polk and Dallas, 6; 1848, Cass and Butler, 6; 1852, Pierce and King, 5; 1856, Fremont and Dayton, 5; 1860, Lincoln and Hamlin, 5; 1864, Lincoln and Johnson, 5; 1868, Grant and Colfax, 5; 1872, Grant and Wilson, 5; 1876, Hayes and Wheeler, 5; 1880, Garfield and Arthur, 5; 1884, Blaine and Logan, 4; 1888, Harrison and Morton, 4; 1892, Harrison and Reid, 4; 1896, McKinley and Hobart, 4.

POPULATION.—In 1790, 141,885; 1800, 214,460; '20, 244,022; '40, 284,574; '60, 326,073; '70, 318,300; '80, 346,991; '90, 376,530. There are ten cos.; for pop. '90 see Census Tables, Vol. XV. The largest cities, 1890, were Manchester, 44,126; Concord, 17,004; Nashua, 19,311; Dover, 12,790, and Portsmouth, 9827.

NEW HANOVER, a co. in s. North Carolina. Pop. '90, 24,026; area, 90 sq. m. Co. seat, Wilmington.

NEW HANOVER, is the most northern large island of the Bismarck Archipelago in the Pacific ocean in lat. 2° to 5° s., and longitude 148° to 152° e. It lies to the northwest of New Ireland (q.v.), and is separated from it by Byron's straits.

NEW HARMONY, a town in Posey co., Ind.; settled in 1815 by a German community of religious socialists, called Harmonists, under the leadership of George Rapp. They

UNIVERSITY OF ILLINOIS
URBANA

believed in framing society on the model of the primitive church, and holding all property in common, discouraged matrimony, and looked for the second coming of Christ and the early approach of the millennium. In 1825, having sold the village and domain to Robert Owen (q. v.), they returned to Pennsylvania. Owen founded an experimental community on his system, but the society soon failed and the property was bought by William Maclure for school use. It is now a flourishing village, containing churches, schools, and a good library, together with some milling establishments. Pop. '90, 1197.

NEW HAVEN, a co. in s.w. Connecticut, bounded s. by Long Island sound, and w. and s.w. by the Housatonic river, which separates it from Fairfield co.; about 619 sq. m. Pop. '90, 209,058, chiefly of American birth, with colored. Naugatuck river is the only stream of any size, though several small creeks and rivers empty into the sound; the principal railroads are the New York, New Haven and Hartford, and its leased lines, including the branch to New London; the New Haven and Northampton; the Boston and New York Air line; and the Naugatuck. Co. seat, New Haven.

NEW HAVEN, co. seat of New Haven county, Conn., and largest city in the state, is at the head of New Haven Bay, four miles from Long Island Sound; latitude, 41° 18′ 23″ north; longitude, 72° 56′ 30″ west; distant from Hartford, the capital, thirty-six miles; from New London, about fifty miles; and from New York, seventy-six miles.

The colony of New Haven played an important part in the settlement of the United States. In 1638 a party of wealthy Puritans under Rev. John Davenport, an acknowledged puritan minister, and Theophilus Eaton, a London merchant, all well known and respectable, landed on these shores, and were invited to settle in Massachusetts. They finally located at Indian Quinnepiac, which the Dutch navigator, Block, had already named Rodenberg, or Red Mount, from the reddish color of East and West Rocks, situated near the harbor. In the wilderness, under an oak tree, a treaty was signed with Momanguin for a tract of country ten miles broad and thirteen miles wide. Thirteen coats were paid for this, and the privilege was granted to the Indians to hunt and shoot. In 1639, June 4th, a constitution was adopted, establishing a theocracy, by which all power was vested in the church-leaders; and on August 22d the first church was organized. These settlers were Millenarians, who believed in the second coming of Christ and that their city was to be the seat of his empire. The first general court met October 16th, and Eaton was elected chief magistrate. In 1640, September 1st, the settlement received its present name, and in 1643, to secure its independence, it entered the New England Union, and formed a confederation with Milford, Guilford, and Stamford, to which Southold, Long Island, and Branford were admitted later, and of which Eaton was made governor. Trade between New Haven and Barbadoes was established before 1647, but a trading settlement planted on the Delaware was broken up by the Dutch, and attempts at a direct commerce with England were frustrated by the loss, in 1646, of the vessel built for that purpose, with a valuable cargo. Discouraged and impoverished by their want of success, the inhabitants of New Haven were inclined to emigrate either to Jamaica or Galway, Ireland.

After the execution of King Charles (q.v.) two of his judges, Goffe and Whalley, called regicides, found shelter and protection in New Haven from 1660–64, and from 1670 to his death, in 1688, Dixwell, a third judge, lived among these people unmolested. The charter obtained by Connecticut from Charles II. (q.v.) in 1662 granted jurisdiction over the territory that included New Haven, and the latter was forced to give up her autonomy and her cherished union of church and state, but was made a county town and joint capital, with Hartford, of the enlarged colony. The October session of the general court was held here until 1873, when Hartford became the sole capital.

During the Revolution, July 5th, 1779, the town was plundered by the British, under Gen. Tryon. In 1784 part of New Haven was incorporated as a city. Commerce increased rapidly after the war, and more than $150,000 was paid in custom duties at this port in 1807, but the Embargo Act and the War of 1812 crippled the shipping trade, and manufactures, rather than commerce, have become the mainstay of the city.

Steamboat communication with New York was opened in 1815, and the first railroad was established in 1848. New Haven took a prominent part in the anti-slavery struggle, sending out a colony in 1856 to found Waubonsee, Kansas, and during the Civil War furnishing from 2000 to 3000 men and $29,681,409. In 1870 Fair Haven was annexed. "The City of Elms" covers a sandy plain, which lies between the Quinnepiac and Mill rivers on the east, and West river on the west. It is enclosed by hills on either side, two spurs of which, East Rock and West Rock, rise to an elevation of 360 and 420 feet respectively, their precipitous faces of volcanic formation forming a unique feature in the landscape. East Rock is the picturesque point in a park of 353 acres, affording extended views, and is crowned by a soldiers' monument 110 feet high. On the slope of West Rock is a pile of boulders, forming a sort of cave, where Goffe and Whalley were for a time concealed. Extending to the north, up the valley of the Connecticut river, are bold bluffs of greenstone rocks, covered with delightful residences. The harbor is large, and was once the scene of extensive shipbuilding. The U. S. government has improved it by dredging and the construction of an east breakwater with a lighthouse at its extremity, and in 1891 began the construction of a west breakwater. Fort Hale, about two miles from the city, formerly commanding the harbor, is now dismantled. In the heart of the city, as originally laid out, is the public square, or "Green," surrounded by a double row of elms; these also border Temple street, which divides the

Green and that part of the college grounds adjoining. In this park are three churches, built in 1814—the Center, the United (Cong.), and Trinity (Prot. Epis.). The first named, the oldest in the city, contains some memorial tablets, and in its crypt are many ancient tombstones. Behind it is the grave of Dixwell and a monument to the regicides. There are other small parks and enclosures and several cemeteries. The Grove Street cemetery has an imposing gateway in the Egyptian style of architecture.

The city is handsomely laid out, many of the streets having Telford pavement. The dwellings are generally detached, and the residence quarters are marked by a certain air of repose, befitting a university town. Electric railroads connect with the adjoining towns, passing over the score or more of bridges within the city limits. The principal business streets are Chapel, Church, and State; Temple, Elm, Prospect, Whitney and Hillhouse avenues are handsome residence streets.

Besides the splendid buildings composing Yale University (q.v.) there are the city hall, court house, county prison, high school, armory, orphan asylum, Battell chapel, custom-house and post-office, and Yale school of fine arts. The Insurance building, Chapel street, and Hoadly buildings, St. Mary's (Rom. Cath.) church, St. Paul's (Prot. Epis.), the Chapel Street Baptist Church, and the Church of the Redeemer are conspicuous. Several statues adorn the college campus. Among the charitable institutions are a Home for Aged Women, Protestant and Roman Catholic orphan asylums, a home for the friendless, a dispensary, the general and Grace hospitals, and the Springside almshouse. There are also a manual training school, training school for nurses, normal training school, the Hopkins grammar school (the oldest preparatory school in the country), Hillhouse high school, public library, and many high grade seminaries and academies. The public park system comprises over 600 acres; the waterworks are supplied from five sources; and there is an electric railway for freight only, the first one in New England.

Geographically and administratively there are the town, city, and school district of New Haven, the former comprising all of the city and school district, and the latter all of the city and a part of the town. The city, under the special charter of 1881, is governed by an executive division consisting of a number of departments, the mayor being at the head of the various commissions, and by a legislative division comprising a board of aldermen and a board of councilmen. A board of education has charge of all the school district affairs, and a board of selectmen of all town affairs. The city has about $20,000,000 invested in manufacturing industries, employing about 18,000 persons, and having an output valued at nearly $34,000,000. The largest of these are slaughtering and meat packing, and the manufacture of carriages and wagons, Winchester rifles, corsets, rubber goods, clocks, foundry and machine shop products, steam boilers, planing mill products, hardware, pianos, patent medicines, malt liquors, etc. There is considerable foreign commerce and a large coastwise and railroad trade. An industry of local importance is the oyster fishery, on extensive artificial beds.

The city is the center of an extensive railroad system, consisting of the New York, New Haven, and Hartford main line, and several leased lines, including the Boston and New York line, and divisions of the Old Colony system; has daily communication with New York by two lines of magnificent steamboats; and has many attractive drives, including those to the summits of East and West Rocks, one down the side of the harbor to Fort Hale, and those through and connecting the four public parks along the shore. Four miles s.w. of the city is Savin Rock, a delightful summer and bathing resort on the sound. Modern fortifications have been planned to be located near Fort Hale on the east of the harbor, and near Savin Rock on the west. Pop. '90, city, 81,298; town, 86,045.

NEW HEBRIDES, a group of islands in the Pacific ocean, to the n.e. of New Caledonia, and to the w. of the Fijis, in s. lat., between 14° and 21°, and in e. long., between 167° and 172°. They stretch 500 m. from n.w. to s.e. They are regarded as the most easterly point of the western division of Polynesia, and their maximum altitude is 3,000 ft. The group embraces Espiritu Santo, Mallicollo, Api, Ambrym, Annatom, Erromango, and Tanna, with an active volcano. Aurora, one of the most fertile of the group, disappeared in 1871, leaving no trace. Most of the group are hilly and well wooded, some even mountainous. The most important woods are ebony and sandal; the principal edible products, yams, bananas, cucumbers, cocoanuts, and sweet potatoes, and the only animal of consequence, a diminutive species of hog, which, when full-grown, is no bigger than a rabbit. The inhabitants, who number about 75,000, are mostly cannibals, except on Annatom, where Christianity is established. Both England and France have laid claim to these islands, which were discovered in 1606, by the Spanish navigator, Quiros, but more fully explored by capt. Cook, in 1774. The islands are under a British and French protectorate, the government being vested in a commission in which both countries are represented. See the autobiography (1891) of John G. Paton, a missionary in the New Hebrides.

NEW HOLLAND, the former name for Australia (q. v.).

NEW INN HALL. See OXFORD.

NEW IRELAND, now NEW MECKLENBURG, the Kirwiri of the Blanche bay natives in the Bismarck archipelago.

NEW JERSEY, a Middle Atlantic state and one of the original 13; lying between the Hudson River and the Atlantic Ocean on the e., New York on the n., Delaware Bay and River and Delaware and Pennsylvania on the w., and Delaware Bay on the s., mostly between 39° and 41° n. lat. and meridians 73° 53′ 51″ and 75° 33′ 2″ w. from Greenwich. Its extreme length is 168 m.; greatest breadth, 59 m.; narrowest part, 32 m.; land area, 7455 sq.m.; gross area, 7815 sq.m., or 5,001,600 acres.

History.—The date of the first settlement is not certainly known. Dutch traders are believed to have occupied Bergen point between 1614 and 1620. On the e. bank of the Delaware a party of Dutch under Cornelis Jacobson Mey and Adriaen Jorisz built a fort 4 m. below Philadelphia in 1623, and called it Fort Nassau. The king of England, in 1634, granted the whole region along the Delaware to Sir Edward Ployden under the name of New Albion, and in 1638 Swedes and Finns purchased lands of the natives and settled on the river. The Dutch and Swedes prevented the English from getting a foothold, however, until 1655, when Peter Stuyvesant from New Amsterdam (New York) drove out the Swedes, or forced them to acknowledge Dutch rule. In 1664 Charles II. assumed sole jurisdiction, and granted all the country between the Delaware and Connecticut rivers to his brother, the Duke of York, who took possession of New Amsterdam with a force sent out under Col. Richard Nichols. Land grants west of New York Bay were made by him to colonists from New England, who began the settlements at Newark, Elizabeth, Middletown, and Shrewsbury. The next year the Duke of York assigned his grant to Lord Berkeley and Sir George Carteret, who named the region New Jersey in compliment to the isle of Jersey, where Carteret had been the king's governor. Elizabeth was made the seat of government in 1665, and Philip Carteret was the first governor of New Jersey. He was unpopular, and had trouble with the colonists about land rents. He went to England in 1670, returned soon afterwards, and continued governor till 1674, when the Dutch recaptured New Amsterdam, and the adjacent country fell into their hands, New Jersey being renamed Achter Kol. But Great Britain regained possession by treaty the same year. The conflicting claims of grantees of lands from Nichols and from Carteret were settled by the king, who confirmed all grants to his brother and Carteret. But the duke had made a conveyance to Sir Edmund Andros, governor of New York, who assumed the power to control the government in New Jersey also; and in April, 1680, imprisoned Carteret. The Duke of York interceded in behalf of the grantees under Nichols and New Jersey's governor, and in 1681 they were settled in their rights. In the mean time (1673), Fenwick and Byllinge, Quakers, had bought Berkeley's interest in New Jersey, and in 1675 had established a Quaker settlement at Salem, in the southern part of the state. Fenwick seems to have exercised jurisdiction in southwestern New Jersey, after the settlement at Salem, up to a line drawn from Little Egg Harbor to lat. 41° on the Delaware, while all of Jersey northeast of that line remained under the gubernatorial rights of Carteret, constituting the province of East Jersey. In Feb., 1682, William Penn, to whom Fenwick had conveyed an interest in the province, and 11 other Friends purchased the whole territory. In 1668 a legislative assembly convened at Elizabeth, and passed criminal laws of excessive severity, and another was convened in 1675. Robert Barclay, a Scotchman, one of the associate purchasers, was the first governor under the new ownership in 1682. Respect for the rights of the settlers and a peaceful and wise administration gave New Jersey 20 years of prosperity. But the company-proprietorship of so large a country was found to have such disadvantages that in 1702 the proprietary rights of the purchasers were ceded back to the crown, and the same year Queen Anne appointed Lord Cornbury governor of New York and New Jersey; but each colony continued to have its separate assembly. In 1738, on the petition of the colony to have a separate administration, Lewis Morris was made governor of New Jersey, which then had a population of 40,000. The growth of New Jersey was peaceful until the beginning of the revolution. The last royal governor was William Franklin, son of Benjamin Franklin, who was appointed in 1763, and was noted as a bitter Tory. New Jersey through her legislature, entered cordially into the measures for the defense of colonial rights against the oppressive legislation of the mother country, and on July 2, 1776, anticipating the declaration of independence by the Continental Congress, adopted a state constitution, which was ratified on the 18th, and which continued as the organic law until 1844, when another was adopted. On June 25, 1776, Governor William Franklin, who had set himself against the action of the legislature, was deposed, placed under guard, and sent to Connecticut a prisoner. William Livingston was elected governor Aug. 13, 1776, and re-elected for 14 years. The battles of Fort Lee, Trenton, Princeton, Millstone, Red Bank, and Monmouth are historical mementoes of New Jersey's part in the war for independence. Her position in the centre of the confederacy made her soil the principal theatre of war. Trenton was made the state capital in 1790. The constitution of 1776, which was superseded by another Aug. 13, 1844, was again materially modified by a commission of 14 in 1873, whose work was approved by the legislature in 1874, and again in 1875, and ratified by the people by an immense majority the latter year at a special election. The constitution of 1776 granted suffrage without distinction of sex or color, and up to 1807 women exercised their right.

Topography.—Three ranges of mts. of moderate height traverse the northern part of the state in a direction n.e. and s.w., and all form low links in the Appalachian chain, which merge into the Catskills, the Shawangunk, and the Highlands of the Hudson on the n.e., and are divided from the Alleghany Mts. of Pennsylvania by the Delaware

River on the s.w. The outcropping rock formations cross the state in bands, in the same n.e. and s.w. direction. The most northerly and highest range of mts. is that called Blue or Kittatinny, having a maximum height of 1527 ft. near the New York line, whence it forms an unbroken ridge to "the Delaware Water Gap." This range has a more rapid ascent on the e. side than on the w., and its summit has a considerable extent of table-lands, naturally well timbered and fertile, under culture. The Kittatinny Valley lies between the range just described and the Highland range s.e. of it. It is a valley of great beauty of scenery and agricultural capability, from 500 to 650 ft. above the sea, about 39 m. in length by 10 in breadth. Berkshire, Longwood, and Greenwood Lake valleys are smaller vales of the same general character. The Highland range next s.e. is in many broken mountain ridges and spurs, extending over a width of 22 m. on the n.e. boundary of the state and narrowing to 10 m. at the Delaware River, where they leave the state. The maximum height of this range is at Rutherford's Hill or Hamburg Mt., 1488 ft. above the sea, and Wawayanda Mt., lying near the New York line, which is 1450 ft. The summer resorts on Schooley's and Musconetcong Mts. are situated on two separate ridges of this range. This range of hills and ridges is generally more abrupt on its southwest than on its northeast side. The trap-rock formation which the Hudson River exhibits in its palisades, beginning a few miles above New York, is a dike breaking through a red sandstone formation which approaches the Hudson from the w., turns s. so as to form the palisades, and terminates at Jersey City, near which it has been tunneled for the Erie and the Delaware, Lackawanna and Western railroads, and cut deep for the Pennsylvania and the New Jersey Central. West of this ridge of trap-rock are what are known as First, Second, and Third Mts.; these being the names given to the successive comparatively abrupt ascents from the alluvial levels near New York bay to the higher ranges before described. Parts of the first rise are known as Orange, Fairmount, and Montclair Mts. This portion of the state, geologically a part of the sandstone belt, is one of the richest upland slopes, and has been noted as the northernmost limit of many trees and shrubs of the southern states, which found protection from westerly winds on the e. sides of the hills, with a climate modified by proximity to the sea. Michaux, in his *North American Sylva*, shows that he found a greater variety of trees and shrubs in this locality than in any other part of the northern states. Southwest of the Orange Mt. range are some trap ridges, known as Rocky Hill, Ten-Mile-Run Mt., Long Hill, Sourland Mt. and Goat Hill; and farther to the n. are Round Mt. and Pickle Mt., the latter 767 ft. above the sea. All these elevations of trap rock show their most abrupt faces to the e., and slope away gently to the westward. The s.e. part, and nearly two-thirds of the area of the state, has no elevation of any importance; the Neversink Highlands, seen from Sandy Hook as one approaches by sea from the e., have a maximum height of 400 feet. They are exceptional elevations in a gently-rolling sandy plain which stretches from the sea to the Delaware river, with a slight rise from each towards the center of the state, where the average summit-level is about 160 ft. above the sea. Sandy Hook is now an important U. S. military post, known officially as Fort Hancock. It is destined to become a place of exceptional strength, and is one of the principal proving grounds for the new ordnance for coast defence. The long stretches of sandy beach on the Jersey coast have been called the "Graveyard of the Sea," on account of the terrible wrecks that have occurred there. In 1847 an appeal was made to Congress for means to procure appliances for preservation of life and property from shipwreck on this coast; $10,000 was appropriated at this time, and since then a long line of stations of the United States Life-Saving Service has been built where most needed.

The state has several distinct drainage basins, which should really be grouped into only two systems, those whose water-shed is to the Atlantic Ocean, and those which contribute to the Delaware river and bay. The latter drain more than one half of the entire state from n. to s. Beginning at the n., on the sea-side slope, an exceedingly narrow strip drains into the Hudson river. On the w. side of the palisade dike the Hackensack comes into the state from New York, and flows southwardly through a narrow valley into Newark bay, w. of and parallel with the bay of New York. The Passaic river, next w., has its sources near the centre of the northern half of the state, directly w. of New York; flows thence n.e. to its junction with the Pequannock, the Ringwood, and the Ramapo; then e. through a gap in the Highland range, and through Paterson, to its main valley, through which it courses southerly to Newark bay. The Raritan is a larger stream, having its sources directly w. of those of the Passaic, flows southerly within 15 m. of the Delaware river, and then in a generally e. course to its mouth in Raritan bay, s. of Staten Island. Its principal tributaries are the Laurington, Millstone, and South rivers. It has the largest and most fertile basin of the Atlantic slope of the state. South of Raritan bay the streams which empty into the sea are small down to Tom's river, a stream about 30 m. long, emptying into Tom's bay, an estuary from Barnegat bay. Thirty miles south of that is the Little Egg Harbor river, and 20 m. farther south is Great Egg Harbor river, both draining the southern part of the state from within fifteen miles of the Delaware river. The main streams, draining the western slope into the latter river, beginning at the n. are Paulinskill, Paquest creek, Musconetcong river, emptying about ten miles below Easton, Penn., and Rancocus creek. Smaller streams are numerous. On the south the Maurice river drains a considerable area into Delaware bay. One hundred miles of the Atlantic shore, north of Cape May, is a con-

tinuous line of harbors and bays, separated from the sea by long stretches of beach, with few inlets on the north and many on the south. Barnegat bay and Little Egg harbor form a continuous bay more than 40 m. parallel with the sea, with inlets only at the middle and at the s. end. Atlantic City has been built for a summer resort on the outer beach, midway between Little Egg and Great Egg harbors. (See ATLANTIC CITY.) The extent of inland navigation formed by the bars is about 75 m. from n. to s., but in length of inland shores it is several hundred m. in extent. South of Barnegat bay and Little Egg harbor the inlets are very numerous to these inland channels. The harbors are: Great Bay (at the mouth of Little Egg Harbor river), Little bay, Reed's bay, Absecum bay (entered through Absecum inlet, just n. of Atlantic City), Lake bay, Great Egg harbor, Peck's bay, Ludlow's bay, Townsend's sound, Style's sound, Leaming's sound, Jenkins's sound, Grassy sound, Richardson's sound, Jarvis sound, and Cape Island sound. The n. shore of Delaware bay is mostly marshy, with no outer sea beach enclosing harbors and inland passages as on the Atlantic side. See CAPE MAY.

There are many pretty lakes in the northern part of the state. Greenwood lake, in Passaic co., sometimes called Long pond, the largest, lies across the n. boundary, one half in New York and one half in New Jersey. It is eight m. long and $1\frac{3}{4}$ m. in greatest width. In Sussex co. is Culver's pond. In Morris co. are Lakes Hopatcong, $5\frac{1}{2}$ m. long and $1\frac{3}{4}$ m. wide; Budd's lake, 2 m. long and 1 m. wide; and Green Pond, at an elevation of 1044 ft. above the sea, between Green Pond mountain and Copperas mountain, 3 m. long and $\frac{1}{2}$ m. wide.

The Delaware Water Gap and the Falls of the Passaic, at Paterson, are the most noted of the natural features.

There are many seaside resorts; among them: Long Branch, Atlantic City, Cape May, Asbury Park, Elberon, Deal, Sea-Girt, Point Pleasant, Spring Lake, Squan, and Ocean Grove. The majority are at the upper end of the coast, and within easy access from New York City. Atlantic City, Asbury Park, Cape May, and Long Branch have the largest summer population, and the first three have become popular as winter resorts for invalids. Lakewood, in the heart of the pine woods, is one of the most popular winter resorts in the northern states. It is eight miles from the ocean, and on account of its sheltered location, its temperature is some 10–12° higher than in New York City. Brown's Mills, in the pine woods east of Philadelphia, has also been a favorite health resort for many years.

GEOLOGY.—The bands of geological outcrop cross the state from n.e. to s.w., and the only important member of the series lacking is the coal formation. Azoic (granite, crystalline limestone, and gneiss) and the paleozoic (sandstone, fossiliferous limestones, shales, and slates) are interlaced in the formation of the extreme n.w. part of the state. The Highland range, of which Morristown may be considered at the center of the belt, is mostly underlaid with the azoic rocks, though the paleozoic are not unfrequently seen outcropping in the valleys. The triassic formation, in which the red sandstone is broken by irruptions of trap and basalt, occupies a broad belt running from n.e to s.w. across the state s.e. of a line drawn from Jersey City to Trenton. This is the most fertile section of the state. The old red sandstone deposit is estimated to have a thickness of 14,000 ft. A remarkable basaltic formation is to be seen on Orange Mt. See BASALT. Tracks of reptiles, birds, and insects are found in many localities, and fossil fishes and plants abound in the sandstones and shales. Among extinct reptilia of the mesozoic and tertiary strata are 9 genera and 23 species of tortoise, 4 genera of crocodile, and the gigantic dinosaur *hadrosaurus foulki*, 30 ft. long; in all 30 species. From the miocene 8 cetaceæ have been obtained, including *squalodon atlanticus;* the eocene furnishes the great serpent *palæophis halidanus;* the drift period, the Greenland reindeer; the terrace period, the mastodon, *elephas primigenus*, and 2 species of horse. The cretaceous formation, including the green sands, chalks, marls, plastic clays, and mixture of marls, clays, and sands, forms a band s.e. of the sandstone belt, extending from Raritan bay to the head of Delaware bay. The remainder of the state s.e. is of the tertiary and drift formations of sands, gravel, loam, and marls. The state's geologic surveys have been quite exhaustive. Prof. Henry D. Rogers made the first in 1839–40; the second was undertaken by Dr. Wm. Kitchell in 1854; the third by Prof. George H. Cook, state geologist, was begun in 1864. A volume entitled the *Geology of New Jersey* embraced the results of surveys up to 1868, since which time annual reports have been published.

MINERALOGICAL AND GEOLOGICAL PRODUCTS.—The azoic and paleozoic formations of the n.w. part furnish magnetic iron ores in many places. The greater portion of this iron ore is sent to the furnaces of Pennsylvania, near the coal supply. About one-fifth of it is worked up by the local blast-furnaces at Ringwood, Boonton, Stanhope, Oxford Furnace, and Phillipsburg. Magnetic and hematite ores are worked on a large scale, and a few mines of bog-iron are worked. Copper ores have been found and worked in Somerset co., but have not proved remunerative. Zinc ores have been found in two places in Sussex co., and are said to supply $\frac{7}{10}$ of the zinc oxide and $\frac{1}{5}$ of the metallic zinc product of the U. S. In 1868, according to Prof. Cook, 25,000 tons of zinc ores were taken out in that co., since which time there has been a falling off. Lead ore is often found, but has not been of a profitable grade to work; nickel also has been found. Graphite, or plumbago, has been mined with profit in several localities in Morris and Passaic cos. Sulphate of baryta, manganese, and iron pyrites are mined and used in the manufacture of sulphuric acid, and green-sand and other sands for glass-making and chemical uses are

drawn from many parts. Mineralogists enumerate upwards of 160 minerals which are found in the state. The proximity of the rich mineral regions of N. J. to the great city of New York brings all its mineral wealth into convenient use, and gives it high value. The geologic products of highest value to the state are its extensive deposits of pure marl, clay marl, and shell marls, used in connection with other fertilizers; for on these have depended the improvement of millions of acres of its soil, large portions of which were formerly considered too poor to cultivate, but are now made productive beyond the average per acre of any state in the union. These marls will probably be the means, in connection with the excrements of the great neighboring cities, of making N. J., in soil, one of the richest of states. Lime is quarried in vast quantities for burning to make into quick-lime for mortar, and also for fertilizing. Porcelain and potter's clays of excellent quality, found in the state, are used in manufacturing, to the amount of 300,000 tons annually. Kaolin also is found in large deposits, though much of it is not of superior quality. Morris co. furnishes infusorial earths, used in the manufacture of dynamite and giant powders, and for polishing purposes, and sand valuable for molding purposes and to enter into the composition of fire-brick for reverberatory furnaces. Burlington co. also supplies these sands. A pure white sand of the finest quality for glass-making is found in s. N. J., and is used in the glass-works of Glassboro and Millville. The variety of building stones furnished by the quarries of N. J. is extensive, and includes fine granite, or gneiss-granite, sandstones of a variety of tone and quality, limestones (including water lime and some marbles), bluestone, trap-rock, slates, fire stones, and conglomerate, altogether providing the great cities around New York bay with a large part of all their building and paving-stones. Trinity church in New York is an example of brown sandstone from the N. J. quarries. Other minerals are agate, aragonite, beryl, calcite, chalcedony, corundum, dolomite, fluorspar, garnet, graphite, jasper, manganese, mispickel, ochre, ruby spinel, serpentine, soapstone, talc, and tourmaline.

Zoology.—Among native animals are the red bat, De Kay's shrew, red fox, gray fox, weasel, mink, otter, raccoon, opossum, red squirrel, gray squirrel, black squirrel, flying squirrel, skunk, woodchuck, jumping mouse, meadow mouse, rabbit, and rarely the deer and black bear in remote parts. Among birds and wild fowl are the turkey buzzard, Cooper's hawk, marsh harrier, bald eagle, fish-hawk, sparrow-hawk, great horned owl, barred owl, yellow-billed cuckoo, night-hawk, whippoo-will, olive-backed thrush, wood thrush, redstart, ruby-crowned wren, common wren, cliff swallow, chimney swallow, shorelark, purple finch, scarlet tanager, indigo bird, waxwing, wood warbler, oriole, titmouse, vireo, blue-jay, robin, raven, turtle-dove, snowy heron, avoset, willet, plover, mud-hen, wild goose, swan, brant, ruffed grouse, quail, wood-duck, curlew, snipe, petrel, loon, auk, and cormorant. The reptiles and fish include the snapping turtle, painted turtle, fence lizard, rattlesnake, adder, black snake, milk snake, green snake, salamander, 7 species of frog and 5 of tree toad. A few of the many kinds of fishes are the shad, black whale, sea bass, white perch, sunfish, darter, black-fish, sheepshead, weakfish, dolphin, mackerel, Spanish mackerel, snowfish, blue-fish, flying-fish, angler, cod, haddock, sturgeon, herring, brook trout, pike, catfish, sucker, small blue shark, ray and lamprey. Lobsters and crabs abound along the coast, and the fisheries, especially of oysters, are a prolific source of wealth. A state board of fish commissioners has done much to stock the fresh-water streams and upland lakes.

Botany.—The total forest area is 2,330,000 acres, of which about 708,092 acres are held in farms. Passing from the mountainous and hilly portions of the n. through the level and sandy tracts to the coast, one finds the white, black, scarlet, and pin-oak, chestnut, shagbark hickory, pignut, tulip, basswood, red and sugar maple, red cedar, white and slippery elm, black walnut, butternut, white and pitch pine, hemlock, spruce, hornbeam, iron-wood, aspen, wild cherry, dogwood, beech, birch, sassafras, mulberry, scarlet thorn, white and black ash, cottonwood, willow, sweet gum, sour gum, white cedar, box elder, black elder, shadbush, clethra, hazel, witch-hazel, waxberry, holly, alder, black alder, and tamarack. The principal growth in the s. is pine. The *magnolia glauca* is found along the coast, and the persimmon grows as far n. as lat. 40.44°. The wild fruits and berries are those of the adjoining states. The mistletoe is found here, and the bittersweet and clematis are common vines. The extensive flora combines northern species with many properly belonging to the southern states. Among the beautiful or curious flowering plants are the trailing arbutus, bloodroot, burr marigold, painted cup, fringed gentian, arethusa, field lily, pond lily, *pyxidanthera barbata*, pitcher plant, golden-club, and *helonias bullata*.

Climate.—Proximity to the Atlantic on its whole eastern and southern parts, and its generally low surface above the sea, give N. J. a climate of less extreme cold than the states inland in the same latitude, but not less extreme heat. The southern cos., however, surrounded by sea waters, show less range between extremes than other portions of the state. Where fresh water joins the sea the marshes are malarious, and there are some portions of the lands overlying the trap-rock dikes where water settles into fissures below the surface and gives rise to malarial diseases. The very rich alluvial lands of the Delaware were formerly more subject than any other portions of the state to the same class of ailments, but in general have long since become quite as healthful as the average of lands. As a whole the state is eminently healthful, and the sandstone belt is considered particularly favorable to persons inclined to lung disease. The mean winter temperature at Burlington is 31.22°; summer, 72.01°; yearly mean, 51.94°; mean winter temperature at Newark, 30.75°; summer, 70.35°; yearly mean, 50.50°; yearly mean temperature at Sandy Hook, 49.9°; av. annual rainfall at Newark, 44.85 ins.

AREA AND POPULATION OF NEW JERSEY BY COUNTIES.

(ELEVENTH CENSUS : 1890.)

COPYRIGHT 1891, BY DODD, MEAD & COMPANY.

Soil and Agriculture.—The soils of different parts of N. J. differ to an unusual degree. On the valleys of the Delaware, the Rapidan, the Passaic, and in many valleys among the mountains of the n. part, the soil is of the best quality. The eastern slope of First, or Orange Mountain, which is a red sandstone formation, was remarkable in a state of nature for the variety and strength of its forest vegetation. In general, it may be stated that the central part of the state is the most fertile, and adapted to the greater variety of products. While parts of the alluvial basins are rich enough to bear crops of tobacco, other sections were originally so thin as to have given rise to the expression—"as poor as the barrens of New Jersey." But those sand-barrens, as they were called, have been found well adapted to fruits and vegetable gardening. The geologic survey of the state has called attention to the oak and pine lands of its southern part. Two-fifths of the area of the state s.e. of the marl belt is divided into two classes: the sands upon which pines alone thrive, and those which grow oak as well as pine, which have more clay and humus. The white oak bottoms are the best parts of the latter. The oak lands have been found particularly susceptible to improvement, and are showing good crops of grains as well as fruits since intelligent industry has been applied in them. During the period of 1880–90 there was a marked decrease in the number, acreage, and value of the farms in the state, the totals in the last year being: farms, 30,828; acreage, 2,662,000; and value, $159,262,840. The cereal, potato, and hay crops have now an annual, value of over $15,000,000, with hay leading, nearly $7,000,000. The farm animals, with milch cows leading, have a value of about $15,000,000. In special productions the state ranks very high. Two counties, Sussex and Warren, produce nearly all the apple brandy made in the United States; three counties, Atlantic, Burlington, and Ocean, yield about one-half of the entire cranberry crop of the country; Morris county is widely noted for the great quantity and superior quality of its peaches and also for its great rose farms, from which the New York market is principally supplied; and the sandy lands, the most northern in the United States where it can be cultivated profitably, yield large crops of the sweet potato. Fruit and berries of various kinds and general market produce are cultivated in many sections with large profit, the markets of New York and Philadelphia being largely supplied therefrom. Cape May county has an interesting peculiarity in its "cedar mines," or sunken forests, of which the town of Dennisville is the center. The "mines" are swamps covering an area of about 10 sq. miles., and underlaid to an unknown depth with immense prostrate trees of the white cedar variety. The trees lie one across another, and there are evidences that they are the growth of successive forests; that they once grew in fresh water; and that they died when salt water reached them either by a subsidence of the land or a rise of the sea. Some fell by the roots and are known as "windfalls," others were broken and are called "breakdowns." They are of unknown age; probably have laid in the water and mud for several hundred years. The "breakdowns" are the ones principally "mined," for from them is made a superior quality of shingles. The wood is of a delicate pink color.

Manufactures, etc.—New Jersey is one of the foremost manufacturing states in the Union. Among her specialties may be numbered hats, in which she ranks next to Connecticut, with an annual production exceeding 9,000,000; potteries, in which she excels in quality and style of finish; and extensive silk and glass works. Newark, sometimes called the "Birmingham of America," is one of the great manufacturing centers of the United States. It has nearly 2,500 industrial establishments, and its productions include brass and iron work, hardware, machinery, leather, hats, and jewelry, valued at over $93,000,000. A novel and interesting establishment in this city is that of the Celluloid company, where hundreds of articles are made in imitation of ivory, amber, tortoise-shell, malachite, and other precious materials. Jersey City has extensive stockyards, abattoirs, grain elevators, sugar refineries, and steel works, beside large factories for silk goods, pottery, drugs and chemicals, soap, etc. The Colgate soap works, first established in New York in 1806, now occupy a large area in Jersey City. It is said that ninety tons of rose leaves are shipped to this firm annually from Southern France. Another old firm in this city is that of the Lorillard Tobacco works, said also to be the oldest of its kind in America, having begun in New York in 1760; it now occupies several blocks. Paterson, besides its locomotive works, its numerous cotton, woolen, velvet, and paper mills, has become the foremost city in America in silk manufactures; it well merits its title of the "Lyons of America," with its many silk mills. Elizabeth has extensive water-tube steam boiler works, potteries, and sewing-machine works, the latter being the famous "Singer" works, opened in 1873. This company has extensive works near Glasgow, Scotland, a factory in Australia, and one in Canada. Trenton makes more crockery and pottery than any other American city. Its production in 1890 amounted to $4,500,000. Perth Amboy has terra-cotta works that produce $400,000 worth of goods annually. Glassboro has the oldest and largest bottle glass factory in America; it was founded in 1775 by practical glass blowers from Europe. The same company has factories at Camden and Salem. Millville has glass works; also works for making cast iron pipes, lamp-posts, all sorts of gas and water apparatus. Other cities having large industrial establishments are New Brunswick, Passaic, Bridgeton, Phillipsburg, and Camden. Bayonne has great petroleum refineries. The U. S. census of 1890 reported for the entire state, 9,221 manufacturing establishments, employing $249,890,428 capital and 186,901 persons, paying $96,509,703 for wages and $188,960,704 for materials, and having an output valued at $353,179,917, giving it fifth rank in value of manufactures. This is one of the foremost states in the production of zinc, which

is mined at Franklin and Ogdensburg, and worked at Newark and Jersey City. The fisheries employ over 10,000 persons; the annual production exceeds $3,000,000, the most important being the oyster.

The following partial list of the products of mines is from the census reports of 1890:

	Quarries.	Cubic ft.	Value.	Capital invested.
Bluestone	3	15,649	$8,550	$21,850
Sandstone	26	6,010,212	597,309	793,115
Slate	5	.....	10,925	103,550
Granite	23	6,374,575	425,673	418,850
Limestone	33	28,058	636	152,539
Soapstone	..	1500 sht. ts.	10,262	.....
Infusorial earth	..	75 sht. ts.	1,500	.....
Ocher	..	300 sht. ts.	1,350	.....

The value of all mineral products in 1890 exceeded $8,000,000. In 1895 the state ranked second in production of magnetic iron ore and fifth in clay products; and Sussex county was the only place in the United States that produced manganiferous zinc ore.

Commerce.—The metropolis of New York is still the great port of entry of the U. S., and still more exclusively of the state of N. J.; so that the foreign commerce of the state shows as a part of the customs business of that city, and its commercial relations with other states of the Union also appear in the statistics of the imports, exports, and sales of the city of New York. New Jersey has a small foreign and a large coasting trade. The series of bays and sounds along the eastern coast, while they fence in the country from the open sea by long bars of sand, form broken inlets, through which many small vessels can pass and repass. They are called variously Wreck Pond, Manasquan, Barnegat, Turtle Girt, Cold Spring inlet. These, with the small streams, after the Hudson and Delaware, the Passaic, Shark river, Toms river, Little Egg harbor, Great Egg harbor, Raritan and Muscanetcong, which are navigable tidal streams, and the "thoroughfares" in the salt marshes afford considerable extent of inland navigation, which is increased by the canals of the state. The custom house districts have as ports of entry Perth Amboy, Newark, Great Egg harbor, Burlington, and Bridgeton. During the year ending Dec., 1894, there entered at the three ports, Bridgeton, Newark, and Perth Amboy, 68 sailing and 8 steam vessels, belonging to the foreign trade, carrying 27,995 tons burden; cleared from these ports 53 sailing and 13 steam vessels, 13,569 tons. The imports at Bridgeton, Newark, and Perth Amboy in 1896 aggregated over $300,000; exports from Newark and Perth Amboy, over $1,350,000.

Railroads.—The state has more railroads in proportion to its territory than any other state excepting Massachusetts. Since 1873 the incorporation of railroad companies has been effected under a general law, thus doing away with the old form of special charters. The principal roads operating in the state are the Pennsylvania, the Central of New Jersey, the Lehigh Valley, the Philadelphia and Reading, the Delaware, Lackawanna and Western, the Erie, the New York, Susquehanna, and Western, the New York and Long Branch, the New Jersey and New York, the West Jersey and Seashore, and the West Shore. The total single-track mileage is about 2,200 with second, third, and fourth tracks, and sidings, about 4,500. The valuation of railroad property is nearly $222,000,000, and the state tax on it, over $1,500,000.

Canals.—The canals of New Jersey were once its principal commercial channels. The Morris canal, 101 m. long, from Jersey City to the Delaware river, at Phillipsburg, has always transported vast quantities of coal from Pennsylvania to New York, and now belongs to the Lehigh Valley railroad company. By its corporation charter it was invested with banking powers, or rather, its corporators assumed such powers from the indefinite range of the powers granted. It cost originally $14,000,000. The Delaware and Raritan canal from New Brunswick to Bordentown, 43 m. long, with a feeder to Trenton 22 m., was built in the beginning of the present century, at a cost of $3,935,287. It has a depth of 8 ft., a surface width of 75 ft., and has 14 locks. It is under lease to the Pennsylvania railroad company.

Banks.—In 1896 there were 102 national banks in operation, with a combined capital of $14,395,000, outstanding circulation $5,592,422, deposits $52,837,710, and reserve $13,551,397; 21 state banks, with capital $1,732,300, deposits $6,723,859, and resources $10,324,239; 21 loan and trust companies, capital $2,106,345, deposits $16,843,780; and 26 mutual savings banks, depositors 154,334, deposits $39,635,535, and resources $43,817,114. There were also over 320 building and loan associations, with nearly 90,000 shareholders, over 750,000 shares in force, and assets exceeding $41,000,000.

Religious Denominations.—The leading denominations in point of numbers and of organizations are the Methodist Episcopal, Presbyterian, Roman Catholic, Baptist, Reformed Dutch, Protestant Episcopal, and Friends. The state contains the Protestant Episcopal dioceses of Newark and New Jersey, and the Roman Catholic dioceses of Newark and Trenton.

Education.—The free school system was not introduced until 1871. The cities have a distinct organization of their schools under the control of city superintendents, who, however, are subject to the state laws and the direction of the state superintendent of education. Each co. has a superintendent. The state board of education, upon the application of a majority of the trustees of each of the school districts of a township, not exceeding 4

square miles in area, may consolidate such districts into one school district. In each consolidated township district there are to be elected 6 school trustees, or 2 from each ward if divided into wards. Such trustees are to be subject to all the provisions of the law relating to district trustees now in force. Any city may borrow money, not exceeding in the aggregate $30,000, for the purchase of land and buildings for schools, and give bonds therefor. Any city may raise by taxation and expend annually for current purposes, a sum which, together with the state apportionment, shall be equal to $15 per capita of average number enrolled. Women are eligible for school trustees, and may vote at any school meeting in the district in which they reside.

The population of school age (5–18) in 1895 was 424,959; total enrollment, 274,270; average daily attendance, 172,465; average number days the schools were kept, 192. The estimated value of all public school property was $11,819,712, and the total amount disbursed for public education was over $5,000,000. The annual school tax on all the property of the state is 2 mills on a dollar. In addition to the fund raised annually by this tax, N. J. has a school fund valued in 1896 at $3,589,274. The number of pupils enrolled in private schools was upward of 45,000. For higher instruction there were about 70 public high schools and about the same number of private secondary schools, having grounds, buildings, and apparatus valued at $2,000,000. The state normal school for teachers, at Trenton, embraces a system of model schools in which the students are trained in the respective departments of school teaching. The Farnum preparatory school at Beverly prepares students to enter the normal school, or for the practice of business. Newark has a normal school for the purpose of preparing teachers for the city schools, and a training school; Hoboken, Paterson, and Jersey City, normal classes. Free evening schools are held in many of the large cities. Districts raising not less than $1000 for the establishment of a school or schools for industrial education, or for adding such education to the course of study pursued in public schools, receive a like amount from the state, and an annual appropriation, equal to that appropriated by the district, not exceeding $5000 in any one year. The teachers and school officers of the state organized, in 1887, a council to advance educational interests. State, district, and local teachers' reading circles are enthusiastically supported. Plainfield is the headquarters of the Chautauqua Univ. (q. v.). The institutions for superior instruction include Princeton university, chartered as the College of New Jersey in 1746 and made a university in 1896 (see New Jersey, College of); Rutgers college (q. v.), at New Brunswick, with which is connected the State agricultural and mechanical college as a scientific school; St. Benedict's college (R. C.), at Newark; Seton Hall college (R. C.), at South Orange; the Stevens institute of technology, at Hoboken; the John C. Green school of science, connected with Princeton university; the Newark technical school; Theological seminary of the Presbyterian church, Princeton; Theological seminary of the Reformed church, New Brunswick; Drew theological seminary (M. E.), Madison; theological school of the Newark Presbytery (German), Bloomfield; Evelyn college for women, Princeton; Peddie institute, Hightstown; Blair Presbyterian academy, Blairstown; Classical academy, Belvidere; and the Hasbrouck institute, Jersey City. Other high grade institutions are the Montclair military academy; the Newark academy; the Lawrenceville school; St. Bartholomew's school, Morristown; Collegiate institute, Newton; Pennington seminary; Paterson classical and scientific school; St. Peter's college (R. C.), Jersey City; Academy of the Sacred Heart (R. C.), Hoboken; the Pingry school, Elizabeth; Freehold institute; Institute of the Holy Angels, Fort Lee; Van Rensselaer seminary, Burlington; St. Joseph's academy, Bordentown; Ivy Hall school, Bridgeton; Centenary collegiate institute, Hackettstown; Mount Holly academy; Dearborn-Morgan school, Orange; Friends' high school, Moorestown; and the Hoboken academy.

In 1896 there were 94 libraries of 1000 volumes and upward each, with an aggregate of 801,152 bound volumes and about 120,000 pamphlets. Besides the college libraries and those of the state at Trenton and the New Jersey historical society at Newark, there are libraries in nearly all the state institutions, in many of the public schools, and large public ones in the principal cities and towns. The various publications aggregate about 400.

GOVERNMENT, ETC.—The capitol is Trenton. The governor, treasurer, comptroller, and superintendent of public instruction are elected for three years; the secretary of state, who is also the commissioner of insurance, attorney-general, and adjutant-general for five years. The governor receives a salary of $10,000. The legislature, meeting annually, and unlimited as to session, is composed of twenty-one senators, elected for three years, and sixty representatives, elected for one year; salary, $500 a year. State elections are held annually, on the Tuesday after the first Monday in November. The right to vote at general elections necessitates a previous residence of one year in the state and five months in the county. The registration of voters is required. New ballot laws based on the Australian system (q.v.) were adopted in 1890. In 1884, a woman suffrage amendment secured twenty-four out of twenty-seven votes. The National Guard comprises seven regiments of infantry, three battalions, two batteries, and several gun detachments, and aggregates 4282 men. Annual encampments are made at the state camp-ground at Sea Girt, where much attention is paid to rifle practice, volley firing and skirmish drills. The State Arsenal occupies the old State Prison, built in 1797 The New Jersey Home for Disabled Soldiers, established in Newark in 1865, was re-

moved to Kearny in 1888. The total available force in time of war is 385,273. During the civil war this state furnished 88,305 men to the union army, which was 10,057 more than her quota and within 10,501 of her entire available force. During the Revolutionary, the Mexican, and the Civil wars the state was honored in exceptional achievements by her representatives, and her soil and her sons have furnished the subjects of some of the most thrilling and weighty chapters in the history of the country.

JUDICIARY.—The distinction between courts of law and courts of equity is still maintained in New Jersey. All judges are appointed by the governor for a term of 7 years, subject to confirmation by the senate. The first, or lower courts, are the co. courts of common pleas and oyer and terminer, consisting of a single judge; an orphan's court, and court of general quarter sessions of the peace. Next above is the supreme court, which makes the circuit of the state, and is composed of a chief-justice (salary, $10,000) and 8 associates, who receive $9000 each. A prerogative court is presided over by the chancellor alone. The court of errors and appeals in the last resort is composed of the chancellor, the justices of the supreme court, and 6 judges specially appointed. The pardoning power is vested in the chancellor, 6 judges, and the governor, but is not exercised without the sanction of the governor. The chancellor receives a salary of $10,000.

LAWS, ETC.—By conformity to the provisions of the statute for that purpose, the lot and building thereon, which is occupied as a residence and owned by a debtor, who is a householder and has a family, are exempt by law from sale or execution, to the value of $1000. All wearing apparel of the debtor and his family and personal property amounting to the value of $200 are similarly exempt, except for the purchase-money therefor. A wife holds property acquired before marriage free from control of her husband or liability for his debts. If over 21 years of age, she may make a will, but cannot dispose of any interest to which her husband would be entitled by law at her death. If living with her husband, she cannot convey her real property without his consent. The grounds for divorce are adultery and wilful desertion for 2 years. A county option and high license bill was passed in 1888, but repealed in 1889. The minimum license in towns, under the new act, is $100, and $250 in cities. On the application of one-fifth of the legal voters in any township or city, a special election must be ordered by the court, at which the amount of the license fee may be raised to any figure a majority of the voters may determine. Such elections may not be held oftener than once in 3 years. Offenders must be tried before a jury, and a second conviction forever incapacitates the convicted party from obtaining a license. The legal and only rate of interest is 6 per cent. The penalty for usury is forfeiture of entire interest. A foreign will directing the sale of land in the state has the same effect as if filed originally in the state. A state board of agriculture was established in 1886, and a board of health and bureau of vital statistics. Each city and township is required to have local boards of health. The riparian lands are under special commissioners, and the maximum price of these lands was fixed by law in 1869. The prices range from 20–30 cts. per foot, on unimproved beaches, to $50 on the bay of New York and the Hudson river. The real and personal estate of manufacturing corporations is taxed the same as real and personal estate of individuals. Twelve hours is a legal day's labor on all street railways and elevated railroads.

The electoral votes have been cast as follows: 1788, 6 votes for Washington for pres., 5 for John Jay for vice-pres., and one for John Adams for vice-pres.; 1792, Washington and Adams, 7; 1796, Adams and Thos. Pinckney, 7; 1800, Adams and C. C. Pinckney, 7; 1804, Jefferson and George Clinton, 8; 1808, Madison and George Clinton, 8; 1812, De Witt Clinton and Ingersoll, 8; 1814, Monroe and Tompkins, 8; 1820, Monroe and Tompkins, 8; 1824, Jackson and Calhoun, 8; 1828, Adams and Rush, 8; 1832, Jackson and Van Buren, 8; 1836, Harrison and Granger, 8; 1840, Harrison and Tyler, 8; 1844, Clay and Frelinghuysen, 7; 1848, Taylor and Fillmore, 7; 1852, Pierce and King, 7; 1856, Buchanan and Breckenridge, 7; 1860, Lincoln and Hamlin, 4, Douglas and H. V. Johnson, 3; 1864, McClellan and Pendleton, 7; 1868, Seymour and Blair, 7; 1872, Grant and Wilson, 9; 1876, Tilden and Hendricks, 9; 1880, Hancock and English, 9; 1884, Cleveland and Hendricks, 9; 1888, Cleveland and Thurman, 9; 1892, Cleveland and Stevenson, 10; 1896, McKinley and Hobart, 10.

CHARITABLE INSTITUTIONS.—There is a state board of charities, a part of whose duties is to visit the state institutions, those of the counties, and private incorporate benevolences. Care and instruction to the deaf and dumb were provided out of the state at New York and Buffalo, until 1883, when a state institution was completed at Trenton at a cost of $49,266. The blind are taken care of in New York and Pennsylvania institutions at a cost of about $14,000 per annum. There are a state training school for feeble-minded children and a state institution for feeble-minded women, both at Vineland. The home for disabled soldiers at Kearny is maintained at an annual cost of from $30,000 to $40,000. The home for soldiers' children, formerly maintained, has been closed, after having executed its trust in educating and providing homes for them. An act for the establishment of orphan asylums was enacted Mar. 9, 1877, providing that any 5 or more persons may form themselves into an orphan asylum association for the purpose of receiving, supporting, and educating orphan children, under such name as they may choose, after being duly incorporated under the further provisions of the act. Such private associations are believed to be a more efficient means of providing for the orphans in each locality than state institutions. An industrial school for girls at Trenton is maintained by the state. A state reform school for juvenile delinquents is located at Jamesburg in Middlesex co., on a farm of 490 acres. The city of Newark also maintains

a reformatory home at Verona. The old state lunatic asylum is at Trenton. The state pays $1 per week for every co. patient in addition to what each co. is obliged to pay for those it sends. The institution derives a revenue from the care of private patients who are sent to it. The new asylum for the insane at Morristown is one of the finest structures for the purpose in the country, having cost about $2,500,000. It will accommodate upward of 1,000 patients. The state prison is at Trenton. In 1884 the legislature passed a bill abolishing contract convict-labor in the prison. The inmates must now be employed upon goods used in institutions under state control, on the public-account system, or the piece-price plan. A system of releasing certain inmates of the state prison on parole has been in operation since 1891. Persons under 16 years of age confined in co. institutions must be kept separate from older prisoners.

Finances. — The state is in a prosperous financial condition. The total bonded debt, Oct. 31, 1896, was $605,000, and the state had sinking fund holdings and other assets exceeding its entire liabilities by more than $200,000. There is no floating debt, and no state tax has been levied for many years. The treasury receipts exceed $2,000,000 per annum, of which over $1,000,000 is derived from tax on railroad corporations, and over $700,000 from that on miscellaneous corporations. The valuation of property in the state, 1896, was $840,767,779, and the valuation of taxable property, $794,428,048. The outstanding war debt, which covers the greater part of the bonded indebtedness, is being reduced by annual payments. By an act of the legislature, passed in 1893, all bonds, securities, improvement certificates and other evidence of indebtedness, heretofore or hereafter issued by the State, or by any county, city, town, township, borough, school district, or other municipality of the State, are exempted from taxation for any purpose.

Population. — Slavery existed in New Jersey for nearly a century, but in 1820 an act was passed giving freedom to all children born of slave parents after certain dates, and whereas there had been over 12,000 slaves in 1800, in 1860 there were but eighteen remaining. In 1790, 184,139—11,423 slave, 2762 free col'd; 1800, 211,149—12,422 slave, 4402 free col'd; 1820, 277,426—7557 slave, 12,460 free col'd; 1840, 373,306—674 slave, 21,044 free col'd; 1850, 489,555—236 slave, 23,810 free col'd; 1860, 672,035—18 slave, 25,318 free col'd; 1870, 906,096—30,658 col'd; 1880, 1,131,116; 1890, 1,444,933. There are 21 cos.; for pop. 1890, see Census Tables, Vol. XV. Hudson and Essex cos. contain nearly two-thirds of the entire German pop. of the state, and Hudson co. more than one-third of the entire Irish pop. The largest cities, 1890, were, Newark, 181,830; Jersey City, 163,003; Paterson, 78,347; Camden, 58,313; Hoboken, 43,648; Trenton, 57,458; Elizabeth, 37,764; Bayonne, 19,033; Orange, 18,844, New Brunswick, 18,603; East Orange, 13,282; Atlantic City, 13,055; Passaic, 13,028; Bridgeton, 11,424; Plainfield, 11,267; and Millville, 10,002. The towns and villages within a radius of 20 m. of New York have been well described as the dormitories of that city.

See histories by Gordon (Trenton, 1834) and by Smith (Burlington, 1865); *Documents relating to the Colonial History of the State of New Jersey* (11 vols., Newark, 1880–88), edited by Whitehead; Elmer's *The Constitution and Government of the Province and State of New Jersey* (Newark, 1872); Whitehead's *East Jersey under the Proprietary Government* (Newark, 1875); *Minutes of the Council of Safety of the State of New Jersey* (Jersey City, 1872); *New Jersey Archives*, 16 vols., 1631–1755 (N. J. Hist. Soc.), etc.

NEW JERSEY, COLLEGE OF, now called Princeton University, and situated in the town of Princeton, N. J., was founded through the exertions of some leading members of the Synod of New York — which then included many of the Presbyterian churches in New Jersey — under charters granted, 1746, by acting governor Hamilton, and, 1748, with more liberal provisions by Governor Belcher. It was opened, 1747, at Elizabethtown; was removed to Newark, and thence to Princeton, 1757, where a large building was erected and named Nassau hall, in honor of William III., of the house of Nassau. This building was used as a barrack and hospital by both American and British soldiers during a part of the revolutionary war. At the battle of Princeton, the British troops made a stand within its walls, and were driven out by Washington's advance. The continental congress met in it in 1783, and attended the commencement of that year in company with Washington, who presented 50 guineas to the trustees to aid in repairing the damages occasioned by the battle. The money was used for a full-length portrait of Washington — painted by the elder Peale — to fill the vacancy in a large gilt frame, hanging in the prayer-hall, from which the portrait of George III. had been shot away by a cannon ball during the assault. Great difficulty was experienced after the revolution in raising funds and repairing the buildings, but the institution revived under its able presidents, and excepting the period of the civil war, when its income and the number of its students diminished, it has made steady progress. Jonathan Dickinson was the first president, Rev. Aaron Burr the second, Jonathan Edwards the third, Dr. Witherspoon — a member of the continental congress, and a signer of the declaration of independence — the sixth; Dr. Maclean, the tenth, honored for his lifelong efficient and varied service in the coll. Dr. James McCosh, who came from Queen's Coll., Belfast, Ireland, the head of the institution from 1868 to 1888, greatly advanced its interests by his distinguished reputation, able instructions, and skillful administration. During his presidency the faculty was enlarged, and the number of students greatly increased; commodious and elegant buildings were erected and new studies introduced, the school of science established, and more than $2,200,000 contributed for various objects designed to increase the efficiency of the coll. Of this large sum $1,356,000 was given by Mr.

John C. Green and by his legatees, since his death, in carrying out his wishes. Among the other large donors are Messrs. N. N. Halstead, Robert Bonner, Henry G. Marquand, William Libbey, R. L. and A. Stuart, James Lennox, and John I. Blair.

The grounds, including an extensive purchase made in 1889, cover 225 acres, beautifully laid out, comprising hilly ground, expanses of meadow and woodland, and adorned by avenues of venerable elms, notably that known as "McCosh's Walk." The buildings, 42 in number, are mostly of stone, and are, with few exceptions, grouped around Nassau hall, and near the main street of the town. The library, Marquand chapel, which contains a mural statue of Dr. McCosh, the John C. Green school of science, Witherspoon, Brown, Blair and Alexander halls, are conspicuous for architectural beauty. Nassau hall erected in 1756 and destroyed by fire in 1802, and 1855, is closely connected with the history of the college. Clio and Whig halls, old buildings devoted to literary societies, have been replaced by handsome structures. Some of the other buildings are West college, Dickinson, Reunion, Edwards and Murray halls, Halsted observatory, Biological laboratory, Chancellor Green library, and the gymnasium. The library, containing about 110,000 vols., is particularly rich in works on mathematics, physics, natural and mental science, philology, and literature. The library of the theological school contains over 50,000 vols. The museum of geology and archæology, in Nassau hall, contains large collections, and the school of science is equally rich in the department of biology. The museum of historic art contains the celebrated Trumbull-Prime collection of pottery, and the Mainion collection of Assyrian antiquities. Halsted observatory contains, as its special instrument, an equatorial of 23 ins. aperture and 30 ft. focal length. An observatory of instruction is devoted entirely to the use of students. There is a magnetic observatory, used by the school of engineering, and there are well-equipped physical, chemical, mineralogical, and histological laboratories.

The academic departments are those of philosophy, of language and literature, of mathematics and natural science. The John C. Green school of science includes a course in civil engineering. During junior and senior years many studies are elective. In exceptional cases, undergraduate students, not members of the regular classes, nor candidates for a degree, are admitted to college privileges, and allowed to take special courses. Examinations for admission to the college are held in the principal cities of the United States simultaneously with the entrance examinations at Princeton. There are 99 endowed scholarships, 4 special funds, 7 fellowships, and a number of competitive scholarships; also 5 university fellowships open to the graduates of any American college. The Cliosophic and American Whig literary societies have for more than a century added greatly to the attractive power and usefulness of the college. Princeton theological seminary (Presbyterian), closely associated with the college, occupies several buildings near by. It was organized in 1812 and chartered in 1822. Its course of study is three years. In 1887–88 it had 10 resident and non-resident instructors and 133 students. The college is governed by a self-perpetuating board of 27 trustees, with the governor of the state as president *ex-officio*, or, in his absence, the president of the college. Although the college is not under direct Presbyterian control, the majority of its instructors, trustees, and students are connected with the Presbyterian church; but it is open to all denominations. Religious instruction is given weekly to all the classes. A large proportion of the graduates have entered the ministry. The faculty, 1896–97, numbered 82. There were 8 fellows, 115 graduate students, 548 undergraduates in the academic department, and 374 scientific students, a total of 1045; Pres., Rev. Francis Landey Patton, D.D. The college celebrated its sesquicentennial in October, 1896, with exercises extending over three days. On the 22d President Patton announced the change of name to Princeton university, by authority of the legislature, and the receipt of gifts aggregating $1,353,291 in value.

NEW JERSEY TEA. See Red Root.

NEW JERUSALEM CHURCH. See Swedenborg.

NEW JOHORE', formerly Tanjong Putri, a Malay settlement on the southern extremity of the Malay peninsula. Here the rajah or tummongong of Johore, who is an independent sovereign, occasionally resides. The climate is healthy; large quantities of gambir and pepper are raised in the vicinity; saw-mills on an extensive scale are in operation. Vessels of the largest draught can approach close to the shore. The valuable timbers of these immense forests are yet scarcely known. Pop. in the New Johore territory about 20,000, chiefly Chinese.

NEW KENT, a co. in e. Virginia, having the Broad York river, formed by the union of the Pamunkey and Mattapony rivers, for its n. e. boundary; and the Chickahominy river for its s. and s.w. boundary; 210 sq. m.; pop. '90, 5511, chiefly of American birth, includ. colored. Its surface is generally level, and largely covered with forests. Its soil is a light sandy loam, and produces wheat, corn, tobacco, and sorghum. Horses, cattle, sheep, and swine are raised. Co. seat, New Kent.

NEW LANARK. See Lanark.

NEW LEBANON, a town in Columbia co., N. Y.; on the Lebanon Springs railroad; 18 m. from Chatham Four Corners, and 24 m. s. e. of Albany. It includes

the villages of Mount Lebanon, Lebanon Springs, Tildens, New Lebanon Center, West Lebanon, and New Britain. The Shaker village of Mount Lebanon is inhabited by nearly 600 persons owning about 4,000 acres of land, which they industriously cultivate, and store their produce in 8 barns, one of which, built of stone, is 196 × 50 ft., and said to be the best in the country. They live in 8 dwelling houses, and have 26 workshops, 2 seed establishments, saw and grist mills, and manufactories of chairs, brooms, and baskets. A kind of cider apple-sauce is made and largely exported. They are specially occupied in preserving garden seeds and preparing extracts of roots and herbs, the annual production being about 200,000 lbs. They have a laboratory, and a large meeting-house. Lebanon Springs is a summer resort noted for its thermal springs, the largest of which discharges 16 barrels of water per minute, with a uniform temperature of 73° at all seasons. It supplies what the baths require, and the water-power for 3 mills, which are run the year round. It has a number of first-class hotels. In the town is a factory where thermometers and barometers are made, said to be the first established in the United States. It has also an extensive manufactory of medicines, with a glass-factory under the same management. The manufacture of vinegar is among the industries, and it has several churches, public schools, a young ladies' seminary, etc. Pop. '90, 1765.

NEW LE'ON, named from the missionary Diego de Leon, one of the states of Mexico. It is traversed by the rivers Salado, San Juan and Del Tigre; has an area of 23,592 sq. m.; pop., estimated, '93, 294,000. The surface is generally mountainous, the soil fertile, and the climate healthy. Lead, gold, silver, and salt are found within its limits. The natural resources of the state have suffered in their development by many military disturbances. The capital is Monterey, and other chief towns are Florida, Saltillo, and Lanares.

NEW LONDON, a co. in s.e. Connecticut, bordering on Rhode Island, and bounded s. by Long Island sound and the Atlantic, and s.w. by the Connecticut river; drained also by the Thames, Yantic, Shetucket, and Quinnebaug rivers; intersected by the New York, New Haven and Hartford, the New England, and the Central Vermont railroads, and by several of their branch lines; about 687 sq. m.; pop. '90, 76,634, chiefly of American birth, includ. colored. The surface is very hilly, but not rugged; the soil is only moderately fertile; oats, Indian corn, potatoes and dairy products are the staples; the sloping hills give excellent pasturage for cattle. Extensive granite quarries are found near New London. Water-power is furnished in abundance by the streams, and there are extensive manufactures of cotton and woolen goods, furniture, flour, articles of india-rubber, paper, fish oil, and other productions. Co. seats, New London and Norwich.

NEW LONDON, city, port of entry, and one of the co. seats of New London co., Conn.; on the Thames river about three miles above its entrance into Long Island Sound, and on the New York, New Haven, and Hartford, the New England, and the Central Vermont railroads; 51 miles e. of New Haven. The city was founded in 1646 under the name of Naumeag; received its present name in 1658; and was incorporated as a city in 1784. It is on the w. bank of the river, at the foot and on the slope of hills that rise behind it, and has an excellent harbor, defended by Fort Trumbull (garrisoned) and Fort Griswold (not garrisoned), the latter the scene of a massacre by British troops in 1781. On the east side of the river and above the city is a U. S. naval station. The city contains a public park, Williams memorial institute for girls, Bulkely school for boys, public library, New London County historical society library, hospital, gas and electric light plants, electric street railroads, and national, state, and savings banks. It has direct communication with New York city by steamboat; waterworks supplied from Lake Konomoe, 5 miles distant; about 12 churches; and daily, weekly, and quarterly periodicals; and large summer hotels. The principal industrial establishments are silk mills, woolen mills, shoe factory, iron foundry, cotton gin factory, printing press works, and boiler and machine shops. New London was formerly one of the noted whale fishery ports. The river is here crossed by the longest drawbridge yet constructed, completed in 1890. The city has an assessed property valuation of over $9,300,000; owns the waterworks plant and the Groton ferry; and continues to import foreign merchandise in considerable quantities. It is a delightful place of residence, and a popular resort in summer. Pop. '90, 13,757.

NEW MADRID, a co. in s.e. Missouri, having the Mississippi river for its s.e. boundary, separating it from Kentucky and Tennessee; the Little river for its s.; and drained by White river; 620 sq. m.; pop. '90, 9317, chiefly of American birth, includ. colored. Its surface, now diversified by swamps, prairie land, and bayous, was considerably lowered in the central portion by the earthquake of 1811–12, forming a large lake. It has another lake in the w portion, and its soil is very fertile. Corn and pork are raised, and there is good pasturage for live stock. Co. seat, New Madrid.

NEW MADRID, city and co. seat of New Madrid co., Mo.; on the Mississippi river and the St. Louis Southwestern railroad; 37 miles s.w. of Cairo, Ill., and 280 miles s.e. of Jefferson city. It was settled in 1780 by Spaniards from Louisiana, and has suffered severely from earthquakes, nearly all of the original town having been destroyed by them. The city is in the rich corn-growing region of the state, and has a large river commerce in grain, corn, lumber, live stock, and market produce, much of which is

shipped down the river to southern cities. It has manufactories of lumber, public high school, several churches, and weekly newspapers. Pop. '90, 1,193.

NEW MALTON. See MALTON.

NEWMAN, EDWARD, 1801–76; b. England; founded the *Entomological Magazine* in 1833, and the *Entomologist* in 1840. In the latter year he began business as a printer and publisher in London, retiring in 1869. He edited the *Zoologist* in 1843, and the *Phytologist* in 1844. He published a *History of British Ferns*, 1840; *The Insect Hunters, or Entomology in Verse*, 1858; *A Dictionary of British Birds*, 1866; *Illustrated History of British Moths*, 1869; and *Illustrated History of British Butterflies*, 1871. His researches were specially devoted to the study of insects injurious to vegetation.

NEWMAN, FRANCIS, d. 1660; b. England; settled in New Hampshire in 1638, and afterwards removed to Connecticut. He was secretary of New Haven colony in the administration of Gov. Theophilus Eaton, and was an assistant in 1653, in which year he went to Manhattan as a commissioner for the colony to demand reparation from Gov. Stuyvesant for damages inflicted upon the New Haven people by the Dutch. He was one of the commissioners of the confederation of colonies in 1654 to 1658, and succeeded Eaton as governor in the latter year, retaining the office till his death.

NEWMAN, FRANCIS WILLIAM, brother of John Henry, was b. in London in 1805, and educated at the school of Ealing. Thence he passed to Worcester college, Oxford, where he obtained first-class honors in classics and mathematics in 1826, and, in the same year, a fellowship in Baliol college. This fellowship, however, he resigned; and he withdrew from the university in 1830, at the approach of the time for taking the degree of M.A., declining the subscription to the 39 articles which was required from candidates for the degree. After a lengthened tour in the east he was appointed classical tutor in Bristol college, 1834. In 1840 he accepted a similar professorship in Manchester New college, and, in 1846, his great reputation for scholarship and his general accomplishments led to his being appointed to the chair of Latin in University college, London, which he held till 1863. During all this time he was not only an active contributor to numerous literary and scientific periodicals, and to various branches of ancient and modern literature, but he also maintained a leading part in the controversies on religion, in which he took the line directly opposite to that chosen by his elder brother, being no less ardent as a disciple of the extreme rationalistic school than John Henry Newman of the dogmatical. These opinions, and the system founded upon them, form the subject of his well-known work, *Phases of Faith, or Passages from the History of my Creed* (1850); and of many essays in the *Westminster*, *Eclectic* and other reviews; but he was also the author of very many separate publications. Of these, several regard the controversy to which we have referred—as, *Catholic Union; Essays Towards a Church of the Future* (1844); *A State Church not Defensible* (1846); a *History of the Hebrew Monarchy* (1847); *The Soul, its Sorrows and Aspirations* (1849). Others are on political or social topics—as, *Radical Reforms*, *Financial and Organic* (1848); *The Crimes of the House of Hapsburg* (1851); *Lectures on Political Economy* (1857); *Europe of the Near Future* (1871). A large number are devoted to historical, classical, and scientific subjects, the most important of which are *Contrasts of Ancient and Modern History* (1847); *Regal Rome* (1852); translations into "unrhymed meter" of the *Odes of Horace* (1853), and the *Iliad of Homer* (1856); a treatise on *Difficulties of Elementary Geometry; Handbook of Arabic* (1866); *Orthoepy* (1869); an English-Arabic *Dictionary* (1871); *Early History of Cardinal Newman* (1891), etc. In view of the eminence attained by each of the brothers, it is interesting to note that after a separation of forty years on account of their differences in religious matters they became entirely reconciled. He d. in 1897.

NEWMAN, HENRY RODERICK, b. New York City, abt. 1833. He gave up the study of medicine, to become an artist, at the age of eighteen years. His talent immediately won recognition, and Emerson and other men of note took an interest in his early career. He went to France, 1870, and after traveling through Switzerland, settled in Venice, 1871, and later removed his studio to Florence. Ruskin has expressed admiration for his art. "Venice," "Tuscan Spring," the "Florence Cathedral," and the "Gulf of Spezia," are his most elaborate works; all of these water-colors (his favorite medium).

NEWMAN, JOHN HENRY, D.D., was b. in London, Feb. 21, 1801, and educated at the school of Dr. Nicholas, at Ealing, whence he passed in 1816 to Trinity college, Oxford, of which college he became a scholar by competitive examination in 1818. Having graduated in 1820, he was elected fellow of Oriel college in 1822, where he attracted the notice of Dr. Whately, and was by him employed in the preparation for publication of his well-known *Treatise on Logic*, and introduced to the editor of the *Encyclopedia Metropolitana*, to which he became a contributor. He was ordained in 1824; and in the following year, his friend Dr. Whately having been appointed head of St. Alban's hall, Newman was by him selected as his vice-principal; but on being named tutor in his own college in 1827, as also public examiner, he resigned the vice-principalship. In 1828 he was presented to the vicarage of St. Mary's, Oxford, in which church the sermons which he delivered at a late period had an extraordinary influence in forwarding the religious movement with which his name is permanently associated. At this period Newman was an earnest antagonist of the Roman Catholic church. He was one of those who

transferred their support from sir Robert Peel to sir Robert Inglis on occasion of the former's introducing the Roman Catholic relief bill; and he was one of the most active in commencing and carrying on the so-called Oxford movement—the great object of which was to counteract as well the Romanizing as the dissenting tendencies of the time, by restoring and bringing into notice what Newman and his friends believed to be the Catholic character of the English church. With this view he commenced, in 1833, the series known as the *Oxford Tracts*, to which he was himself one of the chief contributors; and in 1838 he also became editor of the *British Critic*, which was an organ of the same views, and, in conjunction with Drs. Pusey and Keble, of a *Library of Translations from the Greek and Latin Fathers*. He continued the publication of the tracts up to the 90th number, which was written by himself, and the tendency of which was so distasteful to the Anglican authorities that the heads of houses at Oxford condemned the tract, and the Bishop of Oxford called on Newman to discontinue the publication—a request with which he at once complied. The *British Critic* continued for some time longer to advocate the same opinions: but in 1843 that publication also was discontinued; and Newman, who had for some time resided at Littlemore, near Oxford, engaged, in company with some of his more youthful adherents, in study and ascetic exercises, thenceforward confined himself chiefly to his Littlemore residence, and eventually, in Oct., 1845, was admitted into the Roman Catholic church, a step which was immediately followed by the publication of a work on the *Development of Doctrine*, which was intended as an explanation of the process through which the writer's own mind had passed. Soon afterwards Newman repaired to Rome, where, after some preparation, he was admitted to orders in the Roman Catholic church; and in 1848, on his return to England, he established a branch of the congregation of the oratory of St. Philip Neri, of which he was himself appointed the superior. In 1852 he was appointed rector of the Catholic university established in Dublin, an office which he held for five years, afterwards returning to Birmingham, which he made his home, and in connection with which he established a school of higher studies for the youth of the Roman Catholic religion. In 1879, he was made a cardinal. He was sharply criticised for his withdrawal from the Anglican communion to the church of Rome. In reply to these attacks, especially to the comments of Charles Kingsley, he wrote his *Apologia pro Vitâ Suâ*, in which he gives a complete record of his spiritual life. Dr. Newman, in addition to the large share which he had in the publications already named, is the author of several very important works, written as well before as after his withdrawal from Anglicanism. Of the former period are his *History of the Arians; Prophetical Office of the Church; The Church of the Fathers;* an *Essay on Miracles;* a *Translation of the Treatises of St. Athanasius*, with many learned dissertations, and several volumes of sermons. To the latter period belong the *Development of Christian Doctrine; Lectures on Catholicism in England; Apologia pro Vitâ Suâ; Letter to Dr. Pusey; Essay on Assent;* and *Letter to the Duke of Norfolk on Mr. Gladstone's Expostulation* (1875). Newman is also the author of two religious tales, *Loss and Gain* and *Callista*, and of some fine hymns. He was made a cardinal deacon of the church in 1879: died Aug. 11, 1890.

NEWMAN, John Philip, D.D., b. New York, 1826; educated at Cazenovia seminary, and entered the ministry of the Methodist Episcopal church. He was for some years pastor of the Metropolitan church of that denomination in Washington, and was chaplain of the U. S. senate, 1869–74. Gen. Grant sent him to Asia as an official inspector of consulates, and he published two books describing his travels. He was pastor of Methodist churches in Washington and New York city; of a Cong. church in New York, 1882–84; in 1888 was elected bishop of the M. E. church.

NEWMAN, Samuel, 1602–1663; b. England; educated at Oxford, graduated in 1620, and became a minister of the established church. In 1636 he came as a Puritan to Dorchester, Mass., remaining there about a year and a half, when he removed to Weymouth, being settled there five years. In 1644 with several members of his church he went to Seconet, then a small settlement, and established a church, founding a community out of which grew the town of Rehoboth, formerly including Seekonk and Pawtucket. He is called "the first minister of Rehoboth" where he continued his labors till his death. His *Cambridge Concordance*, a valuable work, was first published in 1643, a new addition appearing in Cambridge in 1683, and a fifth much improved edition was published in London, 1720.

NEWMAN, Samuel Phillips, 1796–1842; b. Mass.; son of Mark H., the publisher; graduated at Harvard college, class of 1816. In 1824 he accepted the chair of Latin and Greek languages and literature in Bowdoin, remaining there fifteen years, when he was appointed superintendent of a state normal school, which position he held at the time of his death. He published *Elements of Political Economy*, *The Southern Eclectic Readers*, and a *Practical System of Rhetoric*, the latter reaching sixty editions in this country and in Europe, and six editions in London.

NEWMARKET, a parish and market-t. of England, famous for its horse-races, is situated in a valley 15 m. e.n.e. of Cambridge, and is partly in the county of that name and partly in Suffolk. It contains many well-built and elegant houses, the residences in many cases of gentlemen who are drawn hither from their interest in the *turf*. The market-house and the famous jockey club are the chief edifices. The town owes its prosperity to the horse-races, and nearly the half of the population are jockeys, grooms, trainers, or stablemen. The race-course of Newmarket, upwards of 4 miles in length, is

owned by the jockey club. It is said to be the finest in the world, and the training-ground bears a similar character for excellence. There are eight race-meetings held here annually. See HORSE-RACING. Population, 6,200.

NEW MEXICO, a s.w. territory of the U. S., is situated between lat. 31° 20′ and 37° n.; long. 103° 2′ and 109° 2′ w.; bounded on the n. by Colorado; on the e. by Oklahoma territory and Texas; on the s. by Texas and Mexico; on the w. by Arizona; length from n. to s. on the e. side, 345 m.; on the w. side, 380 m.; breadth from e. to w. on the n. line, 330 m.; on the s., 352 m.; land area, 122,460 sq.m.; gross area, 122,580 sq.m., or 78,451,200 acres.

HISTORY.—The aboriginal inhabitants, Aztecs or Toltecs, lived in walled cities, had manufactures of cotton and wool, cultivated and irrigated the soil, and were worshippers of idols. In 1537, 1539, and 1540, the Spanish adventurers, Alvar Nuñez, Marco de Niza, and Coronado, visited the region, and in 1581 capt. Francisco de Bonillo, with a party, explored more thoroughly, named the undefined territory N. M., and reported so favorably that it was decided to establish colonies and missions. In 1598 a settlement was made at San Gabriel, about 30 m. n. of Santa Fé, under Juan de Oñate, which was abandoned in 1605, and Santa Fé founded. Mines were opened, but the Pueblo Indians, who were forced to work them, revolted, and in 1680 drove the Spaniards from the country. They regained their power, however; reoccupied Santa Fé in 1694; built Santa Cruz de la Cañada in 1695, and by 1717 had erected 11 churches. In 1706 Albuquerque was founded. In 1846, during the war between the U. S. and Mexico, a force under Gen. Stephen Kearny invaded N. M., and on Aug. 18 captured Santa Fé. In 1848, by the treaty of Guadalupe Hidalgo, N. M. was ceded to the U. S.; in 1850, Sept. 9, was organized as a territory, and in 1853 the region s. of the Gila, known as the Gadsden purchase, was annexed. Arizona and parts of Colorado and Nevada were included at that date, but in 1861, 1863, and 1866 parts were set off, and the territory reduced to its present limits. Since 1861 persistent efforts have been made to secure statehood, and an enabling act was passed by congress in 1894.

TOPOGRAPHY.—N. M. is composed of lofty plateaus, crossed by mountain ranges, enclosing broad and fertile valleys. Two divisions of the Rocky Mts. are prominent: that on the e., and the higher, ending abruptly near Santa Fé; the western, or Sierra Madre range, passing through in a series of lower and often detached mountains (Guadalupe, Organ, etc.) to join the Sierra Madre range of Mexico. High table-lands, isolated peaks, and deep cañons characterize the western side, and in the s.e. is the Staked Plain, a broad and lofty plateau. The Rio Grande valley descends from an elevation of nearly 6000 ft. near the Colorado border to 3000 ft. in the s. Several mountain peaks have an elevation of 12,000 ft. The chief rivers are the Rio Grande, which crosses from n. to s.; the Pecos, which flows in a nearly parallel course to join the larger stream in Texas; the Gila, which rises in the Rocky Mts. and crosses Arizona, and the Canadian, an affluent of the Arkansas.

GEOLOGY AND MINERALOGY.—Palæozoic sandstones and carboniferous limestones, broken through by the upheaval of syenitic rocks and underlaid by tertiary and cretaceous strata, are the chief features of the central part of N. M.; exposed beds of marl and gypsum are commonly seen, and sandstone strata overlaid by lava. The oldest mining districts are the Old and New Placers, Pinos Altos, Arroya Hondo, Cimmaron, Mangano and Moreno, tracts in the Organ Mts., and also in the Sierras Blanca, Carriza, and the Magdalena Mts. The most available of all these that contain gold are those of the New Placer district, which are about 38 m. from Santa Fé. There are deposits of silver at Pinos Altos and elsewhere in the Magdalena Mts. Copper also is found in these regions, and one mine in the first named has yielded as high as 9000 lbs. of metal a week. Lead occurs in the Pinos Altos mines, in the Organ Mts., and elsewhere. Iron and salt are abundant in several districts. Anthracite coal of fine quality is mined in the Placiere Mts., s.s.w. of Santa Fé, bituminous coal in the cañons of the cretaceous plains, and lignite coal in the n. Among other products are gypsum, fire-clay, plumbago, cement, mineral paint, marbles of various kinds, and turquoises.

ZOÖLOGY.—The wild animals are the mountain sheep, elk, deer, antelope, wild hog, panther, ocelot, lynx, grizzly, black, and Mexican bear, coyote, gopher, rabbit, hare, beaver, skunk, weasel, etc. The vulture, hawk, goose, turkey, swan, quail, and duck are commonly seen; also the white heron, road runner, logcock, raven, California woodpecker, ruffed humming-bird, and Carolina wren; centipedes, scorpions, and horned toads are not rare.

BOTANY.—N. M. is sparsely wooded. On the mountains pine, spruce, and fir are found. Lower down grow the cedar, nut pine and mesquite; occasionally the oak, ash, maple, and walnut. Cottonwoods and sycamores are the most common trees. There are many species of yucca and cactus.

CLIMATE, SOIL, AND AGRICULTURE.—The temperature is mild, being seldom below the freezing-point, and rarely rising to extreme heat, owing to the elevation of the surface. The sky is usually clear, and the atmosphere so dry that meat can frequently be preserved a long while without salt. Iron and steel also rarely rust, though exposed continually day and night. Inflammations and typhoid fevers occasionally prevail in the winter season, but pulmonary diseases are rare and malaria does not exist. The mean temperature at Santa Fé is 50.54°; at Fort Craig, 60.37°. The average annual rainfall is about 10 ins. The soil of N. M. is very productive, and but for somewhat primitive

modes of cultivation would yield sufficient crops to supply home consumption. Irrigation by means of wells and canals is employed in many places. The ordinary cereals all grow sufficiently well; also the apple, peach, melon, apricot, pomegranate, fig, and grape. The valleys, foot-hills, and table-lands are covered with nutritious grasses throughout the year, which provide abundant grazing. The most valuable crops in their order are hay, wheat, corn, oats, potatoes, and barley, aggregating in value nearly $2,000,000. The farm and ranch animals number over 3,575,000 head, principally sheep, over 2,500,000 head, of a total value of about $14,000,000.

MANUFACTURES, ETC.—The chief manufacturing industries comprise flour, grist, lumber, and quartz mills. The principal reduction of ore is carried on at Socorro, Silver City, Lake Valley, and Georgetown. There have been lately introduced into the state manufactures of fire-brick, tiling, a sewer piping at Socorro; and considerable extract for tanning is produced from the root of the canaigre plant. Gold, silver, and coal are mined in large quantities. In 1890 there were 127 manufacturing establishments, with capital, $965,938, and value of output, $1,516,195.

TRANSPORTATION.—The principal railroads are the Atchison, Topeka and Santa Fé; Atlantic and Pacific; and Southern Pacific, with their branches. The total mileage, in 1895, was 1520 m.; capital stock, $89,079,100; funded debt, $45,619,629; total investment, $177,261,938; total cost, $138,277,284; gross earnings, $3,687,416.

BANKS.—In 1896 there were 7 national banks in operation, with capital $600,000, and deposits $2,066,676; and 6 territorial banks, capital $200,000, deposits $334,988.

RELIGIOUS DENOMINATIONS, EDUCATION, ETC.—The strongest denominations in their order are the Roman Catholic, Methodist Episcopal, Presbyterian (North), Methodist Episcopal (South), Mormon, and Protestant Episcopal. In 1895 there were 567 public city and district and private schools, with an enrollment of 28,465. The district schools numbered 473; city schools, 26; territorial schools, 5; private sectarian schools, 60; and private non-sectarian schools, 3. The district, city, and territorial schools had property valued at $411,713, and the private schools, $325,250—in all, $736,963. The territorial institutions are the university of New Mexico, the college of Agriculture and Mechanic Arts, the school of mines, the institute for the deaf and dumb, and two normal schools.

GOVERNMENT, ETC.—The capital is Santa Fé. The governor, who receives a salary of $2600, and the secretary are appointed for four years; the other officers for two. The legislature, composed of twelve senators and twenty-four representatives, elected for two years, meets biennially on the last Monday in Dec. The territorial election is held on the Tuesday after the first Monday in November. The supreme court consists of a chief justice and four associate justices, appointed for four years.

The legal rate of interest is 6 per cent.; 12 is allowed by contract, and there is no penalty for usury. The organized military force comprises about 500 men; unorganized, but available, 25,000. The total bonded debt in 1896 was $959,800; floating debt, $4550—total, $964,350. There were also outstanding old militia warrants aggregating $650,000, which the legislature has never recognized nor classed with other public obligations. The assessed property valuations in 1895 aggregated $42,980,752, the highest since 1890.

POPULATION.—In 1860, 93,516; 1880, 119,565—10,844 colored, including 57 Chinese; foreign born, 8051; male, 64,496; female, 55,069; dwellings, 26,311; families, 28,255; persons to sq. m., 1.0; 1885, 133,530—42,740 b. in old Mexico; 1890, 153,593. There are 18 cos.; for population, 1890, see APPENDIX, Vol. XV. The largest cities, 1890, were Santa Fé, 6185, Albuquerque (new town), 3785, and Las Vegas, 2385. The Indians—Pueblo, Navajo, and Apache—number about 50,000.

NEW MILFORD, a town in Litchfield co., Conn.; on the Housatonic river, and the New York, New Haven, and Hartford railroad; 16 miles n. of Danbury. It contains several villages, national and savings banks, electric light plant, public library and memorial hall combined, Everest institute for boys, Ingleside school for girls, several large tobacco warehouses, and manufactories of hats, carbonized stone and sewer pipe, lime, pottery, and silica paints. Pop. '90, 3,917.

NEW ORLEANS, chief city and port of entry of Louisiana, commercial metropolis of the Gulf States, and twelfth city in population in the United States, lies on both sides of the Mississippi River, 100 miles above the delta. It is in latitude 30° north, longitude 90° west; distant from St. Louis, 1170 miles; from Washington, by rail, 1103 miles.

The river here varies from a quarter to a half mile in width, and is 60 to 100 feet deep. By the action of the tides and the deposit of sediment the outline of the city is constantly changing. An entirely new channel has been carved out, shaped like a perfect half-moon, spreading around into a long letter S. While the west bank has been washed away in many places, to "The Crescent City" have been added several new squares and streets at the front, known as the "batture." The U. S. Custom House, begun in 1848, stood on the river bank; it is now three blocks inland. The land slopes gradually from the river toward a marshy tract in the rear of the city, and is several feet below high water, but overflows are prevented by an embankment of earth, or levée, which also forms a delightful promenade. New Orleans was first occupied by the French in 1718 under Jean de Bienville, governor of the Biloxi settlement, and became the capital of Louisiana in 1722. In 1762 the province was sold to Spain, and the inhabi-

tants, displeased with this transaction, took the matter into their own hands and attempted to rule, but were subdued in 1769. In 1800 it again passed into the possession of the French, and in 1803 it was sold to the United States. In 1804, with 10,000 inhabitants, it received a city charter. On the 8th of January, 1815, occurred the memorable battle of New Orleans, in which General Jackson, afterwards President, successfully defended the city against a British army. In 1861, Louisiana having seceded from the Union, New Orleans became an important center of commercial and military operations; it was closely blockaded by a federal fleet, under Admiral Farragut (q.v.), who compelled its surrender, after forcing the defences; General Butler was appointed military governor. Its commerce was destroyed by the war, but revived in 1866, and the deepening of the harbor, the construction of the jetties at the mouth of the river, the establishment and enforcement of a rigid system of disinfection of vessels at the quarantine station, and the effective system of drainage with which the city has been supplied, have been followed by great prosperity and most important sanitary results. The city was the state capital in 1722–1852 and 1865–80. In 1884–85 a World's Industrial and Cotton Exposition was held here.

Throughout the city may be seen traces of the old French and Spanish life, in the buildings, manners, customs, and nomenclature of the streets, which make it one of the most interesting cities in the United States. In the midst of bright flower-beds and graceful shrubbery, shaded by grand old trees and cooled by sparkling fountains, rise villas and cottages and handsome stores. In the old French quarter live almost exclusively the Creoles, "a handsome, graceful, and intelligent race, of a decidedly Gallic type, whose name does not necessarily imply, any more than it excludes, a departure from a pure double line of Latin descent." Here the quaint architecture of the buildings at once attracts and fascinates. The adobe walls, with white stucco fronts, the stone arches and balconies, the grated windows, with minute panes, closely guarded by jalousies, the inner courts, the tiled roofs and portes-cochères, all attest an age foreign to our own. Picturesque bits may be seen on every side—the grand old Cathedral of St. Louis, in the Spanish-Creole style, built on the site of the first church in the state, in 1794, but enlarged in 1850; the court-houses near it, belonging to the Spanish régime; the French market, noted for its quaint but animated effect; the famous coffee-houses, clubs, and restaurants, hitherto frequented by the most celebrated men and generals of the army, and the numerous old forts. New Orleans was once an important fortress, second only to Metz and Strasburg. Fort St. Charles was built in 1794; the old Spanish fort is marked by a park; Forts Jackson and St. Philip are below the city.

In its palmiest days, 1830–40, this city was the resort of politicians, generals, and distinguished men of the nation, as well as foreigners. At that time New Orleans boasted the two finest hotels in the country. Indeed, it is claimed that this city originated the great American caravansary, with its immense extent, its magnificent furnishings, and its perfect table d'hôte. The St. Charles and the St. Louis antedated even the celebrated Astor of New York. It was said by Oakey Hall that hotel life here "was something grander than New York could boast." In 1835, so attractive was it, that New Orleans was called the "Boarding House of the United States." The third great hotel, the Verandah, was burned on the 8th of January, 1851, together with many other buildings—a severe blow to the city. But two parks lay claim to any distinction here, although there are many small public squares. The City Park contains 150 acres, on the Métairie Ridge; the Audubon Park is only a narrow strip, extending back from the river. Statues of Gen. Jackson, Clay, Franklin, Gen. R. E. Lee, and the monument to Margaret Haughery, for a long time the only one of its kind to a woman in the United States, and one to de Bienville adorn the city. The cemeteries of New Orleans are peculiar, owing to the fact that no graves are dug in the swampy soil, but the dead are placed in tombs or "ovens" above the ground. In Greenwood cemetery is a marble monument to the confederate soldiers. The Métairie cemetery contains an equestrian statue erected to the memory of Gen. Albert Sidney Johnston. The Cypress Grove and the old French graveyards are interesting spots.

Among the noteworthy buildings are the U. S. government building, of Quincy granite, occupying an entire square, and one of the largest buildings in the country; the Cotton exchange; the city hall; the U. S. branch mint; the Court-houses; the Criminal court and jail; the Sugar exchange; Board of Trade; Howard memorial library; Y. M. C. A. hall; Temple Sinai; Hebrew Athenæum; Hôtel Dieu; Touro infirmary; Masonic and Odd Fellows' halls; Fisk public library; the archbishop's palace; Washington Artillery hall; Charity hospital; Poydras female orphan asylum; Jewish widows' and orphans' home; German Protestant asylum; Indigent colored orphan asylum; St. Anna's widows' home; St. Vincent orphan asylum; the Shakespeare almshouses; several large office buildings; and the French opera-house.

The public school system is advanced, the grounds and buildings being valuable and extensive, with many pupils enrolled. There are normal schools for white and colored alike. The higher institutions include Tulane university, and its branch for women, Sophie Newcombe College; the College of the Immaculate Conception; and the Leland University, Straight University, Southern and New Orleans Universities for colored people. There are many newspapers and periodicals published in English, German, Spanish and French. The police and fire departments are admirably administered. A reservoir supplies the middle and lower parts of the city with water from the river; rain-water and artesian wells are largely used. The great festival of the year, celebrated here with much splendor, is the Carnival of Mardi Gras, or Shrove Tuesday, when the city is filled with strangers.

URBANA

The difficulty of drainage has been met by a series of street canals, with powerful steam pumps, fed by large iron pipes, which furnish a constant supply of water, pouring through the canals and street gutters, thus improving the health of the city. The manufactures are not extensive; sugar and molasses were valued in 1890 at $11,737,323; rice-cleaning and polishing, $3,577,885; tobacco and cigars, $1,569,145; men's clothing, $2,174,747; foundry products, $1,972,856; total, $48,295,449. New Orleans commands 20,000 miles of steamboat navigation, the outlet of the richest valley in the world, the Mississippi and its tributaries. In the value of its exports, cotton, sugar, rice, tobacco, lumber etc., it ranks second only to New York, and next to Liverpool it is the largest cotton market in the world, handling about 2,000,000 bales annually. Steamship lines connect with Boston, New York, Philadelphia, and other important cities; also with Mexico and South and Central American ports, and Bremen, Liverpool and Havre. The Louisville and Nashville; Illinois Central; Texas Pacific; Queen and Crescent route; Southern Pacific; New Orleans and Western; Yazoo and Mississippi Valley; East Louisiana; and the New Orleans, Fort Jackson, and Grand Isle railroads center here.

Pop. 1810, 17,242; '40, 102,193; '60, 168,675; '80, 216,090; '90, 242,039.

NEW PHILADELPHIA, city and co. seat of Tuscarawas co., O.; on the Tuscarawas river, the Ohio canal, and the Cleveland, Loraine, and Wheeling and the Pennsylvania Co.'s railroads; 24 miles s. of Massillon. It was incorporated as a village in 1808 and chartered as a city in 1896. The city contains a public school library, private normal school, business college, electric light and street railroad plants, iron works, rolling mills, broom works, brewery, and woolen and shirt factories. There are national and state banks, several churches, daily and weekly newspapers, and large salt, coal, and iron mining interests. Pop. '90, 4,456.

NEW PHILIPPINES. See CAROLINE ISLANDS.

NEWPORT, a municipal borough and market-town of England, chief town of the Isle of Wight, and situated near the center of that island, on the Medina. St. Thomas's church, founded in 1854, on the site of an ancient structure built in the reign of Henry III., is a handsome edifice, and contains a monument erected by her majesty in memory of the princess Elizabeth, daughter of Charles I. The town carries on brewing and cement making. Pop. '91, 10,200.

NEWPORT, a thriving market-town and municipal borough, and river-port of England, in the co. of Monmouth, and 20 m. s.s.w. of the town of that name, on the Usk, and near the mouth of that river. Pop. '91, 54,700.

NEWPORT, a co. in s.e. Rhode Island, having the state line of Massachusetts for its e. boundary, and Acoakset river flowing from Watuppa pond to the sea. It consists of several islands—Rhode Island, Canonicut, Goat, and others of less dimensions, besides the portion of the mainland separated from Rhode Island by the e. passage of Narragansett bay; 100 sq. m.; pop. 1890, 28,552, chiefly of American birth with colored. It is intersected by the Old Colony and Newport railroad, terminating at N. Prudence island is included in its territory, and Block Island lying s.w. in the ocean. Its surface is much diversified by hill, valley, and stream, and is noted for pleasing scenery and beautiful drives. It contains beds of anthracite coal, etc. Co. seat, Newport.

NEWPORT, a city in Campbell co., Ky.; at the junction of the Ohio and Licking rivers and on the Chesapeake and Ohio and the Louisville and Nashville railroads; opposite Cincinnati, O., with which it is connected by a bridge. There are here two bridges across the Ohio river and two across the Licking, and the cities of Newport, Cincinnati, and Covington are also connected by electric railroad. The city was settled in 1791, and chartered as a city in 1795. Three miles distant is the U. S. military post of Fort Thomas. There are gas and electric light plants, waterworks owned by the city, several national banks, about 15 churches, two high schools, Mt. St. Martin's academy, Bellevue school library, iron mills, and manufactories of carriages, nuts and bolts, and watch cases. Pop. '90, 24,918.

NEWPORT, city, one of the capitals of Rhode Island, port of entry, and co. seat of Newport co.; on Rhode Island island, in Narragansett bay, and on the New York, New Haven, and Hartford railroad. Its splendid harbor admits the largest ships, and is defended by Fort Adams, an immense granite fortress, mounting many guns, about two miles from the city.

Newport is an important United States naval station, and the "Queen of American Seaside resorts." It was settled in 1639 by William Coddington and some followers who had been expelled from Massachusetts Bay colony for participation in the Antinomian disturbances excited by Anne Hutchinson. A century ago its trade far surpassed that of New York, and was exceeded only by Boston. It was captured by the British during the Revolution, and occupied by the French allies, under Rochambeau, who were so charmed with Rhode Island that they sought to have it annexed to France. The name of Dean, or Bishop Berkeley, author of the poem commencing "Westward the course of empire takes its way," who came here in 1729 to found a university for the conversion of the Indians, is commemorated in an avenue, leading to his residence, now a farm house, called "Whitehall." Newport was incorporated in 1784, surrendered its charter in 1787, and was reincorporated in 1853.

The harbor of Newport is full of animation, with the war-ships, some of which are almost always present, the many launches, yachts, and little steam-vessels, the flags and uniforms of the officers. The narrow streets and quaint stone houses of the old town adjoin the harbor; the new and fashionable quarters lie along the ridge known as the "Cliffs," and reach over to the ocean side of the island. The climate is equable, the average summer temperature being 68.12°, that in winter 31.16°. In the harbor are twenty-five light-houses, one the home of Ida Lewis, the Grace Darling of America; two lightships, and six life-saving stations. The magnificent country houses and private villas clustered along Bellevue Avenue and out upon the "Rocks" are the residences of wealthy men, who flock here from all parts of the United States. Its varied scenery, excellent facilities for boating, and bathing, and driving have served to render Newport the most exclusive and fashionable watering-place in the United States.

Fronting Washington square, or the Parade, in old Newport, is the state house, built in 1742, near by is a statue of Commodore O. H. Perry, the City hall, and the Perry mansion. Other interesting buildings are the Synagogue, 1762, said to be the oldest in the United States; Redwood library, 1748, a handsome Doric building; Trinity church, with an organ presented by Berkeley; Central Baptist church, founded in 1733; the Vernon house, Rochambeau's headquarters, built in 1780; the public library; Newport hospital; Hazard memorial school; Channing memorial church; the armory; new casino; and opera-house. In Touro park, stands the "Round Tower," or "Old Stone Mill," made famous by the Norse origin which has been ascribed to it. Late researches tend to prove, however, that it was built by Governor Arnold in the seventeenth century, and not by the Norsemen in the eleventh. In the same park are statues of M. C. Perry and William Ellery Channing; and in Equality park is a Soldiers' and Sailors' monument in bronze.

The ten-mile drive, where the wealth and fashion of the country congregate, extends through Bellevue avenue two miles, and by way of Ocean avenue around the rocky shores. The favorite walk is along the "Cliffs," passing "Purgatory" and "Paradise Rocks." There is excellent bathing at First and Bailey's beach. The grammar, intermediate, primary, and high schools furnish excellent advantages for education, and there are churches, newspapers, banks, theaters, a costly casino, and a music hall. The manufactures are not extensive; they include cotton goods, flour, brass, copper, fish, oil, etc.

The magnificent steamers of the Fall River line, the finest in the world, connect with Newport from New York daily, and there are daily steamers to Providence and Wakefield, and in summer to Narragansett Pier and Block Island. On Coaster Harbor island are the U. S. naval war college, naval training school, and torpedo station; and Fort Wolcott on Goat island, both in the immediate neighborhood. Canonicut island, opposite Fort Adams, is a very popular and select summer resort. The vicinity of Newport is replete with objects of interest and means of pleasure. Pop. '90, 19,457.

NEWPORT, CHRISTOPHER, b. England, about 1565; commander of the vessels which brought over the Jamestown colony in 1606, and a member of the council for the government of that colony. Returning to England after a visit with Capt. John Smith to Powhatan, he brought over 120 additional emigrants in 1608. Near Richmond he found some yellow mica, with which he loaded his vessels, supposing it to be gold. He came over with Lord Delaware in 1610, was wrecked at the Bermudas, and returned to England in 1612. He died 1617. He wrote *Discoveries in America.*

NEW PROVIDENCE, one of the Bahama islands, between Eleuthera and Andros, in lat. 25° 5′ n.; long. 21° 77′ w.; 17 m. long by about 7 wide; pop., 9000. The surface is broken with hills, but some parts are fertile. Nassau, the capital of the island, is on the n. coast. New Providence was originally an English colony, founded in 1629, was twice captured by Spain, and definitely given back to England by the peace of 1783.

NEW RED SANDSTONE. A large series of reddish-colored loams, shales, and sandstones, occurring between the carboniferous rocks and the lias, were grouped together under this name, in contradistinction to the old red sandstone group, which lies below the coal-measures, and has a similar mineral structure. Conybeare and Buckland proposed the title Poikilitic (Gr. variegated) for the same strata, because some of the most characteristic beds are variegated with spots and streaks of light-blue, green, and buff on a red base. In the progress of geology, however, it was found that two very distinct periods were included under these names; and the contained fossils of each group were found to be so remarkably different that the one period was referred to the palæozoic series, under the name of permian (q. v.), while the other, known as the trias (q. v.), was determined to belong to the secondary series.

NEW RICHMOND, a village in Clermont co., O.; on the Ohio river and the Ohio and Northwestern railroad; 20 miles e. of Cincinnati. It contains a national bank, high school, iron foundry, distillery, saw, flour, and woolen mills, furniture factories, brick works, several churches, and weekly newspapers, and is an important general trade and shipping point by rail and water. Pop. '90, 2,379.

NEW RIVER, VA. See GREAT KANAWHA.

NEW ROCHELLE, a t. and village in Westchester co., New York, on Long Island sound at the junction of the Harlem River branch railroad with the New York, New

Haven and Hartford, 18 m. from New York; pop. '90, of town, 9057; of village, 8217. It contains many beautiful residences, and is a favorite resort from the cities of the vicinity. It has churches, good schools, state bank, hotels, weekly newspapers, stores, and some manufactures. New Rochelle was settled in 1688 by Huguenot exiles, some of whom were natives of La Rochelle (q. v.).

NEW ROSS, a civic town of Ireland, situated on the left bank of the Barrow, partly in the county of Kilkenny, but chiefly in that of Wexford, distant 84 m. s.s.w. from Dublin. It is an ancient town, having been surrounded by walls about the middle of the 13th century. Before the union it returned two members to parliament. It is now a place of considerable commerce, and the modern part of the town on the Wexford side is built with great regularity and taste. On the Kilkenny side is a straggling suburb called Rosbercon, connected with New Ross by a metal bridge, erected at a cost of £50,137. Pop. 5,800.

NEWRY, a parish, civic and market t., situated partly in the county of Armagh, but principally in the county of Down, Ireland, distant from Dublin 63 m. n., and from Belfast 38 m. s.s.w., with both which places it is connected by a branch railway communicating with the Dublin and Belfast Junction railway. The town is nearly coeval with the English invasion, having grown up around a monastery founded in 1183, and a castle subsequently erected by De Courcey. This castle was the scene of several struggles; and in most of the civil wars of Ulster, Newry suffered severely. It was incorporated as a borough, with a corporation and two members of parliament, by James I. The corporation having been abolished by the Irish municipal reform act, the affairs of the town are now administered by 21 commissioners. It is traversed by a river of the same name, which falls into Carlingford lough, and by a canal, by which the navigation is prolonged to lough Neagh, a distance of 32 m. Newry is also connected by the Newry canal with Victoria lock. A commission has been appointed for improving Carlingford lough and to remove the bar; the estimated cost being £80,000. The town is handsomely and compactly built. The quays are lined with spacious warehouses, and there are several mills, tanyards, coach and car manufactories, and iron foundries. Extensive waterworks have been constructed. There are several grain and flour mills and three large spinning mills in the town. Steam-vessels ply to Liverpool and Glasgow from Warrenpoint, a port 5 m. distant on Carlingford lough; and the Newry and Greenore railway, connecting the Newry and Armagh line with the deep water harbor of Greenore. Pop. '91, 13,700.

NEW SCHOOL AND OLD SCHOOL PRESBYTERIANS, formerly the names of two great parties, and, 1838–70, of the two principal divisions in the Presbyterian church of the United States. The parties were produced, and the rending of the church was caused chiefly by three forces having unequal degrees of strength, but all tending to one result. These may be here named without being fully discussed:

1. *Differences in theological views.* The Presbyterian church in the United States was, at the beginning, composed in a great degree of emigrants from Scotland and Ireland, and in its growth continued to receive fresh accessions from those lands. These brought with them and long retained theological opinions and practices which, while they may be spoken of in general terms as Calvinistic, had manifest traits peculiar to themselves. Yet they did not escape entirely the modifications to which opinions of every kind have been subjected by the isolation, conflicts, and liberty of discussion and action, that have given character to American government, churches, and institutions of every kind. During this time, theology and practical religion were among the chief factors in developing the New England colonies and states. Doctrines furnished themes for thought and discussion among ministers and people in a degree scarcely equaled, unless among the early Greek Christians and the reformers of the 16th century. No wonder, therefore, that important modifications were produced and embraced. And as many ministers and other members of churches went from New England to the other colonies, and afterward to the new states, these modifications entered into Presbyterian churches, accelerating and increasing the changes there. Many too, from these churches, obtained their education in New England schools and colleges, a part of them becoming Christians there. Andover theological seminary, preceding that at Princeton by 5 years, instructed a portion of Presbyterian students as well as many from New England who became Presbyterian ministers. This brief statement may show how it was that in the American Presbyterian church, there arose the terms, first of "new side," and "old side," with the division they occasioned, and afterward of "new school" and "old school." The infusion of elements from Congregationalism is traceable.

2. *Differences of opinion concerning church polity and extension.* The early churches of New England were independent and congregational in government, yet were connected together by mutual conference, and, some of them, by associations gradually formed, and having different degrees of strength. But when Congregational ministers and members removed to other colonies, they generally, until comparatively recent years, became pastors and members of Presbyterian churches already established, or united with Presbyterians in forming new ones. The churches of Newark and vicinity, founded by a Connecticut colony, were at first Congregational, but soon became Presbyterian. In 1801 a plan of union was unanimously proposed by the Presbyterian general assembly to the general association of Connecticut, by whom it was unanimously

adopted, with a view on both sides "to prevent alienation, and promote union and harmony in those new settlements which are composed of inhabitants from these bodies." This plan was not only adopted unanimously by the general assembly, but was also for a long time cordially approved by the most eminent ministers in the Presbyterian church. Under the operation of it, and of union with Congregationalists generally, hundreds of the best Presbyterian churches in the land were formed and built up. Yet the polity resulting from the union, like the doctrine embraced, was a Presbyterianism somewhat modified in its usages and forms. This modification entered gradually into the forces which produced the new school and the old school parties. Its chief power, however, was in an element more general than any difference between Presbyterians and Congregationalists alone could have supplied. This was the use of "voluntary societies" in benevolent and missionary work. The country passed through a period, during which many such agencies were formed, chiefly from the necessity for united effort, and partly from want of experience in the work. But as experience and denominational strength increased, conflict between voluntary and more strictly church agencies arose. This conflict entered largely into the development of party spirit between new school and old school Presbyterians.

3. *Differences of opinion and practice concerning slavery and concerning the manner in which it should be treated by Christian churches.* The origin and growth of this difference need not here be traced. It is sufficient to say that it was by far the most powerful of the influences which intensified the party spirit; and that as the region where slavery most prevailed was, because of it, the less subjected to the modifying influences already described, it came to pass that the modified doctrine and polity were found mainly united with opposition to slavery, forming generally new school Presbyterians; and the unmodified doctrine and polity were, in a like degree, united with adherence to slavery, or with silence concerning it, forming generally old school Presbyterians. Without the influence, direct and indirect, of slavery, neither of the other causes, nor both of them combined, would have been strong enough to divide the Presbyterian church; probably not to have caused even a serious attempt to divide it. Reasons for this opinion are found in the fact that after the division the new school part of the church safely outgrew the use of voluntary societies; that just before the reunion the old school portion accepted, as substantially orthodox, the declaration of doctrine made by the new school portion just after the division; that slavery, without auxiliary causes, divided the strong organization of the Methodist Episcopal church; that in the spring of 1861, it divided the old school portion of the church when in "a state of almost unprecedented doctrinal homogeneity;" that it was prevented from rending the national Union itself, only by one of the mightiest conflicts the world has ever known; and that when its power was removed, the process of reuniting new school and old school Presbyterians at once began. At the reunion, agreed to in 1869, and organically effected in 1870, some of the chief statistics were:

	Synods.	Presbyteries.	Ministers.	Churches.	Church Members.	Sunday S. Members.
New School..	22	110	1833	1747	174,626	196,440
Old School...	28	149	2,447	2,859	271,913	254,417

Total amount contributed by both divisions during the year 1869–70 for the support and extension of religion was $8,440,121. See PRESBYTERIAN CHURCH IN THE U. S.

NEW SHOREHAM. See SHOREHAM, NEW.

NEW SIBERIA, a group of islands in the Arctic ocean, lying n.n.e. of the mouth of the river Lena, in Eastern Siberia. Lat. 74° 44′ to 75° 33′ n., long. 146° to 152° e.; length 126 m.; width about 50 m. The principal are Kotelnoi (the largest), Liakov, Fadievskoi, and New Siberia. The coasts are in general rocky, and are covered all the year round with snow. The islands are very important, on account of the immense multitude of bones and teeth of mammoths, rhinoceroses, buffaloes, etc., which are found in the soil. They are now uninhabited, but there are traces of former inhabitants. Neither bush nor tree is to be seen anywhere.

NEW SOUTH WALES, a British colony in the s.e. of Australia. It originally comprised all the Australian settlements e. of the 135th meridian, but the formation, successively, of the separate colonies of South Australia (1836), Victoria (1851), and Queensland (1859) has reduced it to more moderate dimensions. It is now bounded on the n. by a line which, beginning at Point Danger, in lat. 28° 8′ s., follows several lines of heights across the Dividing Range till it meets the 29th parallel, which forms the rest of the boundary westward; on the w. by the 141st meridian; on the e. by the Pacific ocean; and the line separating it from Victoria on the s. runs from Cape Howe, at the s.e. of the island, n.w. to the source of the Murray river, and then along that stream, in a direction w. by n., to the western boundary of the two colonies. Area, 310,700 sq. m., or somewhat more than 2½ times that of Great Britain and Ireland; pop. '71, 503,981;

est. '95, 1,277,870 (685,160 males and 592,710 females). The more general physical character of the country is described under AUSTRALIA. Within the colony of New South Wales the mountain range, which girdles nearly the whole island, is most continuous and elevated, and is known as the Dividing Range. The section of this mountain system on the southern boundary of the colony, called the Australian Alps, rises in mount Kosciusko to 7,308 feet. From this the range extends northward, the water-shed being from 50 to 150 m. distant from the e. coast, and thus divides the colony into two slopes, with two distinct water-systems. The rivers on the eastern side descend with great rapidity, and in oblique tortuous courses, their channels often forming deep ravines. Many of them are navigable in their lower course for sea-going steamers. The principal are the Richmond, Clarence, McLeay, Manning, Hunter, Hawkesbury, and Shoalhaven. The Hunter river, about 60 m. n. of Sydney, opens up one of the most fertile and delightful districts in the country. The Dividing Range, which, opposite to Sydney, is called the Blue mountains, being singularly abrupt and rugged, and full of frightful chasms, long presented an impenetrable barrier to the west, and kept the colonists shut in between it and the sea, and utterly ignorant of what lay beyond. At last, in 1813, when the cattle were likely to perish in one of those long droughts that appear to visit this country at intervals of a dozen years, three adventurous individuals scaled the formidable barrier, and discovered those downs on the western slope which now form the great sheep-ranges of Australia. A practicable line of road was immediately constructed by convict labor, and the tide of occupation entered on the new and limitless expanse. The numerous streams that rise on the w. side of the water-shed within the colony, all converge and empty their waters into the sea through one channel within the colony of South Australia. The southern and main branch of this great river-system is the Murray. The other great trunks of the system are the Murrumbidgee, which is navigable; the Lachlan, at times reduced to a string of ponds; and the Darling. The Macquarie, passing through the rich district of Bathurst (q.v.), is a large tributary of the Darling, but it reaches it only in the rainy seasons. The coast-line from Cape Howe to Point Danger is upward of 700 m. long, and presents numerous good harbors formed by the estuaries of the rivers. Owing to the great extent of the colony, stretching as it does over eleven degrees of latitude, the climate is very various. In the northern districts, which are the warmest, the climate is tropical, the summer heat occasionally rising in inland districts to 120°, while on the high table-lands, weeks of severe frost are sometimes experienced. At Sydney, the mean temperature of the year is about 65°. The mean heat of summer, which lasts here from the beginning of December to the end of February, is about 80°, but it is much modified on the coast by the refreshing breeze. The annual fall of rain is about 50 inches. Rain sometimes descends in continuous torrents, and causes the rivers to rise to an extraordinary height. Sometimes the rains almost fail for two or three years in succession (see AUSTRALIA).

Agriculture is increasing in importance, though the predominant interest is still pastoral. The largest acreage is under wheat and maize. The other crops are barley, oats, potatoes, hay, and tobacco. The chief fruit culture is that of oranges, and sugar-cane is raised in considerable quantities. There are also a large number of vineyards, the production of wine, in 1896, amounting to over 880,000 gallons. In 1895–6, less than one per cent. of the area of the colony was under crop, and about one-fourth was under forest. The rules for the acquisition of land vary in the three parts into which the colony is divided by law, namely,—the eastern, western, and central divisions. Land may be acquired in the eastern and central divisions by a conditional purchase and free selection before survey, the charge being one pound per acre, or by a conditional lease, which is convertible into a conditional purchase. In the more fertile eastern division the maximum area which may be conditionally purchased or leased is 640 acres, while the less valuable lands of the central division are limited by the maximum of 2,500 acres. When the condition of residence on the original plot selected has been fulfilled, further conditional purchases under similar limitations are permitted. The land act of 1895 permits the acquisition of land on easy terms in the central division, but imposes strict conditions in the matter of residence. Land may be taken out in that division as "homestead selections," or as "settlement leases." In the case of a homestead selection, perpetual residence is required, as well as the payment of a fixed annual rental. A settlement lease is accompanied by the obligation of continuous residence for a period of 28 years, but permits the occupation of 1280 acres of arable land and 10,240 of grazing land. A limited extent of land is also sold at auction by the government each year. Land of more than ordinary value throughout the colony may be reserved as a "special area," parcels of which command a higher price. The great majority of the holdings are comparatively small; more than one-half in 1896 had an acreage under 200, the most numerous holdings varying from 16 to 200 acres. The care of the forests is in the charge of the government, a forest conservation department having been created in 1887. The great produce of the country is wool, the export in 1895 amounting to 329,992,675 pounds, valued at £9,976,044. The coal fields of New South Wales are extensive and the seams of great thickness. In 1895, 3,738,589 tons, valued at £1,095,327, were raised. Iron, lead, copper, and tin ores are abundant, and gold was discovered here in May, 1851, and in the next two years a large amount was obtained, but subsequently, owing to the discovery of the richer diggings of Victoria, gold mining in this colony began to languish. Since 1857, however, the annual amounts

found and exported have increased, and down to 1895 the total value of the gold coined, or exported, since 1851 was £42,326,598. The colony raises a large number of live stock.

The principal exports of New South Wales are wool, gold, silver, coal, tallow, hides, beef, fruit, and leather. The largest sharer in the exported produce of New South Wales is Great Britain with her colonies. Until 1892, the United States was the largest foreign market next to Great Britain, but since that time the shipments of wool to the continent of Europe have increased, and Belgium, France, and Germany have surpassed the United States in the trade with New South Wales. The exports to the United States are chiefly tin, gold, coal, wool, skins, shale, etc., and the colony receives from the United States shipments of kerosene, paper, timber, tobacco, and cigars, and various manufactured articles. Of the foreign commodities consumed by the inhabitants of the colony, the most important are those which fall under the heads of wearing apparel, drapery, iron and iron manufactures and machinery, spirits, beer, sugar, etc. In 1870-80, New South Wales adopted free trade principles, but duties were retained on some articles. A further step in the direction of free trade was taken at the close of the year 1895, and all duties except those on spirits, wines, tobacco, candles, oils, sugar, confectionery, etc., have been abolished. After Jan. 1, 1896, Sydney was practically a free port. In regard to industries, a comparatively small portion of the population is engaged in manufactures. In 1895 a larger amount of capital and a greater number of employees were engaged in the preparation of food and drinks than in any other department of manufacturing. Other important industries are metal working and the making of machinery, building materials, clothing and textile fabrics, printing, binding, and the manufacture of paper. The statistics of wages, while not accurate, show in general the prevalence of a high rate, as is natural in a new country. Bricklayers, carpenters, and boiler makers received, in 1895, about $2.00 a day, and common workmen received about $1.50 per day. Foreigners are liable to no special taxes, and they have the same privileges as the citizens of the colony. The alien may hold and acquire real and personal property, but until naturalized may not exercise the right of suffrage, or hold office. Letters of naturalization may be applied for after a residence of not less than five years, but a special exception to this rule was made in the case of the Chinese. Gold is the monetary standard, and the coins in circulation are those of the United Kingdom. Silver is legal tender for an amount not exceeding 40*s.*, and bronze for 1*s.* The colony enjoys excellent transportation facilities, many steamship lines stopping regularly at the ports. Sydney is the metropolis of Australasia, and is the terminus of a large number of important lines. All the principal lines of railway are owned and managed by the government. On June 30, 1896, there were 2,531 miles of government lines open for traffic.

New South Wales is governed by a governor appointed by the crown, a responsible ministry, a legislative council, appointed by the crown for life, and a legislative assembly elected by the resident voters of the colony. Down to 1893 there was a property qualification by law, but in that year it was abolished. The suffrage is exercised by every male subject 21 years of age who has lived 3 years in the colony, and 3 months in his electoral district. As regards religion, all sects are on a footing of equality. By the act of 1862, state aid to religion was abolished. In 1891 there were 502,980 members of the Church of England, 286,911 Roman Catholics, and 109,390 Presbyterians. Other denominations were Wesleyan and other Methodist bodies, Congregationalists, Baptists, Lutherans, Unitarians, and Jews. Education is under the control of the government, but there are numerous private schools and colleges. There is a university at Sydney (q.v.), established in 1852. Sydney is the capital, with a population, in 1895, estimated at 408,500. Other important towns are Newcastle, Bathurst, Goulburn, Parramatta, Broken Hill, Maitland, and Albury.

New South Wales took its origin in a penal establishment, formed by the British government in 1788 at Port Jackson, near Botany Bay (lat. 34°). The prisoners, after their period of servitude, or on being pardoned, became settlers, and obtained grants of land; and these "emancipists" and their descendants, together with free emigrants, constitute the present inhabitants. Transportation to New South Wales ceased in 1840, and up to that date the total number of convicts sent thither amounted to 60,700, of whom only 8,700 were women. They were assigned as bond-servants to the free settlers, who were obliged to furnish them with a fixed allowance of clothing and food. In 1833 there were 23,000 free males and 13,500 free females, to 22,000 male and 2,700 female convicts; and of the free population, above 16,000 were emancipists. The following table shows the recent rate of increase in the population:

	Males.	Females.	Total.
1861	202,099	156,179	358,278
1881	411,149	340,419	751,468
1889	618,300	503,900	1,122,200
1895	685,160	592,710	1,277,870

NEWSPAPER, a periodical publication printed and distributed for the circulation of news. From the broad-sheet relating the most meager intelligence without comment or inference, the newspaper has gradually grown up into a powerful political as well as social engine, diffusing information on all subjects of interest, circulating advertisements, and acting on the public mind, in times of excitement, to an extent that has led it to be called a fourth estate of the realm.

UNIVERSITY OF ILLINOIS
URBANA

The earliest approach to the newspaper is to be found in the *Acta Diurna*, or *Acta Publica*, of ancient Rome, an official gazette, which in the later times of the republic, and during the empire, appeared daily under sanction of the government. The contents of these *Acta* consisted of an enumeration of the births and deaths in Rome, an account of the money paid into the treasury, and everything relating to the supply of corn; extracts from the *Acta Forensica*, including the edicts of magistrates, the testaments of distinguished men, reports of trials, with the names of the acquitted and condemned, a list of the magistrates who were elected; extracts from the *Acta Senatus*, an account of public affairs and foreign wars, of the births, deaths, festivals, and movements of the imperial family; and generally news relating to public buildings, funerals, games, fires, sacrifices, and miracles, as well as amatory stories. The *Acta* seem to have been drawn up under the superintendence of censors, quæstors, and other magistrates, by officers called *actaurii*, assisted by clerks and notaries; and their publication consisted in posting them in some public place in the city, where they could be read by any one who pleased. They continued to be issued until the downfall of the western empire, but there seems never to have been anything corresponding to them at Constantinople.

The beginnings of the newspaper of modern Europe are traceable to Germany and to Venice. Soon after the invention of printing, in the latter half of the 15th c., small news-sheets, called *Relationen* and the *Newe Zeytung*, appeared in Augsburg, Vienna, Ratisbon, and Nürnberg, generally in the form of a letter. The extant numbers contain, among other matters, accounts of the discovery of America, of the conquests of the Turks, of the French and Austrian war in Italy, with such local occurrences as executions, inundations, earthquakes, burnings of witches, and child-murders committed by the Jews. More important, perhaps, were the official *Notizie Scritte*, first issued by the Venetian government in the 16th c., containing accounts of the wars carried on by the republic, and other events of general interest. At first they were not printed, but were to be seen in various public places on payment of a small coin, called a *gazeta*, whence the name "Gazette." After they were allowed by the government to be printed, they obtained a wide circulation over the whole of Europe.

The earliest English newspaper, or news-letters, belong to the reign of James I., and were printed in the form of small quarto pamphlets. Some copies of a sheet, called the *English Mercury*, purporting to be published by authority of Queen Elizabeth in 1588, the period of the Spanish Armada, have been proved by Mr. Watts of the British museum to be literary forgeries, executed about 1766. The first English newspapers appeared at occasional and irregular intervals—the earliest of them, so far as ascertained, is entitled *News out of Holland*, and was published for M. Newbery in 1619. In 1622 these occasional pamphlets were converted into the first *printed* newspaper, entitled *The Certaine News of the Present Week*, edited by Nathaniel Butter. About the same time appeared the *London Weekly Courant*. A large number of publications, hardly deserving the name of newspapers, were circulated during the civil war, with such names as *England's Memorable Accidents*, *The Kingdom's Intelligencer*, *Mercurius Aulicus*, *The Scots Intelligencer*, *The Parliament's Scout*, *The Parliament's Scout's Discovery, or Certain Information*, *The Scots Dove*, *The Parliament Kite*, *The Secret Owl*, *Mercurius Mastix*, *Mercurius Democritus*, *Mercurius Acheronticus, or News from Hell*, etc. The arrangement of the news is poor in the extreme, and what few comments there are, are of the most virulent description. The long parliament subjected the newspaper press to a censorship, which became more strict under Charles II. The first English newspaper which could properly be considered a vehicle of general information, was the *Public Intelligencer*, established by sir Roger L'Estrange in 1663; it was dropped on the appearance of *The London Gazette*, the first number of which was published Nov. 7, 1665, at Oxford, where the court was residing in consequence of the plague being then in London. A second paper, called *The Observator*, was afterwards started by L'Estrange, who, in 1680, exercised his authority as licenser of the press by issuing a proclamation "for suppressing the printing and publishing of unlicensed news-books and pamphlets of news." Small as was the sheet, a difficulty often arose how to fill it. One publisher was in the way of supplying the dearth of news by a passage from the Bible; another announced that "blank space is left that any gentleman may write his own private business."

Up to the reign of Queen Anne few of the newspapers appeared oftener than once a week. From the interest excited by Marlborough's victories arose a demand for more frequent intelligence, and besides 17 newspapers published three times a week, the *Daily Courant*, established in 1709, was issued every day except Sunday. Of the more noted London newspapers, the *London Daily Post and General Advertiser* was established in 1726, and in 1752 became the *Public Advertiser;* a celebrity attaches to it from having been the medium in which "Junius's Letters" first appeared. The *St. James's Chronicle* arose from an amalgamation of two papers, the *St. James's Post* and *St. James's Evening Post*, both which began in 1715. The *North Briton*, edited by Wilkes, first appeared in 1762. The *Morning Chronicle*, discontinued in 1862, dates from 1770; the *Morning Post*, from 1772; the now defunct *Morning Herald*, from 1781; the *Times* first appeared in 1788, as a continuation of the *London Daily Universal Register*, established three years earlier.

During the reign of George III. prosecutions were rife against newspaper writers and

editors; their result, generally, was to give a greatly increased currency to the doctrines assailed, and to confer a fictitious importance on the traders in politics, by whom many of the journals were conducted. The first attempt at parliamentary reporting was resented by the house of commons as a breach of privilege, but the resolutions and the imprisonments of 1771 all ended in the tacit concession of publicity of discussion which has ever since prevailed.

The newspapers of Great Britain have, within the present century, greatly increased in size and improved in literary character. In both respects they are far in advance of the journals of any other country. Each number of the *Times* now consists in general of 16 pages, occasionally 24, and contains upwards of 5,000 advertisements. The success of the *Times* is mainly due to the enterprise of its original promoter, Mr. Walter, who first introduced various improvements in the art of printing, and made a strong effort to secure the best literary talent attainable in all departments of his journal. One of the most notable incidents in the history of the *Times*, was the exposure, through means of its Paris correspondent, of a gigantic scheme of forgery, planned in France in 1840—a scheme which contemplated the almost simultaneous presentation, at the chief banking-houses of the continent, of forged letters of credit from Glyn & Co. The failure of the conspiracy was mainly due to the exertions made by the *Times*. One of the parties implicated, brought an action for libel against the printer, and obtained a verdict of one farthing damages. A public subscription was raised to defray the expenses incurred in defending the action; when the proprietors of the *Times*, declining personally to accept the sum subscribed, invested it in two *Times* scholarships in connection with Christ's Hospital and the city of London school, for the benefit of pupils proceeding thence to Oxford or Cambridge.

The editing of one of the leading London newspapers involves an immense daily expense, and the co-operation of a number of talented writers. The principal editor, as representative of the proprietors, has the whole oversight and responsibility intrusted to him. He occasionally furnishes the leading article, but it is more frequently composed by one of a staff of literary contributors, who are bound on the shortest notice to write on any subject which the editor may assign. The leader is in form a relic of the time when the newspaper was the news-letter; it is its professed object to analyze, condense, and explain public transactions, to scrutinize what is doubtful or suspicious in the conduct of public men, and to expose sophistry and imposture. Under the editor are various sub-editors, having the superintendence respectively of the London, the provincial, the foreign, the literary, the industrial, and other departments. The commercial article is furnished every evening by a contributor in the city. There are 12 to 16 parliamentary short-hand reporters, who are continually relieving one another, besides reporters attached to the courts of law, and correspondents who furnish accounts of public meetings and local news of various kinds. The foreign intelligence, a most important department in the great London journals, is furnished by correspondents in all parts of the world, some of them, particularly those employed in time of war, being men of very high reputation in the literary world.

A stamp-duty on newspapers was imposed in 1713 by 10 Anne, c. 19, amounting to one halfpenny on "half a sheet or less," and one penny "if larger than a half a sheet, and not exceeding a whole sheet." The duty was raised ½d. by 30 Geo. II. c. 19; another halfpenny was added by 16 Geo. III. c. 34; still another by 29 Geo. III. c. 50; and a further addition of 1½d. was made by 37 Geo. III. c. 90, amounting to 4d. in all. Acts 6 and 7 Will. IV. c. 76, reduced the stamp-duty to 1d., with the addition of ½d. or 1d. when the sheet contained upwards of 1550, or of 2,295 square inches on each side. An additional ½d. was chargeable on a supplement. By 18 and 19 Vict. c. 27, passed in 1855, the newspaper stamp was abolished, a change which occasioned an immense increase in the number of newspapers and diminution of their price, though many of the cheap papers then started were of very brief duration. The repeal of the paper-duty, which took effect on Oct. 1, 1861, also added, though to a much less considerable extent, to the number and cheapness of newspapers. The number of stamps issued on British newspapers was 7,500,000 in 1753, 16,000,000 in 1800, and 65,741,271 in 1850.

In 1843 the number of newspapers published in London was 79 ; in 1890 it was just 646. Some 28 of these are daily papers, 9 of them published in the evening, and 1 of these 9 is a reprint of the morning papers, with what news has been received during the day. Of these, the most influential for 40 years back has been the *Times*, established in 1788, of which nearly 70,000 copies are printed daily, and its circulation has been larger on occasions of public interest. It professes independence in politics. The *Daily News*, *Pall Mall Gazette* (an evening paper), *Daily Telegraph*, and *Morning Post* are the most important liberal daily papers, the last named being also the organ of the fashionable world, while the *Standard* and *Globe* (an evening paper), represent the conservative party, and the *St James' Gazette* calls itself anti-radical.

The price of the daily papers varies from ½d. to 3d. Of the 1,648 newpapers not daily, most are published once, some twice, some three times, one four times a week, some once a fortnight, and some monthly. They comprise agricultural, sporting, commercial, and railway journals; a dozen or so purely literary, or literary and scientific; military and naval, musical and theatrical, legal and medical journals. There is a *Court Circular* and a *Court Journal*, a French, a German, an Anglo-American, and a Spanish weekly

paper. There are a few pictorial and about half-a-dozen humorous papers. Of these last, *Punch*, which has been in existence since 1841, is ably conducted, and wields no small influence. A large number are the organs of particular religious sects or parties. The bankers, drapers, grocers, printers, booksellers, brewers, etc., have their respective journals; the builders have six; and there are many newspapers with a purely local circulation, some confined to the obscurer quarters of London. The price of the weekly papers varies from 6d. to ½d. The *World*, *Truth*, etc., are "society papers."

The earliest English provincial newspaper is believed to be the *Norwich Postman*, published in 1706, at the price of a penny, but "a halfpenny not refused." It was followed, in 1714, by the *Norwich Courant, or Weekly Packet*. A *York Courant*, *Leeds Courant*, and *York Journal* were established about 1720; the *Manchester Gazette*, in 1730, and the *Oxford Journal* in 1740. In 1843, 212 newspapers were published in provincial towns of England, and 8 in Wales. The provincial newspapers of England numbered in 1880 over 1,000, besides 60 belonging to Wales, and 20 to the islands. About a fifth of the number profess conservative or liberal-conservative principles, a half liberal, a small number perfect independence in politics, and the rest are avowedly neutral. Only a very few of these are conducted with anything like ability. Among the more important are the *Manchester Examiner*, which is understood to have a circulation of 35,000, and the *Newcastle Chronicle* of 36,000, and the *Manchester Guardian*. A characteristic feature of many second-class provincial papers is a column of gossip or scandal, entitled a letter "from our London correspondent."

The newspaper press of Scotland began during the civil wars of the 17th century. A party of Cromwell's troops, who arrived at Leith in 1652 to garrison the citadel, brought with them a printer named Christopher Higgins, to reprint the London paper, *Mercurius Politicus*. The first number was issued on Oct. 26, 1653, and in Nov., 1654, the establishment was transferred to Edinburgh, where the reprinting went on till 1660. On Dec. 31, 1660, the first number was published of the *Mercurius Caledonius*, which professed to furnish information regarding the "affairs in agitation in Scotland, with a survey of foreign intelligence." It lived only three months, and was succeeded by *The Kingdom's Intelligencer*. The *Edinburgh Gazette*, an official paper published by authority, was established in 1669 by James Watson, a printer of eminence and skill. In 1702 Watson also started the *Edinburgh Courant*, which attained its 215th number, and in 1706 the *Scots Courant*. In 1718 the town-council of Edinburgh gave a privilege to James M'Laren to print the *Edinburgh Evening Courant* three times a week, on condition that before publication he should give "ane coppie of his print to the magistrates." This paper still exists as the *Edinburgh Courant*, now a daily paper, and the principal conservative journal in Scotland. The *Caledonian Mercury*, now defunct, was first published April 28, 1720. The *Scotsman*, which came into existence in 1817, under the conduct of Mr. Charles Maclaren, and was for a short time edited by Mr. J. R. M'Culloch, the political economist, is the most influential liberal journal in Scotland, and is believed to have a circulation of 60,000, larger than that of any daily paper out of London. The earliest Scottish provincial newspaper was the *Glasgow Courant*, established in 1715. The *Aberdeen Journal* was founded in 1746 by Mr. James Chalmers; the first number contained an account of the battle of Culloden. The number of newspapers published in Scotland in 1843 was 69: it is now 180, a good proportion belonging to Edinburgh. A few of the leading newspapers of Scotland contain articles little inferior in talent to those of the best English newspapers, and exercise considerable political influence, at least in matters relating to Scotland. About a score of the Scottish papers are regarded as conservative, 60–70 liberal, and the rest independent or neutral in politics. Edinburgh has 12 newspapers, including the weekly issues of 2 of the 4 dailies; Glasgow 19 (with 6 dailies); Aberdeen 5 in all; Dundee 5; Paisley 5. The price of most of the daily papers is 1d.; of some it is ½d.; that of the weeklies and bi-weeklies varies from ½d. to 4d.

In Ireland, a news-sheet, called *Warranted Tidings from Ireland*, was printed during the rebellion of 1641; but the first Irish newspaper, properly so called, was the *Dublin Newsletter*, commenced in 1685. *Pue's Occurrences*, a Dublin daily paper, originated in 1700, was continued for half a century. It was followed, in 1728, by another daily paper, *Faulkner's Journal*, established by George Faulkner, "a man celebrated for the goodness of his heart, and the weakness of his head." The oldest existing Dublin newspapers are *Saunders'* (originally *Esdaile's*) *Newsletter*, begun in 1746, and the *Evening Post*, instituted in 1725. The *Limerick Chronicle*, the oldest Irish provincial paper, dates from 1766. Ireland possessed 79 newspapers in 1843, and had in 1880 about 140. Most of them are characterized by an energy of language, and a strength of political bias, unknown in the other parts of the United Kingdom. The *Irish Times* and the *Evening Mail*, published in Dublin, and the *Belfast News Letter*, are influential daily papers.

The Isle of Man supports 1 conservative, 2 liberal, and 1 neutral journal. Jersey has 9 journals, 4 printed in French and 5 in English; 4 are liberal, 1 conservative, 2 liberal-conservative, 1 independent, and 1 neutral. Guernsey has an official gazette printed in French, which is Protestant and neutral, besides 2 liberal, 1 liberal-conservative, and 2 neutral papers. These local papers are conducted with a great amount of spirit and success.

In the British colonies, newspapers are numerous, including those in India, printed in

the Bengalee and other native languages. *Hieking's Gazette*, the first Anglo-Indian newspaper, appeared in Calcutta in 1781; it was followed, in 1784, by a small official sheet, the *Calcutta Gazette or Oriental Advertiser*. The still surviving *Bengal Hurkuru* was established in 1795. In the earlier times of Indian newspapers, though there was no direct censorship, exemplary punishment was often inflicted on the authors of offensive paragraphs. In 1794 Mr. Ducane, editor of the *World*, was transported to Europe for an inflammatory address to the army which appeared in his paper; and a similar result followed, in 1798, to another editor, who made some severe observations on the official conduct of a local magistrate. A censorship, established by lord Wellesley, in 1799, was abolished by the marquis of Hastings in 1818; but a license, revocable at pleasure, was required to be taken out by every printer of a newspaper. In 1832 the Indian press consisted of 6 European and 5 native journals. The licensing system was done away with by lord Metcalfe's law of 1835, a step disapproved of by the East India directors, but was again reverted to on the occurrence of the mutiny in 1857. In 1878 an Indian press law tantamount to a censorship was enacted, applicable to the vernacular press only. In 1875 there were in India 135 Eng., 270 vernacular, and 55 mixed newspapers.—The first Australian paper was the *Sydney Gazette*, founded in 1803. Hobart Town had its journal in 1804, and in 1824 newspapers began to multiply in the Australian colonies. The principal are now the *Sydney Herald*, the *Sydney Mail*, the *Argus* of Melbourne, and the *South Australian Register*. The materials for printing this last-named paper were carried out by the original South Australian colonists, the first number having been previously printed in England. A similar course was adopted by the first New Zealand colony in 1839 in founding their *New Zealand Gazette* and *New Zealand Advertiser*. Tahiti has, since 1844, had its *L'Océanie Française*. There is also the *Fiji Times*, the *Fiji Gazette*, and the *Central Polynesian*.

France.—The earliest French newspaper is said to have been established by Théophraste Renaudot, a physician, in the beginning of the 17th century. The first number of his *Gazette* appeared in 1631. In the following year, through interest of cardinal Richelieu, he obtained a royal privilege for his *Gazette;* it was continued weekly up to 1762, and then began to appear twice in the week, and to combine advertisements with public news. Commercial intelligence was added in 1765, and in 1792, theatrical announcements. In 1650 was started the *Gazette Burlesque*, a journal in verse, edited by the poet Jean Loret, devoted in a great measure to the *chronique scandaleuse* of Paris; and in 1672, the *Mercure Galant*, a political and literary journal, which afterwards became the *Mercure de France*, and was continued during the revolution, and down to 1815. The first French daily newspaper was the *Journal de Paris*, which began in 1777, and was discontinued in 1819. A large crop of journals sprang into being with the revolution, organs respectively of republicans, Jacobins, and royalists, but most of them had a very brief existence. Under the first Napoleon the freedom of the press was much restricted. By one of his earliest ordinances as first consul, all the newspapers were suppressed except 13, and under the empire the tolerated journals were allowed to be little more than echoes of the official *Moniteur*. From the danger which attended the handling of political questions, arose the practice of filling a large portion of the sheet with the *Feuilleton* consisting of a sketch or tale by a popular writer, which has ever since been a characteristic of French journalism. During the restoration period, the press being again less fettered, there was a large increase in the number of newspapers. In 1826 there were 127, and in 1829, 307 newspapers published in Paris. The July revolution at first added still further to their number; but the restrictive measures of 1834, consisting in the imposition of a stamp duty, and of an obligation to find security to the amount of 24,000 francs, led to the collapse of a large proportion of the then existing journals. The *Moniteur, Débats*, and *Presse* were in possession of the government, and for a time also the *Constitutionnel*, and every shade of political opinion had its recognized organ. Emile de Girardin's scheme of widening the circulation of the government organ, the *Presse*, by bringing down the subscription price from 80 to 40 francs, had the result of reducing the price of the opposition journals also. Cheap newspapers being thus established, it soon appeared that with the class among whom they circulated most widely the *feuilleton* was regarded of more importance than the political article, and it thus became the policy of the journalists to pay enormous sums to the cleverest novelists of the day, in order to retain them in their service; 100,000 francs paid by Dr. Véron of the *Constitutionnel* to Eugène Sue for his *Juif Errant*, turned out as profitable a speculation for the journalist as for the novelist.

The revolution of 1848, like the revolutions that had gone before it, gave birth to a multitude of short-lived journals. There were 89 different political journals started into ephemeral existence in Paris during the late commune, from Mar. 19 to May 27, 1871. When the late emperor Napoleon was president of the republic, a law was passed obliging the author of every newspaper article to affix his name to it. In Feb., 1852, the press laws were incorporated, with increased stringency, into a *Décret organique sur la Presse*. Louis Napoleon, during the empire, relaxed the stringency a little. The republic holds newspapers in as great bondage as did its imperial predecessor. Among the most important daily papers published in Paris are the *République Français, Pays, Siècle, Presse, Débats, Bien Public, France, Journal Officiel, Charivari, Temps*, and *Figaro*.

Belgium.—In the Low Countries an illustrated war gazette, called the *Nieuwetijdinghe*,

was first published in 1605; it was the precursor of the *Gazette van Antwerpen*, which survived till 1805. During the Spanish and Austrian rule, each town had its privileged newspaper, but the press was considerably fettered in the expression of political opinion. Under the French rule, most of these journals disappeared or sunk into insignificance. The *Annales Politiques* was a political journal of considerable popularity during last century. Since the revolution of 1830, the press has been subject to few restraints, the newspapers have been numerous, and some few of them well conducted. The *Indépendance Belge* has a large circulation, and exercises considerable political influence. It is the property of a company of bankers, and is conducted by a Frenchman of talent and liberal sentiments. The *Moniteur Belge* was instituted as the official organ of the ministry in 1830. *Le Nord*, a Russian organ published in Brussels, is conducted with great ability. A large circulation is enjoyed by the *Journal de Bruxelles*, the *Emancipation*, and the *Etoile Belge*—all papers in the interest of the *parti prêtre*, and supplied with correspondence from Rome. The *Echo de Bruxelles* and the *Journal de Belgique* are independent papers. The *Précurseur d'Anvers*, and the *Escaut* of Antwerp, have a good circulation—the latter is at once ultramontane and ultra-democratic.

Holland.—The earlier newspapers of Holland were in some respects, particularly in the accuracy of their information, in advance of those of other countries, but gave far more prominence to commercial than to political intelligence. They all bore the name of *Courant* appended to the name of the town where they were published. Though subject to no censorship since 1815, it was not till 1830 that they began to comment on political occurrences. At present the principal Dutch journals are the *Allgemeene Handelsblad* of Amsterdam, and *Amsterdam Courant;* the *Harlemsche Courant;* and the *Journal de la Haye, De Nederlandsche Stoompost*, and *Staats Courant*—published at the Hague. In 1890, some 300 newspapers were published in Holland.

Switzerland.—Switzerland being a confederation of states, each with its own institutions, the Swiss newspapers have a very local character; but they are numerous, and some of them have of late years greatly improved in character. The *Swiss Times*, published in Geneva, and printed in both French and English, is now frequently quoted in all countries. In 1890, 450 newspapers were published in Switzerland.

Germany.—Though in Germany the *Relationen*, above alluded to, were in some sort the precursors of newspapers, yet no serial newspaper, properly so called, seems to have existed till 1615. Frankfort was the first town that possessed its journal; next followed Fulda, Hildesheim, and Herford. The earliest Leipsic newspaper was instituted in 1660. The first newspaper with a staff of foreign correspondents was the *Hamburgsche Correspondent;* but no German newspaper can be said to have had any political weight till the institution of the *Allgemeine Zeitung*, founded by Cotta in 1798, now published at Munich, which still takes rank as the first paper in Germany. During French ascendency, the German papers were little more than echoes of the Parisian; but a number of journals of a more national character sprung up during the war of liberation. The abuse of the liberty of the press after 1830 led to the imposition by the diet of restrictions of a somewhat severe character on newspapers. Although within the last 20 years there has been a decided improvement in the literary and political character of the German newspapers, the socialist law of 1878 was a severe restriction of the liberty of the press. Among the principal Berlin daily papers are the *Vossische Zeitung*, the *Norddeutsche Allgemeine Zeitung* (semi-official), the *Neue Preussische Zeitung* (usually known as the *Kreuz Zeitung*), *Post, National-Zeitung*, and *Volks-Zeitung*. The *Allgemeine Zeitung*, published at Augsburg, is a very influential and well-conducted journal.

Austria.—The Austrian newspapers have partaken of the advance in the newspaper press of Germany. The most important of them is the *Wiener Zeitung*, with its evening reprint, the *Wiener Abendpost*, not insignificant either in a literary or political point of view, and the *Neue Freie Presse*. In Austria 1400 newspapers were published in 1890.

Italy.—We have mentioned the early *Notizie Scritte* or gazettes of Venice. The news-sheets which followed them were in disfavor with the see of Rome: and a memorable bull denouncing them was issued by Gregory XIII. Up to 1847 the newspapers of Italy were small, politically insignificant, and subject to a strict censorship. With the accession of Pope Pius IX., a flood of political journals made their appearance, one or two of which only were conducted with any approach to talent, and few lasted above a year. In the Sardinian dominions there continued to be no fewer than 45 political papers published in 1852, 41 of which were printed in Italian and 4 in French. Of that number a great many soon afterwards collapsed. The removal of the former restrictions of the press in other parts of the kingdom of Italy has started into life a number of newspapers. In the year 1890 careful estimates gave the number of newspapers published in the Kingdom of Italy as 1547, besides a number of other periodicals, many of which answer more or less to our ideas of a newspaper. Few of these newspapers are as yet of much promise. The leaders are poor, no great social or commercial questions are discussed, and each journal is the mere advocate of one or other of the political parties. Perhaps the best of them on the whole are *Il Diritto* and *L'Opinione*, which may be compared to some of the second-rate French papers. The *Gazetta Ufficiale del Regno d'Italia* is the ministerial organ, and *L'Italie*, published in France, is looked upon as the organ of the department of foreign affairs. Humorous newspapers, after the model of our *Punch*, are abundant. The *Voce della Verita* is the paper which advocates the cause of the pope. *La Liberta*

and *Il Fanfulla* are published in Rome; Genoa issues its *Carrière Mercantile;* Milan, *La Perseveranza;* and Naples, the *Pungolo* and *Patria.*

Spain.—Sheets called *Relaciones,* giving accounts of important occurrences, used to appear in Spain at irregular intervals in the 17th c., occasionally in the form of romances; but no Spanish newspaper, properly so called, existed till last century, and 50 years ago Madrid possessed but one journal. The first approach to political journalism followed in the wake of the peninsular war and the establishment of the cortes. The gross license with which many of the then established papers were conducted, led, in 1824, to the suppression of all except the *Diario* and *Gaçeta* of Madrid, the *Gaçeta de Bayona,* and a few which were purely commercial or scientific. At present, about 40 journals are published in Madrid, politically and in every other respect very unimportant; the most read is the *España.* The press of Portugal is as insignificant as that of Spain: the official organ is the *Diario do Governo.* Spain had, 1890, 851 journals.

Sweden and Norway.—The earliest Swedish newspaper seems to have been the *Ordinarie Post Tidende,* established in 1643, and continued till 1680. It was followed by the *Relationes Curiosæ* in Latin (1682–1701). Two French papers, the *Gazette Française de Stockholm* and the *Mercure de Suède,* existed in Sweden in the second half of last century, but politically the newspaper press cannot be said to have had any influence until the establishment of the *Argus* by Johanssen in 1820. For a number of years the principal journals of Sweden were the *Fädreneslandet,* the organ of the royalists, and the *Aftonbladet,* that of the reformers. The latter, on King Oscar's accession, ceased to be an opposition journal. The official paper is the *Post och Inrikes Tidningar.* Every provincial town has now its journal, and there are about 114 newspapers in all published in Sweden. Of the Norwegian papers the oldest is the *Christiania Intelligentssedler,* founded in 1763. *Den Constitutionelle* is the government journal, and *Den Morgenblad* the organ of the opposition.

Denmark.—In Denmark journalism is still more recent. Up to 1830 only two newspapers were published in Copenhagen, both entirely made up of extracts from foreign journals. Since 1834 there has been an improvement in the character and increase in the number of the Danish journals. They numbered 84 in 1890. The oldest newspaper now existing in Denmark is the semi-ministerial *Berlingske Tidende,* founded in 1749. The *Fädrelandet* is the journal of the Scandinavian popular party.

Russia.—The earliest newspapers in Russia were published under the personal surveillance of Peter the Great, first in Moscow and afterward in Petersburg, to report the progress of the war with Sweden. Political journalism, properly so called, has, however, never flourished in Russia, and has, in fact, only been allowed in important political crises—as the French invasion of 1812, the Polish insurrection of 1830, and recently during the Crimean war, when the journalists were allowed to exercise their ingenuity in defending the government policy. The largest circulation was at that time attained by the *Sjévernaja Ptsch'eta,* or *Northern Bee,* which had its feuilleton. Generally speaking, the Russian newspapers occupied themselves with scientific and literary subjects rather than public or political news. The *Journal de St. Petersbourg,* in French, is the organ of the court, and has considerable circulation out of Russia.

Turkey.—The first newspaper in Turkey was founded in 1795 by M. Verminhac, envoy-extraordinary of the French government to the court of Selim III., and printed in French at Pera. A Frenchman of the name of Blacque established at Smyrna, in 1825, the *Spectateur de L'Orient,* afterwards the *Courrier de Smyrne,* which had considerable political influence during the Greek war. The same M. Blacque afterwards edited the official journal of the porte, called the *Moniteur Ottoman,* which has, since 1832, been reprinted in Turkish under the name of the *Taqûîmi Vaqâi.* The *Taqûîmi* was till lately a very badly printed sheet, but it has much improved, and now issues weekly instead of monthly, sometimes containing very fair literary and political articles. But the most important Turkish paper is the *Djeridei Havadis,* founded in 1843 by Mr. Alfred Churchhill, an Englishman born in Turkey. It embraces a great variety of matter, a court gazette, official appointments, home and foreign news, advertisements, prices of stocks, and a feuilleton. There are besides in Constantinople two new and popular papers, called the *Terguman Ahwal,* or *Interpreter of Events,* published three times a week, and the *Tas Veeri Evkiar,* or *Mirror of Thoughts,* published twice a week. The latter has a scientific and literary repute. The Turkish papers have no leading articles, and from the constitution of political society in Turkey, there can be no avowed opposition to the policy of the government. The *Courrier de Constantinople,* in French, is one of the principal journals of the capital; here appear also the *Levant Herald* and the *Levant Times* in English. And papers in French, Italian, Greek, and Armenian are published in various parts of the empire.

Greece.—Various newspapers in modern Greek appeared at Paris and Vienna before Greece obtained her independence; but the first political published in Greece was the *Hellēnikē Salpigx,* founded in 1824, and soon followed by the *Hellēnika Chronika* and *Hellēnikos Tēlegraphos* in Missolonghi, the *Philos tou Nomou* at Hydra, the *Ephēmerides Athenaikai* at Athens, and the official *Genikē Ephēmeristēs Hellados* published at Nauplia, with its opponent the *Apollōn,* which afterwards became the *Athēna.* Most of these papers disappeared in 1833 on the system of sureties being introduced. The *Sōtēr* was established as the government organ in 1833. Many very able newspapers are now

published in Greece, the largest number of them in Athens. Of these several appear in in French, Italian, and English. The leading political journal of Athens is the semi-monthly *Spectateur d'Orient;* but generally speaking, the Greek papers make no endeavor to lead the parties in the state. Greece had, 1890, upward of 600 journals.

United States.—In America the earliest newspaper was the *Boston Newsletter*, founded in 1702, insignificant in size and contents, and conducted by John Campbell, the postmaster of the town. A rival to it appeared in 1719 in the *Boston Gazette*, "published by authority." The *Boston Newsletter*, however, throve in spite of opposition. With the name changed to the *Massachusetts Gazette and Boston Newsletter*, it was the support of the British rule against the desire for independence, and ceased to appear when the British troops evacuated Boston. The *New England Courant*, established in 1721, was at first printed by James Franklin, and afterwards edited by his brother the famous statesman. It lasted but six years, but a subsequent newspaper, entitled the *Pennsylvania Gazette*, was started by Benjamin Franklin in 1729, and continued weekly till 1745, when it merged in the *North American*. *Ede's Boston Gazette*, begun in 1755, was for a long time the chief organ of the popular party; in it appeared John Adams's "Letters of Novanglus." The *Massachusetts Spy* was another paper of note on the revolutionary side. It was afterwards removed from Boston to Worcester, and still appears as the *Worcester Spy*. At the revolution the New England colonies possessed 14 newspapers; Pennsylvania, 9; New York, 4; and the middle and southern colonies, 10. All save the semi-weekly *Advertiser* of Philadelphia were published weekly. The development of the newspaper trade has kept pace with the advancing prosperity of the country. In 1800 the number of newspapers had increased to 200, of which several were daily papers. In 1810 there were 359, including 27 daily sheets. In 1828 852 papers appeared; in 1850 no less than 2,526; while in 1870 there were 5,871 newspapers, with a circulation of 20,842,475, and a yearly issue of 1,508,250. In 1880 the number of weekly papers had reached 8,633, besides 133 semi-weekly and 971 daily papers. Some of the New York weeklies have an enormous circulation, the *Ledger* having occasionally sent out upwards of 400,000 copies. The Germans publish 641 papers in their own tongue; the Scandinavians, 49; Spaniards, 26; Italians, 4; Welsh, 5; Bohemians, 13; Poles, 2; Portuguese, 2; while there is a Chinese newspaper published at San Francisco, and a Cherokee one at Tahlequah in the Indian territory. About 17,760 periodicals, with an annual circulation of 3,481,610 were issued in the U. S. and Canada, in 1890. Among the leading newspapers of New York (daily) are the *New York Tribune*, the *World*, the *Herald*, the *Times*, the *Sun*, the *Evening Post*, the *Commercial Advertiser*, and the *Mail and Express*.

The expenditures of American newspapers are on a much more liberal scale than those of foreign periodicals. Some interesting statistics compiled in 1890 by Mr. Eugene M. Camp illustrate very forcibly the liberality and enterprise of American publishers. He gives as an approximate estimate of the annual sum expended in the United States for news-collecting, the following:

For press dispatches	$1,820,000
For special dispatches	2,250,000
For local news	12,500,000
	$16,570,000

The average monthly expenses of fourteen leading American journals for special dispatches, are given in the following table:

Atlanta "Constitution"	$1,100
Boston "Herald"	5,500
Chicago "Herald"	6,500
Chicago "Tribune"	4,500
Cincinnati "Commercial-Gazette"	5,800
Cincinnati "Enquirer"	4,750
Kansas City "Journal"	1,050
Minneapolis "Tribune"	3,000
New York "World"	9,514
Philadelphia "Press"	3,600
San Francisco "Call"	3,500
San Francisco "Examiner"	8,000
St. Louis "Globe-Democrat"	11,660
St. Louis "Republic"	3,300

The average annual outlay for white paper by eighteen leading dailies is as follows:

Atlanta "Constitution"	$63,000
Baltimore "American"	103,000
Boston "Herald"	315,000
Boston "Globe"	326,000
Chicago "Herald"	265,000
Chicago "News"	324,000
Chicago "Tribune"	195,000
Cincinnati "Enquirer"	252,000
Kansas City "Journal"	53,000
Louisville "Courier-Journal"	135,000
Minneapolis "Tribune"	60,000
New York "World"	667,500
Philadelphia "Press"	245,000
Philadelphia "Times"	165,000
San Francisco "Call"	120,000
San Francisco "Examiner"	155,000
St. Louis "Globe-Democrat"	205,000
St. Louis "Republic"	125,000

Among the various syndicates and associations for news-gathering, the expenditures of two are given by Mr. Camp. The Associated Press, which aims to provide news of all important events, does so at an annual outlay of some $1,250,000. The United Press, a stock company, which makes a specialty of local news, spends $450,000 per annum. During the past few years syndicates have been formed for the purpose of providing the Sunday newspapers with novels and stories by popular authors. The syndicate purchases from the writer the MS. of a story, and sells the right of simultaneous publication to one newspaper in each of the great cities, thus making a handsome profit. In 1890–91 there appeared in American newspapers in this way, contributions from William Black, H. Rider Haggard, Wilkie Collins, "the Duchess," Robert Louis Stevenson, Rudyard Kipling, and others of equal popularity.

Rowell reported for 1890 the number of newspapers published in the United States and Canada as 17,760. Of these, 812 were Canadian publications. The following was the frequency of issue: Weekly, 13,164; monthly, 2191; daily, 1626; semi-monthly, 280; semi-weekly, 217; quarterly, 126; bi-weekly, 82; bi-monthly, 38; tri-weekly, 36—total, 17,760.

The following table exhibits the number of papers printed in the several States and Canada in 1890:

New York	1,778	California	536	North Carolina	192	Florida	121
Illinois	1,309	Wisconsin	529	Arkansas	185	South Carolina	120
Pennsylvania	1,281	Texas	494	Connecticut	182	North Dakota	119
Ohio	1,043	Minnesota	427	Maryland	178	Vermont	83
Canada	812	New Jersey	318	Alabama	175	District of Columbia	68
Kansas	807	Colorado	268	Maine	156	Rhode Island	64
Iowa	799	Georgia	257	Mississippi	155	Montana	58
Missouri	756	Kentucky	257	Louisiana	152	Delaware	38
Massachusetts	685	South Dakota	250	Washington	146	Nevada	24
Indiana	651	Tennessee	236	West Virginia	143		
Michigan	644	The Territories	290	Oregon	133	Total	17,760
Nebraska	565	Virginia	220	New Hampshire	126		

The principal religious papers published in New York are the *Observer* and *Evangelist*, organs of the Presbyterians; *Independent* and *Outlook*, bound to no denomination; the *Churchman* is Episcopal; the *Christian Advocate*, Methodist; and the *Examiner*, Baptist. The Unitarians are represented by the *Liberal Christian;* the Catholics by the *Tablet;* and the Swedenborgians and Jews have also their papers.

All the other numerous journals of the American states are, compared with those of New York, accounted provincial, but many are, nevertheless, vigorously conducted. According to a report presented in 1886 to the imperial German diet, at least 34,000 newspapers are published throughout the world; the issues amounting, annually, to 592,000,000. Of these papers, 19,000 are published in Europe, 12,000 in North America, 775 in Asia, and 609 in South America; 16,500 are in the English language, 7,800 in German, 3,850 in French, and about 1000 in Spanish. See AMERICAN JOURNALISM; JOURNALISM, ILLUSTRATED; JOURNALISM, COLLEGE.

NEWSTEAD ABBEY, the home of the Byrons, about 8½ m. n.w. of Nottingham, England. It was founded by Henry II. in 1170, as a priory of black canons. When Henry VIII. dissolved the monasteries it was granted to sir John Byron, who made over a part of it into a dwelling, and it has since been subjected to so many alterations and additions that, though originally a fine specimen of the early Anglo-Gothic, it is now a composite of many styles. The fifth lord Byron, the poet's great-uncle, tore down much of the house, felled large tracts of timber, and did what he could to ruin the estate, from hatred for his son the heir, who, after all, did not survive his father. Lord Byron sold the estate in 1817 to Col. Wildman for £180,000. Wildman spent over £200,000 in improving it, and preserved all the memorials of the poet, his former schoolfellow, which he found. Newstead abbey was in 1881 the property of William Frederick Webb.

NEW STYLE. See CALENDAR, DATE.

NEW SWINDON. See SWINDON.

NEWT, or EFT, *Triton*, a genus of batrachians of the family *salamandridæ*, more aquatic in their habits than the salamander, to which, in form and characters, they are very similar, having an elongated body and tail, and four small weak limbs. The tail is vertically compressed, and a crest is often developed on the back and tail, but the crest is characteristic of the males in the breeding season, and the tail becomes rounded when the animals leave the water, as they often do, particularly in the latter part of summer, or in autumn; which, along with other variations apparently dependent on circumstances, have caused no little multiplication of specific names. The most abundant British species is the COMMON NEWT, or SMOOTH NEWT (*T. punctatus, Lissotriton punctatus*, or *Lophinus punctatus*), which is from 3½ to 4 in. long, brownish gray above, yellowish beneath, spotted with black, with a soft, smooth skin, and two bands of pores on the head; a well-known inhabitant of stagnant pools and ditches, often found also under stones, and in other damp situations. The WARTY NEWT (*T. palustris*, or *cristatus*), also pretty common, is 5 or 6 in. in length, blackish brown above with round spots of a darker tint,

bright orange or orange-yellow with black spots on the under parts, the sides dotted with white, and the tail often exhibiting a white band, the skin rough or warty, and with many pores. The dorsal and caudal crests of the warty newt are separate; those of the common newt are united. Many other species occur in other parts of the world. They all feed on animal food, of which tadpoles and aquatic insects form the chief portions. They deposit their eggs on the leaves of aquatic plants, each egg separately, twisting or folding the leaf with their feet so as to conceal the egg, which is surrounded by a viscous substance, so that the leaf is retained in this form. The transformation of newts and other batrachians is noticed in the article BATRACHIA. They very frequently change their skin. They possess, in an extraordinary degree, the power of reproducing lost members—a limb, a tail, even an eye—in every respect perfect.

NEW TESTAMENT. See BIBLE.

NEW THEOLOGY, THE, or NEW DIVINITY, so-called, according to those who champion it, is not strictly new, nor is it iconoclastic, but is rather "an attempt to re-shape and re-express truth in conformity to the modern conditions of thought," and is better styled REAL THEOLOGY. "It does not yet signify a definite, compact body of doctrine, but is applied loosely and largely to a great variety of opinions advocated by writers in many countries, who have a general unity of spirit." Among its positive features are "a somewhat larger and broader use of the reason than has been accorded to theology; an ignoring of the long apparent antagonism between the kingdoms of faith and of natural law; a rejection of verbal inspiration, but a retaining of views based on verbal inspiration; a truer view of the solidarity of the human race as opposed to excessive individuality; a wider study of man; and a restatement of belief in eschatology." The last position includes an acceptance of the doctrine of "future probation," which, briefly stated, is that no one can be saved without Christ, hence, every one of the human race will have an opportunity hereafter, if not in this life, of accepting or rejecting him. This doctrine must not be confounded with those of purgatory, of universal salvation, or of "progressive sanctification," i.e., that the souls of the righteous are not made perfect in holiness at death, but that in a middle state this perfection will be reached. The advocacy of the New Theology by certain professors in Andover Theological Seminary, and the establishment by them of the *Andover Review*, expressly to advance its principles, gave rise to the inaccurate appellation, ANDOVER THEOLOGY. See the volume, *Progressive Orthodoxy;* Newman Smyth, *Old Faiths in New Lights*, and *The Orthodox Theology of to day;* Munger, *The Freedom of Faith;* Bascom, *The New Theology*, and the criticisms of Frederic Palmer in the *Andover Review*, 1890. See PROBATION AFTER DEATH.

NEWTON, a co. in n.w. Arkansas, drained by the Buffalo fork of White river, and other branches; 838 sq.m.; pop. '90, 9950, chiefly of American birth, with colored. The surface is undulating, hilly in some portions, and heavily wooded. The soil is mostly fertile, and the principal productions are Indian corn, wheat, and tobacco. Large quantities of butter, honey, and sorghum molasses are made. There are deposits of lead in some portions. Co. seat, Jasper.

NEWTON, a co. in n. central Georgia, bounded on the s.w. by the South river, drained by the Yellow and Ulcofauhatchee rivers, which unite with the South, in the s. portion of the co., to form the Ocmulgee; situated on the Georgia and the Middle Georgia and Atlantic railroads; 260 sq. m.; pop. '90, 14,310. The surface is diversified, and large portions of it heavily wooded with hickory and oak. The soil is fertile, especially near the rivers, and produces good crops of corn, wheat, oats, cotton, and sweet potatoes. Considerable quantities of butter, molasses, honey, and wool are raised. There are a number of tanneries, saw mills, and manufactories of cotton yarn. Co. seat, Covington.

NEWTON, a co. in n.w. Indiana, adjoining Illinois; bounded on the n. by the Kankakee river, traversed in the s. by Iroquois river, and on the line of the Pittsburg, Cincinnati, Chicago and St. Louis railroad. The surface is level, mostly prairie, with swamps in some portions. Beaver lake is situated in the north. The soil is fertile, and produces good crops of Indian corn, wheat, oats, potatoes, and hay. Other staples are cattle and wool. Pop. '90, 8803. Area, 400 sq. m. Co. seat, Kentland.

NEWTON, a co. in e. central Mississippi, drained by the Young Warrior, and the branches of the Chickasawha river; on the Queen and Crescent route railroad; 576 sq. m.; pop. '90, 16,625, chiefly of foreign birth, includ. colored. The surface is undulating, and heavily wooded. The soil is fertile, and produces good crops of corn, wheat, oats, sweet potatoes, and cotton. Other staples are wool, pork, butter, and molasses. Large numbers of cattle are raised. Co. seat, Decatur.

NEWTON, a co. in s.w. Missouri, bordering on the Indian territory and Kansas, drained by the Grand and Elk rivers, and Waterfall creek, and crossed by the St. Louis and San Francisco, and the Kansas City, Pittsburg and Gulf railroads; 648 sq. m.; pop. '90, 22,108. The surface is heavily wooded with hickory, red, and white oak, black walnut, and ash. The soil is mostly fertile, and the principal productions are Indian corn, wheat, oats, sweet potatoes, and tobacco. Other staples are cattle, butter, wool, and sorghum molasses. Carboniferous limestone and lead are found. There are flouring and saw mills, and pig-lead is manufactured. Co. seat, Neosho.

NEWTON, a co. in s.e. Texas, bounded on the e. by the Sabine river, which separates it from Louisiana, and drained by the branches of the Sabine ; 970 sq.m.; pop. '90, 4650, inclu. colored. The surface is broken by hills in the n., is more undulating in the s., and heavily wooded with good timber trees. The soil in the hilly portion is sandy and unproductive, but fertile in the lower lands around the rivers. The principal productions are corn, sweet potatoes, and cotton. There are large numbers of cattle ; considerable molasses is made. Co. seat, Newton.

NEWTON, a city in Middlesex co., Mass.; on the Charles river and the Boston and Albany railroad; about 7 m. w. of Boston. It contains 13 villages, all connected with each other and with Waltham, Watertown, and Boston by electric street railroad, and its eastern and southern boundaries join Boston. The city has the Newton theological institution (q. v.), a female seminary, the Fish school for boys, West Newton classical school, high school, hospital, nervine hospital, public library, with several distributing stations, over 35 churches, gas and electric lights, national and savings banks, and a fine boulevard from Boston to Weston bridge. Newton was founded in 1630; incorporated as a town in 1688; and chartered as a city in 1873; charter amended in 1882. It is principally a residential city. Pop. '90, 24,379.

NEWTON, Charles Thomas, b. England, 1816 ; educated at Oxford. In 1840 he became assistant keeper of the department of antiquities in the British museum, but resigned in 1852, and obtained the appointment of vice-consul at Mytilene, where he went for the purpose of securing some of the antique sculptures known to exist in Asia Minor, and in the Ægean islands. He passed a number of years in the exploration of the archipelago, discovering at Halicarnassus (the modern Budrum) the site of Artemisia's mausoleum. He carried on excavations at Branchidæ and Cnidus, 1856–59. He unearthed many valuable sculptures, which, with a fine collection of ancient vases, coins, and inscriptions, he presented to the British museum. In 1860 he was appointed consul at Rome, in 1861 keeper of Greek and Roman antiquities in the British museum, and in 1880 prof. of archæology at University coll., London. His wife, a well-known artist, d. in 1866.

NEWTON, Gilbert Stuart, 1794–1835; b. Nova Scotia; went to England in 1817, and, after a tour in Italy, became a student at the royal academy, where he made the acquaintance of Washington Irving and Charles R. Leslie. His first works to attract attention were "The Forsaken" and "The Lover's Quarrel," engraved in the *Literary Souvenir* for 1826; both were in the manner of Watteau. In 1830 he painted "Shylock and Jessica;" "Yorick and the Grisette," from the *Sentimental Journey;* and "Abbot Boniface" from the *Monastery.* In 1831 he exhibited "Portia and Bassanio," and "Lear attended by Cordelia." In 1832 he returned to this country, where he married. On his return to England the next year, he was elected to the Royal Academy, and exhibited a small picture of "Abelard." He also painted "The Vicar of Wakefield," "Macheath," and a few portraits. He was insane for the last two years of his life.

NEWTON, Sir Isaac, the most remarkable mathematician and natural philosopher of his own or perhaps of any other age, was b. at Woolsthorpe, in Lincolnshire, in the year 1642. That year, remarkable in English history for the breaking out of the civil war between Charles I. and the parliament, is doubly remarkable in the history of science by the birth of Newton and the death of Galileo. The circumstances with which the pursuit of truth, in scientific matters, was at this time surrounded in the respective countries of these great philosophers, were not more different than the characters of the philosophers themselves. Galileo died a prisoner, under the surveillance of the inquisition, "for thinking, in astronomy," as Milton says, "otherwise than the Franciscan and Dominican licensers thought." In England, it had become the practice, and soon became the fashion, through the influence of Bacon and Descartes, to discard altogether the dictates of *authority* in matters of science. The dispositions of the two philosophers were happily suited to the situations in which they thus found themselves. Galileo's was a mind whose strength and determination grew by the opposition it encountered. The disposition of Newton on the other hand, diffident of the value and interest of his own labors, and shrinking from the encounter of even scientific controversy, might have allowed his most remarkable discoveries to remain in obscurity had it not been for the constant and urgent solicitation of his friends that they should be published to the world.

Newton received his early education at the grammar school of Grantham, in the neighborhood of his home, at Woolsthorpe. On June 5, 1661, he left home for Cambridge, where he was admitted as subsizar at Trinity college. On July 8 following, he matriculated as sizar of the same college. He immediately applied himself to the mathematical studies of the place, and within a very few years must have not only made himself master of most of the works of any value on such subjects then existing, but had also begun to make some progress in the methods for extending the science. In the year 1665 he committed to writing his first discovery on fluxions; and it is said that in the same year, the fall of an apple, as he sat in his garden at Woolsthorpe, suggested the most magnificent of his subsequent discoveries—the law of universal gravitation. On his first attempt, however, by means of the law so suggested to his mind, to explain the lunar and planetary motions, he employed an estimate then in use of the radius of the earth, which was so erroneous as to produce a discrepancy between the real force of

gravity and that required by theory to explain the motions, corresponding to the respective figures 16.1 and 13.9. He accordingly abandoned the hypothesis for other studies. These other pursuits to which he thus betook himself, consisted chiefly of investigations into the nature of light, and the construction of telescopes. By a variety of ingenious and interesting experiments upon sunlight refracted through a prism in a darkened apartment, he was led to the conclusion that rays of light which differ in color, differ also in refrangibility. This discovery enabled him to explain an imperfection of the telescope, which had not till then been accounted for. The indistinctness of the image formed by the object-glass was not necessarily due to any imperfection of its form, but to the fact of the different colored rays of light being brought to a focus at different distances. He concluded rightly that it was impossible for an object-glass consisting of a single lens to produce a distinct image. He went further, and too hastily concluding, from a single experiment, that the dispersive power of different substances was proportional to their refractive power, he pronounced it impossible to produce a perfect image by a combination of lenses. This conclusion—since proved erroneous by the discovery of the achromatic telescope by Mr. Chester More Hall, of More Hall, in Essex, about 1729, and afterwards, independently, by Mr. Dollond in 1751—turned Newton's attention to the construction of reflecting telescopes; and the form devised by him is the one which, at later periods, reached such perfection in the hands of sir William Herschel and lord Rosse.

It was on Jan. 11, 1671, that Newton was elected a member of the royal society, having become known to that body from his reflecting telescopes. At what period he resumed his calculations about gravitation, employing the more correct measure of the earth obtained by Picard in 1670, does not clearly appear; but it was in the year 1684 that it became known to Halley that he was in possession of the whole theory and its demonstration. It was on the urgent solicitation of Halley that he was induced to commit to a systematic treatise these principles and their demonstrations. The principal results of his discoveries were set down in a treatise called *De Motu Corporum*, and were afterwards more completely unfolded in the great work entitled *Philosophiæ Naturalis Principia Mathematica*, which was finally published about midsummer, 1687.

Shortly before the *Principia* was given to the public, Newton had been called to take an active part in defending the rights of the university against the illegal encroachments of James II. The conspicuous part which he had taken on that occasion procured him a seat in the convention parliament, in which he sat from Jan., 1689, to its dissolution in 1690. In 1696 he was appointed warden of the mint, and was afterwards promoted to the office of master of the mint in 1699, an office which he held till the end of his life. He again took a seat in parliament, in the year 1701, as the representative of his university. Thus engaged in the public service, he had little time left for mere scientific studies—pursuits which he always held of secondary importance to the public duties in which he was engaged. In the interval of public duty, however, Newton showed that he still retained the scientific power by which his great discoveries had been made. This was shown in his solution of two celebrated problems proposed in June, 1696, by John Bernouilli, as a challenge to the mathematicians of Europe. A similar mathematical feat is recorded of him so late as 1716 in solving a problem proposed by Leibnitz, for the purpose, as he expressed it, of feeling the pulse of the English analysts. When in parliament, Newton recommended the public encouragement of the invention of a method for determining the longitude—the first reward in consequence being gained by John Harrison for his chronometer. He was president of the royal society from 1703 till his death, a period of twenty-five years, being each year re-elected. In this position, and enjoying the confidence of Prince George of Denmark, he had much in his power towards the advancement of science; and one of his most important works during this time was the superintendence of the publication of Flamsteed's *Greenwich Observations*—a task, however, not accomplished without much controversy and some bitterness between himself and that astronomer. The controversy between Newton and Leibnitz, as to priority of discovery of the differential calculus, or the method of fluxions, was raised rather through the partisanship of jealous friends than through the anxiety of the philosophers themselves, who were, however, induced to enter into and carry on the dispute with some degree of bitterness and mutual recrimination. The verdict of the impartial historian of science must be that the methods were invented quite independently, and that, although Newton was the first inventor, a greater debt is owing by later analysts to Leibnitz, on account of the superior facility and completeness of his method. The details of these controversies, with all other information of the life of this philosopher, will be found admirably collected in the life by sir D. Brewster, who writes with not only an intimate acquaintance with Newton's works, but in the possession of all the materials collected in the hands of his family. Newton died on Mar. 20, 1727, and his remains received a resting-place in Westminster Abbey, where a monument was erected to his memory in 1731. A magnificent full-length statue of the philosopher, executed by Roubilliac, was erected in 1755 in the antechapel of Trinity college, Cambridge. This work was assisted by a cast of the face taken after death, which is preserved in the university library at Cambridge. In 1699 Newton had been elected a foreign associate of the Academy of Sciences, and in 1703 he received the honor of knighthood from Queen Anne. Among the best editions of Newton's principal works

are the quarto edition of the *Optics* (Lond. 1704), and the quarto edition of the *Principle*, published at Cambridge in 1713.

NEWTON, Isaac, 1794–1858; b. New York; son of a revolutionary soldier; became a great ship-builder, superintended the construction of more than 90 vessels, and was a naval architect of distinguished reputation. He was the builder of the *Hendrick Hudson*, a river steamboat named in honor of the discoverer, and at the time (1851) considered very elegant; also the *New World*, built about the same time, for the navigation of the North river.

NEWTON, John, 1725–1807; b. London, son of a sea-captain; devoted by his mother to the Christian ministry. But her death occurring when he was seven years of age, he was neglected by his father and step-mother, and soon learned the ways of vicious boys with whom he associated. After a little time at a boarding-school in Essex, he went to sea at the age of eleven. During the next six years he was exposed to the influence of atheistical books and companions. Reading Shaftesbury's *Characteristics* he became an infidel. In his 19th year he was unexpectedly promoted to the rank of a midshipman on board the *Havre* man-of-war. But in his self-will he abandoned the ship while she lay at Plymouth. He was caught, brought back, flogged, and degraded; but became only more hardened. In 1745 he set sail for India as a common sailor. Unable to endure the taunts of his messmates and the frowns of his superiors, he entered at Madeira a Guinea vessel which took him in exchange for another. In six months he left this ship and landed penniless on the African coast near Sierra Leone. He soon found employment in the service of a slave-trader in one of the islands of the Plantanes, and was compelled to perform the most groveling drudgery. In a year the "stout English sailor was transformed into a spiritless, half-naked wretch, suffering under the effects of fever, shivering under the wind and wet of the rainy season, devouring the nauseous roots which he stole by night from the plantations, or the fish which he caught by the sea-shore, and exciting the contempt and even the pity of the meanest of the slaves." In 1747 an English captain arriving at Sierra Leone with orders from his father to bring him home found him "herding contentedly with the negroes in their low pleasures and gross superstitions." He sailed in Mar., 1748. The ship came near foundering in a terrible storm. His mind was awakened to serious thoughts. At the near prospect of death his skeptical indifference and blasphemous defiance deserted him. He prayed, he read the New Testament and Thomas à Kempis, and when the ship reached Ireland he was a changed man. In 1750 he married Mary Catlett. Soon afterwards he was appointed commander of an African slaver, and for four years continued in the slave trade, confessing that "he never had the least scruples as to its lawfulness," though afterwards he labored earnestly to expose its cruelties. During the intervals between his voyages while on shore, and on deck at sea, he studied Horace, Livy, and Erasmus. In 1754 a sudden attack of sickness led him to abandon a sea-faring life, and for 8 years he was tide-surveyor at Liverpool. At this time he studied Greek and Hebrew, and the best theological works in Latin, French, and English. In 1764 he was ordained, and appointed curate of the parish of Olney, where he remained 16 years. He entered heartily into the religious views and work of Wesley and Whitefield. At Olney he published *An Authentic Narrative of some Remarkable and Interesting Particulars in the Life of the Rev. John Newton.* Here too he formed an intimate friendship with Cowper, and in connection with him produced the *Olney Hymns.* Most of them were written by himself for the use of his congregation. In 1779 he was presented with the rectory of the united parishes of St. Mary Woolnoth and St. Mary Woolchurch Hau, London, where he remained till his death, continuing to preach three times a week, even when more than four-score years old, and sight, hearing and memory were fast failing. When entreated to stop, he exclaimed, "What! shall the old African blasphemer stop while he can speak?" His labors were very effective, and he contributed much to dispel the religious apathy of that age. His works besides *Olney Hymns*, were *Omicron's Letters; Review of Ecclesiastical History; Cardiphonia*, or *Utterances of the Heart; The Christian Character Exemplified; Letters to a Wife; Messiah*, being 50 discourses on the Scripture passages in the oratorio of the "Messiah;" *Letters to the Rev. William Bull*, and numerous sermons, discourses, tracts, etc. His letters are beautiful specimens of clearness and simplicity, and rich in Christian experience. Though in his preface to the *Olney Hymns* he disclaims all pretension to being a poet, and claims only the "mediocrity of talent which might qualify him for usefulness to the weak and poor of his flock," yet his verses, being as he himself says, "the fruit and expression of his own experience," live in the memory and affection of Christians, and some find a place in our best collections of hymns. He was a leader in the evangelical party in the church of England.

NEWTON, John, b. Va., 1823. He was appointed second lieut. in the corps of engineers, July 1, 1842, on graduating from West Point military academy, where he acted as assistant professor of engineering 1843–46. The construction of fortifications and the improvement of rivers and harbors next employed his time at various points on the Atlantic coast and great lakes, and 14 years of continuous service secured his promotion to the rank of capt. He was chief engineer of the Utah expedition of 1858. All through the civil war he was in active service, beginning as chief engineer of the department of

Pennsylvania, and later of Shenandoah. Then he was summoned to assist in constructing the defenses of Washington, and had command of a brigade. During the peninsular and Maryland campaigns of the army of the Potomac he was a brig.-gen. of volunteers, and took part in the battles of Gaines Mill, Glendale, South Mountain, and Antietam, where he was brevetted lieut.-col. Commanding a division, he was engaged at Fredericksburg, in the storming of Marye heights and battle of Salem, and his services at the battle of Gettysburg gave him the rank of brevet col., and the command of the 1st corps. In the invasion of Georgia he led a division of the army of the Cumberland through all the engagements preceding the capture of Atlanta, and Mar. 13, 1865, he was made brevet maj.-gen. After the war he was occupied in strengthening the defenses of New York harbor, removing the obstacles to navigation at Hell Gate and other portions of the East river, and improving some of the harbors of lake Champlain, the channel between Staten Island and N. J., and the Hudson river. June 30, 1879, he attained the rank of col. in the corps of engineers; in 1884 was made chief of engineers; retired 1886; was commissioner of public works, N. Y. city (1886–88), and became president of the Panama railroad co. in 1888. He d. in 1895.

NEWTON, Reginald Heber, D.D., b. Philadelphia, 1840; son of Rev. Dr. Richard N.; was educated at the univ. of Pennsylvania; and was ordained to the Prot. Epis. ministry. His position in the Episcopal church is in the extreme "Broad Church," which by its opponents is characterized as the rationalistic party. He has written much on industrial and social topics. Among his works are: *Studies of Jesus* (1881); *Right and Wrong Uses of the Bible* (1883); *The Book of Beginnings* (1884), etc. Though Dr. N. gives strong utterance to his views, he is noted for kindliness of spirit, and fidelity as a Christian pastor. He is rector of All Souls' Church in New York City, and a "broad churchman."

NEWTON, Robert, 1780–1854; b. Roxby, Yorkshire, Eng. He was early brought under the influence of the Methodists, joining that church at the age of 17. In 1798 he was received by the British conference, and in 1803 was appointed to the Glasgow circuit, attending lectures on theology and philosophy at the same time at the university. Most of his time was spent in England and Scotland. In 1812 he was appointed to London, where he soon became distinguished for his eloquence, especially in behalf of the British and foreign Bible society. When he began his missionary work in England there were only 50 Wesleyan missionaries and 17,000 communicants; in a few years through his influence there were 350 missionaries and 100,000 communicants. His services were in great demand in England, Scotland, and Ireland. In Sheffield he did much to check the influence of Paine, which then prevailed among the working classes. From London he was sent to Wakefield, and thence to Liverpool. For 40 years he was known and honored in all the large towns and cities. He was four times elected president of the British conference, and for many years was its secretary. In 1839, at the centenary conference held in Liverpool, he was appointed delegate to the general conference of the Methodist Episcopal church of the United States. He preached in New York, April 26, 1840, to a large audience, and wherever he preached vast crowds were attracted by his eloquence. In Baltimore, where the conference was held, such multitudes gathered to hear him that he afterwards preached in Monument square to an audience, it is said, of 15,000. He published *Sermons on Special and Ordinary Occasions.*

NEWTON, William Wilberforce, b. Philadelphia, 1843; brother of Reginald Heber N. He graduated, 1865, at the univ. of Pennsylvania. He has published some vols. of sermons for children, also *Essays of To-Day* (1879), *Priest and Man* (a novel, 1883), and some vols. of verse. He is rector of a Prot. Epis. church, Pittsfield, Mass., and was the chief promoter of the "American Church Congress," whose first meeting was held, Hartford, Conn., 1885, May. It is composed of members of the various Christian denominations, and meets for discussion in a fraternal spirit, and in the interest of Christian union.

NEWTON-IN-MAKERFIELD, a parish and manufacturing t. of England in Lancashire, 15 m. w. of Manchester, on the Manchester and Liverpool railway. The chief industries are paper-making and coal mining. There is a beautiful lake in the town called Newton Mere, which is covered during the summer months with the pleasure-boats of the townspeople. Horse-races are held here in June, and horse and cattle fairs in May and August annually. Pop. '91, 12,900.

NEWTON'S RINGS. In his investigations of the colors produced by thin plates of any material, solid, fluid or gaseous, sir Isaac Newton hit upon the following mode of exhibiting the colors produced by a film of air. He took two lenses, one convexo-plane, its convex side having a radius of 14 ft., the other equi-convex, with the radii of its surfaces 50 ft., and laid the first with its plane surface downwards on the top of the second, thus producing a thin film of air between the lenses; the film being thinnest near the center, and becoming gradually thicker outwards. On slowly pressing the upper lens against the under one, a number of concentric colored rings, having the point of contact of the lenses for their center, appeared, and increased in size when the pressure was increased. These rings, or more properly systems of rings, are seven in number, and each of them is composed of a number (ranging from 8 in the first or smallest ring, to

2 in the outermost) of rings of different colors, the colors, though different in each of the systems of rings, preserving the same arrangements as the colors of the spectrum, of which they seem to be modifications; thus, in the second ring the inside color is violet, and the outside scarlet red. The colors are very distinct in the first three systems of rings, but become gradually confused and dull towards the outside, till they almost fade away in the 7th system. The center is deep black. The thickness of the air-film at the center is about half a millionth of an inch, and increases gradually to nearly $\frac{1}{130,000}$ of an inch, when the colors disappear.

NEWTON THEOLOGICAL INSTITUTION, at Newton, Mass.; organized, 1825; the first theological seminary established in the country by the Baptist denomination. It has always been served by professors eminent for learning and piety. The buildings and grounds, valued at $200,000, occupy the summit of a hill commanding a fine view. It has an endowment of about $400,000, and a library of about 21,500 volumes; professors, '97, 9; students, 96. President, Rev. Alvah Hovey, D.D., LL.D.

NEWTON-UPON-AYR, a burgh of barony and parish of Scotland, in the co. of Ayr, on the n. side of the river Ayr, and united with the town of that name by three bridges. See Ayr. Its population is 8600. Newton-upon-Ayr has shipbuilding docks, roperies, and iron and brass foundries.

NEWTOWN, a t. in Fairfield co., Conn.; on the Housatonic river and the New York, New Haven, and Hartford railroad; 9 m. w. of Danbury. It was incorporated in 1711, and contains the villages of Newtown, Sandy Hook, Hawleyville, and Botsford. The principal industries are agriculture and the manufacture of rubber goods, blankets, carriages and wagons, and woolen goods. Pop. '90, 3,539.

NEWTOWN, a t. in Queens co., N. Y.; on Long Island, an estuary of Long Island sound, and the Long Island railroad; bounded on the w. by the city of Brooklyn. It contains the villages of Corona, Middle, Winfield, and Woodside, many pretty villas, and extensive market gardens, and manufactories of rope, straw hats, china, oilcloth, and iron foundry products. Pop. '90, 17,549.

NEWTOWN, a modern manufacturing t. of North Wales, in the co. of Montgomery, 7½ m. s.w. of the town of that name, on the right bank of the Severn, and on the Cambrian railway. It is the center of the flannel manufactures of the county. Carries on also other branches of the woolen industry. Pop. '91, 6,600.

NEWTOWNARDS, a civic and market t. of the co. Down, Ireland, 12 m. e. from Belfast by railway. Pop. '91, 9,200. In point of population it is the second town in the county. It contains a court house, a town hall, and a market square; a Protestant church, a Roman Catholic chapel, Presbyterian meeting-houses, numerous schools, and a union workhouse. It is a neat and well-built town, of considerable trade, and with extensive muslin, flax-spinning, and weaving factories, as well as two large hem-stitch factories.

NEWTOWN-LIMAVADY, now called Limavady (Ir. *Leim-a-madha*, "The Dog's Leap") a market t. of the co. of Londonderry, Ireland, and 16 m. e.n.e. of the town of Londonderry. Pop. less than 3,000. Newtown-Limavady, in the period anterior to the establishment of English rule, was the seat of the powerful sept of the O'Cahans, or O'Kanes; and during the wars of the revolution it was the scene of more than one struggle between the followers of James II. and those of William. Its chief importance at present is as a center of the flax trade, once the staple of that district, and again rising in importance. It possesses a town-hall, weaving factory, extensive oat and maize mills, markets, and brewery; union workhouse, Protestant church and other places of worship, and comfortable hotels.

NEW WESTMINSTER, a city in central British Columbia, on Fraser river in the midst of the gold region, the former capital and one of the chief cities of the province; pop. '91, 6,641, including some Indians. It is 15 m. above the mouth of the river, 75 m. n.e. of Victoria, and 100 m. from Yale, at the head of river navigation. The river empties into the gulf of Georgia, and steamers from Vancouver Island make this place a freight and passenger station for ocean steamers, whence the river steamers forward them to Yale. Between this place and Victoria steamers ply frequently. The river at this point is about a mile wide, and contains several inhabited islands. The city is the center of considerable tracts of arable land, delightfully located, has a fine climate and a large rainfall; and the vicinity is a silver producing region, though mines are not yet opened. Its leading industry is salmon fishing, several establishments largely exporting the fish in cans and barrels; and other kinds of fish are caught for this trade, and for the manufacture of fish oil. It has also a large trade in lumber and furs. Anthracite and bituminous coal are exported. It has several churches, Methodist and Roman Catholic colleges, the provincial asylum for the insane, the Dominion penitentiary, residences of Anglican and Roman Catholic bishops, public library, electric lights, electric street railroad, public parks, and important manufactories.

NEW-YEAR'S DAY, the first day of the year. The custom of celebrating by some religious observance, generally accompanied by festive rejoicing, the first day of the year, appears to have prevailed among most of the ancient nations. The Jews, the Egyptians, the Chinese, the Romans, and the Mohammedans, although differing as to

the time from which they reckoned the commencement of the year, all regarded it as a day of special interest. In Rome the year anciently began in March ; and when Numa, according to the ancient legend, transferred it to Jan. 1, that day was held sacred to *Janus Bifrons*, who was thus supposed to turn at once back upon the old year and forward into the new. On the establishment of Christianity, the usage of a solemn inauguration of the new year was retained ; but considerable variety prevailed, both as to the time and as to the manner of its celebration. Christmas day, the annunciation (Mar. 25), Easter day, and Mar. 1 have all, at different times or places, shared with Jan. 1 the honor of opening the new year ; nor was it till late in the 16th c. that Jan. 1 was universally accepted as the first day of the new year. The early fathers—Chrysostom, Ambrose, Augustine, Peter Chrysologus, and others—in reprobation of the immoral and superstitious observances of the pagan festival, prohibited in Christian use all festive celebration ; and, on the contrary, directed that the Christian year should be opened with a day of prayer, fasting, and humiliation. The mandate, however, was but partially observed. The festal character of the day, generally speaking, was pertinaciously preserved, but the day was also observed as a day of prayer ; and this character was the more readily attached to it when the year began with Jan. 1, as that day, being the 8th after the nativity of our Lord, was held to be the commemoration of his circumcision (Luke ii. 21).

The social observances of the first day of the new year appear to have been in substance the same in all ages. From the earliest recorded celebration, we find notice of feasting and the interchange of presents as usages of the day. Suetonius alludes to the bringing of presents to the capital ; and Tacitus makes a similar reference to the practice of giving and receiving new-year's gifts. This custom was continued by the Christian kingdoms into which the western empire was divided. In England we find many examples of it, even as a part of the public expenditure of the court, so far down as the reign of Charles II.; and, as all our antiquarian writers mention, the custom of interchanging presents was common in all classes of society. In France and England it still subsists, although eclipsed in the latter country by the still more popular practice of Christmas gifts. In many countries, the night of New-Year's eve, "St. Sylvester's eve," was celebrated with great festivity, which was prolonged till after 12 o'clock, when the new year was ushered in with congratulations, complimentary visits, and mutual wishes for a happy new year. This is an ancient Scottish custom, which also prevails in many parts of Germany, where the form of wish—"Prosst- (for the Lat. *prosit*) Neu-jahr "—"May the new year be happy "—sufficiently attests the antiquity of the custom. In many places the practice of tolling bells at midnight, and thus "ringing in the new year," is still observed. Many religious communions are wont to celebrate it with a special service. In the Roman Catholic church, the *Te Deum* is still sung at the close of the old year ; and New-Year's day is a holiday of strict obligation.

NEW YORK, a Middle Atlantic state and one of the original 13 ; between lat. 40° 29′ 40″ and 45° 0′ 42″ n. ; long. 71° 51′ and 79° 45′ 54.4″ w. ; bounded on the n. and n.w. by Canada (Ontario and Quebec), the St. Lawrence forming a part of the boundary, Lake Ontario and Lake Erie ; on the e. by Vermont, Lake Champlain, Massachusetts, Connecticut, Lower N. Y. Bay and the Atlantic ; on the s. by the Atlantic, Lower N. Y. Bay, New Jersey and Pennsylvania ; on the w. by New Jersey, the Hudson River separating, Pennsylvania, Lake Erie, Lake Ontario, and their connecting river, Niagara. Long Island (q.v.), which forms a part of the state, is bounded on the n. by Long Island sound; on the e. and s. by the Atlantic; on the w. by New York bay. Greatest length of state from n. to s., 311⅔ m.; greatest breadth, including Long Island, 412 m.; land area, 47,620 sq.m. ; gross area, 49,170 sq.m., or 31,468,800 acres. The total extent of the boundary lines on the border of Canada, Vermont, Massachusetts, Connecticut, New Jersey, and Pennsylvania is 541.28 m. The geographical, political, and commercial importance of N. Y. have given it the popular name of "the Empire State."

History.—While it is claimed that John de Verrazano landed on the coast of N. Y. in 1524, the first white man who is known to have been within the present boundaries of the state was Samuel Champlain, the French navigator, who set sail down the lake which was named after him, on July 4, 1609, antedating by two months Hudson's discovery from the sea. Champlain, governor of Canada, was on an expedition up the St. Lawrence, when he met a war-party of Hurons, which he and two other Frenchmen joined. July 5, at Crown Point, the Hurons met 200 Iroquois, and defeated them, Champlain shooting their chief with his arquebuse. This was the initiatory act which incurred the enmity of the Five Nations, with whom the French continued at war until the final surrender of their possessions in America. Sept. 9, 1609, Henry Hudson, an Englishman in the employ of the Dutch East India company, sailed his little 80-ton shallop *Half Moon* into the waters of New York bay, and three days later commenced his voyage up the river to which his name is attached, which he explored to a point between Hudson and Albany. All the land which he discovered was claimed by the Dutch and named New Netherland ; and in 1611 the States-General offered special privileges to any company opening and encouraging trade with the natives of their newly acquired possessions. This encouragement procured not only trading but colonization. In 1613 a fort was built on Manhattan Island, but the settlement about it was broken up by the English. In the following year another Dutch colony established itself on the same spot, and continued in

possession; and during the ten years succeeding, the shores of the Hudson and those of Long Island sound were explored, and at Fort Orange (Albany) another trading-post was established. In this region the Indians were tribes of the great Algonquin family, while the remainder of the state was occupied by the Five Nations. But while Champlain had embroiled himself with the Indians in the part of the country included in his explorations, thus entailing a long and bloody war upon the French, the Dutch settlers in the s. e., more wary, cultivated amity with the red men, to their own material advantage. In 1621 the prospects of a lucrative commerce with America had induced certain merchants in Holland to combine in the organization of the Dutch West India company, for colonization purposes, and two years later this company took out 18 families who settled at Fort Orange, and 30 families who remained at New Amsterdam on Manhattan Island.

The first important illustration of the benefits of amicable intercourse with the Indians occurred in the purchase from them of Manhattan Island by the Dutch in 1626 for the sum of $24. This was accomplished by Peter Minuits, the director-general who had been sent out by the Dutch West India Company to take charge of its colonies, an able administrator and wise governor. See MINUIT, PETER. A feature of his administration was the establishment of the patroon system, by which certain speculators were permitted by an act of the company passed in 1629 to gain manorial rights over immense tracts of country; thus building up a powerful land aristocracy, whose influence was great in the early history of the state, and whose claims brought about more than two centuries later the "anti-rent" war between landlords and tenants in these manorial districts. The disturbance which this system immediately produced among the colonists themselves was attributed wrongfully to maladministration on the part of Minuits, and he was summoned home and his office filled, in 1633, by Wouter van Twiller, who was succeeded in 1638 by William Kieft. The administration of the latter was signalized by the first serious difficulty between the colonists and the Indians. Some slight disagreement brought about an attack on the natives by the Dutch, which resulted in the massacre of more than 100 unoffending Indians, men, women, and children, and the precipitation of a sanguinary war, which threatened the very existence of the colony. Peter Stuyvesant succeeded Kieft in 1647, and his considerate and judicious direction of affairs relieved the colony from the serious danger into which it had fallen. He pursued a conciliatory policy with the Indians, and the wisdom of his administration soon produced its effect in a satisfactory and progressive condition in the settlements under his jurisdiction. These settlements now constantly extending, soon conflicted with those of the English on the Connecticut river, and of the Swedes on the Delaware. The latter had been established by Peter Minuits, who had joined the service of the Swedish government, after being dismissed from that of the Dutch West India company. In 1655 Gov. Stuyvesant seized this settlement by force and annexed it to his government. The English opposition to the Dutch colonization schemes was persistent from the beginning, and fruitful of much conflict. The English claimed the territory n. of Virginia on the ground of the anterior discoveries by Cabot; and in 1664 a charter was granted by Charles II. to the Duke of York, which covered all the lands lying between the Hudson and the Delaware, and included New Netherland, as well as lands already held by prior grant, by Connecticut, Massachusetts, and New Hampshire. In the summer of the year in which this charter was given, Col. Nicolls was sent from England with sufficient force, and on arriving at New Amsterdam, demanded the surrender of the Dutch possessions. This demand was acceded to by Gov. Stuyvesant, who was powerless to prevent its enforcement, and the country in question passed into the hands of the English without a struggle. The name of New York was now given both to the settlement on Manhattan Island and to the entire province, and that of Albany to Fort Orange. A subsequent recapture by the Dutch was followed by speedy restoration to the English; and on the Duke of York ascending the throne of England under the title of James II., the province passed into the possession of the crown. Its condition at this time was not encouraging as to progress, either in wealth or education. The most of the land was held by aristocratic families, much of it having been dispensed by the Duke of York among his favorites. Heavy taxation and burdensome restrictions on trade bore heavily on the people; there was little political freedom or religious toleration; even under the reign of William and Mary there was little improvement. Colonial possessions, according to the general policy of the European powers, were used to placate or dispose of personal enemies, or to reward personal friends; while their trade was deemed a just perquisite for the royal exchequer. So late as 1689, the persistent tyranny of Nicholson, then governor of N. Y., aroused the colonists to resistance; and Jacob Leisler, a merchant of prominence in N. Y., and holding an official position, seized the government in the name of William of Orange, and held it for two years. He was then superseded by Gov. Sloughter, and on very insignificant grounds was tried for high treason, condemned, and put to death. See LEISLER, JACOB.

While the Dutch and English were colonizing s. e. N. Y. and the line of the Hudson river, also at points some distance in the interior and on Lake Champlain, the French were incessant in their warfare with the Indians and their inroads from Canada into northern and central N. Y., varying their warlike expeditions by missionary enterprises. Excepting brief periods of peace, established by treaty stipulations often broken, the French and Indians were constantly at enmity; while the generally friendly relations of the natives with the English resulted in the northern and western frontier

settlements being protected by the Indians from French invasion during the French and Indian wars. After 1684, when Gov. Dongan concluded an offensive and defensive treaty with the Indians, the English occupied, in peaceful agreement with the latter, the attitude which had been held by the Dutch prior to their ascendency. In 1687 a French army under de Nonville, governor of Canada, invaded N. Y.; the Five Nations, in retaliation, made an invasion of Canada two years afterwards, killing 1000 French settlers, and threatening the destruction of the whole province. On Feb. 8, 1690, at midnight, the town of Schenectady was attacked by French regulars to the number of more than 200, accompanied by a large number of Indians, when 63 of the settlers were killed, and 27 carried into captivity. In 1690–91 the village of La Prairie was twice attacked; and in 1695 Count de Frontenac, with 400 Frenchmen and 250 Algonquins, desolated the Mohawk country, and pursued his invasion almost to Albany, returning laden with plunder and prisoners. Lake Champlain was, in fact, held by the French and commanded by their fortifications until 1759. Hostilities between England and France were concluded for the time by the peace of Ryswick in 1697, and from 1702 to 1748, during Queen Anne's and King George's wars, there was no fighting in N. Y., except some skirmishes along the frontier. But after the outbreak of hostilities in 1754, there being no concert of action among the colonies, the entire British possessions in North America were threatened with subjugation. The French had fortifications on Lake Champlain, on the St. Lawrence, and at Niagara; while the English advanced posts were at Fort Edward on the Hudson, and at Oswego. In 1755 the English under Sir William Johnson defeated and nearly annihilated the French under Dieskau, at the head of Lake George; but in the following year the French captured Oswego and destroyed it, and in 1757 took Fort William Henry. In 1758 Gen. Abercrombie, with an army of 16,000 men, attacked Ticonderoga, but was repulsed. Col. Bradstreet, however, captured Fort Frontenac in the latter year, and in 1759 Niagara was captured by the British, and Ticonderoga and Crown Point surrendered on the appearance of Gen. Amherst with his army. This left N. Y. quite free of the French, and the attention of its people could once more be turned to their own affairs. During the war, and under William Pitt's administration, colonial affairs had been administered less obnoxiously than before; but no sooner was the conquest of Canada completed, than a course of conduct was begun tending to irritate the colonists, and arousing in N. Y. a spirit of opposition whose exhibition the presence of a large royalist force could not prevent.

N. Y. entered earnestly into the arrangements made for self-defense on the part of the colonies. In Oct., 1775, Gen. Tryon, the last British governor of N. Y., fled from his seat of government to a man-of-war in the harbor. Already, in May of that year, Ethan Allen and his "Green Mountain boys" had surprised and captured Fort Ticonderoga. Generals Montgomery and Schuyler set forth two months later on their ill-fated expedition against Canada—whence they returned defeated and dispirited in the following spring. In Feb., 1776, N. Y. city was occupied by an American force, but the battles of Long Island and Harlem Heights, disastrous to the American arms, rendered that position untenable, and, being abandoned by Washington and his army, the British took possession of the city, and held it for 7 years. In the summer of 1777 the province was invaded by Gen. Burgoyne from the Canada side, while simultaneously a British force proceeded up the Hudson to unite with him. The immediate result of this joint expedition was the capture by the British of several American forts on the Hudson and Lake Champlain, but it ended in disaster, Burgoyne's entire army being forced to surrender, Oct. 17, at Saratoga. In 1777–78 West Point was fortified, and considered the strongest position in the country.

In 1779 the Indian country in N. Y. was laid waste by Gen. Sullivan; the Six Nations joined the British, and under Sir John Johnson harassed the defenseless settlements on the frontier; and the Schoharie and Mohawk settlements were constantly being subjected to depredations on the part of hostile Indians. Nov. 25, 1783, the final act of the revolution took place in the evacuation by the British of the city of N. Y., when the colonists were left to frame a government for themselves, which should comprehend the new attitude and larger relations which they held as citizens of a republic. A treaty was now concluded with the Six Nations, the Indians ceding a large portion of their lands to the state. Subsequently other treaties lessened the Indian possessions, until, excepting the reservations, all that they had once owned had been given up to the whites. What was known as the "Holland purchase," 3,500,000 acres sold by Robert Morris to an Amsterdam company—lying west of what was known as the preëmption line, a boundary between N. Y. and Massachusetts lands—having been thoroughly surveyed by its Dutch owners, and made available for settlement, was speedily populated. The lands in central N. Y. were settled as rapidly as the Indians surrendered them. In 1777 the first constitution of the state was adopted, revised in 1801, 1821, 1846, and 1867, the latest amendment having been made in 1894. In the meantime conflicting claims of other states concerning the boundaries of N. Y. had been adjusted amicably; in the case of New Hampshire, by forming the state of Vermont from the disputed territory, N. Y. receiving the sum of $30,000 for relinquishing its claim. The war of 1812 brought the N. Y. frontier again into danger, and a number of engagements occurred in that part of the state bordering on Canada and the lakes. A British attack on Sackett's Harbor, an important American naval station on Lake Ontario, resulted unsuccessfully.

Shortly after the close of the war, in 1816, the requisite legislative action was taken for the building of the Erie Canal, originally suggested by Gouverneur Morris in 1800. The canal was begun in 1817 and finished in 1825; its successful completion being mainly due to the energy and foresight of Gov. De Witt Clinton. The effect of this great work was to enrich the state while opening the way for the stream of commerce which has resulted in making the city of N. Y. the metropolis of the western continent. In 1826 the Hudson and Mohawk railroad was chartered—probably the first railroad charter granted in the country. This road was commenced in 1830, and the New York and Erie in 1836. The gradual absorption of the various N. Y. lines which form the Hudson River railroad, and the consolidation of the N. Y. Central and Hudson River railroad into one powerful four-track trunk line connecting the metropolis with the west, were significant events in the development of the state. For local events of importance occurring in 1843–46, see ANTI-RENTERS.

The part taken by the state of N. Y. in the war for the Union was foremost as became the first state in the union in wealth and population. Every co. furnished its quota of volunteers; its well-organized and thoroughly drilled militia regiments supplied capable officers to the inexperienced army which was so rapidly formed, and the great manufactories of the state were kept busy night and day in supplying arms, clothing, and equipments; at the Watervliet arsenal alone 1500 men were employed during the war. The wealth of New York was poured out like water to sustain the union cause. The U. S. sanitary commission and the union defense committee were organized from among its citizens. The number of troops furnished was 448,850, of whom 4125 were col'd. The bounties paid, $86,629,228, exceeded in amount those of any other state.

TOPOGRAPHY.—Three mountain ranges enter the state from the south, and cross it in a northeasterly direction. The first, a continuation of the Blue Ridge, runs through Rockland, Orange, Putnam, and Dutchess cos., and forms the highlands of the Hudson. Its highest peaks are Beacon Hill, Dutchess co., 1685 ft.; Bull Hill, Putnam co., 1586 ft.; and Butter Hill, Orange co., 1529 ft. The second range, connected with the Pennsylvania Mts., also extends through Sullivan, Ulster, Delaware, and Greene cos., sends out, as its extreme spur on the east, the Shawangunk Mts., reaches into Albany and Schoharie cos. in the Helderberg and Hellibark Mts., and has its main termination in the Catskill Mts. on the Hudson. Its highest elevations are Round Top, 3500 ft.; High Peak, 3664 ft.; and Pine Orchard, 3000 ft., all in Greene co.; and Rockland Mt., 2400 ft., and Walnut Hill, 1980 ft., in Sullivan co. The third range extends through Broome, Delaware, Otsego, Schoharie, Montgomery, and Herkimer cos. to the Mohawk; and reappearing on the north side of that river, continues to Lake Champlain, forming the Adirondack Mt. region. Geographically, the Adirondack region, covering all of Hamilton co. and more or less of eleven other cos., is bounded by Lake Champlain, the St. Lawrence, the Mohawk, and the Black Rivers. This extensive territory contains the only great forests remaining as a public domain within the borders of the state. The first surveys of this territory were made in 1772, but it was precisely 100 years later that a systematic topographical survey of the entire region was undertaken by acts of the legislature. It has three peaks exceeding 5000 ft.—Marcy or Tahawus, 5379 ft.; MacIntyre, 5183 ft.; and Haystack, 4919 ft. There are 10 exceeding 4000 ft., among which are Skylight, 4890 ft.; Whiteface, 4871 ft.; Clinton, 4937 ft., and Dix, 4916 ft.; and eight others, well known to tourists, ranging from 3903 ft. (Baldface) down to 3136 ft. (Hopkins). The lake and river-beds here have an altitude of 1500–2000 ft.

A rolling and beautiful country constitutes the water-shed, separating the north and south drainage of the western part of the state. To the north the surface descends in rolling terraces toward Lake Ontario. The region to the s., embracing the most of the two tiers of counties, is higher, rising in places to 2000–2500 ft. above tide.

The river system comprises that part drained by the great lakes and the St. Lawrence, northerly, and that drained by the Hudson and other rivers, southerly. The water-shed between extends irregularly from Lake Erie, eastward, through the southern tier of counties, to the Adirondacks, Lake George, and the state line, east. The principal rivers are the Hudson, rising in the Adirondacks, 200 m. long, and navigable to Troy, 151 m.; the St. Lawrence, forming the northern boundary for nearly 100 m.; the Mohawk, 135 m. long; the Oswego, 24 m. long; the Alleghany, which has a course of 50 m. in the state; the Susquehanna, the north branch of which rises in the state, and receiving important streams in the Chenango and Tioga; the Delaware, the Niagara, the Black, and the Genesee. The state contains a number of beautiful lakes. With the exception of Lake George (q.v.), the most important lie in the central part. Cayuga is 38 m. long; Seneca, 37 m.; Keuka, 18 m.; Oneida, 18 m.; Canandaigua, 15 m.; Skaneateles, 15 m. The Adirondack region is full of lakes—Long, Schroon, Upper and Lower Saranac, Raquette, Placid, etc. Chautauqua (18 m.) in the southwest, and Saratoga and Otsego in the east, are among the many noted as places of resort. The outlines of the state are irregular, but its river, lake, and ocean boundaries are nearly all navigable, including 352 m. on the lakes, 281¼ on the St. Lawrence, Poultney, Hudson, Kill van Kull, Delaware, and Niagara rivers, and 246 m. on Long Island sound and the Atlantic Ocean. Half of Lakes Ontario and Champlain, and the eastern end of Lake Erie, are the property of the state. The great bodies of water surrounding New York city are noticeable. The chief harbors are New York bay and harbor; Dunkirk

and Buffalo, on Lake Erie; Tonawanda and Lewiston, on Niagara river; Genesee, Sodus, Oswego, Sackett's Harbor, and Cape Vincent, on Lake Ontario; Ogdensburg, on the St. Lawrence; Rouse's Point, Plattsburg, and Whitehall, on Lake Champlain; and Sag Harbor at the e. end of Long Island, with other harbors on the northern and southern shores of that island. Among the many waterfalls are Niagara (q.v.); Trenton, which falls 200 ft. in five cascades; Genesee, three cascades of 96, 25, and 84 ft. in 2½ m.; Taghkanic, Portage, and those near Ithaca and in Watkins Glen. The principal islands are Manhattan, Long, and Staten; Coney and Fire, on the southern shore of Long Island; and Shelter and Gardiner's, off its eastern extremity. The Hudson contains many small islands, Lake George, 220, and about 700 in the St. Lawrence belong to the state. N. Y. is celebrated for her grand and beautiful scenery. The Adirondacks, Catskills, the Hudson, and Lakes George and Champlain combine both; the picturesqueness of her inland lakes attracts the tourist, and Ithaca Gorge, Ausable and Chateaugay chasms, Watkins and Havana glens, are among the places of special interest. The pleasure resorts are among the oldest and best known in the United States. New York City itself, with its adjacent day resorts of Coney and Glen islands, Rockaway beach, and a number of others, has been called the finest summer resort on the continent. When we add to this, Saratoga, Sharon, Richfield, Avon, and numerous other places famous for their mineral springs; Niagara Falls, one of the greatest wonders in the world; the Adirondack region, with its 1300 lakes, its streams and its wonderful gorges and ravines, now made easily accessible by the Adirondack division of the New York Central railroad; the St. Lawrence, with its 1700 islands and islets; the Hudson River valley, the Highlands, and the Catskills, literally teeming with popular resorts, we have a list not easily equalled by any other state in the Union. The beautiful scenery of all these sections tends to make them attractive, not only to tourists, but also makes them sought by many people of wealth for country summer homes. It is said that in the six miles of the Hudson valley lying between Dobbs Ferry and Tarrytown are to be found the homes of sixty-five people whose aggregated fortunes exceed $500,000,000; and many of the islands in the St. Lawrence are also adorned with some of the most costly and attractive summer homes on the American continent.

Geology and Mineralogy.—With few exceptions the later rock formations are not represented in New York, but a very complete series of the older groups are found, from the azoic up to the lower members of the carboniferous. From n.e. New Jersey, extending over Rockland co., and terminating at the trap formation known as the Palisades, on the w. side of Tappan Bay in the Hudson, is the red sandstone of the middle secondary. On the borders of the St. Lawrence and Lake Champlain are some tertiary deposits of the pliocene period; and the drift or boulder formation overruns the whole state, being developed over Long Island in beds of sand, gravel, and clays, so deep that the rocky ledges are everywhere concealed from sight, except at a few points where the gneiss is laid bare on the shore of the East River opposite New York Island. The great metamorphic belt of the eastern states passes into N. Y. all along its eastern line, and to the n. of the Mohawk River branches off over nearly all the rough country lying between Lakes Ontario and Champlain. In this district are the Adirondack Mountains. The granitic and hypersthene rocks of which they consist spread almost to the St. Lawrence, from which the tract is separated by a belt of the Potsdam sandstone, which passes through Potsdam in St. Lawrence co., and surrounds the great district of azoic rocks on its n. and w. sides; and next to this, bordering the St. Lawrence, the calciferous sand-rock overlies the Potsdam sandstone. The birdseye, Black River, and Trenton limestones of the next upper group of rocks lie in Jefferson co. on the e. end of Lake Ontario, and along the s.w. border of the azoic district through Lewis co. and into Herkimer county. The region thus surrounded is the great iron-ore district of n. N. Y. Beds of magnetic and specular iron ores are worked near Lake Champlain and in the s.w. part of St. Lawrence co.; and in the latter neighborhood are also the most promising lead mines e. of Wisconsin. The region e. of the Hudson River consists of the lower members of the New York system of rocks more or less metamorphosed, the sandstone passing into quartz rock; blue stratified limestone into the crystalline and white marbles; and the argillaceous slates of the Hudson River group into silicious, talcose, and micaceous slates. The unaltered Silurian rocks cross the Hudson River in a belt reaching from the lower corner of Dutchess co. to Rondout in Ulster co., and extend into the n.e. portion of New Jersey. The metamorphic formations, comprising the slates and gneiss with occasional beds of crystalline limestone or marble occupy the counties of Putnam and Westchester, and the s.e. portion of Orange county. New York Island consists of gneiss, and the same formation extends across Staten Island, and reappears in the neighborhood of Trenton, N. J. Along its s.e. half this formation is covered by the secondary red sandstone, which from Tappan Bay crosses Rockland co. and New Jersey into Pennsylvania. This group contains valuable beds of hematite iron ore. In the Highlands are also many beds of magnetic iron ore, and there are numerous beds of white marble. It is in the Hudson River slates or lower Silurian limestones that the mineral springs of Ballston, Saratoga, and Sharon are found. In Delaware, Greene, Sullivan, and parts of Ulster and Broome counties the red and gray sandstones of the Catskill group overlay the Portage and Chemung series of sandstones, slates, and shales; and upon some of the Catskills, and at a few points in Delaware and Sullivan cos., the millstone grit or conglomerate, which forms the floor of the coal formation,

caps the highest summits. Only about 100 ft. more of height was needed to reach one or more of the lower coal-beds, and this is as near the carboniferous formation as is reached in New York, though in Pennsylvania coal-beds are formed within six m. of the state line. The Portage, underlying the shales of the Chemung, is composed of thin-bedded gray and bluish close-grained sandstones. These are quarried in Ulster, Greene, Albany, and Seneca cos., and to the amount of several million ft. annually are sent to New York for flagging. This formation also yields grindstones. In the w. part of the state the sandstones are bituminous; and at a number of places in Alleghany, Cattaraugus, and Chautauqua counties, springs of petroleum issue from the rocks of this group, sometimes accompanied by jets of carburetted hydrogen gas. The rock formations from the Potsdam sandstone up, with their various subdivisions, constitute what is known as the New York system, and with the carboniferous group complete the Appalachian system. In this state the formations below the carboniferous are very fully developed, and are particularly rich in fossils. At Trenton Falls, the ravine is cut through the Trenton limestone formation of the transition period, which contains trilobites, nautili, and other fossils of interest. In addition to the minerals mentioned above may be named alum, arsenic, amianthus, asbestos, barytes, bog iron, carbonate of iron, copper, gypsum, magnesia, manganese, serpentine, strontian, water lime, and zinc. The state ranks first in production of salt, nearly 7,000,000 barrels, value $2,000,000, the principal operations being in the Onondaga, Genesee, and Warsaw districts. Natural gas is obtained in several cos. The principal medicinal and mineral springs are those at Saratoga; New Lebanon and Stockport, Columbia co.; Massena, St. Lawrence co.; Richfield, Otsego co.; Avon, Livingston co.; Clifton, Ontario co.; Sharon, Schoharie co.; Chittenango, Madison co.; and Alabama, Genesee co.

Climate.—The climate of N. Y. is varied, with a range wider than any other state. Those portions which are under the influence of the ocean, sound, and lake winds are more even in temperature, and suffer less severely from the late frosts of spring and the early frosts of autumn, and from summer heats, than portions of the country in the same latitude not thus influenced. The mean length of the season of vegetation from the blooming of apple trees to the first killing frost is 174 days; though on Long Island it is 12½ days longer, and in St. Lawrence co. 22 days shorter. The mean summer temperature at Albany is 70.43°; at Buffalo, 67.73°; at Malone, 64.19°; at Utica, 67.17°; at New York, 72.62°; the mean winter temperature at Albany is 25.26°; at Buffalo, 26.58°; at Malone, 21.31°; at Utica, 24.71°; at New York, 31.93°. The av. annual rainfall at Buffalo is 33.84.ins.; at Penn Yan, 28.42 ins.; at New York, 43.24 ins.; mean temperature of state, 46.49°; mean annual fall of water in rain and snow, 40.93 ins.

Fauna.—Of the larger mammals the moose is now extinct, but the recesses of the Adirondacks and Catskills still harbor in considerable numbers, the Virginia deer, the gray and the black panther, wolverine, wolf, lynx, and wild-cat. More widely distributed are the black bear, raccoon, opossum, gray fox, red fox, pine marten, rabbit, fisher, weasel, skunk, woodchuck, muskrat, stoat, porcupine, gray squirrel, red squirrel, and ground squirrel. The birds comprise six orders, and include about all that are found in the eastern United States, together with some Canadian and Arctic species. There are 17 species of snakes, including the venomous rattlesnake and copperhead; 2 species of lizard, and a number of species of frogs and toads. The coast waters, lakes, and rivers furnish abundance of fish, there being 6 orders of bony fishes and 3 of cartilaginous fishes. The state hatching grounds are at Cold Spring, L. I., and the restocking of the streams and lakes has been satisfactorily accomplished. There are 6 orders of mollusks and 10 orders of crustaceans.

Flora.—This includes about 70 species of trees, including 15 species of oak, 5 of maple, pine, and poplar, 4 of hickory, 3 of elm, spruce, birch, and ash, 2 of beech, cherry, willow, magnolia, and pepperidge, besides the larch, tulip tree, dogwood, red and white cedar, balsam, yew, sweet gum, sycamore, locust, honey locust, black walnut, butternut, chestnut, hornbeam, sassafras, basswood, mulberry. The flowering plants number 1550 species; the ferns, 54 species. The vegetation of the summits of the Adirondacks is almost identical with that of the corresponding localities in the Green and White Mountains.

The subject of the preservation of the forests, particularly those of the Adirondack region, has been much discussed of late years, as the reckless cutting by lumber-men, and the annual fires, kindled by accident or design, have, in destroying the trees, dried up the sources of many streams, and seriously threatened even the Hudson itself and its commerce. A forestry bill passed the Assembly in 1885, providing for commissioners, and under them a forest warden, with assistants and inspectors, to have general charge of forests and tree-planting, and particularly the care of the 15 Adirondack counties, with power to prevent and punish the destruction of timber.

Agriculture.—New York is the third state in the Union in agricultural importance. More than half the total area of the state is improved and under successful cultivation, and most of the crops and fruits of the temperate zone can be raised within its borders. In the northern counties and the highland regions lying along the southern border and upon the Hudson, stock and sheep-raising and dairy-farming are pursued. The farm and ranch animals, principally cows, sheep, swine, horses, and cattle, number over 4,000,000 head, valued at about $83,500,000. The cereal crops, in the order of their value, are oats (about $13,000,000), barley ($2,000,000), buckwheat (nearly $2,000,000), rye (over $1,500,000), and corn. The most valuable crop is hay, nearly 4,000,000 tons, valued at

over $41,000,000. Potatoes yield nearly 35,000,000 bushels, valued at nearly $11,000,000. The state ranks first in dairy products and in the number and value of nurseries, second in viticulture, and fourth in live-stock. Broom corn has long been the staple of the Mohawk valley; tobacco is raised in the Chemung valley and in parts of Onondaga and Wayne counties; hops have been an important crop in Oneida, Madison, Otsego, and Schoharie counties; Wayne county produces more dried fruit than any other county in the state, and is also famous for its oil of peppermint. Grapes are successfully grown in the lake region in the central part of the state, in the valley of the Hudson below the Highlands, and on the north shore of Long Island. Maple sugar is an important product of northern and central New York; and fruits, including apples, peaches, pears and strawberries, are largely grown in the western counties north of the water-shed; while peaches are an important crop in Ulster County. Large tracts of land in the vicinity of New York City, and particularly on Long Island, are devoted to market gardening and dairying, and the inhabitants supply milk, butter, cheese, eggs, vegetables, and small fruits to the markets of the metropolis.

MANUFACTURES, ETC.—The industries of New York are too varied for detailed description. It stands at the head of all the states in its gigantic enterprises, its magnificent development of natural resources, and in the enormous value of its manufacturing output. Apart from the great metropolis with its myriads of factories, shops, and warehouses, the whole state is dotted with cities and towns that are alive with manufacturing energy. Brooklyn, Buffalo, Rochester, Syracuse, Utica, Albany, Troy, Binghamton, Yonkers, and Long Island City are all the seats of important manufactures, while Schenectady, with its dynamos and locomotives, Ballston Spa with its paper-mills, Cohoes with its great output of hosiery and underwear, Oswego with its flour-mills, Watertown with its factories, Elmira with its car-shops, and Amsterdam with its great knit-goods establishments, are hives of industry. Kingston, near the Catskills, ships bricks and hydraulic cement; Newburg, coal; Ogdensburg, grain; Syracuse, salt. Rome manufactures farming implements. Poughkeepsie does a great country trade. Rochester is famous for its nurseries and seed houses, in which several thousand persons are employed. The inland trade alone of New York is estimated at more than $2,250,000,000. The freight that passes over the railroads of the state in a year is worth $1,800,000,000; over the canals, $150,000,000; and on the lakes and the Sound, $250,000,000. New York owns one-fifth of all the canal-boats of the United States.

COMMERCE.—In maritime commerce this state ranks first in the Union. Full sixty per cent. of the foreign commerce of the entire nation passes through the port of New York. The imports and exports of merchandise exceed in annual value $850,000,000; of coin and bullion, $190,000,000—in all, nearly $1,050,000,000. The internal commerce of the state exceeds $2,000,000,000 annually; of this over half passes over the railroads, and the remainder through the canals, lakes, and sound. Buffalo, the chief lake port in the state, with a safe harbor protected by breakwaters, has an immense commerce with the northwest. Lumber, grain, cattle, and coal are the principal articles of commerce. Tonawanda, near Buffalo, is one of the largest lumber markets in the world. Oswego, the principal port on Lake Ontario, is an important grain port. Syracuse, also, has a large Lake Ontario commerce. Newburg and Rondout have a large trade in coal, and Hudson ships large quantities of bluestone, hydraulic cement and brick.

TRANSPORTATION.—The railroads of New York are under the supervision of a board of railroad commissioners, first established in 1882. These commissioners are appointed by the governor, and confirmed by the senate. Since the appointment of United States commissioners under the interstate commerce law of 1887, the duties of the state commissioners have been less onerous. Their duties in this state have been confined chiefly to the causes of accidents, to the matter of grade crossings, to the inspection of bridges, and to the establishment and adoption of a uniform code of rules and signals. The Legislature has not always acted on the recommendation of the board, especially in the matter of crossings, but the uniform code has been adopted, and in 1888, after several shocking accidents, both in this state and elsewhere, the law was passed requiring all cars to be heated with steam from the locomotive.

The first railroad for passenger service in this state was the Mohawk and Hudson, now a part of the New York Central, begun in 1830, and opened in 1831, from Albany to Schenectady, a distance of seventeen miles. When this railroad was begun, there were but twenty-three miles of railroad in the whole country, though there were several lines commenced. The second locomotive built in this country was used on the Mohawk and Hudson, and weighed three tons. The great railway systems of the state now are the New York Central and Hudson River, with its hundreds of miles of leased lines and branches; New York, Lake Erie and Western; Delaware, Lackawanna and Western; and the Delaware and Hudson Canal company, New York, Susquehanna, and Western; New York, Ontario, and Western; West Shore; New York, Chicago, and St. Louis; and the New York, New Haven, and Hartford and their numerous branches. The New York Central, one of the grand scenic routes of the continent, has probably the most rapid train service in the world; its train, known as the "Empire State Express," being the fastest regular train yet on record. Connected with the great railway systems of the state are the wonderful express services of Wells, Fargo & Co., Adams, United States, and others, that spread like a network over the whole earth, and greatly facili-

tate the transaction of business. The direct length of the railroads in the state exceeds 8,000 miles; with second, third, and fourth tracks and sidings, over 12,000. The roads are capitalized at over $430,000,000, have a funded debt of about the same amount, and cost for construction and equipment over $860,000,000. Their net earnings are nearly $30,000,000 per annum, and they pay over $29,000,000 in dividends and interest.

The first canal was planned in 1761 by General Philip Schuyler, who desired a waterway by the Mohawk to Lakes Oneida and Ontario. In 1768, Sir Henry Moore discussed the subject before the legislature. A few years later Washington also advocated the matter, and visited the watershed between the Mohawk and Lake Ontario, to ascertain for himself the feasibility of such a work. In 1796 a canal was opened that connected the Mohawk with Oneida Lake, but being on a very small scale it was soon abandoned. The first great enterprise of this kind was the Erie Canal, begun in 1817, and completed, according to the original plans, in 1825, at a cost of $7,500,000. In 1862 a great work of enlargement and improvement was completed. Up to 1895 this canal had cost for construction, improvement, and repair over $52,500,000. At the state election in that year a proposition to bond the state for $9,000,000 for further improvement and enlargement of the canals of the state was adopted by a large majority of the popular vote. A considerable portion of this amount was applied to the Erie canal. Large as the cost of this waterway has been, its expenditure has proved a great gain to the commerce of the state, and the greater part if not all of the cost was repaid in tolls prior to their abolition in 1883. The extension of the railroad system has led to the abandonment of a number of canals, and those still used are the Champlain, built in 1817–37, from Whitehall to Waterford; the Oswego, 1825–62, from Oswego to Syracuse: the Cayuga and Seneca lakes; and the Black river, 1836–41, from Rome to Carthage. A sixth canal in operation is the Delaware and Hudson, 1826–28, from Honesdale, Pa., to Rondout, N. Y. The total cost of the five canals wholly in the state was nearly $68,000,000.

The bridges of this state include some remarkable engineering works. Among them may be mentioned the Poughkeepsie bridge, the Portage bridge on the Erie, the East River bridge, High bridge, Washington bridge, and several others connecting Manhattan Island with the mainland, and the several bridges across the Niagara river.

Another work of remarkable engineering skill is that undertaken by the Niagara Falls Power Company. This company utilizes the water power of Niagara Falls, by means of canals, raceways, tunnels, and turbine wheels, to run mills, factories, etc., near at hand, or to transmit the power thus developed, by means of cables, pneumatic tubes or electricity, to mills, etc., at various distances. Work was begun by the company in 1887, and the first turbine was used in January, 1894.

Banks, etc.—The first bank in this state was chartered in 1791, and in 1896 there were 328 national banks in operation, with a combined capital of $86,646,060, outstanding circulation $42,205,787, deposits $485,339,030, and reserve $139,439,357; 216 state banks, with capital $31,420,700, deposits $192,672,448, and resources $288,459,744; 38 loan and trust companies, with capital $29,600,000, deposits $307,351,893, and resources $392,630,046; 127 mutual savings banks, with depositors 1,695,787, deposits $691,764,504, and resources $783,078,580; and 19 private banking establishments, with capital $1,000,700, deposits $3,692,866, and resources $6,076,674. The exchanges at the clearing-house in New York in the year exceeded $29,350,000,000. There were also over 380 building and loan associations, with assets exceeding $50,000,000.

Religious Denominations.—The leading denominations numerically are the Roman Catholic, Methodist Episcopal, Presbyterian, Baptist, Protestant Episcopal, Reformed, Jewish, Congregational, and the Lutheran general council and synodical conference. The earliest church edifice in the province was built by the Dutch in 1642. When the province passed under English rule in 1664, various denominations organized churches, and tolerance prevailed towards all. There are 8237 organizations, 7942 church edifices, 742 halls used for religious purposes, 2,171,822 communicants, and church property valued at over $140,000,000. Trinity, in New York city, is one of the oldest and best known, as well as one of the wealthiest societies in this country. In 1705, Queen Anne made a grant of land known as the Queen's farm, which was then literally a farm lying on the outskirts of the city, but is now the very heart and business center of the city, and valued at $15,000,000. The present edifice, completed in 1846, stands on Broadway at the head of Wall Street, and is noted for its beautiful spire and chime of bells. St. Patrick's Cathedral, in New York city, finished in 1879, except the spires, at a cost of over $2,000,000, is one of the most magnificent churches in the country. It is of fine white marble in thirteenth-century Gothic style, has seventy beautiful stained-glass windows, several magnificent and costly altars, and two beautifully carved spires. All Saints' cathedral in Albany, begun in 1884, and not yet completed, is another magnificent edifice. An object of interest connected with it is its richly carved stalls, taken from an old Belgian church of the Middle Ages. The projected Cathedral of St. John the Divine, in New York city will, if completed according to the original designs, be the most magnificent edifice on this continent. According to these designs the ground plan is cruciform, and externally there is to be a large central tower crowned with a spire. The proposed dimensions are: length, 530 ft.; width of transepts, 290 ft.; height of central tower with spire, 425 ft. (525 ft. above city level); exterior diameter of central tower, 116 ft. Many remarkable and curious religious beliefs have also had their rise in this state, among which may be mentioned the Millerite fanaticism at Rochester; the Latter-Day

Saints, whose founder claimed to have dug the golden plates from which the Mormon Bible was printed from a hill near Palmyra; the Shakers, at Mount Lebanon; and the Hicksite Quakers on Long Island.

EDUCATION, ETC.—The Dutch West India Company agreed in its charter to provide schoolmasters as well as ministers, so that when the English came in 1664, they found several good schools. Under English rule the schools deteriorated. Popular education met with actual opposition from many of the governors, and nothing important was done by them until 1784, when the Regents of the University were incorporated, and placed in charge of the existing educational institutions. In 1789, each township assigned two lots of land for gospel and school purposes, and after this followed years of unsuccessful effort to establish public schools on a solid basis. In 1812, an act embodying the essential points of the present system passed the Legislature; under this a state superintendent was appointed, and a system capable of great development was begun. In 1854, this department was rendered still more effective by legislative enactment, and its steady, substantial progress since then has made it one of the best in the Union. The state superintendent supervises the public schools, teachers' examinations, training classes, and institutes; and apportions the public moneys, the deaf and dumb, blind, Indian, and Normal students to their proper places. Beside the State Normal College at Albany and the City Normal College in New York, there are ten state normal schools. There are over 12,000 school-houses in the state, beside nearly 300 academies and a great number of private schools; and yet, owing to the constant influx of foreigners, over five per cent. of the population cannot read or write. The school population, 1896, was over 1,650,000; enrollment, over 1,175,000. In 1894 a law was passed providing for compulsory education. The interests of higher education are under the University of the State of New York, a supervisory and administrative institution, which includes all incorporated institutions of academic and higher education. Its powers are vested in a board of nineteen elective regents and four others, *ex officio*. These attend to the incorporation and inspection of all higher institutions of learning, distribute state funds for their use, establish examinations and confer certificates, diplomas, and degrees. Among the many colleges of national repute are Columbia, New York; Union, Schenectady; Cornell, Ithaca; Colgate, Hamilton; Hamilton, Clinton; Syracuse University; University of Rochester; Hobart, Geneva; St. Stephen's, Annandale; St. Lawrence, Canton; and the Catholic colleges of Manhattan, St. Francis Xavier and St. John's, New York city. For women there are Vassar, Poughkeepsie; Barnard, New York; and several others. All the leading religious denominations have prominent theological seminaries, numbering thirteen in the state; there are fourteen medical, seven law, two dental, four pharmaceutical and seven scientific schools. The oldest newspaper of the state was the *New York Gazette*, founded in 1825; the first daily was the *New York Journal and Register*, founded 1788. The oldest of the present papers is the *Evening Post*, established in 1801. There are over 2,000 publications in the state, many of them having a world-wide circulation. New York leads all other states in her interests in library matters. In 1838 the legislature voted $55,000 to be paid annually from the United States deposit fund, for the establishment of the district library system. The number of volumes reported increased annually until the maximum of 1,604,210 was reached in 1853, then steadily decreased until 1883, when only 701,000 were reported. Interest was then revived, and the legislature enacted that the library system be turned over to the regents to become a part of the state library. Their work has been remarkably successful. The state library has been reorganized; a subsidy law passed for the encouragement of local libraries; a library school started for training librarians, cataloguers, etc. (see LIBRARY ECONOMY, SCHOOL OF); a system of traveling libraries established, and a library association formed. The New York Society library, founded in 1700, claims to be the first founded in the state. Columbia University library, founded in 1754, has over 220,000 volumes. Of 4026 libraries of 1000 volumes each and upward reported for the United States, 1896, New York had 572 aggregating 5,251,000 volumes. The principal of these were the New York public library, Astor, Lenox, and Tilden foundation; Mercantile; New York historical society; Apprentices; Y. M. C. A.; New York circulating; Brooklyn; the state; and those of the universities and colleges.

GOVERNMENT.—"The Dutch political system made the judiciary supreme, and denied all arbitrary power, either in people or parliaments, in civil rulers or religious teachers, and sought to fortify the people against its exercise. Thus the feudal shell of Dutch government inclosed the seed of liberty, ready in fullness of time to germinate in most perfect form." A government was actually established for the first in New Netherland in 1624, after the arrival of a party of Walloons sent out by the Dutch West India company, under the direction of Capt. Cornelis Jacobsen May, who preceded Minuits as director. In 1629 the manorial system was introduced, the patroons being invested with the authority of feudal barons, but no political or judicial changes could be introduced without consent of the home government. In 1638 and 1640 the privileges of the patroons were materially restricted and those of free settlers enlarged. Whenever the people settled in sufficient numbers, the company was obliged to give them local government, the officers of which were to be designated by the director and council, in accordance with the custom in the Netherland. But although by the plan of government "no other religion was to be publicly tolerated or allowed in New Netherland, save that then taught and exercised by

authority of the Reformed Church in the united provinces," this provision was a dead letter. English colonists were already settled on Gardner's Island, and at Southampton and Southold, at the eastern extremity of Long Island (1639–40), and others in Westchester and at Gravenzande. On the outbreak of the Indian war in 1641, Director Kieft invited all the masters and heads of families of New Amsterdam and its vicinity to assemble in the fort on a given day, this being the first official recognition of the existence of the people in New Netherland. When these freemen convened, they gave their opinion on the questions before them, and then appointed 12 men to continue to represent their interests; but when the men proceeded to demand certain reforms of government, they were reminded by the director that they had only been appointed to consider the Indian troubles. They were again called together in 1643, when larger liberties were accorded them, and finally 8 men were elected by the director, who became an actual representative body. Gov. Stuyvesant continued this plan, by appointing 9 men, who were "tribunes" of the people, to hold weekly courts of arbitration, and advise the director and council. Troubles afterwards grew out of the demands of the tribunes for a burgher government, and these were referred to the states-general for decision, and a more liberal form of government was ordered, to which order Stuyvesant paid no attention. The Dutch governor continued to oppose the efforts of the people for greater liberty, until his forced surrender to the English cut short his prerogative. Under Nicolls and Andros, the people of New York found themselves in a worse position than under the Dutch governors, but Gov. Dongan convened the first general assembly of the colony, which passed the act entitled "Charter of Liberties and Privileges granted by His Royal Highness to the Inhabitants of New York and its Dependencies," and by which legislative power was granted to the colony. James II. abolished this general assembly, and endeavored to unite all the colonies as the dominion of New England, under Gov. Andros. William and Mary revived the general assembly, and granted to the people of N. Y. a certain degree of freedom; but the struggle between the colonists and the crown continued until the final revolution in all the colonies resulted in the expulsion of English authority. The provincial convention which met in N. Y. on April 20, 1775, was the first organized body in the colony after the overthrow of royal authority, the latter having been declared to have come to an end in the colony on April 19. The first constitution of the state of N. Y. was adopted April 20, 1777. The articles of confederation of the Continental Congress were ratified by the state March 1, 1781. The constitution of the U. S. was ratified by the state, July 26, 1788.

The present executive government comprises a governor, receiving a salary of $10,000 and house, lieutenant-governor, secretary of state, comptroller, treasurer, attorney-general, state engineer and surveyor, superintendent of the bank department, superintendent of the insurance department, superintendent of public instruction, auditor of the canal department, superintendent of state prisons, superintendent of public works, besides the governor's staff, and various boards and commissions for charity, lunacy, quarantine, etc. The legislative branch of the state government includes a senate and assembly; the senate consists of 32 members, elected in November of every alternate year (odd numbered), holding their offices for two years from the first of January next succeeding. The senators receive an annual salary of $1500, and also $1 for each ten miles of travel in going to or returning from the place of meeting once in each session. Ten dollars per day in addition is allowed when the senate alone is convened in extraordinary session, or when acting as a court for the trial of impeachments. The lieutenant-governor is *ex officio* president of the senate. The assembly consists of 128 members, elected annually by single districts. Each co. has at least one member. They receive the same compensation as senators. Their officers are chosen at the opening of the session. The state is represented in Congress by two United States senators and thirty-four members in the house of representatives. To be a voter, a person must have been a citizen for 90 days, a resident of the state for one year, of the county, four months, and of the town or precinct, thirty days. The registration of voters is required in all cities and in all incorporated villages of over 7000 inhabitants. New ballot laws based on the Australian system were adopted in 1890. No person convicted of a felony can vote.

Albany, the capital, founded by the Dutch as Fort Orange in 1624, is the oldest incorporated city in the United States, its charter dating from 1686. The state capitol is an imposing structure, built of Maine granite, in the Renaissance style of architecture, with dome-capped tower 320 feet high; it covers three acres, and is certainly the most pretentious building in the U. S., and with the exception of the capitol at Washington, and public building at Philadelphia, is the largest. See ALBANY.

LAWS, ETC.—Since 1848 married women have had separate rights to real and personal property. A married woman may carry on business, and may sue or be sued on her own account. A husband may convey directly to his wife, and a wife to her husband. Absolute divorce is granted for one cause only, adultery. Women may practise law on the same terms as men. No minor under 18 years of age, and no woman under 21, shall be employed at labor in any manufacturing establishment for a longer period than 60 hours in any one week, and no child under 13 shall be employed in any manufacturing establishment. A prohibitory liquor law was passed in 1855, but subsequently was declared unconstitutional by the United States supreme court, and a license law was enacted in

1857, by which the selling of liquors to Indians, minors, and habitual drunkards is prohibited. The legal rate of interest is six per cent. Any rate is legal upon call loans of $5000 or upward, on collateral security. With that exception, six per cent. is the only rate. The penalty for usury is forfeiture of principal and interest, with grace. There is a state board of mediation and arbitration for amicable adjustment of labor disputes between employers and employés.

The National Guard consists of over 850 commissioned officers and over 12,500 enlisted men, the total authorized strength being 15,000 officers and men, and the annual cost over $450,000. The number of men in the state liable to military duty is nearly 950,000, of whom 500,000 are officially reported as effectives. A State camp of instruction was established at Peekskill in 1882, and the various regiments, companies, etc., make annual encampments there under strict military discipline. Great proficiency in marksmanship has been acquired by practice at the rifle ranges. The naval reserve comprises battalions in New York city and Brooklyn, made up of merchants and professional men, and two separate divisions at Rochester. This force is already a highly important factor in the future defense of the country, and in their annual drills have done admirable work on board the cruisers provided by the United States navy department.

The National Institutions in New York are among the most important in the country. The West Point military academy, established in 1802, is one of the most interesting. The post covers about 2400 acres among the Highlands on the Hudson, and commands one of the finest river sites in the world. Objects of interest are: the old forts; the old furnace used during the Revolution for casting cannon for the continental army; Bloody Pond, said to be guarded still by the ghosts of Hessian soldiers; and trophies of various wars. The navy yard in Brooklyn is the principal naval station of the Union; it occupies 100 acres, with numberless foundries, workshops, etc., and two dry-docks. Its museum contains many interesting collections. The United States arsenal, founded at West Troy in 1814, covers 105 acres, and has forty buildings, including the great gun factory for the national army. The engineer school of application at Willet's Point provides practical instruction for engineer officers, and torpedo practice for artillery officers. David's island is the recruiting station for the army in the east. The various islands in New York harbor are all national property, of which Governor's island, a prominent military post; Ellis, with its Barge office, where three-fourths of the immigrants land, and Bedloe, with its statue of Liberty, are the chief. There are also about a dozen forts in and around the harbor for the defense of the city. Besides these, the government has forts at Buffalo, Niagara, Oswego, Rouse's Point, and Plattsburg. Sackett's Harbor is the principal naval station on Lake Ontario. Places of historical interest are also scattered throughout the state. Among these a few are the André monument at Tarrytown, also the old church built in 1699 of bricks brought from Holland; Sunnyside, the home of Irving, covered with ivy grown from a slip given him by Sir Walter Scott; the old Hasbrouck mansion, better known as Washington's headquarters at Newburg; the fortress built by the British at Crown Point in 1759; and the numerous old manor houses.

The prisons of the state are at Clinton, Auburn, and Sing Sing, the one at Auburn having separate buildings for women. There are also six penitentiaries, not to mention county jails, houses of refuge, etc. The state reformatory is at Elmira. In 1888 death by electricity was substituted for hanging as a penalty for murder.

The electoral votes have been cast as follows: 1792, Washington and Clinton, 12; 1796, Adams and Pinckney, 12; 1800, Jefferson and Burr, 12; 1804, Jefferson and Clinton, 19; 1808, Madison and Clinton, 13; 1812, Clinton and Ingersoll, 29; 1816, Monroe and Tompkins, 29; 1820, same; 1824, Adams, 26; Calhoun, 29; 1828, Jackson and Calhoun, 42; 1832, Jackson and Van Buren, 42; 1836, Van Buren and Johnson, 42; 1840, Harrison and Tyler, 42; 1844, Polk and Dallas, 36; 1848, Taylor and Fillmore, 36; 1852, Pierce and King, 35; 1856, Fremont and Dayton, 35; 1860, Lincoln and Hamlin, 35; 1864, Lincoln and Johnson, 33; 1868, Seymour and Blair, 33; 1872, Grant and Colfax, 35; 1876, Tilden and Hendricks, 35; 1880, Garfield and Arthur, 35; 1884, Cleveland and Hendricks, 35; 1888, Harrison and Morton, 36; 1892, Cleveland and Stevenson, 36; 1896, McKinley and Hobart, 36.

Finances.—The state treasury receipts exceed $30,000,000 annually; the equalized value of real and personal property, 1896, was $4,368,712,903; amount of personal property not subject to taxation for state purposes, over $111,000,000. The state debt was practically extinguished in 1893, only $660 of old canal-stock then remaining, and the new canal bonds previously mentioned constitute the entire existing debt.

Population.—The population of this state by the census of 1790 was 340,120; 1800, 589,051; 1810, 959,049; 1820, 1,372,812; 1830, 1,918,608; 1840, 2,428,021; 1850, 3,097,394; 1855, 3,466,212; 1860, 3,880,735; 1865, 3,831,777; 1870, 4,382,759; 1875, 4,705,208; 1880, 5,082,871; 1890, 5,997,853. There are sixty counties; for population of state by counties, see back of state map. There are (1897) 38 cities, the largest of which are New York, 1,515,391; Brooklyn, 806,343; Buffalo, 255,664; Rochester, 133,896; Albany, 94,923; Syracuse, 88,143; Troy, 60,956; Utica, 44,007; Binghamton, 35,005; Yonkers, 32,033; Elmira, 30,893; Long Island city, 30,506; Auburn, 25,858.

NEW YORK, co. N. Y. (See New York city.)

NEW YORK, the largest city and most important seaport in the United States, and the third city in size in the civilized world, is situated on the east side of the mouth of the Hudson river, at its confluence with the East river, a continuation of Long Island Sound, and at the head of New York bay, 18 miles from the ocean ; lat. 40° 42′ 43″ n. ; long. 74° 0′ 3″ ; 232 miles s.w. of Boston, 715 miles e. of Chicago, and 226 miles n.e. of Washington.

HISTORY.—The history of New York begins with the exploration of Henry Hudson in 1609. A few fur-traders soon settled on Manhattan Island, but the first permanent colonizing was made in 1624 by the West India Company of Holland. Peter Minuit, the first governor, bought the island from the Indians for sixty guilders, about 24 dollars. The town was founded in 1623 and was called New Amsterdam. The population by 1660 amounted to nearly a thousand. The inhabitants established farms, carried on a flourishing fur trade, and defended the settlement by a stockade across the island on the line of the present Wall street, and a fort on the site of the Battery. Peter Stuyvesant, the last of the four Dutch governors, arrived in 1647. In 1664, in time of peace, Colonel Nicholls seized the town, and without resistance from its citizens it passed into the hands of the English, and the town was renamed New York, in honor of the Duke of York, to whom the whole province was granted by Charles II. In 1673 the town was surrendered to a Dutch squadron, but was held for a year only, when it was given up to the English by treaty. Sir Edmund Andros was the first English governor. After his overthrow in 1689, Leisler, the leader of the progressive party, usurped the government until 1691, when he was hanged for treason. For the next seventy-five years the affairs of the town and province were identical. In 1710 New York contained about 6000 inhabitants, mainly of Dutch, Huguenot, and English stock, and in this mixture of nationalities it differed widely from other colonial towns. At this time the negro slaves formed nearly half the population, and two risings of the slaves, in 1712 and 1741, were suppressed with great cruelty. In 1702 a free grammar school was opened ; and the first newspaper in the city, the *New York Gazette*, was started in 1725. A few years later communication with Boston was furnished regularly by stages, making the trip in two weeks. A city library was founded in 1729, and a classical academy in 1732. Zenger's *Weekly Journal* was founded in 1733, and two years later Zenger was prosecuted for libel, and imprisoned—the first attack on free speech in the country. Zenger was acquitted, but the affair increased the spirit of independence. In 1765 the Stamp Act Congress met in New York, nine of the thirteen colonies being represented, and voted a Declaration of Rights ; and blood was shed in 1770 (six weeks before the Boston Massacre) during a riot caused by the removal by the soldiers of the liberty-pole of the Sons of Liberty. In 1774 a ship loaded with tea was sent back to England, and the cargo of another was thrown overboard. The colonial assembly adjourned April 3d, 1775. The committee of safety took control of the city as soon as news of the battle of Lexington was received, and the governor retreated to a British man-of-war in the harbor. Delegates to the Continental Congress were chosen July 25th ; in January, 1776, the city was occupied by militia, who were forced to withdraw on August 26th, and the British held the city of New York for seven years. The British troops evacuated the city November 25th, 1783. From January, 1785–1790, Congress met in New York, in the old City Hall, corner of Wall and Nassau streets, and here Washington was inaugurated, April 30th, 1789. In 1785 a manumission society was formed, and the Bank of New York was organized. More than 2000 persons died during an epidemic of yellow fever in 1789. In 1790 the population numbered 29,906, and the city limits were extended to the lower line of the present City Hall Park. In 1805 the population was 78,770, and since then the growth has been rapid, as immigration increased greatly after the war of 1812. The New York free school was incorporated in 1805. Robert Fulton made his first steamboat voyage to Albany in 1807 ; and that year the city was surveyed and laid out, substantially on its present plan. In 1812 a steam ferry to Long Island was opened, and gas was introduced in 1825. In Oct., 1825, the Erie Canal was opened, and the first boat arrived from Buffalo Nov. 11th. In 1832 an epidemic of cholera carried off 3500 persons, and another two years caused 1000 deaths. The great fire of 1835 occurred Dec. 16th, and destroyed the entire eastern side of the town below Wall Street, including about 648 stores, the merchants' exchange and the South Dutch Church, with a loss of $18,000,000. In 1837 a financial panic caused many failures, and general loss to the country, and great destitution and suffering in the city, which led to the Bread Riots of that year. Through this period riots were frequent ; one of the most serious was the Astor Place riot of 1849, directed against Macready, the English actor, in which many of the mob were killed. Another riot took place in 1857, growing out of a conflict between two police organizations in the mayoralty of Fernando Wood, when the Seventh Regiment of militia was called out to protect the peace. The Croton Aqueduct was completed in 1842 ; the first city railroad was built in 1852, and on July 14th, 1853, the Crystal Palace Industrial Exhibition was opened with striking ceremonies. A second severe financial panic occurred in 1857, followed by the usual suspension of banks and business failures. From 1861–1865 the city was engaged in patriotic service in behalf of the Union, furnishing 116,382 troops, at a cost of $14,577,215. In July, 1863, occurred the riot caused by the enforcement of the military draft, lasting three days, during which business was sus-

pended, property destroyed, and 1000 lives were lost. The city suffered for several years from frauds perpetrated by the Tweed ring which controlled municipal affairs, and in 1871 William M. Tweed (q. v.) and other officials were prosecuted and imprisoned. In 1873 another great financial panic took place, caused by the failure of Jay Cooke and company. On May 24th, 1883, the Brooklyn bridge was formally opened, and in 1886 the Bartholdi statue of Liberty was unveiled. New York has been the scene of many imposing processions and celebrations,—on the occasions of La Fayette's visit in 1824; the funeral processions of Lincoln, April 25th, 1861, and of General Grant, August 8th, 1885; the laying of the Atlantic cable, 1858; the opening of the Brooklyn bridge; the celebration of Washington's inauguration as President of the United States, in 1889, from April 29th, to May 1st; and the Columbian celebrations of October, 1892, and April, 1893. In 1897 a new charter was granted. (See GREATER NEW YORK).

TOPOGRAPHY.—Manhattan island is very rocky, the principal formations being gneiss and mica schists, and except in the lower part, much blasting has been necessary to prepare for building. The island is 13½ miles long, and has an average breadth of 1⅘ miles, reaching its greatest width, 2¼ miles, near 14th street. A rocky ridge runs through the center, rising abruptly from the Hudson at Washington Heights 238 feet, and descending rapidly on the east side to the Harlem Flats. Originally the surface of the upper part of the city was very irregular and the southern part marshy. The site of the Tombs was covered by the Collect pond, a large body of water connected with the Hudson river by a narrow canal along the line of the present Canal street. Manhattan island has an area of 22 square miles. The city was formerly limited to Manhattan island, Randall's, Ward's, and Blackwell's islands in the East river, and Governor's, Bedloe's, and Ellis islands in the Upper bay, and had an area of 14,380 acres; but it was extended by an act of legislature, taking effect Jan. 1st, 1874, annexing the following villages of Westchester county: Morrisania, West Farms, Kingsbridge, Mott Haven, North New York, Port Morris, Melrose, Woodstock, Highbridgeville, Claremont, Tremont, Mount Hope, Mount Eden, Fairmount, Belmont, Fordham, Williamsbridge, Spuyten Duyvil, Mosholu, Riverdale, and Mount St. Vincent, which constitute the 23d and 24th wards. The greatest length, from the Battery to Yonkers, is 16 miles, the greatest breadth, from the Hudson to Throgg's Neck on Long Island sound is 9½ miles, and the total area is 72⅝ square miles, or 46,500 acres. Several localities in the upper part of Manhattan island retain their original names—Yorkville and Harlem on the east side, and on the west, Bloomingdale, Manhattanville, Carmansville, Washington Heights, and Inwood. In 1889 it was determined by a commission that the boundary between New York and New Jersey follow the mid channel line down the Hudson, thus giving to New Jersey Bedloe's island. Ellis island was sold to the United States Government in 1808, and Governor's island is reserved as a military station. Manhattan island is connected with the mainland by twelve bridges across the Harlem river; the most noteworthy being High bridge (1460 feet long, the highest arch being 116 feet above the river surface), on which the old Croton aqueduct is carried over the Harlem, and the Washington bridge (2400 feet long, the central arches being 135 feet above high-water mark), completed in 1889 at a cost of $2,680,000. New York is connected with Brooklyn by the steel wire suspension East River bridge (see BRIDGE). A bridge is projected across the East river to Blackwell's island and Long Island city; ground was broken in 1891 for a bridge across the North river to Jersey city; and considerable work has been done on a tunnel (see TUNNEL) under the North river.

HARBOR.—New York harbor, consisting of the Upper and Lower bays, is famous as one of the largest, safest, and most beautiful in the world. The Upper bay, or the harbor proper, is eight miles long, and four to five miles wide, and has an area of 14 square miles. It is connected by the Narrows, between Staten and Long Islands, from 1 mile to 1½ in width, with the Lower bay, which is protected from the ocean by a bar running north from Sandy Hook, and contains 88 square miles of anchorage. Improvements have given a depth of 30 feet in the main ship channel at low tide. The average rise of the tide is 4½ feet at Sandy Hook. The bay is connected with Long Island sound by a channel known as the East river. The narrow, crooked passage between Ward's island and Long island, called Hell Gate, was formerly very dangerous to navigation; but most of the obstructions have been removed. Hallett's reef was blown up in 1876, and Flood rock in 1885; and a uniform depth of 26 ft. at low water was thus secured through the whole channel. In the East river are Randall's (100 acres), Ward's (200 acres), and Blackwell's (120 acres) islands, on which are the charitable and correctional institutions of New York city. The harbor is defended by forts Lafayette (now in ruins) and Hamilton on the Long Island side of the Narrows, forts Wadsworth and Tompkins on the opposite shore, Castle William and Fort Columbus on Governor's island. Fort Schuyler and the works at Willett's point defend the East river at Throgg's Neck, where it opens into Long Island sound. The available water front of New York is about 37 miles, but even this is inadequate, and many vessels sail from wharves in Jersey city and Brooklyn. There are 78 piers on the North river, and 73 on the East river. From these piers and the wharves in Jersey city and Brooklyn steamers sail to Great Britain and the continent of Europe and Asia, to the West Indies, South America, and Mexican and Central American ports, to Halifax and St. John's, and to many points along the coast of the United States, east and south.

STREETS.—The island is compactly built on the east side for about 9 miles, and on the west for nearly the same distance. The lower part of the city is irregularly laid out, and the streets are narrow and winding, but above 13th street straight avenues, 100 feet wide, running north and south, are crossed at right angles by streets from 60 to 100 feet wide, extending from river to river. There are thirteen numbered avenues, four near the East river, designated A, B, C, and D, and three named avenues, Lexington, Madison, and Columbus, the last an extension of 9th avenue. Broadway, the most noted street in America, is 60 feet wide and five miles in length, and extends from the Battery to 59th street, closely following the central ridge to 14th street, and from that point crossing the city obliquely. At 59th street the Boulevard begins—an avenue 150 feet wide, and extending nearly to the Harlem river, in a generally northerly direction. The numbered cross streets are designated East and West from Fifth avenue, each avenue beginning a new hundred in numbering.

BUILDINGS.—At the southern end of Manhattan island is the Battery, a park of 21 acres, having a fine view of the bay. The name is derived from the fort erected by the early Dutch settlers, and it was formerly a fashionable residence quarter. On the west side is Castle Garden, first a fort, then a concert hall, afterward an immigrant depot, and now a public aquarium. At the eastern end is the handsome granite Barge office, and in the center a tablet marks the site of the famous "liberty pole." North of the Battery on the left is the Washington or Field building, and on the right is the Produce exchange, an imposing structure of brick and terra cotta in the Italian Renaissance style, with a campanile 225 feet in height. Near by is the United States Army building, and at the corner of Broad and Pearl streets stood Fraunces tavern, the oldest building in New York, where Washington took leave of his officers in 1783. At 73 Pearl street a tablet marks the site of the Stadt Huys, or City hall, built in 1646 and destroyed in 1699, where the first Colonial Congress (of delegates) was held in 1690. Just above the Army building is the site of the first Dutch church. Bowling green, a small circular green at the beginning of Broadway, has been called the cradle of New York, and is the center of the oldest traditions. The buildings on the south side are on the site of Fort Amsterdam, built in 1626, which contained the governor's house and the chapel where Dominie Bogardus preached. The green was originally the market-place in front of the fort. The fort was torn down in 1787, and the site is now marked by a tablet at No. 4 Bowling green. The leaden statue of George III., which was erected in the Green in 1770, was thrown down July 4th, 1776, and melted into bullets. The railing enclosing the park was once ornamented with balls and crowns, which were torn off by the citizens at that time. In early days it was surrounded by the houses of the most eminent and the wealthiest citizens. No. 1 Broadway was the site of the Kennedy house, occupied by the British generals in the war, and later changed into the Washington Hotel. Benedict Arnold lived at No. 5 Broadway, and there carried on his treacherous negotiations with General Clinton. From the Bowling green to Wall street the most conspicuous buildings on Broadway are the Welles and Standard Oil Company's buildings, Aldrich court, on the site of the first white man's dwelling, and opposite the last is the Tower building, 185 feet high and only 25 feet in width. Wall street, running from Broadway to the east, is the center of American business. Many of the financial institutions of the city are concentrated here, and their transactions are greater than those of all the financial exchanges of all other cities in the country. The street takes its name from the city wall which ran through it in the Dutch days. One block from Broadway stands the United States Sub-Treasury, a granite Doric building, approached by a flight of eighteen steps, on which is a large bronze statue of Washington, by J. Q. A. Ward, erected in 1883. When the Stadt Huys at Coenties Slip was given up in 1699, a new one was built here, which was used as the City Hall till 1809. Here the Colonial Congress met in 1765, and the first Congress of the United States assembled here in 1789, and on the balcony Washington was inaugurated. The present building was erected by the Government for a custom house, but soon became too small for the purpose. Further down on the opposite side of Wall street is the United States Custom House, a massive pile of Quincy granite, with a colonnade of eighteen columns, 38 feet in height. It was built for the merchants' exchange, and cost $1,800,000. On Broad street is the Stock Exchange building, of white marble, in French Renaissance style. The value of stocks dealt in here daily frequently amounts to $30,000,000. The Mutual Life Insurance Company's office, one of the finest business buildings in the city, contains the rooms of the Chamber of Commerce, the oldest commercial corporation in the United States. At the corner of Pine and Nassau is the office of the New York clearing house, whose business averages daily $115,000,000, the largest amount for one day being $295,821,422.27. At the head of Wall street, on Broadway, stands Trinity church, a fine Gothic brown-stone edifice, by R. M. Upjohn, 192 feet long, 80 feet wide, with a steeple 284 feet high. Trinity corporation is the richest in the United States, and the oldest in New York except the Collegiate corporation. The first church was built in 1697, but destroyed by fire in 1776; the second edifice was pulled down in 1839, and the present church was finished in 1846. In 1705 the parish received the gift of a tract on the North river lying between Vesey and Christopher streets. The income from this is over $500,000, supporting the church and several chapels. The beautiful altar and reredos is a memorial of W. B. Astor, and the bronze

doors were given in 1893 in memory of J. J. Astor. In the churchyard are the graves of many noted men—Alexander Hamilton, Robert Fulton, Albert Gallatin, Captain Lawrence, General Phil Kearny. In the northeast corner is the Gothic monument in memory of the patriots "who died in British prisons in the Revolution." The next place of interest is the Equitable building, said to be the largest in New York. In the rear is the site of the old sugar-house prison, where so many patriots died in the Revolution. On John street, a short distance further, is Golden hill, where the fight took place between the soldiers and the Sons of Liberty, January 1770. At Broadway and Vesey street is St. Paul's church, the oldest in New York, built in 1766. Washington's pew is still shown, though renewed since that time. In the rear wall of the church facing Broadway is a tablet in memory of General Richard Montgomery, the hero of Quebec. South of City Hall park is the Post Office, a huge granite building, which cost between $6,000,000 and $7,000,000. The City Hall park, the site of the old "Commons," lies between Broadway and Park row. In it stands the City hall, the best specimen of Italian architecture in the country, built in 1803–1812. The governor's room contains the chair in which Washington was inaugurated, the desk on which he wrote his first message to Congress, and other relics, and portraits of many eminent men. The register's office was used in the Revolution as a prison, where thousands perished of fever or starvation. North of the City hall is the Court house, which, under the Tweed Ring, cost the city $12,000,000. Park row contains the buildings of most of the Great New York newspapers; the most prominent are those of the New York *Times*, the *Tribune*, and the *World*, which is the largest of all. From its gilded dome, 310 feet high, a most conspicuous feature of lower New York, a magnificent view can be obtained. The U. S. signal service station is on the roof of the Manhattan Life Insurance Company's building, 66 Broadway.

Beyond the Bridge are to be found the various foreign quarters for which this locality is noted. The Jewish quarter is in Chatham and Baxter streets, the Italian in Mulberry street, and the Chinese in Mott street. In this region is the famous Five Points, once the worst part of the city. On Centre street stood the city prison, commonly called the Tombs, a granite building of pure Egyptian architecture. It was on the site of the Collect pond, which was filled up in 1817, and the prison was built about 1840, and removed in 1897. On the adjoining block is a new and very large municipal building. Chambers street marks the limit of old New York. The stockade stretched across the island on about the line of that street nearly until the Revolution. Above Chambers street, Broadway is occupied chiefly with wholesale warehouses. On Astor place is the new building of the Mercantile library, which is on the site of the old opera house in front of which the famous Astor Place riot took place in 1849. Near by is the Astor library, founded in 1848 by John Jacob Astor, and since then endowed by several members of the Astor family, the entire fund amounting to about $1,700,000. The library owns over 300,000 volumes, besides valuable manuscripts, and a collection of paintings by Meissonier and other French painters, and is now a part of the New York public library (Astor, Lenox, and Tilden foundations). At the junction of Astor place and third avenue is the Cooper Union, built in 1857 by Peter Cooper, and endowed at an entire cost of almost $1,000,000. It includes free schools of science and art, a free library and lecture hall. Directly opposite is the Bible house. Beyond Astor place, at the bend of Broadway, stands Grace church, a beautiful Gothic edifice of white limestone, built in 1845. The beautiful rectory, chantry, and church-house form a picturesque group of buildings. At 14th street Broadway passes Union square, an attractive park of about 3½ acres. On the west side is Tiffany's famous establishment. East of the square, on 14th street, are the Academy of Music, once the principal opera-house, and Tammany hall, the seat of the famous political organization, incorporated in 1789 as a benevolent institution, the name being a corruption of Tamenund, a famous Indian. Between Union and Madison squares, on and west of Broadway, is the great retail shopping district. At 23d street Broadway crosses Fifth avenue, and runs along Madison square, a public park of about six acres. Here are St. Gaudens' bronze statue of Farragut, Rogers's bronze statue of W. H. Seward, Ward's bronze statue of Roscoe Conkling, and the Worth monument. In the vicinity are some of the best hotels, the finest restaurants, and many of the leading theaters. East of the square is the Madison Square Garden. The huge building contains an amphitheater, where horse-shows, flower-shows, etc., are held, and also a theater, concert-room, ball-room, and restaurant. The whole area is 425 by 200 feet, and a tower 300 feet high stands at one corner, surmounted by a figure of Diana, by St. Gaudens. Between Madison square and 42d street, Broadway is lined with theaters and hotels. The best-known theaters are Daly's, Wallack's, the Fifth Avenue, the Casino, a beautiful Moorish structure, and the Metropolitan opera-house which was burned in 1892 and rebuilt in 1893. At 59th street Broadway is continued by the Boulevard, a wide and beautiful street, with a park of grass and trees in the center. The fashionable street of New York is Fifth avenue, beginning at Washington square, a park of about nine acres. Spanning the main drive is the Washington Memorial Arch, by Stanford White, erected in 1892. North of the square is still a remainder of the once fashionable quarter. Below 42d street Fifth avenue has been generally encroached on by business; below 23d street are to be found many large publishing houses and clubs. At 23d street is the Fifth Avenue hotel, and within a short

distance above is the Holland house. Delmonico's, formerly in the neighborhood of the Fifth Avenue, was removed to 44th street in 1897. At 34th street is the large marble Stewart mansion, erected at a cost of $3,000,000, and now occupied by the Manhattan club. At 39th street is the Union League club, one of the largest in the city. The fine Moorish temple, Emanu-El, the chief synagogue in New York, is at 43d street. At 42d street is the old Reservoir, on the left of which is Bryant park, the site of the Crystal Palace. Near Fifth avenue, on 43d street, is the fine Renaissance building of the Century club, and just beyond is the magnificent Racquet Club house. At 50th street is St. Patrick's cathedral, one of the finest church buildings in the country. It is 332 feet long, 132 feet wide, and 112 feet high, and has two beautiful spires, each 330 feet in height. It is built of white marble, in decorated Gothic style, was designed by James Renwick, and has cost $2,000,000. The interior is fine, and the decoration of the altars is very elaborate. It has seats for 2600 and standing room for as many more. Opposite are the brown-stone Vanderbilt houses, decorated with beautiful carving. The house of Mr. W. K. Vanderbilt, on the next corner, is in the style of a French château, most elaborately carved, and probably the finest private residence in the city. At 57th street is the house of Mr. Cornelius Vanderbilt, a brick and gray stone structure, also in the French château style, and occupying an entire block on the avenue. This part of Fifth avenue is filled with stately residences, many of fine architecture. At 59th street, Fifth avenue reaches the Plaza, a square just below Central Park, surrounded by enormous hotels—the Plaza, the Savoy, and the New Netherlands. Above 59th street, facing Central Park, are magnificent houses in various styles of architecture. At 60th street is the house of the Metropolitan Club, finished in 1894. It cost $1,500,000, and is one of the most magnificent in the world. Between 70th and 71st streets is the Lenox library, built by Mr. James Lenox, at a cost of $1,000,000, and endowed by him with nearly $250,000. It is a handsome building of Lockport limestone, and has a frontage of 192 feet. It contains a free reference library with many *incunabula*, the Stuart collections of 10,000 volumes and 242 valuable paintings, the picture gallery of 150 fine modern paintings, including several by Andrea del Sarto, Gainsborough, Constable, Reynolds, Stuart, Copley, and Turner, and Munkacsy's "Blind Milton." Among the treasures of rare books and MSS. are the Mazarin Bible of 1455, and copies of many early books, and a magnificent vellum manuscript of the Gospels, with superb illuminations by Giulio Clovio, valued at $12,000.

The Metropolitan Museum of Art, a partly-completed building 233 by 224 feet, is in Central Park, opposite 83d street. The museum was incorporated in 1871, and the present value of the collections is over $7,000,000. The most important of these are the Cesnola collection of Cypriote antiquities, the most valuable in the world; the Marquand collection of old masters, containing several masterpieces; the collection of modern paintings, including Rosa Bonheur's "Horse Fair," Meissonier's "1807," Detaille's "Defence of Champigny," all very valuable; the Wolfe collection of paintings; the collections of Egyptian antiquities, of glass and pottery; the Astor and Stuart lace collections; that of gems and golden ornaments; and the collection of antique casts, including fine models of the Parthenon, an Egyptian temple, the Pantheon, and Notre Dame. Central Park, now one of the most beautiful in the world, extends from 59th to 110th streets, and from Fifth avenue to Eighth avenue, and covers 862 acres. It was designed by F. L. Olmsted and Calvert Vaux in 1858, and has cost about $15,000,000. It is the fashionable drive of New York, and every afternoon a stream of superb equipages pours in from Fifth avenue. The park is separated by the new Croton Reservoir into the North and South parks. It contains about nine miles of carriage-drives, about six miles of bridle paths and about 30 miles of foot paths. Some of the most beautiful features are the Mall, the chief promenade; the Terrace, a fine stone construction with flights of steps leading to the lake; the Belvedere, the highest point, on a hill commanding a fine view; and the Ramble, a labyrinth of charming paths, streams, and thickets. The North park, above the Reservoir, has many natural beauties. On the west side, in Manhattan square, below 81st street, is the American Museum of Natural History, incorporated in 1869. The building erected in 1874–77 and the handsome Romanesque wing added in 1891 are but a part of the plan, which, when completed, will occupy about 18 acres. The collections, now valued at $3,000,000, include the Jesup collection of North American woods, the finest of its kind in existence; the collection of American building stones; the collections of mammalia, birds, and insects; the collections of minerals and shells; the fine Tiffany collection of gems, and the anthropological and ethnological collections. There is a lecture-room, accommodating 1000 persons, in which lectures are given to the school-teachers of New York, as well as a library of 34,000 volumes, and rooms for students. Morningside park begins near the northwest corner of Central park, and extends to 123d street. It is a narrow, elevated piece of land, having an area of 32 acres, and forms a boundary to the ridge known as Cathedral Heights, on which many imposing edifices are in process of construction. These are the new St. Luke's hospital, the Cathedral of St. John the Divine, which will be, when finished, one of the finest buildings in the United States. Above is the site of the new buildings of Columbia university, now in process of erection, and near the end of the ridge is the handsome new building of the Teachers' college. Riverside park is another narrow strip,

URBANA

lying between the Riverside drive and the Hudson river, and extending from 72d street to 130th street. The average width is about 500 feet, and the area is about 178 acres, part of which has been laid out. At the upper end of the park is the tomb of General Grant, where a magnificent monument has been constructed. The corner-stone was laid in 1892, and the monument covers a square of 100 feet, and is 160 feet high and 300 feet above the river. The drive which skirts the park is one of the finest roads in the country, and is said to be the widest. It is nearly three miles in length, with graceful curves, and commands beautiful views of the Hudson and the opposite shores. Many beautiful houses have been built on the east side, and the adjoining region promises to be the most attractive in the city; new styles of architecture and novel combinations of brick and stone produce a marked contrast with the older parts of New York. Among the most striking buildings of this district are the Collegiate church, at 77th street, a modified reproduction of Flemish architecture, and the most important example of that style; the beautiful Romanesque church of St. Agnes, a chapel of Trinity church, with a fine campanile and extensive parish buildings, and the attractive Hoffman Memorial church of All Angels. North of Riverside park lies Manhattanville, containing handsome residences. Here is the Convent school of the Sacred Heart, with extensive grounds. Beyond is Trinity cemetery, belonging to Trinity parish, and the site of the hardest fighting in the battle of Harlem Heights. It contains a fine monument to Audubon, erected in 1893, whose house was on the northern boundary of the cemetery. Audubon park, a group of beautiful residences, now occupies the grounds. On the high ridge to the north is the picturesque region of Washington Heights, containing many handsome houses, and the site of Fort Washington, on the highest ground of the island, 260 feet above the river, captured by the British in 1776, after the battle of Harlem Heights. Washington's headquarters at that time were at the Morris house, at 161st street and St. Nicholas avenue, still well-preserved, and better known as the Jumel house, later occupied by Aaron Burr, who married Madame Jumel. From this house Nathan Hale started as a spy into the British lines. In the vicinity is Alexander Hamilton's house, called "The Grange." Several other historic houses are in this region; the Apthorpe house at 91st street and Ninth avenue, first the headquarters of Washington, and later of the British; the Claremont restaurant was formerly a fine place, occupied at one time by Joseph Bonaparte, and the Somerindyke house, near 75th street, was used by Louis Philippe and his brothers. Many charitable institutions are located in this region; one, the Isabella Home, is on the site of Fort George, a redoubt built here in the Revolution. The principal places of interest in the annexed district, across the Harlem river, are the new public parks, not yet fully laid out, but which possess great natural beauty; Morris Park, the magnificent race-track of the New York Jockey club, said to surpass any in the country, and costing over $2,000,000. On the Harlem river, north of Morris dock, is University Heights, the site of the new buildings of New York university, formerly occupying the Gothic building in Washington square. Just below is the Berkeley Oval, belonging to the Berkeley athletic club; and north is the large building of the Webb academy and Ship-Builders' home, founded in 1890 by W. H. Webb.

Madison avenue, which begins at Madison square, is one of the finest residence streets in New York. At the upper corner of the square is Madison square garden; at 49th street was the former site of Columbia university, the oldest and most important educational institution in New York, which in 1897 was removed to the new site above Cathedral Heights previously mentioned. Conspicuous among the private residences are the Villard mansion, at 50th street, built around a court, and the Flemish Tiffany house at 72d street, one of the largest and most picturesque residences in the United States. The first story is of stone, and the rest of light-colored brick. The arched entrance with a portcullis is beneath a recessed balcony. In the great roof is the sumptuous studio of Mr. Louis C. Tiffany, its sombre vaulted ceiling relieved by the beautiful hangings.

Fourth avenue branches off from Third avenue a short distance below Cooper Union, and first runs toward Union Square, passing the Cooper Union and the Bible House, the headquarters of the American Bible Society, instituted in 1816. The society has issued about 55,000,000 copies of the Bible, in more than eighty languages and dialects. At 23d street is the National Academy of Design, a partial reproduction of the Doge's Palace at Venice, and the principal art institution in the country. Members consist of the Academicians, with the honorary title N.A., and the Associates with that of A.N.A. Exhibitions of paintings are held in the spring and fall, the former being the more important. The galleries are on the third floor and lighted from the roof. The lower floors are used for offices, lecture-rooms, and art schools connected with the academy. On the opposite corner is the building of the Young Men's Christian Association. At 27th street, Fourth avenue passes Madison Square garden, and at 34th street becomes Park avenue, with a tunnel beneath for the cars. Park avenue is one of the finest streets in the city, 140 feet wide, and ornamented with little parks about the openings of the tunnel. Near 34th street is the Unitarian church of the Messiah. Below 42d street it is the center of Murray hill, a fashionable quarter, and at that point it is interrupted by the Grand Central depot, the only passenger railroad dépôt in N. Y., an enormous red brick building, nearly 700 feet long and 240 feet wide, in which twelve trains can be accommodated side by side. The train space is covered by

a glass and iron roof 110 feet high, with an arch of 200 ft. In the addition there are seven tracks for incoming trains. Three railroads enter the station, the New York Central and Hudson River road, the New York, New Haven and Hartford, and the Harlem railroad, and about 125 trains leave and arrive daily. North of the dépôt, Park avenue contains many hospitals and institutions. The most conspicuous buildings are the handsome house of the Arion Society and the Armory of the Seventh Regiment, occupying the whole block at 67th street. The armory is handsomely fitted up; the drill hall is 300 feet long and 200 feet wide. The Normal college, a large Gothic building with a tall square tower, is at 68th street. It is part of the public-school system, and trains teachers for the schools. About 1600 pupils are enrolled. On the left are the four imposing buildings of the Union Theological Seminary.

Lexington avenue begins at Gramercy park, a private park between 20th and 21st streets, for the use of residents only. Around the square are the houses of many eminent New Yorkers. On the south side is the Players' Club-house, built and endowed by Edwin Booth. At 23d street is the College of the City of New York, also a part of the public-school system. Further up are numerous hospitals and institutions. Between Third and Second avenues on Stuyvesant place is St. Mark's church, now an Episcopal church, but established by Governor Stuyvesant in 1660 for the Reformed Dutch services. It is built on the farm of Governor Stuyvesant, whose tomb is beneath the church, and also the tombs of Colonel Sloughter, one of the Colonial governors, Governor Tompkins, one of the first of the State of New York, and other early officials. A tablet at Third avenue and 13th street marks the site of the famous Stuyvesant pear tree, which stood there for 200 years. The lower part of Second avenue was once a fashionable region, and still contains the houses of some old families. At 11th street is the building of the New York historical society, founded in 1804, and now the most important organization of the kind in the United States. It contains the Lenox collection of Assyrian marbles, the unique Abbott collection of Egyptian antiquities, a library of 85,000 volumes, especially rich in works on America and in local histories, and valuable manuscripts, including some of Washington, Gates, Hamilton, Jay, and other distinguished men. The gallery of art contains about 900 works, many by renowned painters. In 1891 the society bought a site at 76th street and Central Park West for a new building, which will probably cost a million dollars. At 15th street is Stuyvesant square, on the west side of which is St. George's church, formerly a chapel of Trinity church at Beekman and Cliff streets, and the second Episcopal church built in New York. The upper part of Second avenue with Third avenue and all the streets east are filled with tenement-houses and small retail stores. The crowded state of these districts is indicated by the fact that in one ward of the city there are 290,000 persons to the square mile, and in several there are 200,000 to the same area. Dry Dock village, an old section on the east side, extended from Houston street to 14th street east of Avenue A, and included what was known as Manhattan island, formed by a creek encircling the region about Burnt Mill point, near the foot of 10th street. The chief point of interest on the east side is Bellevue hospital, the most famous institution of its kind in the country, situated at the foot of 26th street and occupying the entire space between 26th and 28th streets. Besides the hospital proper, in which the operating-room, said to be the finest in the world, will seat 1000 students, it contains the Bellevue medical schools and two training schools for nurses. About 13,000 patients are received yearly, and four branches are maintained in various parts of the city. On the opposite side of 26th street is the medical school of the university.

Sixth avenue begins a short distance below Washington square and runs to 59th street; above Central park it is known as Lenox avenue. It ranks next to 14th and 23d streets in retail business, and contains many large establishments. At 10th street is the Jefferson Market court-house, a picturesque Italian gothic building of red brick and sandstone; at 23d street is the masonic temple, and at 42d street is Bryant park. On Seventh avenue the most conspicuous buildings are the State arsenal, a turreted gray stone structure at 35th street, and Carnegie music hall at 57th street, founded by Mr. Andrew Carnegie, at a cost of $1,250,000. It contains a large hall with seats for 3000 persons, the finest music hall in New York, a smaller concert room and other apartments. The regular concerts of the Symphony and Oratorio societies are given here. On the corner of Eighth avenue and 23d street is the grand opera-house, a large and handsome white marble building. That part of Eighth avenue skirting Central park is a fashionable region known as Central Park West. At 72d street are the enormous Dakota flats, resembling a French château, only surpassed in size by the Central Park apartment houses at 59th street and Seventh avenue, known as the Granada, Madrid, Cordova, etc. At 106th street is the New York cancer hospital.

Ninth avenue begins at 12th street and runs through what was formerly Chelsea village, extending from about 18th to 25th streets. Chelsea square, between 20th and 21st streets, is occupied by the picturesque buildings of the Episcopal theological seminary. Near by, on 23d street, is the large Chelsea apartment house. At 59th street is Roosevelt hospital, built on the pavilion plan, and covering an entire block. The hospital was endowed by the late I. H. Roosevelt, and the fund now amounts to $1,340,000. In the grounds is the Syms operating theater, the most perfectly appointed in the country, endowed by the late W. J. Syms with $350,000. Opposite, on

the corner of Tenth avenue, is the College of Physicians and Surgeons, the medical department of Columbia university. With it are affiliated Roosevelt hospital, and the hospitals erected by the Vanderbilt family, costing, with the college site, $1,000,000. On the corner of 59th street and Ninth avenue is the massive dark gray stone church of the Paulist Fathers. Between 77th street and 81st street, Ninth, here called Columbus avenue, passes Manhattan square, containing the Museum of Natural History.

Tenth avenue above the Boulevard is called Amsterdam avenue, and Eleventh avenue is known as West End avenue above 72d street. West of Broadway, below 14th street, was Greenwich village, during and after the Revolution a suburb of New York. Here lived John Adams and Governor George Clinton, who dated his messages "Greenwich, near New York;" Aaron Burr lived here at the time of his duel with Hamilton, who died in the old Bayard house, where Horatio street runs at present. Between Crosby street and West Broadway, Spring and Reade streets, is the wholesale dry-goods district, covering about 135 acres, and containing more valuable merchandise than can be found anywhere else in the same space. West of this is the silk importers' region, and the wholesale grocers' warehouses center about Franklin street. Importers of china and glass are found between Warren and Barclay streets, and from Dey to Liberty streets are the headquarters of machinery. East of the City Hall park and west of Franklin square is the center of the leather trade, on the site of the old Beekman swamp, hence known as the Swamp, where is the fine stone building of the Hide and Leather bank. Beekman street is the principal region for paper dealers, and between Hanover square and East river tropical products are sold. Manufactories are mainly on North and East rivers. Most of the large banks, exchanges, law and insurance offices and corporations are located below the city hall. On the North river, the upper part is generally given up to lumber, brick, and stone yards; below 10th street begin the piers of the ocean steamships; below Canal street are the piers of the Hudson river and eastern steamboats, and freight and transportation lines. The produce trade is concentrated at Washington market. Along South street on the East river are the docks of sailing vessels; above that are those where canal boats unload their cargoes of western grain. Next come the docks of vessels in the southern fruit trade, then Fulton market and a number of ferries, followed by a succession of dry docks, and above the last, iron foundries and lumber yards. One of the North river piers—No. 35, used as a depot for southern fruit—has a steam-heated building capable of holding 15,000 boxes of oranges. This and one in Boston are the only ones in America.

Parks.—There are 50 parks in the city proper, and six new parks in or near the annexed district above the Harlem river—Van Cortlandt park, just below the Yonkers line, and a mile from the Hudson, containing 1069 acres; Bronx park, between West Farms and Williamsbridge, separated by the Bronx river, and containing 653 acres; Crotona park, below Tremont, containing 135 acres; Claremont park, west of Crotona, containing 38 acres; St. Mary's park, in Morrisania, containing about 25 acres, and Pelham Bay park, on Long Island sound near City island, containing 1700 acres and a shore front of nine miles. Mosholu parkway connects Van Cortlandt with Bronx park, and other parks are to be connected in the same way. The area of new parks and parkways north of the Harlem river is over 3,840 acres, and the cost was nearly $10,000,000.

Cemeteries.—As late as 1822 there were twenty-three church grave-yards below the city hall; but two of these remain—those of Trinity church and St. Paul's chapel. Interments on Manhattan island are now, with the exception of a few special cases, permitted only in Trinity and the Marble cemeteries; the latter is on Second street, between First and Second avenues. Woodlawn, in the 24th ward, is the only other burial-place within the city limits where interments are permitted. Consequently many cemeteries have been created in the vicinity of New York, on Long Island and in New Jersey. On Long Island are Calvary cemetery, the principal Roman Catholic burial-place, at Newtown; Cypress Hills, near Brooklyn, containing the National cemetery, in which about 4000 soldiers are buried; Evergreen, partly in Brooklyn; Greenwood, in Brooklyn, the largest and most beautiful of all; Lutheran and Maple Grove, at Jamaica; Mount Olivet, at Maspeth, and Washington cemetery, in Brooklyn. In New Jersey are New York Bay cemetery, in Jersey city and Machpelah. Sleepy Hollow is near Tarrytown, and Rockland cemetery is near Sparkill, New York. The principal crematory near the city is that conducted at Fresh Pond, Long Island.

Public Monuments.—Few of the monuments in New York possess great artistic merit. The best are St. Gaudens' statue of Farragut, in Madison square; MacMonnies' Nathan Hale, in City Hall square, unveiled in 1893; Brown's equestrian statue of Washington, in Union square; Ward's statues of Horace Greeley, the Pilgrim, and Washington, at the sub-treasury. The greater part of the statuary is in Central park, which contains statues or busts of many literary and public men—Shakespeare, Scott, Burns, Moore, Bryant, Halleck, Schiller, Cervantes, Webster, Hamilton, and Bolivar; also the bronze soldier, erected by the Seventh regiment, and the Indian Hunter and the Still Hunt. The Egyptian obelisk, presented by the Khedive, stands near the Metropolitan museum. Of the many drinking-fountains, that by Warner, in Union square, is the most artistic. The statue of Liberty is described elsewhere.

Churches and Institutions.—There were in New York, in 1897, 555 churches, classified as follows: 4 African Methodist, 53 Baptist, 64 Methodist, 12 Congregational,

31 Lutheran, 56 Presbyterian, 4 Reformed and 6 United Presbyterian, 88 Protestant Episcopal, 1 Reformed Episcopal, 28 Dutch Reformed, 88 Roman Catholic, 3 Unitarian, 3 Universalist, 55 synagogues, 2 Friends' Meetings, and 57 miscellaneous places of worship. The oldest church is the Reformed Dutch, the first Protestant organization in America as well as in New York. It dates from 1628, when the settlers began to hold services over a mill. The first church was built in Whitehall street, just above the army building; the church within the fort was built later. The South church was built 1697, at the corner of William street and Exchange place, and the Middle church, erected in 1721, stood in Nassau street. The Collegiate Middle Dutch church society is, next to Trinity, the wealthiest corporation in the city, and was chartered in 1696, and now supports four churches and three chapels. The Episcopal church is next in age, and of this Trinity is the oldest and most important parish, now maintaining several chapels—St. Paul's, St. John's, Trinity chapel, St. Chrysostom's, St. Augustine's, St. Agnes, St. Cornelius', on Governor's island, etc. Other leading Episcopal churches not already mentioned are St. Thomas's, St. Bartholomew's, Calvary, and All Souls. The first Presbyterian church was founded in 1719, on Wall street, and is now at Fifth avenue and 11th street. The most prominent church is the Fifth avenue, one of the largest in the city. The first regular services of the Roman Catholic church were held in 1783, and the first church, St. Peter's, in Barclay street, was built 1786. The most important churches after the fine cathedral at 50th street, are St. Stephen's, St. Leo's, St. Francis Xavier, and St. Paul the Apostle.

The hospital system of New York is one of the best in the world, and numbers 72 hospitals and about 45 infirmaries and dispensaries. The principal general hospitals are the New York, the oldest in the city, founded in 1770, Bellevue, Roosevelt, St. Luke's, Presbyterian, Mt. Sinai, German, Hahnemann, and Woman's. The floating hospital of St. John's Guild is a charity distinctive of New York. There are about 107 asylums and homes, and many benevolent societies.

Education.—The New York public school system is under the general control and direction of the board of education, composed of 21 commissioners, appointed by the mayor. There were reported in 1896, number of children of school age, 486,000; enrolled in the public schools, 247,500; in daily attendance, 175,000; private school enrollment, 70,500; public school buildings, 152, and several in course of erection; teachers, nearly 4,500; value of public school property, $20,600,000; and annual expenditure, $6,200,500. The school system includes the primary, grammar, and evening schools, a nautical school on the ship *St. Mary's*, 48 corporate schools (industrial and reformatory), the normal college for girls, and the College of the City of New York. There are many excellent private schools, over forty of the first rank. The first school was founded in 1633, and exists still at the present school of the Collegiate church on West 77th street. The next in age is Trinity parish school. The higher institutions are Columbia university, New York university, the Teachers' college, and Barnard college for women—the last two affiliated with Columbia university—and Rutgers Female college. The principal Roman Catholic institutions are St. John's college, Manhattan college, and St. Francis Xavier college, and the academies of Mt. St. Vincent and the Sacred Heart. There are six industrial schools, four business colleges, four training schools for nurses, the Webb academy, the Auchmuty and Hirsch trade schools, and the state institutions for the blind and the deaf and dumb. The theological schools are Union seminary (q.v.), Presbyterian, the general seminary of the Protestant Episcopal church, founded in 1819, and the Jewish seminary. The largest medical schools are the college of Physicians and Surgeons, the Bellevue Hospital medical college, and the New York University medical college. Bellevue Hospital medical college is in the hospital grounds, at the foot of East 26th street. It is independent of the city colleges, and was organized by the commissioners of charities and correction in 1861. Other well-known medical schools are the New York Post Graduate medical school, the New York Homœopathic medical college, the Woman's medical college of the New York infirmary, the New York medical college for women, and the Eclectic medical college. There are also the New York College of Pharmacy and the New York College of Dentistry, the American Veterinary College, and the New York College of Veterinary Surgeons. In addition to the law schools of Columbia university and New York university, there is a New York law school in the Equitable building, having access to the large library of the company. The leading art schools are the Art Students' League, in the Fine Arts Society building, in 57th street, the schools of the Metropolitan museum and the Academy of Design, the schools of the Cooper Union, and the Gotham art institute. The school for Artist Artisans, founded in 1888, has been very successful. The chief school of music is the National Conservatory of Music of America; other schools are the New York College of Music, the Metropolitan College of Music, and the Grand Conservatory of Music.

Libraries, the Press.—New York has no great public library like Boston's, but there are more than forty-five libraries of considerable size, many of which are free to the public under certain conditions. The largest is the Astor library (q.v.), containing, in 1897, nearly 283,000 volumes. The Mercantile contains about 247,000; the library of Columbia university, 175,000 volumes; the Apprentices', about 85,000 volumes; the Lenox, about 110,000 volumes; the New York Society library, 100,000 volumes; the New York free circulating library, more than 93,000 volumes. The main

library is in Bond Street, and seven branches are established in various parts of the city. The circulation in 1896 was over 750,000. The Cooper Union library numbers about 31,000 volumes. Libraries of considerable size are connected with the New York Historical Society, the Museum of Natural History, and the American Institute.

The publications of New York include about 56 daily papers, 270 weekly periodicals, 350 monthly magazines, etc., and several quarterlies. The leading morning papers are the *Times*, the *Tribune*, the *World*, the *Sun*, the *Herald*, the *Staats-Zeitung*, and the *Journal of Commerce*. The chief evening papers are the *Evening Post*, the *Commercial Advertiser*, the evening editions of the *Sun* and *World*, the *Evening Telegram*, and the *Mail and Express*. The leading weekly publications are the *Nation*, the *Critic*, the *Outlook*, the *Independent*, *Harper's Weekly*, *Frank Leslie's*, the *Illustrated American*, the comic journals *Life*, *Puck*, and *Judge*. The principal monthly magazines are *Harper's*, the *Century*, *Scribner's*, the *Cosmopolitan*, *North American Review*, the *Bookman*, and the *Popular Science Monthly*. The cosmopolitan character of New York is shown by the number of publications in foreign languages. Seventy-six are printed in German, Spanish, Swedish, Armenian, French, Hebrew, Italian, Danish, Polish, Finnish, Russian, Portuguese, Bohemian, and Magyar.

Museums, Theatres.—The principal museums of New York are the Metropolitan Museum of Art and the American Museum of Natural History. Valuable collections are to be found in the Lenox Library and the Historical Society. Exhibitions are held at the Academy of Design, the building of the Society of Fine Arts, and the American Art Galleries in 23d Street; the leading art stores have galleries open to the public, and occasionally private collections are exhibited in aid of charities. The most important building devoted to amusements is the Metropolitan Opera-House, which contains the largest auditorium in the world. There are numerous theatres, representing all forms of the drama, many concert halls, and innumerable theatres of a low grade; and in music New York is in advance of any other great city. The most important musical performances are given by the Philharmonic Society, under the conductorship of Seidl, and the Oratorio and Symphony Societies, under the leadership of Damrosch. The prominent musical clubs give excellent concerts, and the Sunday concerts at the Lenox Lyceum, the Madison Square Garden, and elsewhere provide music of the best grade.

Clubs and Societies.—Clubs and club life are a prominent feature of New York. There are at least 300 recognized clubs, and innumerable societies and associations. The large clubs are conducted at enormous expense, and have proportionally great resources. The incomes of the Union League and Manhattan Clubs are from $300,000 to $500,000 yearly. The leading social clubs are the Union, Metropolitan, Manhattan, Union League, Knickerbocker, New York, St. Nicholas, and Calumet. The principal literary and artistic clubs are the Century, Aldine, Authors', Lotus, University, Press, Players', and Sorosis (q.v.). The chief athletic clubs are the Manhattan and the New York, the Racquet and the Berkeley. The New York, the American, and the Seawanaka-Corinthian are the prominent yacht clubs. The most important learned and scientific societies are the New York Academy of Medicine, the New York Academy of Science, the American Geographical Society, and the New York Historical Society.

Hotels.—New York is probably unsurpassed in the number and excellence of its hotels, which are generally grouped about the following centres: Union Square, Madison Square, and the Plaza. The principal down-town hotel is the Astor House; above 14th Street the most prominent are the Fifth Avenue, Clarendon, Westminster, Everett, and Brunswick; above Madison square the finest are the Windsor, the Waldorf, the Imperial, the Buckingham, the Holland House; and at 59th street are the magnificent new hotels, the Plaza, Savoy, and New Netherlands.

Militia.—The militia forms the first brigade of the National Guard of the State of New York, which includes seven regiments of infantry: the Seventh, Eighth, Ninth, Twelfth, Twenty-second, Sixty-ninth, and the Seventy-first, two batteries of artillery, a cavalry troop, A, and a signal corps. The total strength of the brigade in 1897 was over 4900 men. Several of the regiments, especially the Seventh and Twelfth, have magnificent armories, with drill rooms, libraries, and gymnasiums. A recent additional organization is the Naval Reserve, with a strength of 600 men. The headquarters of the Military Department of the Atlantic are located on Governor's Island.

Banks, Insurance, etc.—In 1896 there were 49 national banks in operation, having a combined capital of $50,450,000, deposits of $372,781,898, and reserve of $109,148,724; 40 state banks, with capital, $14,822,700, deposits, $112,709,108, and surplus, $11,887,700; 25 savings banks, with deposits, $378,085,532; 23 trust companies; 24 safe deposit companies; and 7 foreign banking agencies. The exchanges at the clearing-house in the year ending Sept. 30, 1896, aggregated $29,350,894,884. There were about 50 fire insurance companies, belonging to the state, other states, and foreign countries; about 30 life insurance companies; over 15 accident insurance companies; and a large number of miscellaneous companies.

Post-Office.—Besides the General Post-Office, in City Hall park, there are 25 branch post-offices or stations, designated by the letters of the alphabet, with the exception of the Highbridge station. There are 61 sub-stations, at which stamps are sold, letters registered, and money orders issued and paid, and about 1600 letter-boxes, from which collections are made from twelve to twenty-five times a day, and collection by carts is

being introduced. In 1896 the total number of letters, newspapers, packages, etc., entering the post-office was 1,361,356,483, requiring a force of nearly 3000 men. The total receipts of the post-office were $7,780,292, and the expenses were $3,133,213.

TRANSPORTATION.—Only four railroad lines terminate within the city limits: the New York Central and Hudson River railroad, the New York and Harlem railroad, the New York, New Haven and Hartford railroad, all at the Grand Central Depot, and the New York and Putnam, at 155th street. The New York Central and Hudson River has a depot for local trains at 30th street and 10th avenue, and a freight depot on the former site of St. John's park. All the other lines terminate in Jersey City or Hoboken, with the exception of the New Jersey Southern Division of the Central railroad, which terminates at Atlantic Highlands, connecting with New York by steamboat, and of the Long Island railroads, which terminate at Hunter's Point, L. I.

The elevated roads are united in one company, called the Manhattan. There are 18 lines of street railroad running north and south, and 16 cross-town lines. Four of these are cable roads, Broadway, Third Avenue, 125th Street line, and the Tenth Avenue and 186th Street line. During the year ending September 30th, 1896, the elevated roads carried more than 185,000,000 passengers, and the surface roads carried over 250,000,000. New York is connected with Brooklyn and other places on Long Island by numerous ferries, over which it is estimated that 75,000,000 persons cross annually. To relieve the ferry traffic the East River bridge was undertaken by a company formed in 1869, with a capital of $500,000, to which New York added $3,000,000 and Brooklyn $1,500,000; see BRIDGE. New York is connected with Jersey City and Hoboken by many ferries; also with Staten Island and the small islands in the harbor.

Steamboats run regularly to more than 140 different ports on the Hudson, the Bay, Long Island sound, and the Connecticut river. The Albany and the Sound steamboats are colossal in size and handsomely appointed.

The principal transatlantic steamship lines are the Cunard, White Star, Compagnie Générale Transatlantique, the International Navigation Company's lines, the American and the Red Star, and the North German Lloyd. A Mediterranean service is maintained by the North German Lloyd and the Hamburg-American Lines. The Antwerp, Amsterdam, Rotterdam, the German lines, and those for the Baltic ports sail from Hoboken and Jersey City; the majority of the South European, South and Central American, and Asiatic lines of steamships sail from Brooklyn piers. The more important coastwise lines are the Old Dominion, Clyde, Mallory's, and Cromwell's lines. There are 18 lines of steamships to British ports; 23 to continental ports; 30 to South and Central American ports and the West Indies; 13 lines to domestic and Canadian ports, and 5 to Asia.

COMMERCE.—Between 50 and 60 per cent. of the foreign trade of the United States passes through the port of New York, and for more than fifty years it has been the principal distributing agency of foreign goods. New York communicates with the West by four trunk lines—the Erie, New York Central, Pennsylvania, and Baltimore and Ohio, and two smaller lines—the West Shore and the Delaware and Lackawanna; and with the Great Lakes by the Erie canal and Hudson river for eight months of the year. The foreign commerce of the port of New York for the year ending June 30th, 1896, was: imports, $530,904,931; exports, $491,400,781, making a total of $1,022,305,712, more than half the entire commerce of the United States, which was $1,897,585,480.

About three-fourths of the immigrants to the United States land at New York; in 1896 the number was 180,556. Since January, 1892, the landing-place for all immigrants is Ellis island, where there is room for 10,000 daily. The first exchange in the city was built in 1690–91 at the foot of Broad Street; now there are twenty-seven, of which the leading is the Produce Exchange, the largest commercial association in the world, with a membership of 3000. The transactions in 1896 were 4,510,000 barrels of flour, 1,129,000,000 bushels of wheat, and 94,400,000 bushels of corn. The Maritime Exchange has its rooms in the Produce Exchange building. The Stock Exchange, on Broad street, has 1100 members, each seat being worth at least $20,000. In 1896 the chief transactions were: State and railroad bonds, $367,943,550; government bonds, $27,121,550; shares of stock, 54,490,634. The Consolidated Exchange, a union of the petroleum and mining stock exchanges, was organized in 1875, and now does nearly as large a business as the Stock Exchange. In 1896 the transactions included 55,502,660 shares of railroad stocks; 1,035,840 mining stocks, and 1,150,324,000 bushels of wheat. The other important exchanges are the Coal and Iron, the Coffee, the Cotton, Mercantile, Metal, and Maritime exchanges, and the New York Board of Trade and Transportation. The New York Chamber of Commerce was chartered in 1770, and is the oldest commercial corporation in the country. It has a membership of about 800.

MANUFACTURES.—The manufactures of New York are nearly as important as its commerce, and its growth in this line is shown by the increase in the number of establishments, from 4375 in 1860 to 25,403 in 1890. In the last year the capital invested was $426,118,272, employing 354,291 hands; the wages paid was $230,102,167, and the value of the products was $777,222,721. The article most largely manufactured was clothing, with products valued at $138,000,000; printing and publishing produced a value of $54,500,000, meat packing, $50,250,000. The other large manufactures are of iron and steel, refined lard, malt liquors, sugar and molasses, tobacco, pianos, and shoes.

GOVERNMENT. — The first English charter of the city of New York was granted by James II. in 1686, and is known as the Dongan charter. In 1730 the Mont-

gomerie charter was granted by George II. In 1830 a new charter was adopted, followed by others in 1857, 1870 and 1873, the latter in force till 1898. The legislative power is vested in a board of 31 aldermen, holding office for two years. The executive power is vested in the mayor and the heads of departments appointed by him for a term of six years (except in special cases). The mayor is elected at the November general election for a term of two years. The departments are those of finance, law, police, public works, parks, docks, street-cleaning, charities and corrections, fire, health, taxes and assessments and buildings. The salary of the Mayor is $10,000, and that of each alderman $2000 per annum. The finances are under the direction of the Comptroller, who is elected for three years, with a salary of $10,000. The city treasurer is called the Chamberlain and is appointed by the Mayor, with a salary of $25,000, out of which he pays all expenses of his office. He settles all bills passed by the Comptroller. New York is divided into congressional, senatorial, and assembly districts; the last are subdivided into election districts. The city has 10 representatives in Congress, and sends 9 senators and 30 assemblymen to the Legislature. The total funded debt of the city on Jan. 1, 1897, was $195,907,690; total sinking fund, $77,630,491; net debt, $118,277,198; and total assessed valuation of real and personal property, $2,106,484,905.

Law Courts. — The first court of law of which there is any record was established in 1626. This Dutch court was continued till 1665, when it was abolished by the English governor, and superseded by one composed of the mayor, aldermen and sheriff. This was known as the Mayor's Court, and continued in existence till 1821 when it was changed to the Court of Common Pleas. The assembly which convened in 1691 created the courts of justices of the peace, and the Court of General Sessions; also the present Supreme Court, the criminal circuit of which received the name of Oyer and Terminer when the old court was abolished. In 1828 the Superior Court of the City of New York was created, with a chief justice and two associates. The constitution of 1846 created the Court of Appeals. The courts now in existence are the United States Circuit Court, the United States Circuit Court of Appeals (organized in 1891), the United States District Court, the Supreme Court, Court of Common Pleas, the Superior Court of the City of New York, City Court (formerly Marine Court), the eleven district courts, the Surrogate's Court, the Court of Arbitration (established in 1874), and the criminal courts: Oyer and Terminer, Court of General Sessions, and Court of Special Sessions, and six police courts. The head of the law department of the city government is the Corporation Counsel, appointed by the Mayor, with a salary of $12,000 per annum. Each police court has connected with it a prison — viz., the Tombs, which is also the city prison, in Centre street; Essex Market, in Essex street, between Grand and Broome; Jefferson Market, Sixth avenue and West 10th street; Yorkville, 57th street, between Third and Lexington avenues; Harlem, 125th street, between Third and Lexington avenues, and Fordham. The Ludlow Street jail is used for prisoners from the federal and state courts. The Morgue is in the grounds of Bellevue Hospital.

Water Supply. — Two aqueducts, the Croton and the New, supply New York with the water of the Croton Valley, in Westchester county, 40 miles from the city. The Croton aqueduct, built in 1842, crosses the Harlem river at 175th street over High bridge, and carries 75,000,000 gallons daily. A dam on the Croton river forms Croton lake, and this, with two other reservoirs, known as Boyd's Corner and Middle Branch, has a capacity of 9,500,000,000 gallons. At the end of High bridge is an engine house and high-service tower, and a reservoir with a capacity of 11,000,000 gallons. An additional high service tower was erected at 98th street and Columbus avenue. There are two reservoirs in Central park of 1,030,000,000 and 150,000,000 gallons capacity, and the reservoir at 42d street, formerly a distributing reservoir, has a capacity of 20,000,000 gallons. The supply of this aqueduct was insufficient, and a new aqueduct was authorized by the legislature in 1883 and completed in 1890. This is known as the New aqueduct, and has a daily capacity of 318,000,000 gallons. From its beginning at Croton lake to 135th street and Tenth avenue, the entire length is 30.75 miles, and the average depth of the tunnel is 170 feet. The present storage capacity of the Croton water-shed is 17,150,000,000 gallons.

The Greater New York. — In 1890 the legislature created a commission of municipal consolidation, consisting of 11 members, to inquire into the expediency of a proposed consolidation of New York and Brooklyn into one city. The commission presented a bill to the legislature of 1893 providing for the submission of the question of consolidation to a vote of the people directly interested, but the legislature adjourned without taking action on it. In the following year the same bill was reintroduced, adopted, and approved by the governor, and in the election in November 177,053 votes were cast in favor of consolidation and 133,309 against it. Early in the session of 1896 a joint sub-committee of the cities committee of both houses of the legislature was appointed to inquire into the subject of consolidation. This committee, in reporting, submitted a bill favoring consolidation, which was adopted in each house, and then referred to the mayors of New York, Brooklyn, and Long Island City. The two first mayors disapproved of the measure in the form submitted and the third approved it. The three messages were read in the legislature, and the bill was repassed. The act to consoli-

date was signed by Gov. Morton and became a law on May 11, 1896. The act named 6 commissioners and the governor appointed 9 others, to prepare a charter for the consolidated city. In March, 1897, a proposed charter was passed in each house of the legislature. Mayor Strong of New York vetoed it; the legislature repassed it over the veto; and Gov. Black approved it on May 5. The bill provided that the act of consolidation should take effect on Jan. 1, 1898, and that an election for mayor should be held in the autumn of 1897. While action was pending on the measure both New York and Brooklyn increased their areas and population by annexing suburbs under legislative sanction.

The territory thus affected comprised all the municipal corporations and parts of municipal corporations other than counties, within the following limits: the county of Kings; co. of Richmond; city of Long Island City; towns of Newton, Flushing, and Jamaica; and the part of the town of Hempstead in the co. of Queens west of a line drawn from the s.e. point of the town of Flushing through the middle of the channel between Rockaway beach and Shelter island. The city of New York, as constituted by the act, is divided into five boroughs, as follows: The borough of *Manhattan*, consisting of Manhattan, Governor's, Bedloe's, Ellis, Blackwell's, Randall's, Ward's, and the Oyster islands; the borough of the *Bronx*, consisting of all the portion n. and e. of Manhattan between the Hudson river and the East river or Long Island sound, including all islands within these limits; the borough of *Brooklyn*, consisting of the former city of Brooklyn; the borough of *Queens*, comprising all that portion of Queens co. consolidated with the new city; and the borough of *Richmond*, consisting of the territory formerly known as Richmond co. The following general statistics of the enlarged city are compiled from the report of the commission to the legislature.

	New York Co.	King's Co.	Queen's Co.	Richmond Co.	Westchester Co.	Total.
State tax for 1894 and 1895.....	$4,186,119.96	$1,114,886.36	$154,100.51	$58,344.88	$242,119.41	$5,755,571.12
Population, State census, 1892...	1,801,739	995,276	117,982	53,452	29,412	2,997,461
Assessed value real estate, 1893..	$1,562,582,393	$513,501,141	$50,672,499	$19,750,376	$82,802,083	$2,227,208,492
Assessed value personal estate...	$370,936,236	$19,704,920	$2,377,860	$162,950	$2,277,956	$395,459,822
Area, square miles.....	38.85	65.75	123.98	57.19	20.24	306.01

The Greater New York thus became the second city in the world in population; next to London in area; and the first in the world in length of railroads, number of ferries, extent of commercial wharfage, capacity of warehouses, area of public parks and value of manufactures.

The executive authority is vested in a mayor, elected for four years, annual salary $15,000, who is ineligible for re-election excepting after an intervening term. He appoints all heads of departments, excepting a few elective ones, can remove all officials he appoints during the first six months of his term, and has large powers. The legislative department consists of a municipal assembly, comprising a council of 29 members, whose president is elected by the people at large for a term of four years, salary $5,000 per annum, other members being elected in prescribed districts for four years, salary $1,500 per annum; and a board of aldermen, of one member from each existing or future assembly district (beginning with 60 in all), elected for two years, salary $1,000 per annum. Every ex-mayor of the city, as constituted by the act, is an ex-officio member of the council as long as he remains a resident, but has no vote. For administrative purposes there are departments of finance, law, police, parks, buildings, charities, correction, fire, docks, and ferries, taxes and assessments, education, health, and, as parts of the board of public improvements, water supply, highways, street cleaning, sewers, public buildings and bridges. There are also a municipal statistical commission and a municipal civil service board. The comptroller is the head of the finance department, elected for four years, annual salary, $10,000; the corporation counsel is the head of the law department, appointed for four years, annual salary, $15,000. The fire department is single-headed; the police department, bi-partisan, with four commissioners, one chief, five deputy chiefs, and 6,382 patrolmen; the dock department has three commissioners; the central board of education has 19 members, comprising the chairmen of each of the four school boards, 10 delegates elected in the boroughs of Manhattan and Bronx, and 5 delegates elected in Brooklyn; the health department has 5 commissioners, including the health officer and the president of the police board; the department of taxes and assessments has five commissioners, the president holding office for six years, the others for four years; and the park department has three paid commissioners and an unpaid art commission. The judicial authority is vested in municipal courts, taking the place of the former civil courts, and new judges will serve for 10 years. There are 11 such courts in Manhattan, 5 in Brooklyn, 3 in Queens, and 2 each in the Bronx and Richmond, all having jurisdiction in cases involving $500. The former court of special sessions is continued in two divisions, the first embracing the boroughs of the Bronx and Manhattan, the second, the boroughs of Brooklyn, Queens, and Richmond, with 5 justices in each division. Justices of inferior courts of criminal jurisdiction are now

URBANA

known as city magistrates, have 10-year terms, and number 7 in Manhattan, 6 in Brooklyn, and 2 each in Bronx, Queens, and Richmond. Each borough has a president, elected for four years, who calls all meetings of local boards and certifies all official acts of the local boards of the districts of local improvements. The presidents of the boroughs of Manhattan, the Bronx, and Brooklyn receive $5,000 per annum; those of Queens and Richmond, $3,000. For the purposes of local improvement, the city is divided into 22 districts, each with a board comprising the president of the borough and each member of the municipal assembly who is a resident of such local improvement district. One of the most important features of the charter relates to the granting of franchises to persons or corporations. All grants must be by specific ordinance, are limited in duration to 25 years, and at the expiration of that period may revert to the city or be renewed by it for 25 years more.

POPULATION.—At the beginning of the century the population of the city was 60,489; in '30, 191,112; in '50, 515,547; '60, 805,658; '70, 942,292; '80, 1,206,299; '90, 1,515,301. In 1892 the State census gave 1,801,739.

Among the many works on New York are the histories by Mrs. Martha J. Lamb (2 vols., 1877–81), and by Todd (1888); Scoville's *Old Merchants of New York City;* Newberry's *Geological History of New York Island and Harbor* (1878); Camman and Camp's *Charities of New York* (1868); Roosevelt's *New York* (1891), and Wilson's *Memorial History of New York* (3 vols., 1893).

NEW YORK, COLLEGE OF THE CITY OF, is the only free college supported by city taxpayers in the United States. It began its existence as the free academy in 1848, having first received the sanction of a popular vote, and its present title was bestowed upon it in 1866. Standing at the head of the public school system, its trustees are the members of the board of education, together with the president of the college. It has had but two presidents, Horace Webster, LL.D., and from 1869, Alexander S. Webb, LL.D. Tuition, books, and stationery are free, all expenses being paid on presentation of vouchers to the comptroller of the city, who disbursed in 1895–6, for this instruction $149,854.46. Candidates for admission to the college must be 14 years of age, and must pass an examination on the studies taught in the grammar schools. Students have the option of a five years' classical, scientific, or mechanical course, the first year being considered introductory. Since its foundation in 1866 the college has had over 19,000 students. The year 1896–97 began with 1897 students, of whom 560 were in the introductory, and 351 in the collegiate classes, and the graduating class of 1896 numbered 82. The buildings and grounds on the s.e. corner of Lexington av. and East 23d st. are valued at $600,000; the library of 30,271 volumes at $66,000; the apparatus, cabinets, casts, models, etc., at more than $40,000; and the institution has library and medal funds aggregating $43,550. In 1896 there were 52 instructors and 1693 students.

NEW YORK PUBLIC LIBRARY, an institution in New York city created in 1895 by the consolidation of the Astor and Lenox libraries and the merging of a part of the estate of the late Samuel J. Tilden, under the corporate name of the New York Public Library, Astor, Lenox, and Tilden Foundations. In 1896, John Shaw Billings, M. D., formerly of the medical department of the U. S. army, and professor of hygiene in the University of Pennsylvania, was appointed by the joint board of trustees superintendent-in-chief of the consolidated libraries. Pending the erection of a new library building in Bryant park, the work of the Astor and Lenox libraries continued as usual, with administrative headquarters in the former on Lafayette place. See ASTOR LIBRARY; LENOX, JAMES; TILDEN, SAMUEL JONES.

NEW YORK UNIVERSITY was chartered in 1831, and began to receive students the next year. It now consists of six schools. The date of the opening of each school and the number of each faculty and students in 1896–7 were as follows: the Undergraduate college opened in 1832, faculty 31, students 177; Law school in 1835, faculty 23, students 594; Medical college in 1841, faculty 62, students 344; Engineering school in 1862, faculty 29, students 41; Graduate school in 1886, faculty 24, students 83; School of Pedagogy in 1890, faculty 8, students 122. Total, deducting for names counted twice, instructors 142, students 1361. The number of graduates approaches 10,000. The University schools of law and pedagogy are at Washington square east. The University medical school is on East 26th street near First avenue. The University college, engineering school and graduate school are at University Heights. The University owns real estate at these three points worth over $2,000,000, including cost of library at University Heights, in course of erection. The site and buildings at University Heights are hardly surpassed in beauty in America. The endowments of the University have been largely increased of late years. The first chancellor of the institution was the Rev. Dr. James H. Matthews, and the Rev. Dr. H. Crosby held the office several years. The present chancellor is H. M. MacCracken, D.D., LL.D.

NEW ZEALAND, a British colony in the south Pacific Ocean, consists of three islands, two large and one much smaller, and of a number of islets scattered round the coasts. These islands, which are named respectively north, south (sometimes also middle), and Stewart's island, are situated 6500 m. w. from the coast of South America, and about 1200 m. s.e. of Australia. The group is irregular in form, but may be said to extend from the s. in a n.n.e. direction, and, like the peninsula of Italy, resembles a boot in shape. North island is 500 m. long, and 200 m. in greatest breadth from e. to w.; south island is 550 m. long, and 210 m. in greatest breadth; Stewart's island is triangular in

shape, and has an area of about 665 square miles. Area of the three islands, about 100,000 square miles. The north is separated from the south island by Cook's strait, which is 18 m. wide at its eastern and 90 m. wide at its western end; the south is separated from Stewart's island by Foveaux strait, which averages about 20 m. in width. The group extends in lat. from 34° 23′ to 47° 16′ s., and in long. from 166° 30′ to 178° 30′ e., being thus almost the antipodes of the British isles.

Coast Line.—Of the entire coast line of over 3000 m., nearly 2200 m. is formed by the shores of north island, which are deeply indented, and contain many excellent harbors. Commencing from north cape, and going s.e. round the island, the chief harbors are Monganui, Wangaroa, the bay of islands, Auckland, Mercury, and Tauranga bays, and the ports of Wellington, Manukau, and Hokianga. On the n. and s. coasts of south island, which are much broken, the harbors are numerous and excellent; on the eastern coast, the principal harbors are Akaroa, Victoria, and Dunedin. On the coast of Stewart's Island, there are also good ports.

Surface.—The New Zealand islands are of volcanic origin, and a great portion of the entire area is occupied by mountains, among which are many extinct and a few active volcanoes. In north island, Mount Ruaperhui, the highest summit of the central range, is 9,195 ft. in height, and is capped with perpetual snow. In the same range is Tongariro, an active volcano, 6,500 ft. high. A continuous range of mountains runs along the western coast of south island, and assumes the form of table-lands and isolated peaks toward the east. This range rises in Mount Cook to about 12,350 feet. In Stewart's Island, the greatest elevation is about 3,000 feet. In north island, the mountains are mostly clothed with evergreen forests of luxuriant growth, interspersed with fern-clad ranges, and occasionally with treeless grassy plains; extensive and rich valleys and sheltered dales abound; and in the east of south island there are many expansive plains of rich meadow-land, admirably adapted either for agriculture or cattle-breeding. Water and water-power are found in great abundance in the colony, and the numerous rivers are subject to sudden floods from the melting of the mountain snows. As a rule, however, the streams are short, and are not navigable for more than 50 m. above their mouths. The chief is Waikato river, in north island, which, issuing from the Taupo lake (30 m. long by 20 broad), flows in a northern direction for 200 m., and reaches the sea on the w. coast. In south island, the rivers Clutha, Mataura, and Waiau, all flowing s., are among the chief. Around lakes Rotomahana and Rotorua are a number of grand and beautiful geysers, which throw up water heated to 2° above the boiling-point. The geology of New Zealand is remarkable in a high degree. The mountains, which are of every variety of outline, are chiefly composed of the lower slate-rocks, intersected with basalt, and mixed with primary sandstone and limestone. Beds of coal and lignite exist, and the former have been to some extent worked.

Soil, Climate, and Productions.—Of the whole surface-extent of New Zealand (nearly 70,000,000 acres, little short of the combined area of England and Wales, Scotland, and Ireland), two-sevenths is estimated to consist of dense forest tracts, one-half of excellent soil, and the remainder of waste lands, scoriæ-hills, and rugged mountain regions. Nearly 40,000,000 acres are supposed to be more or less suitable for agriculture and cattle-breeding. The soil, although often clayey, has in the volcanic districts more than a medium fertility; but the luxuriant and semi-tropical vegetation is perhaps as much due to excellence of climate as to richness of soil. Owing to the prevalence of light and easily-worked soils, all agricultural processes are performed with unusual ease. The climate of New Zealand is one of the finest in the world. The country contains few physical sources of disease: the average temperature is remarkably even at all seasons of the year, and the atmosphere is continually agitated and freshened by winds that blow over an immense expanse of ocean. In a word, the climate much resembles that of England, with half the cold of the English winter; while the summer is longer and somewhat warmer, the atmosphere is more breezy and pure, and there are many more fine days throughout the year. In north island, the mean annual temperature is 58°; in south island, 52°. The mean temperature of the hottest month at Auckland is 68°; and at Otago, 58°; of the coldest month, 51° and 40°. The air is very humid, and the fall of rain is greater than in England, but there are more dry days. All the native trees and plants are evergreens. Forests, shrubberies, and plains are clothed in green throughout the year, the results of which are, that cattle, as a rule, browse on the herbage and shrubs of the open country all the year round, thus saving great expense to the cattle-breeder; and that the operations of reclaiming and cultivating land can be carried on at all seasons. The seasons in New Zealand are the reverse of ours; January is their hottest month, and June the coldest. All the grains, grasses, fruits, and vegetables grown in England are cultivated in this country with perfect success, being excellent in quality and heavy in yield; while, besides these, the vine is cultivated in the open air, and maize, the taro, and the sweet-potato are cultivated to some extent in the sunny valleys of north island. The entire acreage under crop in New Zealand in 1851 was 29,140; in 1858, it was 141,007; in 1881, 4,768,192; and in 1896 was 10,698,809. Of the crops, the principal were wheat, oats, barley, potatoes, and sown grass, which, under ordinary circumstances, are grown to great advantage in New Zealand. Besides a few harmless lizards, a small species of rat is the only indigenous four-footed animal found in either of the great islands. Hawks are numerous. The country is destitute of snakes,

and possesses no insect so noxious as the English wasp. The pig, introduced by Cook, runs wild, and the red and fallow deer, the pheasant, partridge, quail, etc., and the commoner domestic animals introduced by colonists, thrive well. In 1896 there were in the colony 237,418 horses, 1,047,901 cattle, 18,982,080 sheep, 239,778 pigs, besides poultry, mules, asses, and goats. Coal in abundance, and of good quality, as well as iron, gold, silver, tin, copper, etc., are distributed over the colony. For statistics of the quantity of gold exported, see article OTAGO. Valuable timber is in great abundance. The expenditure out of ordinary revenue for 1896–7 is estimated at £4,452,165 and the revenue, including a surplus of £215,558 brought forward, at £4,699,558, leaving a surplus of £247,393. In 1896 the public debt was about £42,271,891. The exports, consisting principally of wool, corn, gum, preserved meat, and gold, amounted in 1895 to £8,550,224; the wool of that year being valued at £3,662,131. The total exports of gold from 1857 to 1895 were £51,351,002, in 1895 alone £1,162,181. The imports, consisting of British manufactures, etc., amounted to £6,400,129 in 1895. In March, 1896, there were 2,189 m. of railways in operation and many in course of formation; there were also 15,764 m. of telegraphic wires erected.

The colony was divided into the following nine provinces: Auckland, Taranaki, Wellington, Hawke's Bay, Nelson, Marlborough, Canterbury, Otago, and Westland. The provinces were abolished by the colonial parliament in 1875, and a system of counties substituted. The government is administered by a governor appointed by the crown, and a ministry, a legislative council nominated by the crown and a house of representatives elected by the people. Leading educational institutions are the university of N. Z. (which grants degrees), the university of Otago, and Canterbury college, Auckland university, schools for higher education, and private schools. A very large proportion of the population of European descent can read and write, more particularly in Otago. The principal churches are the Church of England, predominating in Canterbury; the Presbyterian church, which dominates in Otago and Southland; the Wesleyan; and the Roman Catholic. In 1895 the immigrants into New Zealand amounted to 21,862 persons: the emigrants from it, to 20,967; leaving a balance of 895 in favor of immigration. The population in 1858 was 59,328; in '71, 256,260; and in '96, 703,360. The New Zealanders, or Maoris (q. v.), reported in 1867 at 38,540, and in 1896 at 39,805, are mostly located in north island. The military and civil forces of New Zealand are the volunteers, numbering 7,508 of all ranks, and the armed constabulary in the north island. The hospitals and charitable institutions are numerous.

New Zealand was discovered by Tasman in 1642, and was repeatedly visited by capt. Cook, who surveyed the coast in 1770. After the settlement of Port Jackson, in New South Wales, the English and American whaling ships had recourse to the coast of New Zealand for provisions and shelter. New Zealand flax came also to be an article of traffic, and individual Englishmen began to settle on the coasts, and intermarry with the natives, and acquire land in right of their wives or of purchase. Missionary enterprise began in 1814, favored by various chiefs, and the missionaries not only labored to convert the natives, but introduced improved culture among them, and tried to protect them from the injustice, fraud, and oppression of the Europeans that had acquired settlements. A British resident or consul was appointed in 1833, but without authority. To put an end to the state of anarchy induced by a desultory colonization, and the purchase of lands for a few hatchets or muskets, a lieutenant-governor was appointed in 1840, and a treaty concluded with the native chiefs, whereby the sovereignty of the islands was ceded to Britain, while the chiefs were guaranteed the full possession of their lands, forests, etc., so long as they desired to retain them: the right of pre-emption, however, was reserved for the crown, if they wished to alienate any portion. Thus New Zealand became a regular colony, the seat of Government of which was fixed on the bay Waitemata, and called Auckland. The previous year an association, called the New Zealand company, had made a pretended purchase of tracts amounting to a third of the whole island, and for a dozen years most of the colonization of New Zealand was conducted under its auspices. The conduct of the company is considered to have been on the whole prejudicial to the prosperity of the colony; and after a long conflict with the government, they resigned, in 1852, all their claims—which the government had never confirmed—on condition of receiving £268,000 as compensation for their outlay. The unscrupulous way in which the company and others often took possesion of lands brought on, between 1843 and 1847, a series of bloody conflicts with the warlike natives, whose hostility, after having subsided for some time, in 1861 again broke out in a series of intermittent struggles. These continued until, on the withdrawal of the imperial troops, the colonists, from their knowledge of bush life and intensified earnestness, completely subdued the refractory natives, who are now turning their attention to agriculture and trade. In 1852 constitutional government was established, and in 1865 the seat of government was transferred from Auckland to Wellington, the present capital. See illus., SANDWICH ISLANDS, NEW ZEALAND, ETC., vol. XIII.

NEW ZEALAND FLAX. See FLAX, NEW ZEALAND.

NEXT FRIEND is, in English law, the name given to the person in whose name, or rather by whose agency, an infant—i.e., a person under the age of 21—sues in the courts of law and equity. The object is chiefly to have some party responsible for costs in case

the infant fails in the action. In practice, the father, if alive, is usually the next friend, but any substantial person may be so. In the court of chancery, a married woman sues or appears by the intervention of a next friend, where she is personally interested.

NEY, MICHEL, a celebrated marshal of the first French empire, was the son of a cooper, and was born at Saarlouis, Jan. 10, 1769. He was a non-commissioned officer in a hussar regiment when the revolution began, and afterwards rapidly rose to high military rank. For the capture of Mannheim by a *coup de main*, he was made a general of division in 1799. He was interim commander of the army of the Rhine for a short time, during which he frustrated by a bold diversion an important movement of the Archduke Charles against Massena and the army of Switzerland. After the peace of Luneville, Bonaparte, anxious to win Ney, with other republicans, to his party, brought about his marriage with a young friend of Hortense Beauharnais, and appointed him inspector-general of cavalry. On the establishment of the empire, he was made a marshal. In 1805 he stormed the intrenchments of Elchingen, and was created duke of Elchingen. He afterward rendered important service in the Tyrol; contributed much to the French successes of 1806 and 1807; and served in Spain with great ability in 1808 and 1809, till he was dismissed by Massena, the commander-in-chief, on a dispute about the plan of the campaign. Chagrined by this, and dissatisfied with Napoleon's despotism, he remained for some time inactive; but in 1812 received the command of the third *corps d'armée*, and greatly distinguished himself at Smolensk and the Moskwa, in consequence of which he was created prince of Moskwa. He also displayed great abilities in the French retreat. He had a principal part in the campaigns of 1813 and 1814, but after the capture of Paris, he urged the emperor to abdicate, and submitted to Louis XVIII., who loaded him with favors. On Napoleon's return from Elba, Ney assured the king of his fidelity, and was sent against Napoleon at the head of 4000 men; but finding the emperor to be received with general enthusiasm, and his own soldiers to be favorable to his cause, Ney went over to his side. In the battle of Waterloo, he commanded the centre, and had five horses shot under him. After the capitulation of Paris, he yielded to the entreaties of his family to retire to Switzerland; but a costly Egyptian sabre, the gift of Napolean, led to his being suspected by an official, and arrested. He was condemned to death for high treason, and was shot in the garden of the Luxembourg on Dec. 7, 1815. He left three sons, who published his *Mémoires* (2 vols. Par. 1833). Some believe that Ney was not actually shot, but was allowed to escape to America, where he lived for a number of years in North Carolina, under the name of P. S. Ney, dying in 1846. See Weston, *Historic Doubts as to the Execution of Marshal Ney* (1895).

NEYRA, DOMINIGO, clergyman, was born about 1689 in Banda Oriental, now Uruguay, studied theology in Spain, where he joined the Dominican order, and returning to America, was ordained priest at Santiago, Chile, in 1713. From 1713 to 1722 he was a professor in the Dominican colleges at Cordova and Buenos Ayres. Through his influence the Dominican province of Banda Oriental was formed in 1724. The years from 1722 to 1729 were passed in Spain, and in the latter year he was made regent of studies in the convent of San Elmo at Buenos Ayres. In 1737 Neyra was chosen prior of the convent at Buenos Ayres; soon became provincial, and established a seminary, and in 1739 went abroad to collect a library and secure a corps of teachers. The war with England was then in progress, and not only was his library captured, but he himself was obliged to remain in Spain till 1748. He wrote a book entitled *Ordênanzas de la moderna provincia de San Agostin de Buenos Ayres.*

NEZ PERCES, a co. in n.w. Idaho, bounded on the w. by Washington; drained by the Clearwater, Salmon, and Lewis or Snake rivers; about 1610 sq.m.; pop. 1890, 2847 with Chinese. Co. seat, Lewiston.

NEZ PERCÉS INDIANS, or SAHAPTIS, a tribe of Indians now on reservations in western Idaho and Washington. They made a treaty with Capts. Lewis and Clarke about 1805. From 1832 to 1847 a Christian mission was maintained among them. The tribe has generally been friendly to the whites, but has not attained a high degree of civilization. In 1854 a treaty was made by a part of the tribe, now known as treaty Indians, but a large number held out against it and were very often engaged in war with the Sioux. Among the reservation Indians, missions have been established, and books have been printed in their language, which have many grammatical peculiarities. They own large droves of cattle and horses. There are now about 1,300 Indians on the reservations in Idaho and Washington.

N'GA'MI, LAKE. The existence of lakes in the interior of Africa was vaguely known as far back as the days of Herodotus; and the earliest modern maps show at least half a dozen large and small, one of which is about the size, and very nearly in the position of that shallow reservoir of surface drainage which was discovered, or at least first visited, by a European in 1849, when Dr. Livingstone and Mr. Oswell, who were aware of its existence from native report, reached its shores by a circuitous route from the Cape Colony. Although since ascertained to be of little importance in the physical geography of these regions, lake N'gami was at first supposed to be in some way connected with the larger inland seas of Nyassa, Victoria Nyanza, and Tanganyika. It is situated in lat. 20° 30′ s.

and long. 23° 30′ e., at a height of about 3000 ft. above the level of the sea, and is connected by a series of sluggish anastomosing streams with the river-system of the Zambesi; its extent as well as depth varies with the fall of rain in the country to the n. of it, but its average size may be taken at 40 m. long, by a breadth of 10 and an area, which appears to be decreasing, of 297 sq. m. In 1853 lake N'gami was reached from the w. coast near Walfish Bay by the traveler Anderson, and there is now a well-beaten route for traders between these two places, and a considerable quantity of ivory and ostrich feathers are annually collected in the neighborhood of the lake. The principal characteristics of the region are rivers, with very sluggish current, and often flowing in different directions to and from the lake, large salt pans and extensive dry flats, covered with dense bush, the haunt of elephants and other large animals. The water of N'gami is generally fresh, but in the dry season beeomes brackish. The e. end is much deeper than the western, and it has been inferred that during the last c. the shape and size of the lake have undergone material alterations. The chief tributary, the Tonke or Tioge, coming from the n.w., is deep, and in June, July, and August brings down vast volumes of water. The Suga or Zouga is the main outlet, runs towards the s.e., and finally disappears in a large salt-marsh.

NGAN-KING-FU, a large and wealthy town of China, in the province of Nganwei. It stands on the left bank of the great river Yang-tze-Kiang 100 m. s.w. by w. of Wuhy. The surrounding country is highly cultivated and very densely peopled. The mineral riches of the neighborhood are also considerable. Ngan-King is a place of busy trade, great part of the goods intended for Nankin passing through the hands of its merchants. The trade is carried on by means of vessels on the river.

NGAN-WHEI, or NGAN-HOEI, an interior province of China; bounded n.e. by Kiang-su, s.e. by Chekiang, s. by Kiangsee, on the w. and n.w. by Houpe and Honan; drained by the Hoai-ho and Yang-tze-Kiang rivers and their tributaries; 48,461 sq. m.; pop. 20,596,288. The surface is mostly level, but broken to the s. and w. by ranges of hills of no great elevation. It contains a number of lakes, of which Chan-Hu or Nest lake is the most important. There are mines of gold, silver, copper, and other metals. The best green tea in China is grown in the s.e. portions of this province. Inks, varnish and lanterns are manufactured.

NIAGARA, a co. in the w. of New York on lake Ontario, traversed by the New York Central and Hudson River railroad and branches and by the Erie canal; 504 sq. m.; pop. '90, 62,491. Co. seat, Lockport.

NIAGARA, chief t. in Lincoln co., in the Canadian province of Ontario, is situated on lake Ontario, at the mouth of the river Niagara, and is distant by water from Toronto 36 miles. Burned down in Dec., 1813, by the American gen. M'Clure on his retreat, it was afterwards rebuilt, and promised to be a flourishing town; but its trade has fallen off, and it is now best known as a summer and pleasure resort. Pop. '91, 1349.

NIAGARA, BATTLE OF, more frequently called battle of Lundy's Lane, was fought by the falls of Niagara on the Canada side, between the British and American forces, on July 25th, 1814. General Brown, who was encamped at Chippewa, opposite Buffalo, with 3000 Americans, received information about noon that the British general, Drummond, had crossed the Niagara at Queenstown, and was moving on the American dépot of supplies at Fort Schlosser. Colonel—afterwards General—Scott was sent with 1200 men to make a demonstration on the enemy's posts at Queenstown, and thus divert him from his purpose. Scott had advanced but two miles, when he came within sight of a small party of British. They retired as the Americans approached, and about sunset a strong force of British under General Riall, and a battery of seven pieces, were discovered on a wooded eminence at the head of Lundy's Lane, and about a mile and a half from Niagara Falls. Scott immediately sent word to headquarters for reinforcements, and at the same time sent Major Jessup with the 25th regiment to turn, if possible, the British left. Scott himself advanced through the woods, a terrible struggle ensued, and Riall and his staff were captured. In the mean time the main body of troops under General Brown came up, and the British were also reinforced, and their battery increased to nine guns. A terrible fire was kept up with heavy loss to the Americans, and it was finally decided to dislodge the British, if possible, from their strong position. The assault was led by two regiments, and when they had nearly reached the guns they were discovered. The first regiment was driven back, but the other under Scott pushed on, captured the guns, and turned them on the British. Three desperate but vain attempts were made by them to regain their lost position, and the struggle was finally terminated about midnight. Generals Drummond and Brown, and Colonel Scott were all severely wounded. Owing to a lack of horses, the Americans were obliged to leave the captured guns, and they were soon in possession of the British again. The American loss was 743; the British, 878.

NIAGARA FALLS, a city in Niagara co., N. Y.; on the Niagara river and the Erie, the Lehigh Valley, the Michigan Central, the New York Central and Hudson River, the Grand Trunk, and other railroads; 20 miles n. of Buffalo. It comprises the former villages of Niagara Falls and Suspension Bridge, and was chartered in 1892. It is the seat of Niagara university (R. C.), and De Veaux college (P. E.), and has several public schools, business college, public library, several hospitals, electrical power companies, flour and paper mills, planing mills, bicycle factory, carbide and carborundum works, gas and electric lights, electric street railroads, over 15 churches, and several national and state banks. There are many objects of historic and scenic interest. See NIAGARA RIVER and FALLS. Pop. '90, village, 5,502; city, 1892 state census, 12,638.

NIAGARA RIVER AND FALLS received their name from the Indians, in whose

language the word *Niagara* means the "thunder of water." A record of a voyage in 1535 by a French mariner named James Cartier contains, it is believed, the first printed allusion to either. In 1603 the first map of the district was constructed by a Frenchman named Champlain; and 75 years later the river and the cataract were visited by Father Hennepin and described at some length in a book. The river receives the waters of all the upper lakes—the Erie, St. Clair, Huron, Michigan, Superior, and a number of smaller ones; and neither the snows of winter nor the evaporation of summer, neither rains nor drought, materially affect it. Its waters flow on, full and clear, perpetually the same, with the exception that about once every seven years they have a gradual rise and fall, which is attributed to some undiscovered disturbance that affects lake Erie. On issuing from lake Erie it is three-quarters of a mile broad; but as it flows on, it becomes several miles wide, making room for a number of islands, the largest of which, Grand island, is 12 m. long, and from 2 to 7 broad. At the foot of Grand island, which reaches within 1½ m. of the *falls of Niagara*, the river is contracted to a breadth of 2½ m., and grows narrower as it proceeds. By this and by the descent in the channel, which is about 60 ft. in the mile above the falls, are produced the swift currents known as the *Rapids*, in which the river, notwithstanding its great depth, is perpetually white with foam. At the falls, which are 22 m. from lake Erie, the river is divided by an island containing about 75 acres, called Goat island; but in consequence of a bend in the channel, by far the larger portion of the water is sent down by the Canadian side. On this side, therefore, is the grander cataract which has been named the *Horseshoe fall*, but no longer bears the name appropriately, as the precipice has been worn from a curved into a somewhat angular shape. This process of wearing away goes on gradually still, and Table Rock, once a striking feature of the Canadian bank, has wholly disappeared. The Horseshoe fall is above 600 yds. in breadth, and about 158 ft. in height. The water is so deep that it retains its green color for some distance below the brow of the precipice; and it rushes over with such force that it is thrown about 50 ft. from the foot of the cliff. One may thus, having donned an oil-skin dress, enter two or three yards behind the curved sheet of water; but the spray is so blinding, the din so deafening, and the current of air so strong, that it requires a tolerably calm nerve and firm foot. The separation caused by Goat island leaves a large wall of rock between the Canadian and American falls, the latter being again divided by an islet at a short distance from Goat island. This fall is from 8 to 10 ft. higher than the Horseshoe, but only about 220 yds. broad. A little above the fall the channel is divided by Bath island, which is connected by bridges with Goat island and the American shore. A small tower, approached from Goat island, formerly stood on a rock over the brow of the Horseshoe fall; and from this the finest view on the American side could be obtained, the Table rock on the Canadian side giving the completest view of the entire cataract. The falls can also be seen from below on both sides, and every facility is given for viewing them from all the best points, while magnificent hotels, Canadian and American, offer their inducements to the tourist to stay till he has received the full influence of the scenery. The river is crossed about 200 or 300 yds. below the falls, where it is 1200 yds. broad. The current is lessened for about a mile, but increases again as the channel becomes narrower and the descent greater. Between 3 and 4 m. below the falls, a stratum of rock runs across the direct course of the river, which, after forming a vast circular basin, with an impassable whirlpool, is forced away at right angles to its old channel. At Niagara Falls city a remarkable piece of engineering work has been completed, by means of a hydraulic canal and a great tunnel that cost about $4,000,000, for the purpose of utilizing the power of the falls for manufacturing.

From the foot of the falls to Lewiston, a distance of 7 m., the river descends 104 ft., running between perpendicular walls 250 ft. high; then the height of the chasm gradually diminishes the next 7 m., and during the remainder of its course to lake Ontario, until it is only about 25 feet. It has long been a theory with geologists that this deep chasm, and consequently the gigantic cataract, has been made by the action of the water on the limestone strata through countless ages. Originally, it is believed, the falls were simply from the plateau that overlooks lake Ontario at Lewiston. Within the short period even of less than a hundred years many changes have occurred that are significant in connection with this opinion. In 1818 large parts of the edge of the precipice on the American side of the falls broke down; in 1828 fragments descended from the Horseshoe falls; and since 1855 several other pieces have broken away. An able report of Prof. James Hall, in 1842, for the state geological survey, also shows that the falls at that time were different in important respects from the description given of them by Father Hennepin, who described a third fall from the Canadian side toward the e., facing the line of the main fall, and caused by a great rock that turned the divided current in this direction. Sir Charles Lyell—in whose work, *Travels in North America*, may be found the most complete accounts of Niagara—estimated that the falls wear away about one foot of the precipice every year, which would be equivalent to an annual displacement of 1,500,000 cubic feet of rock. Other scientists have estimated the displacement at about half an inch of the falls every five years. Dr. Julius Pohlman believes that the falls cut their way back from a point about the present Whirlpool Ra-

pids, showing that between the surveys of 1841 and 1886 the Horseshoe Falls receded 485 feet, or at the rate of nine feet a year.

The great maelstrom called the Whirlpool, some distance below the falls, excites much interest. Its depths are unknown; a thousand feet of cord was found too short to reach its bottom. All the water pouring over the falls passes through the Whirlpool and flows on and out through the cañon. Authorities state that at one time the falls were here and during thousands of years excavated the whirlpool. The grounds about the falls have lost much of their beauty by the destruction of timber and the building of unsightly mills. In 1878 Lord Dufferin, then gov.-gen. of Canada, conferred with Gov. Robinson of N. Y., in regard to taking measures to form an international park about Niagara. Gov. Robinson in his message to the N. Y. legislature, 1879, urged some action in the matter. By resolution the commissioners of the state survey were charged to investigate the question. They found that it would be practicable to restore the scenery about the falls to its natural aspect by clearing away the buildings from a narrow strip of land, 100 to 800 ft. broad and a mile long, and planting it with trees which would screen from view the buildings of the village; a map was made showing what lands should be taken for the purpose. An act providing for the selection and appropriation of the lands was framed, but was defeated in the senate, 1880. Friends of the measure succeeded, however, in keeping alive public interest in the matter, and a society was organized, called the Niagara Falls assoc., through whose efforts the defeated bill was again brought before the legislature and passed, 1883. A commission was empowered to proceed to condemn through the courts the lands needed, which adopted in the main the plan before proposed by the commissioners of the state survey. The lands selected were surveyed and appraised at a valuation of $1,433,429.50. A bill appropriating this sum was passed, 1885, which declares that the lands are purchased by the state, that they may be restored to and preserved in a state of nature; and that every part of them shall be forever free of access to all mankind. Following these directions, the lands were, with form and ceremony, transferred to the state, 1885. The reservation on the Canadian side comprises 154 acres, which cost $436,813, and was formally opened in 1888. At Niagara Falls city, where a number of railroads are concentrated, the river is crossed by a steel suspension bridge, built to replace the original one (1869) which was destroyed by a gale in 1889; by a cantilever railroad bridge, the first of its kind in the United States, built in 1883; and by a steel suspension bridge, north of the cantilever, carrying railroad tracks, a roadway, and footways.

NIARE, *Bos brachicheros*, the wild ox or buffalo of tropical Western Africa, is in size and weight about equal to the smaller breeds of British oxen, but of greater strength. The head is rather small, the muzzle black, the ears long and pointed, and fringed with beautiful silky hair, several inches long. The horns are 10 or 12 in. long, curved backwards, and sharply pointed. The animal is gracefully proportioned, having nothing of the clumsiness of the common buffalo. The body is covered with a coat of thin red hair. The tail is tufted at the extremity with black hair several in. long. Herds of these oxen were seen by Du Chaillu in the open or prairie lands to the s. of the mouth of the Ogobai. They are shy and fierce; if wounded, they turn upon the hunter with terrible fury. No attempt seems yet to have been made to domesticate this animal, which is probably very capable of it, and might be found more suitable than other oxen for warm climates.

NIAS, an important island belonging to Holland, lies to the w. of Sumatra, in 0° 18′ 54″—1° 35′ n. lat., and 97°—98° e. long., and has an area of about 2100 sq. miles. In 1857, when the Dutch took complete possession of the island, the population was reckoned at 170,000. There are several places where ships can anchor and take in provisions, water, etc. On the e. coast is the village of Nias, and on the w. Silorongang. Little islands and coral reefs lie here and there on the coast, which in some places is steep, while mountain-chains run from the s.e. to the north-west. There is a greater breadth of excellent farming-grounds than the population, reduced by internal wars and the exportation of slaves, can properly cultivate. They grow rice, cocoa-nuts, bananas, tobacco, sugar-canes, etc., and raise large quantities of pepper. Cattle and horses have been imported, and they pay great attention to the raising of pigs and fowls. Formerly, about 500 Niassers were carried away annually as slaves to Batavia and other places, but this traffic has been in a great measure suppressed. Its present population is between 200,000 and 250,000.

The Niassers are of the Malay race, but fairer than the Malays usually are. They are gentle, sober, and peaceful, remarkably ingenious in handicraft, ornamenting their houses with wood-carvings, forging arms, etc. The women labor in the fields, the children weave mats, while the men look after the live-stock, and hunt the deer and wild swine. They worship a superior deity, and fear a powerful one, who pursues them if they do evil. Polygamy is permitted, but is rare. The gift to the bride's family is from 60 to 500 dollars. Divorce is not allowed, and adultery is punished by the death of both parties. Dead bodies are placed in coffins above the ground, and creepers and flowering shrubs planted, which speedily grow up and cover them. Trade is on the increase.—See *Malayan Miscellanies*, vol. ii.; *Het Eiland Nias, door* H. J. Domis; Crawford's *Descriptive Dictionary* (London, 1856); *Tydschrift voor Ned. Indië* (1854, 1860); E. Modigliani, *Un Viaggio a Nias* (Milan, 1890), etc.

NIBBY, Antonio, a Roman archæologist of high celebrity, was b. in 1792. He was one of those who, following in the footsteps of Winckelmann, made an elaborately minute investigation of the remains of antiquity their special study. The first work that made him known was his translation of Pausanias, with antiquarian and critical notes. In 1820 he was appointed professor of archæology in the university of Rome. In the same year appeared his edition of Nardini's *Roma Antica;* and in 1837–38, his learned and admirable *Analisi Storicotopografico-antiquaria della curta de Contorni di Roma,* to which was added (1838–40) a description of the city of Rome itself. Among his other writings, may be mentioned his *La Mura di Roma disegnate da W. Gell,* and a large number of valuable treatises on the form and arrangement of the earliest Christian churches, the circus of Caracalla, the temple of Fortuna at Præneste, the graves of the Horatii and the Curiattii, etc. Nibby d. Dec. 29, 1839.

NI'BELUNGENLIED, or '*Niebelunge Not,*' as the words are written in the oldest manuscripts, is one of the most finished specimens of the genuine epic of Germany belonging to the middle ages. There exist twenty more or less perfect manuscript copies of this curious poem, the earliest of which belong to the beginning of the 13th c., from which period till the middle of the 16th c. it enjoyed the greatest popularity among Germans of all classes. Nothing certain is known of the author or authors of the work beyond the fact, that it was put into its present form by a wandering minstrel in Austria about or prior to the year 1210, which is the date of the oldest accredited manuscript. According to W. Grimm and Lachman's critical analysis of the poem, it is in itself a compilation of pre-existing songs and rhapsodies, strung together into one whole upon a plan remarkable for its grand simplicity, although less skill is shown in some instances in the manner in which the several parts are connected. In the more authentic manuscripts the poem consists of only twenty parts, and it is conjectured that the latter portions of the epic, which are given only in some of the texts, as that of St. Gall, are the composition of later compilers. The epic cycle embraced in the Nibelungenlied may be more specially regarded as the fusion of the history of the mythical people, called in the poem the Nibelungen, with five leading groups of myths, in which are incorporated the adventures of some of the most universally popular personages belonging to the semi-historic myths of mediæval German folk-lore, as, for instance, the hero Siegfried with his mantle of invisibility, and the lovely Icelandic heroine Brunhilt; King Günther of Burgundy, and his fair sister, Kriemhilt, the wife of Siegfried; Haco of Norway, Dietrich (Theodoric the great king of the Ostrogoths) of Berne (Verona), and Etzel (Attila), king of the Huns. The loves and feuds, and the stormy lives and violent deaths of these national heroes and heroines, are skillfully intertwined in the Nibelungenlied, and artistically made to center round the mythical treasure of the Nibelungen, which, after the murder of Siegfried, who had brought it from the far north, is secretly buried by his murderer Haco beneath the Rhine, where it still remains. The poem, in its rude but strict versification, tells the tale of Kriemhilt's vengeance for her husband's death with a passionate earnestness that carries the sympathies of the reader with it, until the interest culminates in the catastrophe of the fierce battle between the Burgundians and Huns at the court of Etzel, whose hand Kriemhilt has accepted, the better to accomplish her purposes of revenge. The tale of horrors fitly closes with the murder of Kriemhilt herself, after she has satisfied her vengeance by slaying with Siegfried's sword his murderer Haco. This tale, which seemed to echo back the clash of arms and strife of passion which characterized the early periods of German history, kept a firm hold on the imaginations of the people till the taste for polemic writings, fostered, if not created, at the period of the reformation, caused this as well as many other treasures of folk-lore to be almost lost sight of and forgotten. Attention was again, however, drawn to it in the 18th c., by the publication of detached portions of the poem by Bodmer, *Criemhilden-Rache* (Zurich, 1751), and by Müller in his *Sammlung deutscher Gedichte aus dem* 12–14 *Jahrh.* (Berlin, 1782); but it was not until comparatively recent times that the value of the work in an historical and philological point of view was recognized. Lachmann made known the result of his investigations in 1826. His views were supported by Müllenhoff and Rieger (1856). Holtzmann (1854), on the other hand, asserted that the longest version is the more ancient, and was followed by Zarncke, Hermann, and Fischer. Pfeiffer tried, in 1862, to prove that the author of the present Nibelungenlied was the Austrian Von Kürenberg (*circa* 1140). See Paul's statement of the case in *Die Niebelungenfrage* (1877). All the manuscripts in the Nibelungenlied comprise another poem under the title of *Die Klage,* which treats of the burial of the heroes who fell in the conflict at Etzel's court, and the laments which were composed in commemoration of that event. It is of greater antiquity than the Nibelungenlied, and, like it, the work of an unknown author. A critical analysis of the Nibelungenlied will be found in Carlyle's *Miscellaneous Essays*

NICÆ'A. See Nice.

NICARA'GUA, a republic of Central America, bounded on the n. by the republic of Honduras, on the e. by the Carribean sea, on the s. by the republic of Costa Rica, and on the w. by the Pacific; lat. 10° 45′ to 15° n.; long. 83° 20′ to 87° 30′; area, about 49,200 sq. m.; pop. '95, 380,000, or including uncivilized Indians, 420,000. Nicaragua is traversed by two ranges of mountains—the western which follows the direction of the

coast-line, at a distance of from 10 to 20 m. from the Pacific; and the eastern (a part of the great range of the Cordilleras), which runs nearly parallel to it, and sends off several spurs towards the Caribbean sea. The former is generally high and volcanic, but sinks at times almost to the level of the plains. Between the two ranges lies a great interior basin, containing the lakes of Nicaragua (q. v.) and Managua. The principal rivers are the Rio Coco, or Segovia, forming part of the boundary between Honduras and Nicaragua; the Escondido, or Blewfields; and the San Juan, all of which flow into the Caribbean sea. The eastern coast of Nicaragua is called the Mosquito coast. The country is in many places densely wooded—the most valuable trees being mahogany, logwood, Nicaragua wood, cedar, and Brazil wood. The pastures are splendid, and support vast herds of cattle. The chief products are sugar-cane (softer and juicier than the Asiatic variety), cacao, cotton, coffee, indigo, tobacco, maize and rice, with nearly all the fruits, etc., of the tropics—plantains, bananas, tomatoes, bread-fruit, arrowroot, citrons, oranges, limes, lemons, pineapples, guavas, etc. The chief vegetable exports are sarsaparilla, aloes, ipecacuanha, ginger, copal, gum-arabic, caoutchouc, etc. The northern part of Nicaragua is rich in minerals—gold, silver, copper, iron, and lead—but the mines are not so carefully worked now as under the Spaniards. The incessant political distractions of the country have notoriously all but destroyed the material prosperity of the country. The trade is chiefly with the United States and Great Britain. The seat of government is Managua, with, '91, 27,000 inhabitants; the largest town and former capital is St. Leon, with a population of 34,000. The town of Nicaragua has a pop. of 10,000 to 12,000. There are 91 m. of railroad, which cost $2,700,000.

In 1503 Columbus saw the coast of N., but the Spaniards first entered the country in 1521 under Gil Gonzales de Avila, and it was conquered by Pedro Arias de Avila, the governor of Panama in 1522. In 1821—the great year of revolution in Central America—it threw off allegiance to Spain, and after a desperate and bloody struggle, secured its independence by the help of the "liberals" of San Salvador. Nicaragua in 1824 became the second state in the federal republic of Central America, but on the dissolution of the union in 1839 became an independent republic. In 1847–48 a dispute broke out between Nicaragua and Great Britain about the Mosquito coast, which led to some hostilities, and was only finally settled in 1860. Meanwhile, in 1855, a civil war had broken out between the so-called "conservatives" and "liberals," which resulted in the victory of the latter, who were, however, obliged to call in the help of the since notorious Col. William Walker (see FILIBUSTERS). In 1894 the so-called Mosquito Reserve was reincorporated into the republic by voluntary resolution of the Indians.

By the constitution of Aug. 19, 1858, the republic of Nicaragua is governed by a president, who is elected by universal suffrage, and holds office for four years. There are two legislative chambers—the senate and the house of representatives. Liberty of speech and of the press exists, but is not absolutely guaranteed. The Roman Catholic religion, however, is the only one *publicly* tolerated, but the services of other religious bodies may be privately performed.

NICARA'GUA, LAKE (native *Cocibolca*), a sheet of fresh water in the republic of the same name, 110 m. long, and from 30 to 50 broad. Its elevation above the Pacific, from which it is separated by a low range of hills, is little more than 100 feet.

NICARA'GUA, or RI'VAS, a t., cap. of the department of Nicaragua, Central America, on the western shore of the lake Nicaragua, 60 m. s.s.e. from Managua. Pop. 10,000 to 12,000.

NICARA'GUA SHIP-CANAL. (For its history up to 1889 see INTEROCEANIC SHIP-CANAL.) The Nicaragua Canal Construction Company was in 1895 executing the project under contract with the Maritime Canal Company, the original charter company. On Oct. 8, 1889, Nicaragua formally recognized the beginning of the work of construction, and in September, 1890, appointed a commission to see that the company held to the concession, which required the spending of at least $2,000,000 within the last year of the second term. According to the surveys made in the first term of two and one-half years, the entire length of the canal route is 169.5 miles. The highest level is Lake Nicaragua, 100 ft. above sea level, which is reached by means of three locks on each side. The bottom width of the canal is to be from 80 to 120 ft., and the upper width from 80 to 288 ft., while the depth is to vary only between 28 and 30 ft. Of the total route 142 m. are included in the river San Juan, the artificial basins and the lake, while the entire length of the summit level reach is 151 miles, for which distance vessels may proceed rapidly. The whole estimated cost of the canal is $90,000,000, not including commissions, bankers' fees, and interest during the construction. If the tonnage rates in force on the Suez canal are charged, a total revenue of $17,500,000 will probably accrue. The estimated time for the construction of the canal is six years.

NICASTRO, a t. of s. Italy, in the province of Calabrie, is most beautifully situated w. of the Apennines, on the margin of the coast plains, and commanding views of the sea, 16 m. w.n.w. of Catanzaro. It is the see of an archbishop. There are hot springs in the vicinity. Pop. about 10,300.

NICCOLA PISANO, a distinguished sculptor of Pisa, to the influence of whose works the rise or restoration of sculpture in connection with Gothic architecture is mainly attributable. There is no record of the date of his birth, but it is believed to have been between 1205 and 1207. He was born at Pisa and is thought by some to have been the son of one Pietro da Siena, a notary. His earliest work is supposed to be the "Deposition," over one of the doors of the façade of the cathedral at Lucca, dated 1237. He

worked on the principle of studying nature, modified or corrected by the ideal of antique sculpture; and it is said that he first adopted this principle from the sculpture on an ancient sarcophagus brought from Greece in the ships of Pisa; but, though most of the finest specimens of Greek sculpture were not discovered till long after Niccola's time, he must have had an opportunity of studying many important remains on the various classic ruins with which Italy abounds. This sculptor's reputation is supported by three important works, which remain and are still admired for their excellence—the pulpit of the baptistery at Pisa, the "arca" or shrine of St. Dominic for the church of that saint at Bologna, and the pulpit of the cathedral at Siena. The first of these was finished in 1260, and is reckoned the most elegant pulpit in Italy. It is of white marble, six-sided, supported by seven Corinthian columns, and adorned with five bas-reliefs of subjects from the New Testament. The second work, the "arca" of St. Dominic, is one of even greater extent. It is composed of six large bas-reliefs, delineating the six principal events in the legend of San Domenico and is ornamented with statues of our Savior, the virgin, and the four doctors of the church. The operculum or lid was added about 200 years afterwards. The subjects on the pulpit at Siena, the third of these works, are the same as those on that at Pisa, with the substitution of the "Flight into Egypt" and the "Massacre of the Innocents" for the "Presentation"; and the enlargement of the concluding composition, the "Last Judgment." In these compositions there is great felicity of invention and grouping, truth of expression, and grace in the attitudes and draperies; and in that of the "Last Judgment" the boldness displayed in the naked figures, twisted and contorted into every imaginable attitude, is wonderful, and evinces the skill with which Niccola drew on the antique and on nature. But it must be admitted that there is a degree of confusion or overfullness in the grouping, and that the heads of his figures are often large in proportion to the bodies; faults incidental to all early efforts. In this last work it appears by the contract for its execution that Niccola was assisted by his scholars Lapo and Arnolfo, and his son Giovanni; and this accounts for a certain feebleness that may be observed in portions of it. He died at Pisa in 1278, and was buried in the Campo Santo. Niccola's influence on art extended widely; his pupils Arnolfo and Lapo executed numerous works at Rome, Siena, and other cities. His son and heir in reputation, though not his equal in talent, Giovanni Pisano, was constantly engaged on works of importance; in Pisa, where the Campo Santo (for he was also an architect) was erected from his designs; in Naples, which he visited on the invitation of Charles I. of Anjou; at Arezzo, where he executed the marble shrine of St. Donato for the cathedral; at Orvieto, the bas-reliefs on the *facerata* of the Duomo, by many ascribed to Niccola, being by him; at Pistoja, where he executed the pulpit, etc. The year of his death is not ascertained; it was probably about 1320; After Giovanni's death the Pisan school split into two principal branches, Florence and Siena; that of Naples may also be reckoned a branch, from the influence exercised over it by Giovanni.—Andrea Pisano, the ablest of Giovanni's pupils, was called to Florence to execute in marble the statues, bas-reliefs, etc., designed by Giotto in ornamenting the cathedral of S. Maria del Fiore, then in course of erection. The talent he displayed soon raised him to a high position and important employment. He executed numerous statues for the façade of the cathedral, and a bronze gate for the baptistery, of very great excellence. This gate still exists, along with the later and still more celebrated gates of Ghiberti. Under the influence of Giotto's genius he became completely Giottesque in thought and style; and his works bear so distinctly the impress of that master-mind that the design of many of them, and particularly the baptistery gate, are ascribed to Giotto. He died in 1349, aged 79. See Vasari; *Christian Art*, by lord Lindsay; Agincourt, *Davia Memorie Istoriche;* Rosini, *Storia, etc.;* Cicognara (tom. i.), *Monumenti Sepolcrali della Toscana.*

NICCOLINI, Giovanni Battista, a distinguished Italian poet, was b. in 1782, in the vicinity of Pisa, of a noble but impoverished family. Niccolini's first literary efforts were full of high promise of the classical and antique beauties which characterize his finest compositions, and in 1810 he was crowned by the Crusca academy. Through the influence of the queen of Etruria he was appointed secretary of the Academy of Fine Arts, where he delivered to the young artists lectures on history and mythology; but on the fall of the Bonaparte sovereigns this post was withdrawn from the poet. In 1805 the grand duke Ferdinand appointed him librarian in the Pitti Palace, an office he resigned in order to escape the servility of court dependence. By the death of a relative he acquired wealth and the power of exclusively devoting himself to literature, and published several much-admired essays and lectures; and in 1827 appeared his noble work *Antonio Foscarini.* In 1835 Niccolini published anonymously his best poem—*Arnaldo da Brescia*—and nothing finer has been written in modern Italian, whether it be viewed as a classical creation, full of life and poetry, or as a work of glowing patriotism. Niccolini lived in the enjoyment of fame and honors to a ripe old age, and died at Florence in 1861.

NICE, or Nicæa, formerly a city of Bithynia, in Asia Minor, situated on the eastern shore of lake Ascania. It was built, or rather rebuilt (for an olden town had existed on its site), by Antigonus, the son of Philip (316 B.C.), and received the name of Antigoneia, which Lysimachus changed to Nicæa, in honor of his wife. It was a handsome town, and of great importance in the time of the Roman and Byzantine emperors; all the streets crossed each other at right angles, and from a magnificent monument in the center the four gates of the city were visible. It is famous in ecclesiastical history for two

councils held in it—the first and seventh ecumenical councils. The FIRST COUNCIL of Nice was held 325 A.D., and was convened by the emperor Constantine, in concert, according to Roman Catholic historians, with the Roman pontiff, for the purpose of defining the questions raised in the Arian controversy. (For details of the proceedings, so far as regards Arius, the reader is referred to ARIUS.) The supporters of Arius at first are said to have numbered upwards of twenty; but ultimately the decree condemning him was subscribed by the whole body of the council, the number of dissentients being, according to the highest computation, only five, while the most probable account reduces it to two. The NICENE CREED adopted in this council forms the subject of a separate article. In addition to the Arian question the council of Nice also deliberated on a schism, called the Meletian schism, which at that time divided the church of Egypt, and the particulars of which have formed a subject of recent controversy. The decree of Nice appears to have been founded on a compromise, but did not effectually suppress the schism. The decree of Nice on the celebration of Easter was of wider application, and met with universal acceptance, the few recusants being thenceforward called quartodecimans (q.v.). This council also enacted twenty canons of discipline. For a minute and picturesque description of this council see Dean Stanley's *History of the Eastern Church*.—The SECOND COUNCIL OF NICE, called also the seventh ecumenical council, was assembled under the empress Irene (787), who was regent during the minority of her son Constantine, for the purpose of reconsidering the subject of images. The tenor of the decree on images is detailed under that head. In the west the question of the acceptation of this council was the subject of considerable controversy, arising, in great measure, from a grossly erroneous Latin translation of the acts, which for a time obtained extensive circulation.

NICE (Ital. *Nizza*), seaport and episcopal city, cap. of the department of the Alpes Maritimes, France, is situated on both sides of the river Paglione, 100 m. s.s.w. of Turin, and about the same distance e.n.e. of Marseilles. Pop. '72, 42,363; '96, 93,760. It consists of three principal parts—the *Quartier de la Croix de Marbre*, or *New Town* (on the right bank of the Paglione), the *Old Town*, and the *Port*. The first of these is much frequented by foreigners, particularly English (whence its name of "English town"). It is close upon the river, has a handsome quay filled with gay shops, and a splendid square called the Jardin public. Two bridges over the Paglione connect it with the old or upper town, which extends back to the foot of a hill called the Castle hill. The old town is excessively dirty, and has narrow, stinking streets, with macaroni and confectionery shops, grocery establishments, slaughter-houses, etc. The port, almost separated from it by the Castle hill, is crowded with a seafaring population. The harbor admits vessels drawing 15 ft. of water, but it is difficult of entrance. The Castle hill, an isolated mass of limestone 800 ft. high, receiving its name from having been crowned by a strong castle, now in ruins, is laid out in public gardens, and affords an extensive and splendid prospect out to sea. The chief public buildings are in the Corso, or in the adjoining streets, in one of which there is an English library and reading-room. There is an Episcopalian, and also a Presbyterian church in Nice, and an English cemetery. The most attractive promenade in the old town is the *Terrace*, from 15 to 20 ft. high, erected as a protection to the town against a stormy sea. But the most agreeable and fashionable drive and promenade is the *Promenade des Anglais*, extending for a mile along the shore from the right bank of the Paglione, and skirted on one side by elegant villas and hotels. Beggars are numerous, owing, doubtless, to the great influx of visitors. Fine as the usual winter and spring weather of Nice is, it is exposed to the n. winds, or *mistral*, which during these seasons often brings a temperature which in England would be considered cool, or even cold, in April or October. The *Quartier Carabacel* is the most sheltered part of the place, and therefore the best for an invalid. Dust and bad drainage are the drawbacks to the amenity of Nice; but this is true with regard to most of the places of winter resort in the south. The mean January and February temperature is 47°, equal to that of April in England; March is 52°; April 58°, about the same as June in England, or July in Scotland.

The ancient Ligurian town of Nicæa, founded, it is said, by a colony of Phocæans from Massalia (Marseilles), became subject to Rome in the 2d c. B.C. It probably occupied the Castle hill, rather than the site of the present city. Subsequently it passed into the hands of the Goths, Burgundians, Visigoths, kings and counts of Arles, the Angevine sovereigns of Naples, and the dukes of Savoy (1388), in whose family it remained till 1860, when it was ceded to France.

NICE, COUNCILS OF, the first of which, held 325 A.D., is properly called ecumenical. It was convened by the Emperor Constantine who, with the invitation sent to each bishop, provided public conveyance for himself, two presbyters, and three servants. The empire had at the time about 1800 bishops, 1000 of whom were in the Greek provinces, and 800 in the Latin. Of these, according to the statement of Athanasius, 318 attended the council, of which only 1 was from the Latin church. The total number of delegates, including presbyters and others, was probably more than 1500. The eastern provinces were largely represented. Many of the members were venerable and illustrious men, among whom were Eusebius, eminent for learning; Athanasius, then only a young deacon, attendant on the bishop of Alexandria, small and insignificant in person,

but conspicuous for intellect, eloquence, and zeal: Arius, a parish-priest of Alexandria, 60 years old, tall and emaciated in person, wild, sometimes almost to madness, in manner ascetic, and negligent in dress, yet having a sweet voice, and fascinating speech; Potamon of Herakles; and Paphnutius, of the upper Thebaid, whose right eye had been dug out with a sword, and the empty socket seared with a hot iron; Paul of Neo-Cæsarea, also scarred by the brand of hot iron which had crippled both his hands; Jacob of Nisibis, who had spent years as a hermit in forests and caves, subsisting on plants and roots; Spiridion of Cyrus, continuing, even after his ordination, a literal shepherd; Hosius of Cordova, the ablest and best of the western delegates; two Roman presbyters, influential as representing Sylvester, the bishop of Rome, who was kept at home by the infirmities of age; a Persian bishop from the eastern frontier, and a Gothic bishop from the north. Constantine's object in convening the council, as announced in his opening address, was to heal the divisions in the church, the system of which, he said, had surprised and distressed him. There were two principal controversies then raging—one of them doctrinal, relating to the nature of Christ, and the other ritualistic, having reference to the time for the observance of Easter. At the opening of the discussions on the former there seemed little prospect that the emperor's prayer for harmony among the delegates would be answered. Accusations and recriminations were bandied to and fro without regard to his presence. He was unmoved amid the angry voices, turning from one side of the hall to the other, giving attention to the questions proposed, and bringing together the angry partisans. Laying aside his stately Latin he addressed them in broken Greek, praising some, persuading others, shaming a third class, and directing all his energies to the one point of securing unanimity of decision. The first sessions were devoted chiefly to a discussion of the Arian views, accompanied with an examination of Arius himself. He maintained that the Son of God was a creature, though indeed the most exalted of all; that he had been made out of nothing; that there was a time when he did not exist; and that, in his own free will, he was capable of right and wrong. The songs which he had written to popularize his opinions were sung in the council; and, apparently by himself, dancing like an eastern dervish while he uttered their wild, abstract statements in long straggling lines. The first attempt to reach a decision was made by producing an ancient creed of Palestine, the basis of that which was ultimately adopted, but opposed at first by the orthodox—the more violently, because the Arians were willing to adopt it. A letter having been read from Eusebius of Nicomedia, in which he declared that to assert the Son to be uncreated would be to say that he was of one substance (ὁμοοῦσιος with the Father; the expression was laid hold of as furnishing the very test for which they were seeking. The creed, as finally adopted, was as follows: "We believe in one God, the Father, Almighty, Maker of all things, both visible and invisible; and in one Lord, Jesus Christ, the Son of God, begotten of the Father; only begotten—that is to say—of the substance of the Father; God of God, Light of light, very God of very God; begotten—not made—being of one substance with the Father; by whom all things were made, both things in heaven, and things in earth; who for us men, and for our salvation, came down and was made flesh, and was made man; suffered, and rose again on the third day; went up into the heavens; and is to come again to judge the quick and the dead; and in the Holy Ghost." But those that say "there was when He was not," and "before He was begotten He was not;" and that "He came into existence from what was not;" or who profess that the Son of God is a different person or substance; or that he is created, or changeable, or variable, are anathematized by the Catholic church. The second controversy determined at the first council of Nice had reference to the time for observing Easter, and was the most ancient in the church. Its name—the "quartodeciman"—or, fourteenth-day controversy, was derived from the Jewish rather than the Christian calendar. The question in dispute was, Ought the Christian passover to be celebrated on the same day as the Jewish—the 14th day of the month Nisan—or on the following Sunday? This fundamental question became entangled with others relating to the fast of 40 days, and to the changes in the vernal equinox. On the one side were the apostolic traditions, and on the other the new Catholic spirit seeking separation from Jewish ideas. At the date of the council the Judaic time was observed by the principal eastern churches; and the Christian time by the western churches, with a part of the eastern. The decision was in favor of the Christian time; not as a matter of doctrine to be received under penalty of anathema, but as determined by common consent on the principle that the will of the majority should prevail. Some smaller matters also were decided by the council, and 20 canons passed on various subjects pertaining to morality and religion. II. The second council of Nice, incorrectly called the seventh ecumenical, convened first in 786 by the Empress Irene and her son Constantine, was dissolved, because of the tumults raised by the image-breaking party, and reassembled the following year. Three hundred and seventy-five bishops attended from Greece, Thrace, the isles of the Archipelago, Sicily, and Italy. The council was occasioned by the emperor's ill-judged severity in forbidding the use of images for any purpose, and causing them everywhere to be removed and destroyed; and by the violent opposition to his course. At a council assembled 754, in Constantinople, consisting of 338 bishops, a decree was published against the use of images. To revoke this decree was the object for which Irene summoned the second council of Nice. At the fifth session this object was accomplished by the passage of an order that images should be restored to their places, and car-

ried in procession as before. At the next session it was affirmed that the eucharist is nowhere spoken of as the *image* of our Lord's body, but as the very body itself. At the seventh session it was decided that images ought to be exposed to view in order to excite love toward the objects represented by them, and that salutation and adoration of honor ought to be paid to them, but not the worship which belongs to God alone. For a long time this council was not recognized by the French. Their chief objections to it, as contained in the Caroline books, written by order of Charlemagne, were: 1. That no western bishops, except the pope, by his legatees, were present. 2. That the decision was contrary to their custom, which was to use images, but not in any way to worship them. 3. That the council was not assembled from all parts of the church; nor was its decision in accordance with that of the Catholic church. These objections were answered by pope Adrian, but with little effect on the Gallican church.

NICENE CREED, a detailed statement of doctrine, which forms part of the liturgy of the Roman, Oriental, and Anglican churches, and is also received as a formulary by many of the other Protestant communions. It was drawn up principally by Hosius of Corduba, and is called by the name of the council of Nice, although nearly one-half of its present clauses formed no part of the original Nicene formulary; while, on the other hand, that document contained a series of anathemas condemnatory of specific statements of Arius, which find no place in the present so-called Nicene creed. The distinctive characteristic of the creed drawn up in the council was the word *Homoousios.* (See Homoousian.) Its clauses correspond (except in a few verbal details) with those of the modern formulary as far as the words "I believe in the Holy Ghost;" after which follow the anathemas referred to above. The remaining clauses of the present creed, although they seem to have been in public use earlier, were formally added in the first council of Constantinople (381), with the exception of the clause, "And from the Son," which was introduced in various churches of the west in the 5th and 6th centuries; and ultimately its formal embodiment in the creed, has continued a subject of controversy with the Greeks to the present day. See Greek Church. This creed appears to have been used in the public liturgy from the latter part of the 5th century. Its position in the liturgy varies in the different rites. In the Roman liturgy it is read on all Sundays, feasts of our Lord, of the blessed Virgin Mary, apostles' days, and all the principal festivals, but not on week-days, or the minor saints' days.

Several Arian creeds, in opposition to that of Nice, were drawn up at Sirmium and elsewhere (see Liberius), but none of them met with general acceptance.

NICEPHORUS, patriarch of Constantinople, 750–828; b. Constantinople. He was the son of Theodore, imperial secretary of Constantius Copronymus. He first held high office at court. In 787 he was present as imperial commissioner at the Nicene council, where, in defense of image-worship, he opposed the iconoclasts. This zeal for image-worship he inherited from his father. Soon after his return to the capital he retired to a convent, whence, in 806, he was called to be patriarch of Constantinople. Leo the Armenian, who became emperor in 813, passed an edict in 814 against the worship of images. But neither menaces nor entreaties could induce Nicephorus to assent to it. He became unpopular at court, and in the ensuing year was deposed, and withdrew to the convent of St. Theodore, which he himself had founded, and remained there till his death. He is sometimes called *Homologeta,* or *Confessor,* because of his vigorous opposition to the Iconoclasts, and his subsequent deposition. He published several valuable ecclesiastical works, characterized by great beauty of style. His historical productions are distinguished for accuracy, discernment, and erudition. The most important are *Breviarium Historicum,* a historical abridgement, published with a Latin translation and notes by Father Petra, in Paris, in 1616; and M. Cousins has given a French translation of it in his *History of Constantinople; Chronographia Brevis,* a short chronicle of events from the beginning of the world to the author's time, with the series of kings, emperors, patriarchs, bishops, etc. It was translated into Latin, and published with notes, by Father Goar, Paris. Nicephorus is numbered among the saints in both the Greek and Roman churches.

NICHE, a recess formed in a wall to contain a statue or some ornamental figure. In classical architecture, the niches are generally square recesses with canopies formed by small pediments. In Gothic architecture, the niche is one of the most frequent and characteristic features; the door-ways, buttresses, and every part of the buildings being in many instances ornamented with niches and statues in endless variety.

NICHIREN, b. at Kominato, province of Awa, Japan, 1222; the founder of one of the largest, wealthiest, and most influential sects of Japanese Buddhists, and the great revivalist of Buddhism in the 13th century. He became a profound student of those Chinese and Sanscrit texts containing the writings of Buddha's first apostles, whose richness and genuineness Prof. Max Müller has recently acknowledged. After many years spent in preaching, founding temples, and making missionary tours, he died at Ikegami, near Tokio, in 1282. He was several times exiled, wrote several works, still extant, and probably did more than any other man to bring all Japan under the tenets of Buddhism. His place of decease is visited annually by thousands of pilgrims, who come on foot or by railway. The Nichirenites are the "ranters" of Buddhism; and probably the grossest

form of the modern degenerate religion of Buddha finds its expression, with an outward show of great intellectual ability, among the disciples of Nichiren.

NICHOL, JOHN, LL.D., b. Scotland, 1833; only son of Prof. John P. Nichol, late professor of astronomy; received an education at the university of Glasgow, 1848–55. In the latter year he went to Balliol college, Oxford, where he pursued his studies until 1859; and in 1861 he was appointed professor of English literature in the university of Glasgow. In 1873 the degree of LL.D. was conferred upon him by the ministry of St. Andrews. He became a successful tutor, having directed the studies of 150 candidates for Oxford; and popular as a lecturer, having given more than 200 addresses on miscellaneous subjects, and to classes of ladies in special branches of study, in various parts of Great Britain. During the American civil war he espoused the union cause, and, as well by its advocacy as by his Broad Church doctrines, made himself a mark for hostile comment in Scotland. He contributed to the *Westminster*, *North British*, and other reviews; was one of the writers on the *Encyclopædia Britannica;* and published *Fragments of Criticism*, a volume of essays (1860), *Hannibal*, a classical drama (1872), *Byron*, in the *English Men of Letters* series (1880), *American Literature, an Historical Review* (1882), *Landmarks of English Literature* (1882), *Lord Bacon's Life and Philosophy* (1887–89), etc. He d. in 1894.

NICHOL, JOHN PRINGLE, 1804–59; b. Scotland; at first a school-teacher, then a minister. His fondness for scientific studies led him to give up the ministry, and he became a popular lecturer and writer on astronomy. Among his works on this subject may be mentioned *Views of the Architecture of the Heavens* (1838); *Contemplations on the Solar System* (1844); *Exposition and History of the Planet Neptune* (1848); *The Stellar Universe* (1848); *The Planetary System, its Order and Physical Structure* (1851). He published also *A Cyclopædia of the Physical Sciences* (1857). He was professor of practical astronomy at the university of Glasgow.

NICHOLAS, a co. in n.e. Kentucky, intersected by the Louisville and Nashville railroad; 190 sq. m.; pop. '90, 10,764, chiefly of American birth, with colored. It is drained by Licking river, forming its n.e. boundary, and the South Fork as its s.w. border. Its surface is undulating, rising in the n. into considerable elevations. Blue Lick spring is celebrated for its medicinal qualities. The soil is calcareous and very fertile, producing every variety of grain, dairy products, tobacco, wool, and sorghum. It has distilleries and manufactories of flour and lumber. Co. seat, Carlisle.

NICHOLAS, a co. in central W. Va., intersected centrally by the Gauley river forming a part of its w. boundary; about 720 sq. m.; pop. '90, 9309, chiefly of American birth, with colored. It is drained by Meadow river and Buffalo creek, also Birch river in the n.e. and numerous rivulets. Its surface is diversified, much of it rising into high hills; in the n.e. is Birch mountain. Its soil is moderately fertile, producing corn, oats, wool, dairy products, and sorghum. Live stock is raised. A large proportion of the surface is covered with forests, and coal and iron are found. Co. seat, Summersville.

NICHOLAS, the name of five among the Roman pontiffs, of whom the following alone appear to call for separate notice.—Nicholas I. was born of a noble Roman family, and on the death of Benedict III., in 858, Nicholas was elected to succeed him, and was consecrated in St. Peter's church, in the presence of Ludwig II., emperor of Germany. The earliest incident of importance of his pontificate is his conflict with Photius (q.v.), who had been intruded into the see of Constantinople after the deprivation of Ignatius. Nicholas demanded from the emperor the restoration of Ignatius, as well as the withdrawal of certain attempted invasions of the jurisdiction of the west. On the refusal of his demand, Nicholas excommunicated Photius (see GREEK CHURCH), and that patriarch, in return, assembled a council at Constantinople, and retorting upon his rival the same sentence, alleged that with the translation of the seat of civil sovereignty from Rome to Constantinople the ecclesiastical supremacy was likewise transferred. The emperor Michael supporting Photius in his claim, Nicholas failed to command submission to his sentence; nor was it till the following reign, that of Basil the Macedonian, that Photius was deposed, and Ignatius restored to his see. Meanwhile, however, Nicholas had been embroiled with the emperor Ludvig. The pope had been appealed to by the unjustly divorced wife of Ludvig's younger brother, Lothaire, king of Lorraine, and had appointed legates to inquire into and report upon the case; and the legates having exceeded their powers by giving a sentence in favor of Lothaire, the pope declared their sentence null, and excommunicated them. Ludvig espoused their cause, and marched his troops to Rome, in order to enforce satisfaction. After some hostile demonstrations, the emperor, terrified, it is said, by his own sudden illness and some fatalities which befell his followers, desisted from the enterprise, and withdrew his troops. Lothaire was forced to make submission; the decree of Nicholas was enforced, and Theutberga was formally reinstated in her position as a wife and queen. Nicholas died in 868.—NICHOLAS V. was originally called Thomas Parentucelli. Born at Pisa in 1398, he was educated at Florence and Bologna, and having fixed his residence in the latter city, he was eventually named bishop of that see by the pope, Eugenius IV. During the troubled period of the councils of Basel and Florence, and in the difficult negotiations with the German and other churches which arose therefrom, he conducted himself with such ability and prudence, that on the death of Eugenius IV. he was chosen to succeed him on Mar. 6, 1447. At this time, the anti-pope, Felix V., still maintained

himself, although supported by a very small party; but Nicholas prevailed on him to abdicate, and thus restored the peace of the church in 1449. In the judgment of the literary world, however, the great distinction of the pontificate of Nicholas lies in the eminent service which he rendered to that revival of letters which dates from his age. The comparative repose in which he found the world at his accession, enabled him to employ, for the discovery and collection of the scattered master-pieces of ancient learning, measures which were practically beyond the resources of his predecessors. He dispatched agents to all the great centers, both of the e. and the w. to purchase or to copy every important Greek and Latin manuscript. The number collected by him was about 5,000. He enlarged and improved the Roman university. He remodelled, and may almost be said to have founded, the Vatican library. He caused translations to be made into Latin of most of the important Greek classics, sacred and profane. He invited to Rome the most eminent scholars of the world, and extended his especial patronage to those Greeks whom the troubles of the native country drove to seek a new home in the west. Alarmed by the progress of the Turkish arms in Asia, he endeavored to arouse the Christian princes of Europe to the duty of succoring their brethren of the e.; but the age of enthusiasm was past, and he was forced to look on inactively at the fall of Constantinople in 1453. This event, by forcing a large number of learned Greeks to repair to Italy and other countries of the w., contributed powerfully to that progress of learning which Nicholas had deeply at heart; but he scarcely lived to enjoy this result, having died two years later, in 1455, at the comparatively early age of 57. He must not be confounded with an anti-pope of the same name, Peter de Carborio, who was set up, in 1328, by Ludvig of Bavaria, in antagonism to John XXII. (q.v.).

NICHOLAS, Saint, a highly popular saint of the Roman Catholic church, and reverenced with still greater devotion by the Russian church, which regards him as a special patron, was one of the early bishops of Myra in Lycia. The precise date of his episcopate is a subject of much controversy. According to the popular account he was a confessor of the faith in the last persecution under Maximinian, and having survived until the council of Nice, was one of the bishops who took part in that great assembly. This, however, seems highly improbable. His name does not occur among the signatures to the decrees, nor is he mentioned along with the other distinguished confessors of the faith who were present at the council, either by the historians, or what is more important, by St. Athanasius. He may, with more probability, be referred to a later period; but he certainly lived prior to the reign of Justinian, in whose time several of the churches of Constantinople were dedicated to St. Nicholas. Of his personal history hardly anything is certainly known, and the great popularity of the devotion to him rests mainly on the traditions, both in the w. and in the e., of the many miracles wrought through his intercession. He is regarded, in Catholic countries, as the especial patron of the young, and particularly of scholars. In England, his feast was celebrated in ancient times with great solemnity in the public schools, Eton, Sarum cathedral, and elsewhere; and a curious practice founded upon this characteristic of St. Nicholas, still subsists in some countries, especially in Germany. On the vigil of his feast, which is held on Dec. 6, a person in the appearance and costume of a bishop assembles the children of a family or of a school, and distributes among them, to the good children, gilt nuts, sweetmeats, and other little presents, as the reward of good conduct; to the naughty ones, the redoubtable punishment of the "Klaubauf." The supposed relics of St. Nicholas were conveyed from the e. to Bari, in the kingdom of Naples, towards the close of the 11th c.; and it is a curious fact that in the Russian church the anniversary of this translation, May 9, is still observed as a festival.

NICHOLAS, Saint, is regarded also as the patron saint of sailors, as well as of parish clerks, and of thieves or "knights of St. Nicholas." From the nearness in time of the saint's festal day to that of the Nativity, St. Nicholas became connected with the legends and festivities of Christmas week, and synonymous or nearly so with Santa Claus and the Dutch Kriss Kringle. By the Dutch settlers of New York St. Nicholas was regarded with special favor, and to this day his festival is annually observed with great hilarity by the St. Nicholas society of Manhattan island. *The Visit from St. Nicholas* is the title of Dr. Moore's well known song, beginning: "'Twas the night before Christmas, and all through the house, etc." In art, St. Nicholas is represented as clad in episcopal robes and carrying three purses, three golden balls, or three children, referring to three different stories illustrating the saint's charity. See Befana.

NICHOLAS I., more properly Nikolai Paulovitch, emperor of Russia, was the third son of Paul I., and was b. at St. Petersburg, July 7, 1796. He was very carefully educated under the eye of his mother, a princess of Würtemberg, and subsequently devoted his attention to military studies and political economy, without, however, giving evidence of any natural capacity for these subjects. He visited England and other European countries in 1816, and in the same year made a tour through the Russian provinces. On July 13, 1817, he married Frederika-Louisa-Charlotte-Wilhelmina, the eldest daughter of Frederic William III. of Prussia, and lived in domestic retirement till the death of Alexander I. (December 1825), when, owing to the resignation of his elder brother Constantine, he succeeded to the throne of Russia. A long-prepared military conspiracy broke out immediately after his accession, which he suppressed with

great vigor and cruelty. Capital punishment, which had been abolished by the empress Elizabeth, was revived, for the purpose of inflicting it upon the leaders of the insurrection. The rebels were hunted down with merciless energy, and in no case, even after the rebellion ceased to be in the least degree dangerous, was their punishment commuted. Instead of pursuing the course upon which Alexander had entered—cultivating the mind of the nation, so as to base his government upon education and intelligence—Nicholas, after a brief ebullition of reformatory zeal, reverted to the ancient policy of the czars, absolute despotism, supported by mere military power. His first great measure, the codification of Russian law, was commenced in 1827, and completed in 1846.

Soon after his accession, a war with Persia commenced, but it was concluded on Feb. 28, 1828, by the peace of Turkmanshai, which gave a considerable extent of territory to Russia. In the same year he entered upon a war with Turkey, in which victory, though at enormous cost, constantly attended his arms, and the peace of Adrianople (q. v.) obtained for Russia another increase of territory, the free navigation of the Danube, with the right of the free passage between the Black and Mediterranean seas. The political movements of 1830, in the west of Europe, were followed by a national rising of the Poles, which was suppressed after a desolating contest of nine months, in which the utmost efforts of the whole military resources of Russia were required. Nicholas punished the rebellion by converting the kingdom of Poland into a mere Russian province, and strove to extinguish the Polish nationality. This policy, however, was viewed with great dissatisfaction throughout Europe, and the vanquished Poles were everywhere regarded with general sympathy. Russia, by Nicholas's mode of government, became more and more separated from the fellowship of the western nations. Intellectual activity was, as far as possible, restrained to things merely practical, education limited to preparation for the public service, the press was placed under the strictest censorship, and every means used to bring the whole mind of the nation under official guidance. His Panslavism (q. v.) also prompted him to Russianize as much as possible all the inhabitants of the empire, and to convert Roman Catholics and Protestants to the Russian Greek Church, of which the Czar is the head. The independence of the mountaineers of the Caucasus was inconsistent with his schemes, and war was consequently waged against them with the greatest energy and perseverance, although with little success, and at the cost of immense sacrifices both of money and lives. The extension of British influence in Central Asia was also viewed by him with alarm, and was attempted to be counteracted by various means, amongst which was the expedition for the conquest of Khiva in 1839, which failed so signally (see KHIVA). Between 1844–46, he visited England, Austria, and Italy. During the political storm of 1848–49 he abstained from interference, watching, however, for an opportunity of doing so with advantage to Russian interests. The opportunity was at last found in the request of the emperor of Austria for his assistance to quell the Hungarian insurrection. This good service rendered Austria, as he thought, a faithful and firm ally. He succeeded at the same time in drawing closer the bonds of alliance between the Russian and Prussian monarchies, a proceeding fraught with the most mischievous consequences to the latter power. The re-establishment of the French empire still further tended to confirm these alliances, and led Nicholas to think that the time had at length come for carrying into effect the hereditary Russian scheme for the absorption of Turkey; but the unexpected opposition of Britain and France, and his own invincible repugnance to give up his long-planned scheme of conquest, brought on the Crimean war, during the course of which he died at St. Petersburg, Mar. 2, 1855, of atrophy of the lungs; but his death was undoubtedly hastened by chagrin at the repeated defeats which his arms sustained, and by over-anxiety, and the excessive labor he underwent to repair his losses. He was remarkable for temperance, frugality, and patriotism, but equally so for vanity and ostentation. He was fanatically beloved by his Russian subjects, and was at the same time regarded by them with feelings of awe, a tribute to his lofty stature and imperial deportment, which gave him the most intense pleasure. This extreme vanity seems, to some extent, to have affected his mind, and to have been partly the cause of his political blundering towards the close of his reign.

NICHOLAS I., Prince of Montenegro, b. 1841; educated in Cettinge, Trieste, and at the Paris military academy, returning to Cettinge when about 20 years old. In 1860 occurred the assassination of Prince Danilo, the uncle of Nicholas, who was immediately proclaimed prince; and the same year married the daughter of the waywode Peter Valsetitch, by whom he has an heir, Danilo Alexander, b. 1871, and several sons and daughters. In the first part of his reign he traveled extensively, visiting all the European countries. He introduced many reforms in education, civil administrations, and army organization. On Jan. 19, 1878, the subjects of Prince Nicholas captured Dulcigno, and by the Berlin treaty of the same year, Montenegro was recognized as an independent power, the sovereignty up to that time having been claimed by the Porte. Various districts of Herzegovina and Albania were ceded to Montenegro by the same treaty. In the complications which followed both with the Albanians and with the Porte, Nicholas showed much political sagacity, but in the seizure of Gusinje (Oct. 1879), his reign was disgraced by pillage, and slaughter of women and children. The port of Antivari and all the waters of the principality are closed to ships of war of all nations, Austria alone having maritime and sanitary police authority on the coast.

NICHOLAS II., Czar of Russia, was born May 6 (May 18, new style), 1868. He was educated by special instructors, and in 1890 travelled extensively in the East, besides visiting some of the European capitals. On the death of his father, Alexander III. (Nov. 1, 1894), he succeeded to the throne. Although regarded prior to his accession as a mild and somewhat indefinite character, his administrative acts have so far exhibited great energy and decision. He married, in 1894, the Princess Alix of Hesse.

NICHOLAS, Grand Duke of Russia, b. Russia, 1831; son of Nicholas I, and brother of the late emperor, Alexander II. He entered the military service in 1847, spent a few days at Sebastopol in 1855, during the siege, and was for two years on the staff of the army in the Caucasus, where he took part in several skirmishes against the seven cherkesses. He was soon made general, and inspector-general of engineers, and commander in-chief of the army. In the Russo-Turkish war, he was commander-in-chief of the army of the Danube, which invaded Roumania in April, 1877; he resigned in April, 1878, and was succeeded by Gen. Todleben. He married, in 1856, Princess Alexandra of Oldenburg, by whom he had two sons. He d. in 1891.

NICHOLAS, George, d. 1790, b. Va., son of Robert Carter Nicholas, chancery judge of Virginia, graduated in 1772 from William and Mary college, Williamsburg, Va. In the revolutionary war he was major of the 2d Va. regiment in 1777, and afterward held the rank of colonel. He was distinguished for bravery in the field, and wisdom in council, and had high reputation as statesman and jurist. He was a member of the convention which made valid the federal constitution, and wielded a powerful influence in the house of delegates. In 1790 he removed to Kentucky, was the first attorney-general of that state, and one of the original framers of its constitution, April 1, 1792.

NICHOLAS, Wilson Cary, about 1757–1820, b. Virginia; educated at William and Mary college. On the outbreak of the revolution he entered the army, became the commander of Washington's life-guard, and continued in that position until its disbandment in 1783. He was a member of the Virginia convention which ratified the U. S. constitution, was U. S. senator 1799–1805, and was elected to congress in 1807; previous to that time he was collector of the ports of Portsmouth and Norfolk. In 1814 he was elected governor of Virginia by the Jeffersonian democrats.

NICHOLLS, Francis Tillon, b. La.; 1834; graduated at the U. S. military acad., 1855; and took part in the Seminole war in Florida. He was a brig.-gen. in the confederate army, in which service he lost a leg and an arm. In 1876 he was elected, as a democrat, gov. of La., and after a severe contest with the republicans under Packard, was fully recognized. He was re-elected in 1888; made a successful fight against the Louisiana lottery company in 1890; and was appointed chief-justice of the state supreme court in 1892.

NICHOLS, Edward Tatnall, b. Ga., 1823; entered the navy, midshipman in 1842; and was made lieutenant in 1850. He commanded the steamer *Winona*, in 1862, and took part in the bombardment of forts Jackson and St. Philip, the latter of which surrendered to him April 28. The following summer he was at the passage of the Vicksburg batteries, and fought the confederate ram *Arkansas*. In 1863 he took command of the steamer *Alabama*, in the West India squadron, and 1864–5 of the *Mendote* in the blockade squadron in the n. Atlantic. He was made captain in 1866; commodore in 1872; commandant of the Boston navy yard, 1872–6; rear-admiral, 1878. He d. 1886.

NICHOLS, Ichabod, 1784–1859, b. Portsmouth, N. H.; educated at Harvard. After graduating he studied theology at Salem, and was for four years a tutor in mathematics at the university. In 1809 he became associate pastor of a Portland (Me.) Unitarian church; in 1814 became sole pastor and remained so for more than 40 years; and in 1855 removed to Cambridge, Mass. His published works are *Natural Theology* (1830), *Remembered Words from the Sermons of Rev. Ichabod Nichols* (1860), and *Hours with the Evangelists* (1859).

NICHOLS, John, 1745–1826, b. near London; apprenticed when a boy to Wm. Bowyer, the last of the learned printers. He rapidly rose in the favor of his master, in 1766 was taken into partnership, and on the death of Bowyer, about ten years later, was at the head of the business. For the next 40 years he devoted himself to writing and printing a very large number of works (said to have been 57 as early as 1812). These were occupied mainly with literary anecdotes and antiquarian research. His first book was *Biographical and Literary Anecdotes of William Bowyer, Printer, F.S.A.* (1782), afterwards expanded into six octavo volumes and called *Literary Anecdotes of the Eighteenth Century.* From 1778 until the time of his death, Mr. Nichols was editor of the *Gentleman's Magazine.*

NICHOLS, Richard, 1624–72; b. in England; in 1664 was appointed one of four commissioners to look into complaints made in various parts of New England and to overpower the Dutch of Manhattan. The latter surrendered in the same year and Nichols was recognized as governor of New York and New Jersey. In 1668 he returned to England, resigning the administration of New York to Col. Lovelace, and that of New Jersey to Carteret.

NICHOLS, William Augustus, 1818–69, b. Penn., educated at West Point and after graduating in 1838 was commissioned in the 2d artillery. In the Mexican war he served as aid-de-camp to Gen. Quitman and was made brevet assistant adjutant-general in 1852, with rank of captain, for his gallant services at Monterey, Churubusco and Molino del Rey. At the outbreak of the civil war he was a lieutenant-colonel, was made colonel

in 1864, and brevetted brigadier-general in 1864 and major-general in 1865. After the war he was made adjutant-general of the department of the Missouri.

NICHOLSON, Sir Francis, d. 1728; b. England; lieut.-gov. of New York under Andros, 1687–89. He was lieut.-governor of Virginia, 1690–94, and governor, 1698–1705. He was governor of Maryland, 1694–98; commanded the expedition against Port Royal in 1710, and the unsuccessful expedition against Canada in 1711. He was governor of Nova Scotia, 1713–17, was knighted in 1720, and was governor of South Carolina, 1721-25, when he was made lieut.-general.

NICHOLSON, Isaac Lea, D.D., was born at Baltimore in 1844. He was prepared for college in the schools of Baltimore and graduated from Dartmouth in 1869. He studied theology in Alexandria, was ordained deacon in St. Paul's (Prot. Epis.) church, Baltimore, in 1871, and priest in 1872, and was assistant to the rector of St. Paul's church until December, 1875, when he accepted a call to his first parish in Westminster, Md. In 1879 he accepted a call to the rectorship of St. Mark's church, Philadelphia. In March, 1883, he was elected bishop of Indiana, but declined the honor. In June, 1891, he was elected bishop of Milwaukee.

NICHOLSON, James William Augustus, b. Mass., 1821; midshipman, 1838–44; became passed midshipman, and in 1852 was raised to lieutenant. In 1853–55 he accompanied the Japan expedition in the sloop *Vandalia*. During the war of the secession he was in actions which required great coolness and bravery in a commander. He took part in the engagement at Aquia creek, a branch of the Potomac river near Fredericksburg, Virginia. He commanded the steamer *Isaac Smith*, of the South Atlantic blockade squadron, in the battle of Hilton Head at Port Royal, Beaufort, S. C., Nov. 7, 1861, when the naval, combined with the land forces under Gen. W. T. Sherman, captured Forts Warren and Beauregard. In 1862 he was promoted to commander, and in the same year was in action with the confederate flotilla on the Savannah river. At the battle of Mobile bay, Aug. 5, 1864, he commanded the monitor *Manhattan*, attached to the w. gulf blockade squadron, under Admiral Farragut, destroying and capturing the confederate fleet in a short, sharp conflict, resulting in the surrender of Fort Gaines; he also engaged in the bombardment of Fort Morgan. In 1865–66 he commanded the steamer *Mohigan* in the Pacific squadron, and was promoted to captain in 1866. In 1867–68 he commanded the Wampanoag, and was raised to the rank of commodore in 1873; retired, 1883; d. 1887.

NICHOLSON, James, 1737–1804, b. Md.; adopted a seafaring life as did two of his brothers, who afterwards rose to be captains in the navy. He participated in the capture of Havana in 1762, and in 1763 took up his residence in New York. In 1775 he was appointed captain of the *Defense*, in the American Navy, and in 1776, he regained from the British several vessels which they had captured. The same year he took command of the *Virginia*, carrying 28 guns, and the next year he was appointed commander-in-chief of the navy, succeeding Commodore Esek Hopkins, and remaining in that position till the close of the war. His vessel being prevented from going to sea by a strict blockade, he volunteered with his crew in the American army, and took part in the battle of Trenton. Soon afterward in putting out to sea, his ship ran aground and was taken, but he succeeded in escaping, and most of the crew were saved. In 1780, in command of the *Trumbull*, of 38 guns, he fought for 3 hours with the British ship *Wyatt*, losing 30 men; neither ship gained a decided advantage. In 1781, off the Delaware capes, after a stubborn resistance, he was captured by the *Iris* and *General Monk*. At the close of the war, he returned to New York city, where he was appointed commissioner of loans. He was the father-in-law of Albert Gallatin.

NICHOLSON, John, British general, one of the most distinguished of the later school of Indian soldiers, was born in Dublin, Dec. 11, 1821. His father, a physician of considerable reputation in that city, died when the boy had just completed his 8th year. By his mother, a woman of strong sense and much practical piety, he was carefully educated; and from her he seems to have inherited or imbibed a certain religious gravity and earnestness of character which was early noted in him, and continued to distinguish him through life. Through the influence of her brother, Sir James Weir Hogg, an Indian cadetship was obtained for him; at the age of 16, he arrived in Calcutta, and was soon after posted to the 21st native Bengal infantry, then stationed at Ferozepore. In 1840, his regiment was ordered to Ghizni in Afghanistan, where two years after, in the insurrection which avenged the English occupation of the country, it was compelled to surrender to the enemy. After a time of miserable captivity, he regained his liberty, and joined the relieving army under Gen. Pollock, to be saddened immediately after by the death, in action, of his brother Alexander. A period of inactivity ensued, during which he was stationed at Meerut, doing duty as adjutant of his regiment. On the breaking out of the Sikh war in 1845, he served in the campaign on the Sutlej, and was present at the battle of Ferozeshah, though, as attached to the commissariat department, without special opportunity of distinguishing himself. After the cessation of the war, through the recommendation of Col. (afterwards sir Henry) Lawrence, Nicholson, now a lieutenant, was appointed assistant to the resident at the conquered capital, Lahore, and thus fairly transferred to the political branch of the service, in which most of his future time was passed. But shortly, with the outbreak of the Sikh rebellion in 1848,

there came an interlude of military activity, in which he greatly distinguished himself. To Nicholson's daring and promptitude was due the preservation to Britain of the important fortress of Attock; and soon after, his success at the Margulla pass, in intercepting and defeating a large body of the insurgents, brought his name prominently before the world. Throughout the struggle which followed, he rendered important service; and at the great battles of Chillianwalla and Gujerat successively, he earned the special approval of lord Gough, to whom he was immediately attached.

The Punjab having finally become a British province, Capt. Nicholson was appointed a deputy-commissioner under the Lahore board, of which sir Henry Lawrence was president. He had now been nearly ten years in India; his strength was somewhat shaken by arduous service, and various illnesses which from time to time had assailed him; and above all, he was anxious to visit and console his widowed mother, then prostrated by the death in India, by an accident, of William, his younger brother. In 1850, accordingly, he took his furlough, and returned home, taking Constantinople *en route*, and visiting, with an eye to professional instruction, the capitals of all the great military powers of the continent. On his return to India, he was again appointed by Lawrence a deputy-commissioner in the Punjab, and for five years subsequently his work lay among the savage tribes of the frontier. His success in bringing them under thorough subjection to law and order, was something marvellous; and such were the impressions of fear and reverence wrought by the force and massive personalty of the man, that he became among these rude populations, under the title of "Nikkul Seyn," the object of a curious kind of hero-worship. So far was this carried, that a sect actually arose, of Nikkul-Seynees, who consecrated him as their Guru (or spiritual guide), and persisted—despite of severe floggings regularly inflicted by the worthy man, indisposed to accept divine honors—in falling at his feet, and making him an object of express adoration.

With the outbreak of the great mutiny in 1857 came Nicholson's supreme opportunity, and the brief career of glorious achievements in which he developed in the eye of the world the full power and splendor of his military genius. In the saving of the Punjab, virtually India was saved to England; and under John Lawrence, who succeeded his brother, sir Henry Nicholson—though not without noble coadjutors to divide with him the honor—perhaps did more than any other single man to hold firm England's grasp of the Punjab. He it was who suggested the formation of the famous movable column, by which mainly the work was done, and presided over its organization. Shortly, he was appointed to command it; and in his dealings with the suspected regiments of sepoys, he exhibited a particular combination of boldness with subtlety, discretion, and astuteness, scarcely too much to be admired. At Trimmu Ghaut, on the 12th and 14th of July, he brought to bay, and nearly annihilated, a large force of the declared rebels. Things thus made safe behind him, he marched to re-enforce the army of Gen. Wilson, engaged in the siege of Delhi, arriving in camp on Aug. 7. His presence and counsels gave new impulse to the operations; and in every way he strove, with fiery and impatient energy, to expedite the delayed assault. A strong body of the enemy having tried to make their way into the British rear, to Nicholson was assigned the task of intercepting and bringing them to battle. This he achieved on Aug. 24, near Nujuffghur—under circumstances of extreme difficulty, in the most masterly manner surmounted—obtaining a most brilliant result in the complete ruin and dispersion of the mutineers. When the assault on the city was at last ordered, Gen. Nicholson (for to this rank he had now attained) was selected for the post of honor; and on the morning of Sept. 14, he led the first column of attack. After the troops had forced their way into the city, an unforseen check occurred, and Nicholson, ever in front, exposed himself in the most fearless manner to animate his men to advance. Conspicuous by his towering stature, he became the mark of the enemy's bullets, and fell, shot through the body. He lingered for some time in great suffering, and died on the morning of the 23d. Over the whole of India, the victory was saddened by his death; for it was felt that in John Nicholson, to use lord Canning's expression, "a tower of strength" had fallen. During the whole war of the mutiny, though it claimed many noble victims, there fell no man more regretted in his death than Nicholson, or in his death more worthy of regret. Throughout his career, he shone—as opportunity offered—a veritable "king of men;" one of those born to command, who naturally and inevitably rise to it, and however great in achievement, seem to need only the hap of ampler opportunity in the future, to outsoar their great achievements in the past. No one ever seems to have come fairly in contact with him without being strangely impressed with this sense of a magnificent reserve of *power* in him. It remains only to add, that his nature was on the one side as gentle, tender, and affectionate, as on the other it was strong and brave; and that, by all who had intimate relations with him, he was not less beloved for his mild virtues, than for his sterner gifts honored and admired.

NICHOLSON, John B., 1783–1846; b. Va., joined the U. S. navy as midshipman in 1800. In 1812 he was promoted to lieutenant, and on the breaking out of the war with England was ordered on board the *United States*, serving as 4th lieutenant. He was present at the engagement which terminated in the capture of the *Macedonian*, and was 1st lieutenant of the *Peacock*, bringing in the prize ship *Épervier*. In 1828 he was promoted captain and afterwards to the rank of commodore.

NICHOLSON, Samuel, 1743–1813; b. Md.; brother of James. He was lieutenant under Paul Jones in the *Bonhomme Richard*, and took part in the fight between her

and the *Serapis*. He was promoted to a captaincy in 1779, and in 1782 commanded the frigate *Dean*, of 32 guns, and made a long cruise, during which he captured a number of prizes, including 3 sloops-of-war. He retained the rank of captain after the reorganization of the navy, and was the first commander of the frigate *Constitution*. At the time of his death he was the senior officer in the service.

NICHOLSON, William Carmichael, 1800–72; b. Md., entered the navy in 1812. He was attached to the *President*, under Decatur, and took part in the engagement off Long Island, in Jan. 1815, which resulted in her capture by a British squadron. He was made lieutenant in 1821, and commander in 1841. He commanded the sloop *Preble* in the Mediterranean squadron in 1843, and the schooner *Boxer* in the Pacific squadron in 1850. He was appointed fleet-captain of the Pacific squadron in 1855, and commanded the steam-frigate *Mississippi* in the East India squadron 1858–60. He was stationed at the naval asylum in Philadelphia at the beginning of the civil war, and soon afterwards was placed in command of the steam-frigate *Roanoke*. He became commodore in 1862, and was retired in 1864.

NICHOLSON, William Rufus, D.D., b. 1822, ordained presbyter in the Prot. Epis. church, 1847. He is prominent among the bishops of the Reformed Epis. church, having been consecrated in that office, 1876. He has written several monographs, among others, *The Lord's Supper*, *Call to the Ministry*, *Sanctification*, etc. He became dean of the Reformed Episcopal theological school, Philadelphia.

NIC'IAS, a famous Athenian statesman and general during the Peloponnesian war, was the son of Niceratus, a very wealthy citizen, who had acquired his fortune by working the silver mines at Laureium. Nicias belonged to the aristocratic party, and after the death of Pericles presented himself as the opponent of Cleon, the great popular or demagogic leader. He was not a man of quick, brilliant, audacious genius, like Alcibiades; on the contrary, he was remarkably wary and cautious, even at times to timidity. Success generally accompanied his enterprises against the Spartans and their allies. In 427 B.C., he captured the island of Minoa; next year he ravaged the island of Melos and the coasts of Locris; the year following that he obliged the Spartan force in Sphacteria to surrender, and also defeated the Corinthians. In 424 B.C. he made havoc of part of Laconia, captured the island of Cythera, and achieved several other successes. After the death of Cleon he brought about a peace between the Spartans and Athenians, 421 B.C. Six years afterwards the Athenians, at the instigation of Alcibiades, resolved on a great naval expedition against Sicily. Nicias was appointed one of the commanders, although he had strongly protested against the undertaking. In the autumn of 415 B.C. he laid siege to Syracuse, and was at first successful, but subsequently experienced a series of disasters; his fleet was destroyed, and his troops began a retreat towards the interior of Sicily. They were speedily forced to surrender, and Nicias was put to death 413 B.C. See Thirlwall's and Grote's *Histories of Greece*, and Plutarch's *Life of Nicias*.

NICKEL (symbol, Ni; equiv. 29.3—new system, 58.6—sp. gr. 8.8) is a grayish-white glistening metal, capable of receiving a high polish, of about the same hardness as iron, and, like that metal, malleable and ductile. It has about the same fusibility as wrought iron, but is less readily oxidized than that metal, since it remains unchanged for a long time in a moist atmosphere, and is very little attacked by dilute acids. It is strongly magnetic, but loses this property when heated to 600°. It dissolves in hydrochloric and dilute sulphuric acid with a development of hydrogen gas, and is very readily oxidized in nitric acid.

Nickel only occurs in the native state in meteoric stones, in which it is always present in association with the iron which forms the principal part of those masses. It is found in tolerable abundance in Saxony, Westphalia, Hungary, Sweden, etc., where it occurs in the form of *kupfernickel* (so called from its yellowish-red color), which is a combination of nickel and arsenic. The metal is obtained on the large scale for the purpose of making German silver (q.v.) and other alloys, either from this compound or *speiss*, which is an impure arsenio-sulphide of nickel, formed during the manufacture of *smalt* (q.v.), by somewhat complicated chemical processes. In small quantities it may be obtained by reducing one of its oxides by means of hydrogen at a high temperature, or by exposing the oxalate to a very high temperature in a crucible lined with charcoal.

Nickel forms two compounds with oxygen—viz., a protoxide, NiO, and a sesquioxide, Ni_2O_3, which is not basic, and may be passed over without further notice. The *protoxide* occurs as a greenish-gray powder, which exhibits no magnetic properties, and is insoluble in water. It is obtained by heating the carbonate or the *hydrated protoxide* in a closed crucible. The hydrated protoxide, $Ni(OH)_2$, is obtained by precipitation from a solution of one of its salts by potash. The salts of the protoxide and their solutions are of a delicate, very characteristic green color; but in the anhydrous state most of them are yellow. The neutral salts, soluble in water, slightly redden litmus, have a sweetish, astringent, metallic taste, and when administered in moderate doses excite vomiting. The most important of the salts is the sulphate, $NiSO_4 + 7H_2O$, which crystallizes in beautiful green rhombic prisms. It is obtained by dissolving the metal or its oxide in dilute sulphuric acid; and is the source from which the other salts of nickel, the carbonate, oxalate, etc., are obtained. The principal use of nickel is in the composition of various alloys, such as German silver. Nickel has two sulphides, or sulphurets, the protosulphide, NiS, formed by fusing sulphur and nickel, and also found native in the mineral milierit; and the disulphide NiS_2, obtained by heating the carbonates of nickel and potash with

sulphur to redness. An arseniate of nickel, $Ni_3(AsO_4)_2+8H_2O$, is found native at Chatham, Conn., and is called nickel-ochre. An anhydrous carbonate, $NiCO_3$, is made by heating chloride of nickel with carbonate of potash or soda in a sealed tube. It crystallizes in minute rhombohedrons. A hydrocarbonate, $NiCO_3,2Ni(OH)_2,2H_2O$, also exists as a native mineral, called emerald nickel, and found in mines in the form of incrustations and short stalactites; sometimes massive; pearly lustre, emerald-green color, transparent, translucent; hardness 3 to 3.25; sp. gr. 2.57 to 2.69. It occurs in Lancaster co., Penn., associated with serpentine, and also in the Shetland Islands. The nitrate $Ni(NO_3)_2,6H_2O$ crystallizes in 8-sided emerald-green prisms, soluble in twice their weight of cold water. It is made by dissolving the metal in nitric acid. Sulphate of nickel, $NiSO_47H_2O$ crystallizes in green rhombic prisms, soluble in 3 parts of cold water. It is made by the action of dilute sulphuric acid on the metal. When these crystals are exposed to the light they subdivide, without falling apart, into minute regular octahedrons. If the crystallization takes place between 59° and 77° F. it will be octahedral, and instead of 7, there will be only 6 molecules of water. The methods of smelting and working nickel ores are complicated, and some of them are not generally known. The uses of nickel until recently were principally for forming alloys with other metals. In some countries besides the United States, coins of small value have been made of an alloy of nickel, zinc, and copper. The U. S. cent, authorized by the act of Feb. 21, 1857, was composed of 88 per cent of copper and 12 per cent of nickel. The metal is used in the preparation of the alloy called German silver, which contains 2 parts of copper and 1 of zinc and nickel each. White copper, or *pakfong*, of China, consists of copper, 40.4; nickel, 31.6; zinc, 25.4; iron, 2.6. Recently nickel has been used for plating other metals, and this use has made it one of the most valuable of metals. Chemists had for some time known that a brilliant deposit of nickel could be obtained by electrolysis from solutions of nickel salts, but no advantage was taken of this knowledge till Mr. Isaac Adams of Boston devised a method of rendering nickel-plating practicable and profitable. He employs a double chloride of nickel and ammonium, or of sulphate of nickel and ammonium. See ELECTRO-CHEMISTRY; ELECTRO-METALLURGY; ELECTRO-PLATING; ELECTROTYPE; GALVANIC BATTERY. It is important to have the salt perfectly pure, and it must therefore be made from pure nickel. Mr. Adams found that it was not practical to use a plate of pure metal as the *anode*, because it would not dissolve sufficiently fast to satisfy the demands of the solution (the deposit of metal on the *cathode*, and consequently its separation from the salt, being the greater). This was remedied by combining the nickel *anode* with carbon, forming a carbide. This causes the metal to dissolve exactly as fast as it is deposited. Since 1880, large pieces of malleable nickel have been manufactured. Experiments made by the United States government in 1890 and 1891 show that nickel when blended with steel in armor plates, imparts to the plate a very marked toughness, preventing the cracking that so often follows the impact of a projectile. Large quantities of nickel have lately been mined at Sudbury (Ontario), in Canada.

NICOBAR ISLANDS, a group of islands in the Indian ocean, n.w. of Sumatra, and forming, with the Andamans (q.v.), an extension of the great island chain of which Java and Sumatra are the principal links. Lat. 6° 40′ to 9° 20′ N., long. 93° to 94° east. They are divided by the Sombrero channel into two groups, of which the principal members are the Great Nicobar (area 260 sq.m.), and the little Nicobar (area 86 sq.m.). The inhabitants, who are not numerous, are distinct from Malays and Burmese, and are said to resemble the hill-tribes in Formosa. The Danes made a settlement here in 1754, were dispossessed by Great Britain from 1807 to 1814, and finally withdrew in 1848. In 1869, the Indian government took possession of these islands, and affiliated the new settlement at Nancowry harbor to the great penal colony at Port Blair in the Andaman islands. The soil is fertile, and the cocoa-nut palm grows abundantly. Pop. of group, 6,000.

NICODÉ, JEAN LOUIS, composer, b. near Posen, Aug. 12, 1853. He studied the pianoforte under Kullak, theory under Wüerst, and counterpoint and composition under Kiel. After teaching and appearing in public for several years, he became instructor at the Dresden Conservatorium in 1878. His orchestral works are highly valued, and he has also written chamber and pianoforte music.

NICODEMUS, a Pharisee, member of the Jewish sanhedrim, or great council of the nation, who, impressed by what he had heard of Jesus, and perhaps convinced that he was the Messiah, came by night for fuller private converse. He may have come in secret through fear or prudence; he may have found it impossible to meet Christ alone without interruption in the day time. He received memorable instruction, (John iii.) He appears in two scenes afterwards—the first, when at the sitting of the great council he ventured in a few words to defend Jesus against the unjust suspicions of the Jews; the second, when he united with his colleague Joseph of Arimathea in rendering the last honors to the crucified Jesus. Scripture gives no other information of him Tradition relates that having declared himself a follower of Christ, and been baptized by Peter, he was removed from his office and expelled from Jerusalem; that he found refuge in a country-house of Gamaliel his cousin, with whom he remained until his death. The so-called *Gospel of Nicodemus* or *Acts of Pilate* is undoubtedly spurious, and of no value.

NICOLAI, CHRISTOPH FRIEDRICH, a celebrated German author, bookseller, and publisher, was b. Mar. 18, 1733, at Berlin, where his father was also a bookseller. He

devoted himself very earnestly to literary and philosophical studies, and early distinguished himself by his *Briefe über den jetzigen Zustand der schönen Wissenschaften* (Berl. 1756), in which he exposed the errors of both Gottsched and Bodmer, then carrying on a controversy which was agitating the literary world of Germany. He became the associate of Lessing and Moses Mendelssohn. Jointly with the latter he edited for some time the admirable *Bibliothek der schönen Wissenschaften* (Leip. 1757–58); and, with Lessing, he gave to the world *Briefe, die neueste deutsche Litteratur betreffend* (24 vols. Berl. 1759–65). By this he was led to conceive the plan of the *Allgemeinen deutschen Bibliothek* (106 vols. 1765–92), a periodical which he edited for many years, and which contributed much, particularly in the early period of its existence, to the progress of literature and improvement of taste in Germany, but was too frequently characterized by an undue acerbity of tone. Nicolai's hostility to the new schools of literature and philosophy, which sprang up in Germany, exposed him to attacks from the pens of Herder, Goethe, Schiller, Lavater, and Fichte. His death took place Jan. 8, 1811.

Among Nicolai's works may be mentioned his *Topographisch-historische Beschreibung von Berlin und Potsdam* (Berl. 1769, 3d. edit. 1786); *Characteristischen Anecdoten von Friedrich II.* (Berl. 1788–92), both of permanent value; some novels, as his *Leben und Meinungen des Magisters Sebaldus Nothanker* (4th edit. Berl. 1799); *Geschichte eines dicken Mannes*, a sharply satirical performance (2 vols. Berl. 1794); *Beschreibung einer Reise durch Deutschland und die Schweiz* (Berl. 1781; 3d. edit. 12 vols. 1788–96).

NICOLAI, Otto, a German musical composer of note, b. at Königsberg in 1810. His early life was a struggle with poverty and difficulties. He studied for three years in Berlin under Klein; and in 1835 went to Rome, where he went through three more years of study under Baini. After traveling for ten or twelve years over Europe, he became, in 1847, Kapellmeister at Berlin, a post which he soon resigned. He appeared as a composer of dramatic music as early as 1831; but his first work of importance was *Il Templario*, founded on Scott's romance of *Ivanhoe*, which, produced at Turin in 1841, attained a high and permanent reputation. In 1848 he wrote at Berlin *Die Lustigen Weiber von Windsor*, on which his renown as a musician is founded, a work charming for its clear design and lively vigorous tone, whose overture is almost worthy of Weber. Two months after the production of this his *chef-d'œuvre*, its composer died at Berlin.

NICOLAITANS, a class of persons, spoken of Rev. ii., as found in the churches of Ephesus and Pergamos, whose doctrine and deeds were hateful to Christ. Irenæus, who wrote near the close of the 2d c., and is the earliest author who mentions them, says that they were followers of Nicolas of Antioch, one of the seven deacons chosen at Jerusalem. As there was a traitor among the "twelve," there may have been an immoral man among the "seven;" but in the absence of all contemporary evidence a statement made a hundred years after the writing of the Revelation has no force against the presumptive evidence that a man who was one of seven selected from the whole church of Jerusalem as of "tested character, full of the Holy Ghost, and of wisdom," did not afterwards become notorious as a teacher and perpetrator of abominable crime. As to the particular character of the offenses taught and practiced by these persons, many vain conjectures have been made. The ingenious suggestion of Michaelis is not improbable, that those thus condemned by Christ were of similar character with "the followers in the way of Balaam;" described by Peter in his second epistle; and that *Nicolaitans* is simply the Greek translation of the Hebrew "*Balaam*," both signifying *conquerors* or *masters of the people*. This theory is supported by the fact that in the Revelation, while the church of Pergamos is censured for tolerating within it persons who held the doctrine of Balaam, after the special character of the crimes he had taught Israel to commit has been described, it is added "*even so* thou also hast those who hold the doctrine of the Nicolaitans."

NICOLAS, Sir Nicholas Harris, 1799–1848; b. England; a lieutenant in the navy who retired from the service and devoted himself to the study of English law and antiquarian literature, and in 1825 was called to the bar. Among his numerous works those which are best known are *Synopsis of the Peerage of England* (1825); *Testamenta Vetusta* (1826); *Chronology of History* (1835); *History of the Battle of Agincourt; Dispatches and Letters of Lord Nelson* (1844); and *Memoirs of Sir Christopher Hatton* (1847).

NICOLAY, John George, b. Essingen, Bavaria, Feb. 26, 1832. Educated in the United States, and after editing an Illinois daily paper for some time, he was made assistant to the secretary of the state of Illinois. While in this position he met Abraham Lincoln, and served as the latter's private secretary, 1861–5; was U. S. consul to Paris, France, 1865–9; and marshal of the supreme court of the U. S. 1872–87. He has written *The Outbreak of Rebellion* (1887), and, jointly with John Hay, *Abraham Lincoln, a History* (1891).

NICOLE, Pierre, 1625–95, b. Chartres, France; at an early age attained unusual proficiency in philosophy and classical studies, and when but fourteen began at Paris a course of philosophical and theological study. Here he came much under the influence of Antoine Arnauld (q. v.), and was deterred from taking orders by his views on the Jansenist discussion and his dislike of the Jesuit power. He attached himself to the recluses of Port Royal-des-Champs (q. v.) at Les Granges, and became an instructor in the Jansenist schools, while continuing the study of theology at the Sorbonne. From this

time he devoted his pen to extending and expounding the doctrines of Jansenism, though he did not fully agree with the extreme advocates of that system. The number of his moral, religious, and controversial treatises is large, all characterized by purity of style, subtilty of discrimination, and a broad and generous humanity. To him more than any other writer is the Port Royal logic (*La Logique, ou l'art de Penser*, 1668) to be attributed. Others of his works are: *Perpétuité de la Foi; Les Visionnaires; Essais de Morale*, in 6 volumes, 2 published posthumously; his philosophical reputation rests mainly on the essays and logic. Personally, he was a man of great humility and modesty, and was so far from seeking public applause that in more than one instance he did not deny the belief that a work of his own was written by others of the Port Royal brotherhood. He labored incessantly in his chosen work till, worn out by the controversy which was so little suited to his natural disposition, in 1693 he was compelled by increasing illness to desist, and 2 years afterwards was followed to his grave by the most distinguished men of his time.

NICOLET, a co. in s. Quebec, having the St. Lawrence river for its n. and n.w. boundary, drained by the Becancour river, the Nicolet and West Branch, which form part of its s.w. border; 595 sq. m.; pop. '91, 28,735. It is traversed by the Three Rivers division of the Grand Trunk railway. It has several flour and saw mills, boot and shoe factories, and an extensive trade in lumber. Its soil is fertile along the rivers, and its surface is covered with immense forests, diversified with plains adapted to the cultivation of grain. Co. seat, Becancour.

NICOLL, William Robertson, b. at Aberdeen, Scotland, Oct. 10, 1851, educated at the university and the Free Church college at Aberdeen, minister at Dufftown, 1874–77, and at Kelso, 1877–86. In 1884 he became the editor of *The Expositor;* in 1886 of *The British Weekly*, which he founded; and in 1891 of *The Bookman*, which he also founded. He has written *The Incarnate Saviour* (1881), *The Lamb of God* (1886), *The Key of the Grave* (1893), and, jointly with C. K. Shorter, a new *Life of the Brontës* (1895), and has edited a number of theological works.

NICOLLET, a co. in s. Minnesota, having the Minnesota river for its e., s., and w. boundary; 455 sq. m.; population in 1890, 13,382, chiefly American. It is intersected by the Chicago and Northwestern, and the Chicago, St. Paul, Minneapolis, and Omaha railroads, forming a junction at St. Peter. It is drained by numerous lakes, the largest, Swan lake, nearly 9 m. long. Its surface is extensively covered with forests, but a large proportion stretches out into broad prairies. The foundation of the soil in some portions is silurian limestone. Its products are grain, potatoes, wool, sorghum, the products of the dairy, and live stock. Its leading industries are the manufacture of brick, furniture, leather, and flour. Co. seat, St. Peter.

NICOLLET, Jean Nicolas, 1786–1843, b. France; studied under Laplace, and in 1817 was appointed librarian of the Paris observatory. In 1832 he came to the United States on a scientific expedition, and explored the territory drained by the Missouri, Arkansas, and Red rivers, and the upper Mississippi. He obtained much valuable information on the natural history of the districts which he visited, and on the languages and customs of the Indian tribes. Soon after his return he was sent, with John C. Fremont, to the western territories, to make a general report of their resources and draw up a map of them. He published *Mémoire sur la mesure d'un arc de parallèle moyen entre le pôle et l'Équateur;* and *Lettre sur les assurances qui ont pour base les probabilités de la durée de la vie humaine.*

NICOMACHUS, a Greek painter in the 4th c. B. C., a son and scholar of Aristodemus. Among his works are: *The Rape of Proserpine*, in the temple of Minerva, on the capitol; *Victory riding in a four-horse chariot*, also in the capitol; *Apollo and Diana*, *Cybele on a Lion*, *Female Bacchanals*, and *Scylla*.

NICOMEDEIA, the capital of ancient Bithynia, was situated at the north-eastern angle of the gulf of Astacus, in the Propontis, now called the bay of Ismid; was built about 264 A.D. by Nicomedes I., who made it the capital of his kingdom, and it soon became one of the most magnificent and flourishing cities in the world, and some of the later Roman emperors, such as Diocletian and Constantine the Great, selected it for their temporary residence. It suffered greatly both from earthquakes and the attacks of the Goths. Constantine died at a royal villa in the immediate vicinity. Hannibal committed suicide in a castle close by. It was the birthplace of the historian Arrian. The small town of Ismid or Isnikmid now occupies its site, and contains many relics of ancient Nicomedeia.

NICOP'OLIS, recently a Turkish fortress, now a fortified town in the province of Svistov principality of Bulgaria, is on the Danube, about 24 m. n.e. by n. of Plevna. The fortifications, though extensive, were never of much importance, and the Berlin congress of 1878 provided for their demolition. The city used to be divided into two portions: the fortress and Turkish town, defended on every side by batteries and ramparts, and the eastern quarter, comprising the dwellings of the Bulgarians, Wallachs, and Jews. Nicopolis is widely built, most of the houses being surrounded by gardens. It is an important market for Wallachian wares, but otherwise is not a great center of trade. Wine is produced in the vicinity. Pop. about 5000.

Nicopolis, the ancient *Nicopolis ad Istrum*, was founded by Trajan, and fragments of the old wall still remain. Here the Hungarians, under their king Sigismund, were defeated by the sultan Bajazet I. in 1396. The city gives title to a Greek archbishop and to a Catholic bishop.

NICOPOLIS in Epirus, one of the many cities bearing the same name—"city of victory"—founded by Augustus to commemorate his victory over Antony in the battle of Actium; immediately after which he inclosed and dedicated to Neptune the space where his tent had been pitched, on a height which commanded a view of both the land and sea forces. Here he afterward built the city, and made it a Roman colony. "Some of the finest parts," Josephus says, "were the work of Herod, who was one of the greatest builders of his day." His connection with it, added to the well-known wide diffusion of the Jews into all the principal countries and cities, renders it probable that many of them lived there. Paul, in his letter to Titus, announced his purpose to pass the winter at Nicopolis; the subscription to the epistle asserts that Paul wrote it at Nicopolis of Macedonia, implying that it was there that he intended to pass the winter. But his language shows that he had not yet gone to Nicopolis, and the subscription to the epistle has no authority. Jerome's opinion is generally adopted, that it was the Augustan Nicopolis to which Paul referred. Its situation was convenient, as a central point, in some of his journeys east and north. He had, long before, preached at Illyricum, and one of his last official acts was to send Titus—probably after he had joined him at Nicopolis—on a mission to Dalmatia. Possibly he was arrested at Nicopolis soon afterward, and taken finally to Rome. At this time the city, though only about 30 years old, had become the chief place in western Greece. As it owed its origin and importance to war, so it was destroyed by hostile armies. Julian, finding it in ruins, rebuilt it. Again destroyed by the Goths, Justinian restored it a second time. During the middle ages a new city was built at the point of the promontory, and the "city of victory" was deserted. The ruins, covering a large portion of the isthmus, still show its original grandeur and size. Wordsworth thus speaks of them: "A lofty wall spans a desolate plain; to the north of it rises, on a distant hill, the shattered stage of a theater; and to the west, the extended though broken line of an aqueduct connects the distant mountains with the main subject of the picture—the city itself." There are also ruins of a mediæval castle and other buildings on the low, marshy, and now desolate plain.

NICOSI'A, a town of Sicily, in the province of Catania, 25 m. n.e. of Caltanissetta. It is situated on the crest of a steep, conical hill between two head-branches of the Salso. It has scarcely any manufactures, but carries on some trade in corn, wine, oil, and cattle. Near it are beds of alum, schist, a rich mine of rock-salt, and springs of petroleum. Pop. 14,900.

NICOSIA. See LEFKOSIA.

NICOT, JEAN, 1530–1600, b. France; a diplomatist appointed by Francis II. ambassador to Portugal. During his residence at Lisbon he obtained, from a Flemish trader, some seeds of the tobacco plant from Florida. Nicot subsequently introduced tobacco into France, and it was called, in his honor, *Nicotiana*. He wrote a treatise on navigation, and *Treasury of the French Language*, one of the earliest French dictionaries.

NICOTIA'NA. See TOBACCO.

NI'COTINE, or NICOTY'LIA, $C_{10}H_{14}N_2$, is one of the natural volatile oily bases destitute of oxygen, and constitutes the active principle of the tobacco plant, in the leaves, roots, and seeds of which it occurs in combination with malic and citric acids. It is likewise contained in the smoke of the burning leaves. It is a colorless, intensely poisonous liquid, of specific gravity 1.027 at 66° F., which boils at 482° F. (250° C.), evolves a very irritating odor of tobacco, especially on the application of heat, is very inflammable, and burns with a smoky flame. It is moderately soluble in water, and dissolves readily in alcohol and ether. If exposed to the air, it absorbs oxygen, and becomes brown, and ultimately solid. The quantity of nicotine contained in tobacco varies from 2 to 8 per cent; the coarser kinds containing the larger quantity, while the best Havana cigars seldom contain more than 2 per cent, and often less.

A remarkable case of poisoning by nicotine—that of the count Bocarmè, who was tried and executed in Belgium for the murder of his brother-in-law—is recorded in the *Annales d'Hygiène* 1851, and was the occasion of Orfila's publishing his *Mémoire sur la Nicotine*. A distinguished student of the college of chemistry subsequently employed it for the purpose of suicide. The deaths that have taken place from the use of tobacco in the form of injection—of which several cases are on record—were doubtless due to the action of this substance.

NICO'YA, GULF OF, opens into the Pacific ocean from n.w. Costa Rica, lying between the main land and the peninsula of Nicoya, which terminates in cape Blanco; this cape being situated at the w. side of the gulf of Nicoya, at its mouth, and cape Herradura on the east. It is about 55 m. long, lying n. and s., and 30 m. wide at its mouth. Punta Arenas, the sole port of entry on the Pacific side of Costa Rica, is situated on the e. side of the gulf. In it are a number of small islands among which are San Lucar, Bejuca, Chira, and Venado. Several streams empty into it, the chief of which are the Tempisque, Rio Grande, and Nicoya rivers.

NIEBUHR, BARTHOLD GEORG, one of the most acute historians, critics, and philologists of modern times, was b. Aug. 27, 1776, at Copenhagen, where his father, Karsten Niebuhr (q.v.), then resided. The aptitude for learning which Niebuhr displayed almost from infancy, led him to be regarded as a juvenile prodigy, and unlike many

other precocious children, his powers of acquiring knowledge kept pace with his advancing years. After a carefully conducted preliminary education, under the superintendence of his father, he spent a session at Göttingen studying law, and from thence proceeded in his 19th year to Edinburgh, where he devoted himself more especially to the natural sciences. On his return to Denmark, he became private secretary to the finance minister, Schimmelmann, and from that period till 1804 held several appointments under the Danish government, which, however, he was led to resign in consequence of his strongly pronounced political tendencies, which made him enter heart and soul into the feeling of hatred of Napoleon, which was at that time agitating the minds of Germans. In accordance with these views, Niebuhr entered the Prussian civil service in 1806, and during the three succeeding years he shared in the vicissitudes which befell the government of his chief, Count Hardenberg, after the disastrous battle of Jena, and the consequent pressure of the Napoleonic influence on the management of the state. The opening of the university of Berlin in 1810 was a new era in the life of Niebuhr, who, with a view of promoting the interests of the new institution, gave a course of lectures on Roman history, which, by making known the results of the new and critical theory which he had applied to the elucidation of obscure historical evidence, established his position as one of the most original and philosophical of modern historians. His appointment, in 1816, to the post of Prussian ambassador at the papal court, where he remained till 1823, gave him an opportunity of testing on the spot the accuracy of his conjectures in regard to many questions of local and social bearing. On his return from Rome, Niebuhr took up his residence at Bonn, where, by his admirable lectures and expositions, he contributed very materially to the development of classical and archæological learning. He was thus employed when the revolution of 1830 roused him from the calm of his literary pursuits. Niebuhr's sensitive nature, unstrung by physical debility, led him to take an exaggerated view of the consequences of this movement, and to anticipate a recurrence of all the horrors of the former French revolution, and the result was to bring about a state of mental depression and bodily prostration, which ended in his death in January, 1831. Niebuhr's attainments embraced a more extensive range than most men are capable of grasping, for he was alike distinguished as a shrewd man of business, an able diplomatist, an accurate scholar, and a man of original genius. He had mastered 20 languages before the age of 30, while the mass of facts which his tenacious memory retained, and the intuitive sagacity that enabled him to sift true from false historic evidence, and often to supply by felicitous conjecture the link wanting in some imperfect chain of evidence, exhibit the extraordinary scope of his intellect. It is not to be denied, however, that he is often arbitrary and unhistorical in his conjectures, and the stricter sort of skeptical critics, like the late sir George Cornewall Lewis, even go so far as to regard his effort to construct a continuous Roman history out of such legendary materials as we possess as, on the whole, a failure. Among the many important works with which he enriched the literature of his time, the following are some of the most noteworthy: *Römische Geschichte* (3 Bde. Berl. 1811–32; 2d edit. 1827–42; 1833; 1853), the first two volumes have been translated by J. C. Hare and C. Thirlwall, and the third by Dr. W. Smith and Dr. L. Schmitz; *Grundzüge für die Verfassung Niederlands* (Berl. 1832); *Griech. Heroengeschichte* (Hamb. 1842), written for his son Marcus; the *Kleinen historischen und philologischen Schriften* (2 Bde. Bonn, 1828–43), contain his introductory lectures on Roman history, and many of the essays which had appeared in the transactions of the Berlin Academy. Besides these, and numerous other essays on philological, historical, and archæological questions, Niebuhr co-operated with Bekker and other learned annotators in re-editing *Scriptores historiæ Byzantinæ;* he also discovered hitherto unprinted fragments of classical authors, as, for instance, of Cicero's *Orations* and portions of Gaius, published the *Inscriptiones Nubienses* (Rome, 1821), and was a constant contributor to the literary journals of Germany. See Miss Winkworth's *Life and Letters of Niebuhr* (3 vols., 1852); Classen's *Niebuhr* (1876).

NIEBUHR, Karsten, a distinguished geographer and traveler, was b. in 1733, in the Hanoverian territory of Hadeln, on the confines of Holstein. Being early thrown on his own resources, he spent several years of his youth in the position of a day-laborer; but his natural energy having led him to apply himself to the study of geometry, and having acquired a small property, he went to Göttingen, where he attended the classes at the university until his resources were wholly exhausted. At this period he entered the Danish service, and in 1761 he joined the scientific expedition which king Frederick V. sent to explore certain portions of Arabia, with a view of illustrating some passages of the Old Testament. The expedition reached Cairo at the close of the year 1761, and after having carefully explored the pyramids, and crossed the desert to Mount Sinai and Suez, proceeded to Arabia Felix. Here, however, the various members of the expedition, which included the eminent naturalist Forskäl, all perished with the exception of Niebuhr, who had himself suffered severely from fever. After the untimely death of his companions, he adopted the diet and dress of the natives—a measure to which he was probably indebted for the good health which he enjoyed during the rest of the travels, which he prosecuted with extraordinary resolution for more than six years. He proceeded as far as India, visiting also Persia and Asiatic Turkey, and continued the observations and researches of his late colleagues in addition to his own special geographical

investigations. On his return to Denmark, in 1767, Niebuhr at once devoted himself to the task of publishing the results of his important mission, which appeared in German under the following titles, *Beschreibung von Arabien* (Copenh. 1772), and *Reisebeschreibung von Arabien und andern umliegenden Ländern* (Copenh. 1774–78, 2 vols.); the publication of the third volume of this work was unfortunately delayed, in consequence of the pressure of numerous other engagements arising from his professional and official duties, and it was not till more than 20 years after his death that the book made its appearance under the supervision of Niebuhr's daughter, and through the liberality of the eminent bookseller Perthes of Hamburg. In addition to these valuable observations, Niebuhr edited and published at his own cost the natural-history notes of his deceased friend and fellow-traveler, P. Forskäl, which he arranged in two works, *Descriptiones Animalium*, etc. (Copenh. 1775), and *Flora Ægyptiaco-Arabica* (Copenh. 1776). The accuracy of detail, fidelity of delineation, and careful avoidance of all exaggeration, which characterize Niebuhr's geographical and social descriptions of Arabia and other Asiatic countries, have made his works classical text-books for all who wish to study the subject. Although Niebuhr accepted, in 1778, a civil post, which fixed his residence in the remote provincial town of Meldorf, in the Ditmarsh district of Holstein, where he devoted himself during the rest of his life to the fulfillment of his official duties, he never relinquished his interest in scientific inquiry, and contributed several valuable papers on the geographical and political history of the nations of the East to the *Deutsche Museum*, and other periodicals. He died in 1815, leaving a character of being at once one of the most truthful and scientifically exact travelers of modern times.

NIEDERMEYER, Louis, 1802–61, b. in Switzerland; when very young showed a strong taste for musical composition; afterward studied under Moscheles and other eminent masters at Vienna and Rome. His first opera was produced at Naples, but of several composed by him, *Stradella* (1837) was the only one which had much success. He also set to music a number of songs by Victor Hugo, Lamartine, and Manzoni. Perhaps the best of his works are his religious compositions which display great originality.

NIEL, Adolphe, 1802–69; b. France, having studied at the École Polytechnic in 1821, and received a military education at the military academy of Metz, in 1827 he was made lieut. of engineers, in 1835 was promoted to captain and accompanied the expedition against Constantine in Algeria, under generals Damrémont and Vallé in 1836–37. Gaining much distinction for bravery, he was raised to *chef-de-bataillon* and placed in command of the engineering corps in Algeria. He was raised to the rank of colonel in 1846. In 1849, as the head of the staff of engineers, he took part in the suppression of the revolutionary movements at Rome then defended by Garibaldi, who surrendered after a siege of two months. He was then promoted to the rank of brig.-gen. and accomplished the official duty delegated to him, of carrying the key of the city to the pope at Gaeta. Returning to Paris, he was appointed director of the engineering department in the ministry of war, and in 1853 was raised to the rank of general of division, and in alliance with the English fleet, conducted the siege which destroyed the important Russian fortress of Bomarsund in Aug., 1854. He planned the operations through which Sebastopol was overcome by the allied armies of England and France, in 1854–55, after a siege of 11 months, and commanded the engineers in the Crimea. He was aid-de-camp to the emperor, and after the taking of the Malakoff was decorated with the cross of the legion of honor. In 1859 he was sent as ambassador to the court of Victor Emmanuel, to demand the hand of Princess Clothilde for Prince Napoleon. He distinguished himself in the campaign in which occurred the battle of Solferino, June 24, 1859, and was made a marshal of France. In 1867 he was minister of war, and throughout his career sustained a high reputation as a scientific military officer.

NIEL'LO-WORK, a method of ornamenting metal plates by engraving the surface, and rubbing in a black or colored composition, so as to fill up the incised lines, and give effect to the intaglio picture. It is by no means quite certain when this art was originated; Byzantine works of the 12th c. still exist to attest its early employment. The finest works of this kind belong to the former half of the 15th c., when remarkable excellence in drawing and grouping minute figures in these metal pictures was attained by Maso di Finiguerra, an eminent painter, and student of Ghiberti and Massacio. In his hands it gave rise to copper-plate engraving (see Engraving), and hence much interest attaches to the art of niello-cutting. Genuine specimens of this art are rare, some of those by Finiguerra are very beautiful and effective, the black pigment in the lines giving a pleasing effect to the surface of the metal, which is usually silver. Those of his works best known are some elaborately beautiful pattines wrought by him for the church of San Giovanni at Florence, one of which is in the Uffizia, and some are in various private collections. In the collection of ornamental art at South Kensington, there are no less than 17 specimens of this art.

NIEMANN, Albert, b. Germany, 1831; at first a singer in the chorus at Dessau. The magnificence of his tenor voice attracted the attention of the king of Hanover, who took him into his service. Wagner selected him to sing in *Tannhäuser* on its first production in Paris in 1861. He has sung in the United States.

NIEMBSCH VON STREHLENAU. See LENAU, NIKOLAUS.

NIEMCEWIECZ, JULIAN URSIN, 1757–1841, b. Poland; entered the army as an adjutant at the age of 20, and became an intimate friend of Kościuszko. After a tour in England and on the continent, he left the army in 1788, and entered the Polish diet as a deputy from Livonia, and became an advocate of the patriotic party. In 1791 with his colleague Weyssenhoff, he began the publication of the *National and Foreign Gazette*, and he also encouraged the spirit of nationality by his poems and dramas. He drew up the so-called "constitution of the 3d of May," which changed Poland from an elective to an hereditary monarchy, and abolished many of the privileges of the nobility. In the insurrection caused by the second partition of Poland, Niemcewiecz was the adviser and aide-de-camp of Kościuszko; and he was wounded and taken prisoner at the disastrous battle of Macieiowice. During his imprisonment of 2 years, at St. Petersburg, he familiarized himself with the English poetry of the 18th c., and translated Pope's *Rape of the Lock*. On his release he came with Kościuszko to this country, where in 1800. he married Mrs. Livingston-Kean of New York. Among his acquaintances in America, were Jefferson, and the exiled duke of Orleans, who afterwards became king Louis Philippe. In 1802 he was allowed to return to Poland on the death of his father. He came back to the United States for a brief period; but when Napoleon entered Poland in 1806, he sailed for Europe, and on the establishment of the grand-duchy of Warsaw, the king of Saxony made him secretary of the senate, inspector of schools, and member of the supreme council of public instruction. After Poland again passed under the power of Russia, though retained by the emperor Alexander in his office of perpetual secretary, he kept alive the memories of Polish nationality, in his *Historical Ballads*, 1816. He delivered a funeral oration over Kościuszko in 1817, and in 1822 began the publication of his *Collection of Memoirs on Ancient Poland*, celebrating the national heroes of Poland. He took part in the unsuccessful revolution of 1830, and spent the rest of his life in exile. Besides the works already named, he published novels, comedies, and tragedies. His *Notes on My Captivity in St. Petersburg*, appeared in 1843, and was translated into English, the next year. A volume of memoirs of his own time was published at Paris, in 1848.

NIE'MEN (called by the Germans, *Memel*), a river in e. Europe, rises in the Russian government of Minsk, flows westward to Grodno 180 m., n. and w. along the frontiers of the Polish province of Augustowo, and w. through East Prussia to the Kurische Haff. Entire length, 565 miles. It is navigable for large craft at Grodno, 400 m. from its mouth, and is free of ice from March to November. Between Grodno and Kovno there are 55 rapids and shallows, and pilots are therefore required for the navigation of the river. At Winge, 8 m. below Tilsit, the Niemen divides into two branches, of which the northern, the Russ, reaches the Kurische Haff by nine mouths; and the southern, the Gilge, by seven mouths. The delta is traversed by several canals. The Niemen is of considerable commercial importance. Large barges bring down the produce of Lithuania and of a portion of Poland to Konigsberg and Memel. Corn, hemp, flax, hides, and bacon, are the principal articles brought from the interior. Its principal affluent is the Vilna on the right.

NIEPCE, JOSEPH NICÉPHORE, 1765–1833; b. France; entered the army, but resigned on account of ill-health, and in 1795 became civil administrator of the district of Nice. He resigned in 1801, and thenceforward pursued the study of chemistry and mechanics. In 1813 he made researches in regard to the production of pictures upon metallic plates by means of light. In 1824 he was able to fix images by light upon plates of glass, and afterwards of copper, and of silver covered with a thin coating of bitumen. He entered into a partnership with Daguerre in 1829.

NIEPCE DE ST. VICTOR, CLAUDE MARIE FRANÇOIS, a French chemist and photographer, was b. at Saint Cyr, near Chalon-sur-Saône, July 26, 1805. He served for some time in the army; but having made an important chemical discovery in connection with dyeing, he was permitted to exchange into the municipal guard of Paris, that he might pursue his scientific studies with more facility. This was in 1845, at which time his attention having been forcibly attracted to the important discoveries in photography which had been made by his uncle Nicephore Niepce (see PHOTOGRAPHY), he resolved to devote his energies to this subject. He was led, in 1847, to the discovery of methods for obtaining images on glass, coated with albumen, starch, or gelatine, and for reproducing designs by the use of vapor of iodine. His investigations were for a time interrupted by the revolution of 1848, but he soon resumed them, directing his attention more especially to the obtaining of photographic images in colors; and before the close of 1852, he had succeeded in obtaining faithfully colored images of flowers, natural and artificial, colored engravings, gold and silver lace, etc., upon silvered plates which had been sensitized by a chloride of copper. In obtaining these pictures, both photographic printing and the camera were employed; but to his intense disappointment, he found that the colors soon began to fade, and after a time disappeared. This process he named "heliochrome." His third and most important invention, that of the art of "heliography," or the production of engraved steel-plates by photography, was first communicated to the academy of sciences in May, 1853. He does not deserve the credit of having originated the idea; for his uncle, previous to 1839, had communicated an imperfect sketch of a similar invention to M. Arago; and Mr. Talbot and others had succeeded by a similar process in

obtaining images of simple objects on steel plates; but to Niepce belongs the credit of having removed the almost insurmountable manipulative difficulties, and rendered the process of much more general application, thus making it practically serviceable. He afterwards employed himself in improving and perfecting his various discoveries.

In 1855 he published the various memoirs in which he had at different times communicated his three great discoveries to the academy of sciences, under the title of *Recherches Photographiques*, which was followed, in 1856, by *Traité Pratique de Gravure sur Acier et sur Verre*. He presented to the academy a number of memoirs on the action of light on a variety of substances, the last being *Sur l' Action de la Lumière et de l'Electricité* (Feb., 1860). Niepce's scientific studies did not interfere with his military promotion, as he was successively appointed chef-d'escadron, and (1854) commandant of the Louvre. He died in April, 1870.

NIER'STEIN, a village of Germany, in the grand-duchy of Hesse, and 9 m. s.e. of Mintz, gives name to a well-known and highly-prized variety of Rhenish wine, which is produced in the neighborhood. Pop. about 4000.

NIESCHIN, a t. in Russia, on the Ostr river, 35 m. s.e. of Tchernigov; pop. 21,590. It contains a monastery, a cathedral, churches, a hospital, schools, and a gymnasium. The chief production and export is tobacco.

NIEU'WER AMSTEL, a commune of the Netherlands, in the province of North Holland, 5 m. s. by w. from Amsterdam. Pop. 2,500. A few miles to the e. of it is the village of Ouder Amstel, with about 3,000 inhabitants, on the Amstel, one of the smaller mouths of the Rhine, which passes through the city of Amsterdam, and falls into the Zuider Zee.

NIEU'WVELDT MOUNTAINS, a portion of the most northerly of the three ranges of mountains in Cape Colony, which at various distances from the southern coast all run parallel to it. Of these three ranges, the most northern attains the greatest altitude, having an average height of 7,000 feet. The portion known as the Nieuwveldt mountains extend in lat. 31° 40′ to 32° 30′ s., and are intersected by the meridian of 22° e. longitude. From their southern slopes, the Gamka or Lion river draws its head waters; and from their northern, the Gariep or Orange river obtains an important tributary in the Upper Zak.

NIÈVRE, a central department of France, occupies a portion of the watershed between the Loire and the Seine, and is bounded on the w. by the rivers Allier and Loire. Area, 2632 sq. m.; pop. '96, 333,899. Mountains occupy the eastern border, and extend in a line of heights from s.e. to n.w., dividing the department into two great declivities. The soil is generally rocky and sandy, cut up by ramifications, almost always wooded, of the mountains of Morwan. There are several plateaus more or less fertile, a number of hills covered with vines, and valleys productive in pastures; but the principal wealth of the department consists in its forests and minerals. The Nièvre, whence the name of the department, is an inconsiderable affluent of the Loire from the right. The three chief rivers—the Allier, Loire, and Yonne—are navigable, and the Yonne, which belongs to the system of the Seine, is connected with the Loire by a canal leading across the watershed. Of the entire area, more than 792,000 acres are cultivable land, and more than a third of the whole surface is covered with forests, the timber from which, forming one of the principal sources of wealth, is conveyed by water in great quantities to Paris, etc. About 6,000,000 gallons of wine are made yearly. From the mines of Nièvre iron of good quality is obtained in abundance; lead, copper, and silver are also found; and there are coal mines, and quarries of marble and granite. Arrondissements, Nevers, Château-Chinon, Clamecy, and Cosne; capital, Nevers.

NIFLHEIM (from the same root as Lat. *nebula*, cloud, and Eng. *home*), meaning the abode of clouds, was one of the nine separate abodes or homes, of which the old Scandinavians conceived the world as consisting in the beginning of time. It is the kingdom of cold and darkness, and is separated from Muspelsheim, the kingdom of light and heat, by a huge chasm (Ginungagap, yawning gap). Here flows the spring Hvergelmir, watched by the dragon Nidhugger; this spring sends out twelve ice-rivers, from the drops of which, thawed by sparks from Muspelsheim, sprang the chaotic giant Ymir and the cow Audhumbla. Niflheim was also the abode of Hel (q. v.), the goddess of death, who here received all who died of sickness or old age.

NIGEL'LA, a genus of plants of the natural order *ranunculaceæ*, having five colored spreading sepals; five or ten small two-lipped petals, with tubular claw; the carpels more or less connected together, many-seeded; the leaves divided into threadlike segments, the flowers solitary at the top of the stem or branches. They are annuals, natives chiefly of the countries near the Mediterranean and the warmer temperate parts of Asia. Some of them, occasionally seen in gardens in Britain, are vulgarly known by the names *Devil-in-a-bush* and *Devil-in-a-mist*. The seeds are aromatic, and somewhat peppery. Those of *Nigella sativa*, a species common in cornfields in the s. of Europe, are supposed to be the Black Cummin of the ancients, and perhaps the Cummin of the Bible. The seeds of a species of Nigella are much used by the Afghans for flavoring curries.

NI'GER, the great river of western Africa. Its name, according to Dr. Barth, is a contracted form of one of the native names, *N-eghirrĕu*, which, as well as all the other

names, *Dhiulibá* (*Joliba*), *Mayo*, *Isa*, *Kwara* (*Quorra*), and *Baki-n-ruwa*, means simply "the river." The principal head-water rises on the slopes of mount Loma, a peak of the Kong mountains, in a barren, desolate, and treeless region, in lat. 9° 25′ n., long. 9° 45′ w., about 1,600 ft. above sea-level. It flows n.e. to Timbuktu, where it bends eastward, and after flowing in that direction for about 250 m., it curves toward the s., and proceeds in a general s.s.e. course, until arriving at the head of its delta, in lat. about 5° 30′ n., it separates into many branches, and enters the gulf of Guinea, between the bights of Benin and Biafra. It is called the Timbri for the first 70 m. of its course, after which it receives the name of the Joliba, or more correctly Dhiúlibá; and after passing Timbuktu, it is known principally as the Quorra. Little is known of its course until it reaches Sego (lat. 12° 30′ n.), a distance of 350 m. from its source, but from that point it has been explored throughout nearly the whole of its course. From Sego to Timbuktu it flows through a fertile country, producing rice, maize, and vegetables, and abounding in good pasturage. In lat. 14° 10′ n., the river separates into two branches; the western is called the Joliba or Mayo, the eastern the Bara-Isa. These, as they proceed, are known as the White and Black rivers respectively; and they unite after inclosing the island of Jimballa, 220 m. in length, and from 2 to 20 m. in breadth The river again bifurcates before arriving at Timbuktu, and after passing that town, the two branches, on one of which—the northern—Cabra, the port of Timbuktu is situated, again unite. In the district of union in the s.w. of Timbuktu, the country far and wide is intersected by numberless streams, forming a complicated net-work of water-courses. The river then flows e., sending off many creeks and branches to Bamba; its banks here are low and marshy, and during the rainy season are overflowed. In this region, rice, tobacco, wheat, and even barley are grown. The river then passes the town of Burrum, where it curves to the s.e., and from this point—called from the bend, the *Knee of Burrum*—it bears the name of Kwara or Quorra until it reaches the delta. Immediately below *Burrum*, the Niger does not present an imposing appearance. Its bed resembles a broad marshy valley, inclosed by ridges of rock or high dunes, thickly overgrown with reeds and sedges, and cut up by numberless streams and creeks. At the ferry of Burri (lat. 15° 55′ n.), the breadth of the river is from 800 to 900 yards; and here the whole valley, about 10 m. broad, is fruitful, carefully cultivated, and well peopled. Further s., the towns of Garu and Sandu are passed, and here the bed is rocky and the navigation dangerous. At the town of Say, the Niger, after reaching a breath of from 2,500 to 3,000 paces, is narrowed to a width of 1,000 paces, flows at the rate of three miles an hour, and is inclosed by rocky banks. From Say to Wara, the course of the Niger remains still unknown. From Wara it flows e.s.e. to Rabba; and from this town to its mouth, the course of the river is comparatively well known. In lat. between 8° and 7° 30′ n., it flows round the eastern shoulder of the Kong mountains (2,000 to 3,000 ft. high), and here the banks of the Niger are extraordinarily beautiful. In lat. 7° 40′ n., it receives the Benne from the e. The delta consists of an immense mangrove forest, cut up into islands by the numerous branches (22 in number) of the river. The principal mouths are the Bonny, Mari, and Nun.

The existence of the Niger seems to have been first made known in ancient times by travelers from the s. shores of the Mediterranean, who, crossing the great desert, came upon the upper course of a great river flowing toward the rising sun. This river Herodotus supposed to be a branch of the Egyptian Nile. Pliny speaks of the *Nigris* of Ethiopia, but he also thought that it flowed into the Nile. No definite notion on the river had been formed until it was visited by Mungo Park in July, 1796, when this traveler explored its banks for a distance of 160 m. See Park, Mungo. Caillié explored the river from the town of Jennee to Timbuktu; and the English expedition of 1832, under Lander and Allen, proved that the Quorra was navigable from Boussa to the sea; information, however, which was obtained at an immense cost of human life from the unhealthiness of the climate. Subsequent expeditins have ended with similar results. In 1864, Dr. Barth followed the course of the river from Timbuktu to Say, and much of what is now known about the Niger is due to his labors. The entire length of the river is estimated at 2,600 miles.—Barth's *Travels in Central Africa*.

NIGHT-HAWK, *Chordeiles Virginianus*, a bird of the goatsucker family (*caprimulgidæ*) very common in America, from the Arctic islands to the West Indies. It is a bird of passage, visiting the north in summer. It is about nine inches in length, and 23 inches in expanse of wing. The gape is destitute of bristles. The tail is slightly forked. The general color is brown, but it is much mottled and marked with white; and there is a white mark on the throat, in shape like the letter V. The night-hawk is seen pursuing its insect prey in the air, chiefly before sunset, and before dawn, and attracts attention by its rapid repetition of a sharp impatient cry, which has gained for it the name *Piramidig*. It produces also in its flight a remarkable hollow booming sound, "like blowing into the bung-hole of a barrel," in the moments of its perpendicular descent through the air. Its movements in the air are extremely beautiful and rapid. When fat and plump, as it usually is on its southward migration, it is esteemed for the table, and great numbers are shot.

NIGHT HERON, *Nycticorax*, a genus of *ardeidæ* (see Heron), intermediate in form between bitterns and herons, but with shorter and thicker bill than either, and legs

shorter than in herons. The COMMON Night Heron (*N. Gardeni* or *Europæus*) is found in Europe, Asia, Africa, and North America, chiefly in the warmer temperate regions. It is most abundant in America, and is partly a bird of passage. It is a very rare visitant of Britain. Its length, from the tip of the bill to the end of the short tail, is fully two feet. It weighs nearly two pounds. Its plumage is soft, the general color ash-gray, passing into black on the neck and head, and into white on the breast and belly. The back of the head is adorned with three very long white feathers, which hang down on the neck. The nests are built in trees, and in general many together, forming a *heronry*. The night heron feeds chiefly by twilight or at night; and is never seen standing motionless, like herons, but walks about in search of prey, by the sides of ditches, ponds, etc.; its food consisting chiefly of fishes, frogs, and other aquatic animals. Its cry is very loud and hoarse.—Other species of night heron are found in Africa and Australia.

NIGHTINGALE, *Philomela*, a genus of birds of the family *sylviadæ*, approaching in character to the *merulidæ*, the young having their first plumage mottled, as in the thrushes, and the legs being longer than in the fauvettes and other *sylviadæ*, with which they are commonly classed. The bill is straight, slender, not quite as long as the head; the wings do not much pass beyond the base of the tail; the first quill is very short, the third is the longest; the tail is slightly rounded.—The COMMON NIGHTINGALE (*P. luscinia*) is well known as the finest of songsters. It is rather larger than the hedge-sparrow, with about the same proportionate length of wings and tail. It is of a rich brown color above, the rump and tail reddish, the lower parts grayish-white. The sexes are alike. It is a native of many parts of Europe and Asia, and of the north of Africa; and is a bird of passage, extending its summer migrations in the continent of Europe as far north as the south of Sweden, but in Britain it has scarcely ever been seen further north than Yorkshire. It is plentiful in some parts of the south and east of England, but does not extend to the western counties, and never appears in Ireland. It frequents thickets and hedges, and low damp meadows near streams. The extensive market-gardens near London are among its favorite haunts. It feeds very much on caterpillars and other larvæ. It arrives in England about the middle of April, the males ten or fourteen days before the females. It is at this season, and before pairing has taken place, that bird-catchers generally procure nightingales for cage-birds, as they then become easily reconciled to confinement, whilst, if taken after pairing, they fret and pine till they die. The nightingale makes its nest generally on the ground, but sometimes on a low fork of a bush. The nest is loosely constructed of dead leaves, rushes, and stalks of grass, with a lining of fibrous roots. The eggs are four or five in number, of a uniform olive-brown. The song of the male ceases to be heard as soon as incubation is over. In captivity, however, it is often continued through a more considerable period. The nightingale usually begins its song in the evening, and sings with brief intervals throughout the night. The variety, loudness, and richness of its notes are equally extraordinary; and its long quivering strains are full of plaintiveness as well as of passionate ecstasy. The nightingale has been a favorite from most ancient times; and is often mentioned in the poetry of India and Persia, as well as of Greece and Rome. The loves of the nightingale and the rose are a fanciful theme in which eastern poets delight. The nightingale much resembles the redbreast in manners, and is equally pugnacious. It has been known to breed with the redbreast in captivity.—There is another and rather larger species of nightingale in the east of Europe. See illus., BIRDS, vol. II.

NIGHTINGALE, FLORENCE, famed for her labors in reforming the sanitary condition of the British army, the daughter of William Shore Nightingale, of Embly Park, Hampshire, and Leigh Hurst, Derbyshire, was born at Florence, Italy, in 1823. Highly educated, and brilliantly accomplished, she early exhibited an intense devotion to the alleviation of suffering, which, in 1844, led her to give attention to the condition of hospitals. She visited and inspected civil and military hospitals all over Europe; studied with the sisters of charity in Paris the system of nursing and management carried out in the hospitals of that city; and, in 1851, went into training as a nurse in the institution of Protestant deaconesses at Kaiserswerth, on the Rhine. On her return to England, she put into thorough working order the sanitorium for governesses in connection with the London institution. Ten years was the term of apprenticeship thus served in preparation for the work of her life. In the spring of 1854 war was declared with Russia and a British army of 25,000 men sailed to the east. Alma was fought Sept. 20, and the wounded from the battle were sent down to the hospitals prepared for their reception on the banks of the Bosporus. These hospitals were soon crowded with sick and wounded, and their unhealthy condition became apparent in a rate of mortality to which the casualties of the fiercest battle were as nothing. In this crisis Miss Nightingale offered to go out and organize a nursing department at Scutari. The late lord Herbert, then at the war-office, gladly accepted, and within a week from the date of the offer—viz., Oct. 21—she departed with her nurses. She arrived at Constantinople Nov. 4, the eve of Inkermann—the beginning of the terrible winter campaign—in time to receive the wounded from that second battle into wards already filled with 2,300 patients. Her devotion to the sufferers can never be forgotten. She has stood twenty hours at a stretch, in order to see them provided with accommodation and all the requisites of their condition. But she saw clearly in the bad sanitary arrange-

ments of the hospitals the causes of their frightful mortality, and her incessant labor was devoted to the removal of these causes, as well as to the mitigation of their effects. In the spring of 1855, while in the Crimea organizing the nursing-departments of the camp-hospitals, she was prostrated with fever, the result of unintermitting toil and anxiety; yet she refused to leave her post, and on her recovery remained at Scutari till Turkey was evacuated by the British, July 28, 1856. She, to whom many a soldier owes his life and health, had expended her own health in the physical and mental strain to which she had subjected herself. It is known that for years Miss Nightingale has been an invalid. It is not so well known that her sick-room has been the scene of the most arduous and constant labor for the improvement of the health of the soldier. In 1857 she furnished the "commissioners appointed to inquire into the regulations affecting the sanitary condition of the British army" with a paper of written evidence, in which she impresses, with the force and clearness which distinguish her mind, the great lesson of the Crimean war, which she characterizes as a sanitary experiment on a colossal scale. Her experience in the Crimea, the results obtained by the labors of the sanitary commission, results accumulated under her own eyes, showing that the rate of mortality among soldiers could be reduced to one-half of what it was in time of peace at home, turned the attention of Miss Nightingale to the general question of army sanitary reform, and first to that of army hospitals. In 1858 she contributed two papers to the national association for the promotion of social science, on hospital construction and arrangements, afterwards published, along with her evidence before the commissioners, by J. W. Parker and son. The *Notes on Hospitals*, from their clearness of arrangement and minuteness of detail, are most valuable to the architect, the engineer, and the medical officer. In 1860 she published her *Notes on Nursing*, a little volume which is already among the treasured text-books of many a household. At the close of the Crimean war a fund was subscribed for the purpose of enabling her to form an institution for the training of nurses. The interest of the fund amounts to £1400 per annum; and though no separate institution has been formed, it is spent in training a superior order of nurses in connection with St. Thomas's and King's college hospitals. In the year 1863 was issued the report of the commission on the sanitary condition of the army in India. The complete report, with evidence, occupies two folio volumes of nearly 1000 pages each. The second of these huge folios is filled with reports from every station in India, occupied by British and native troops. These reports were sent in manuscript to Miss Nightingale, and at page 347 of vol. i. are inserted her observations upon this immense mass of evidence. In these observations, the facts are brought together in an order, and with an incisive force of statement, which render it one of the most remarkable public papers ever penned. That report very soon inaugurated a new era in the government of India; for the views of Miss Nightingale extended not only to the sanitary reform of the British army, but to that of the towns of India. In 1871 Miss Nightingale published *Notes on Lying-in-Institutions, together with a proposal for organizing an Institution for training Midwives and Midwifery Nurses;* in 1873 *Life or Death in India*, and (in *Fraser's Magazine*) *A Note of Interrogation*, which attracted a good deal of attention, mainly on account of the way she handles religious beliefs and life.

NIGHT-JAR. See GOATSUCKER.

NIGHTMARE, *Incubus, Ephialtes,* consists in a horrible dream, the terror being inspired by a sense of weight or oppression referred to the pressure of mountains, giants, hags, serpents, upon the breast. It is attributed to acceleration or irregularity of the circulation in the chest or in the brain. It has been traced backward to plethora, posture, heavy suppers; and forward as a prognostic of heart disease or hydrothorax. It differs from ordinary dreams in possessing always the same characteristic of fear of some object in contact with the body, in a recognized inability to move or speak while there is a strong desire to do both, and in the presence of a semi-consciousness of the real source of the apprehension. The affection is recorded to have been epidemic; and modern instances have occurred where large communities have been agitated by night panics. A regiment of French soldiers, quartered in a ruined monastery, were awakened, at the same hour in two successive nights, by a black dog leaping on the breast of each. These veteran warriors, inured to danger, inaccessible to superstition, could not be prevailed upon to make a third trial. Such frightful impressions occur during the day, and during mere somnolency or drowsiness, but more generally at the moment of awakening during the night. The time, the distinct recollection retained of the circumstance, and the bodily perturbation which remained when consciousness was re-established, all conspired to convert these visions into the objective hobgoblins, the omens and supernatural revelations of past ages; and which still linger as matter of belief where the temperament or situation of the individual resembles those of our ancestors. In a very large number of instances such dreams represent, or are continuations of, the previous waking thoughts and emotions. They are so far voluntary that indigestible food or excess may induce them. Fuseli, for artistic purposes, created "chimeras dire" in sleep by supping on pork chops.

NIGHTSHADE, the English name of certain plants of the natural order *solanaceæ* (q.v.), possessing the narcotic properties frequently developed in that order. Among

them are some species of *solanum* (q.v.), particularly the COMMON NIGHTSHADE, or BLACK NIGHTSHADE (*S. nigrum*), an annual or biennial, with erect angular stem, ovate, sinuate-dentate leaves, drooping lateral umbels of white flowers, and globose black berries; a frequent weed in waste places in England and in most parts of the world. Few plants are more widely diffused. It is only slightly narcotic. The leaves, in a fresh state, are said to be injurious to animals which eat them, but seem to lose almost all narcotic property by boiling, and are used as spinach, particularly in warm climates. The berries, although generally dreaded or suspected, may also, it is said, be eaten, at least in moderate quantity, without danger. They contain, however, the alkaloid *solanine* found also in the shoots of the potato.—WOODY NIGHTSHADE, see BITTERSWEET. For DEADLY NIGHTSHADE, see BELLADONNA. For ENCHANTER'S NIGHTSHADE, see CIRCÆA.

NIGRITIA. See SOODAN.

NI'HILISM is a term used of certain philosophical or half-philosophical systems of "negative" tendency, especially such as deny God, the soul, and the moral distinction between good and evil. Of late, however, it has become familiar throughout Europe as applied to the hyper-revolutionary programme of a Russian organization in various ranks of society. The young men at the universities seem to be largely addicted to Nihilism, and are equaled in their zeal by the "fair girl graduates" of Russia. The Nihilists are said to have adopted many of the socialistic views of Proudhon (q.v); but while their scheme is in other respects vague and ill-compacted, their foremost principle is the belief that society may be and ought to be regenerated by a sudden and sweeping overthrow of most existing social and political institutions. Towards preparation for this extensive undertaking, their bold propagandism is especially directed. While violently opposed to Pan-slavism (q.v.) as supporting old and obsolete notions of nationality and patriotism, cosmopolitan Nihilism is yet so far purely Russian as apparently not to have established direct relations with the socialistic organizations of western Europe. Herzen (q.v.), as an admirer of west European culture, widely to be distinguished from the Nihilists, gave a powerful impetus to the spread of democratic opinions in Russia. But the great leaders of the Nihilistic movement were the indefatigable agitator Michael Bakunin (born 1814) and the journalist Tchernyschevski. In 1869, during certain students' demonstrations, revolutionary manifestoes were distributed. Much was done for promoting revolutionary opinions through the medium of Sunday-schools, ere these were suppressed by government. Young men of good birth adopted menial callings in order to understand the grievances and burdens of their poorer brethren, and to enter with fuller sympathy into their feelings. Nihilistic associations began to display organized activity, and considerable funds were collected. Government now began numerous prosecutions. In 1871 there was a lengthened trial, and numerous condemnations to Siberian exile. In 1875 an actual rising took place under a red banner, amongst the students at Kazan. In 1877 139 persons, mostly young men and women, were tried, and many condemned. The unanimous acquittal by a St. Petersburg jury of the lady assassin, Vera Sassulitch, who attempted the life of Gen. Trepoff, governor of a prison, displayed a dangerous condition of public feeling, and led to the significant, though "temporary," withdrawal of the trials for political crimes from juries, these being now assigned, to courts-martial. The assassination, by Nihilists especially commissioned, of the general at the head of the secret police of Russia and of the governor of Kharkov, in 1878 and 1879, show the boldness and persistency of the Nihilistic propaganda.

The name Nihilists, derived from the Latin *nihil*, nothing, is therefore appropriate to an organization which, in aiming at the destruction of the existing legal and political and social systems, has as yet prepared to replace them with nothing. It is stated that the term was first employed by the Russian novelist, Ivan Turgenieff, in his stories of Russian society. It was, however, accepted by the organization itself, as will appear in the following quotation from a speech by a member, and which may be accepted as fairly significant of the doctrines with which the minds of the advanced radicals of Russia have become imbued. "Nothing, in the present state of social organization, can be worth much, for the simple reason that our ancestors instituted it. If we are still obliged to confess ourselves ignorant of the exact medium between good and evil, how could our ancestors, less enlightened than we, know it? A German philosopher has said: 'Every law is of use. It rules the conduct of individuals who feel for one another and appreciate their respective wants. Every religion, on the other hand, is useless; for ruling, as it does, our relations with an incommensurable and indefinite Being, it can be the result only of a great terror or else of a fantastic imagination.' Now, we Nihilists say, no law, no religion—nihil! The very men who instituted these laws ruling their fellow-creatures have lived and died in complete ignorance of the value of their own acts, and without knowing in the least how they had accomplished the mission traced for them by destiny at the moment of their birth. Even taking it for granted that our ancestors were competent to order the acts of their fellow creatures, does it necessarily follow that the requirements of their time are similar to those of to-day? Evidently not. Let us then, cast off this garment of law, for it has not been made according to our measure, and it impedes our free movements. Hither with the axe, and let us demolish everything. Those who come after us

will know how to rebuild an edifice quite as solid as that which we now feel trembling over our heads." Two points will be observed in this manifesto: the one being its positive antagonism to all existing things—because they exist; the other the sophistry with which the accepted position is reasoned out to a logical conclusion. And this brings us naturally to the starting points of Russian nihilism: in the influence of the Russian history; in the nature of the Russian people; and in the exceptional character of the Russian political system.

The present autocracy of Russia was originally an oligarchy, and not until Ivan I. (III.) founded the existing Russian empire in the 15th c. was the power of the grand-dukes, true oligarchs, destroyed. Autocracy was cemented by his immediate descendant, Ivan the Terrible, by Peter I., Catherine II., and finally by Nicholas. Under the changed political condition instituted by these monarchs, there came to be but three orders or classes among the Russian people: the czar, the nobility and aristocracy, and the serfs: there was no *bourgeoisie* or middle class. This anomalous condition is supplemented by another; the existence for centuries of the *mir*, an actual democracy, which has outlived tyranny and spoliation, and by which each village community has kept alive the ideas of socialism and equal rights. The *mir* is in fact a co-operative association of the local peasantry, under a head elected by themselves, who exercises parental authority in conjunction with the village parliament which is convened in cases of emergency. This institution is primitive in its origin, which was Slavonic, is patriarchal in discipline, and preservative of the socialistic element in rural economy. Through its means exists the veritable commune in Russia; since the arable land and pasturage belong not to individuals, but are the collective property of the commune, which enjoys unlimited authority in making allotments and in the redistribution of the soil. These village communes contain about five-sixths of the population, and are opposed to Cæsarian despotism on the one hand, and centralized bureaucracy on the other. When to this extraordinary combination of factors is added that of the persistent tendency of the Russian aristocracy toward anarchy—which is a historical fact—it will be seen what a readiness there is for socialistic ideas and positive revolutionary principles. After Ivan the Terrible, a period of actual anarchy existed in Russia, when the boiars (barons) succeeded in fastening still more strongly the chains of servitude upon the unhappy serfs. The accession of Michael Romanoff to the throne, and the foundation of a new dynasty, proved to be the death-blow to their hopes for ascendency in the realm, and there was nothing for them, and for all the petty potentates and government officials in the empire, but to continue an iron grasp on the lower order, for the increase of their wealth and power, if not of their dignity. A reviewer in *Blackwood* has epitomized the situation: "We have the monarch who rules, the courtiers who assassinate, and the serfs who obey." And Mr. Gladstone wrote, so late as 1880, of what he called "the oligarchic, diplomatic, and military class:" "This class, or rather this conglomerate of classes, ever watchful for its aims, ubiquitous yet organized, standing everywhere between the emperor and the people, and oftentimes too strong for both, is at work day and night to impress its own character upon Russian policy." Under Ivan the Terrible was organized the opritchini (elect, or covenanted), a body of guards, selected sometimes from the lowest of the people, who swore implicit obedience to the czar, and in return were chartered libertines, robbers, and assassins. Each of them exercised a despotism as odious in its sphere as that of the czar, and they became the nucleus of a new kind of nobility, the nobility of function and government employ, which for all practical purposes nearly superseded the hereditary nobility. It is to be remembered that Nicholas ascended the throne over the ruins of a conspiracy which only his personal majesty and invincible courage enabled him to control; and this by such a massacre of those engaged in the uprising, that in one day 15,000 persons were slain, whose bodies were thrown by torchlight into the Neva. But before the accession of Nicholas, in 1821, when all Europe was convulsed with revolutionary disorder, Russia began to feel the influence of the new ideas which pervaded the political atmosphere of the entire continent, and did not escape the infection of secret societies which had been brought back by the armies from France. It is not unreasonable to suppose that it was this influence which brought about the insurrection of Dec., 1825; since one of the leaders in the outbreak was Alexander Hertzen, who with Bakunin, is considered a founder of the nihilist organization; and who continued throughout his life (he died in 1870) to disseminate the most advanced radical opinions. As an illustration of the tendency of his writings, we have the following: "Despotism itself lives behind wooden walls, and has no stability. A conservative government like that of Austria has never been possible in Russia; we have nothing to conserve, because there is nothing stable among us. . . . . Every government brings into question existing rights and institutions; what was ordered yesterday is countermanded to-day. Because there is no historical basis, we love novelties to distraction."

Alexander II. ascended the throne under circumstances which, though less sanguinary than those of his father's accession, were yet essentially untoward. Apparently everything was in ruins: the military system had broken down; the Crimean war had been a disaster; the administrative machinery of the state had almost collapsed. In closing the Crimean war, the new emperor uttered a manifesto which was significant of his hopes and designs for the future of Russia. Among other expressions in it was the desire that "by the combined efforts of the government and the people, the public admin-

istration would be improved, and that justice and mercy would reign in the courts of law." The beginning of his reign was signalized by the copious use of the pardoning power; and in its second year he began to move in his vast enterprise of emancipating the serfs, by submitting the question to the nobles of the empire. The number of serf-owners in Russia was about 110,000, having under their control 23,000,000 peasants. In 1857 the emperor issued a ukase which was the beginning of the tremendous change which he had undertaken; and on Feb. 19 (March 3, N.S.), the emancipation law was completed, and the signature of Alexander II. gave freedom to 23,000,000 men. By the agrarian, or land law, which followed, the peasants of a commune were enabled to buy their holdings by a cash payment of about three years' rent, the state advancing four-fifths of the full payment, which was to be repaid, with 6 per cent interest, in 49 years. In the outset, under this act, Russia paid $500,000,000 to the landlords to settle the newly emancipated serfs upon their own holdings, comprising farms extending over 300,000,000 acres. And as the peasants, from time to time, failed to meet their payments, the government advanced the amount. The final result of the land-law will be that the peasant, by paying four-fifths of his rent for 49 years to the state instead of to his landlord, will, at the expiration of that period, have become absolute owner of his farm. It is to be observed that by the enforcement of the emancipation act and the land act, the landlords lost first, their serfs, and then 20 per cent of their rentals. The third great act of Alexander II. was to extend the system of the *mir*, or local self-government, so as to give the peasants entire control as to this, with a very complete organization of elected officials. As the emperor also reformed the judiciary; introduced trial by jury, and the system of trials in open court; made decided improvements in the public administration of office; promoted education, so that between 1860 and 1870 the number of children who could read multiplied five-fold; and finally destroyed most of the existing class distinctions, and relaxed the severity of the censorship of the press; the continued existence of nihilism, and its potency, as shown in the recent assassination of this very czar, present a most difficult social and political question. The anomaly of the union of many of the wealthiest and most aristocratic Russians, men and women, with students and other educated persons, with the peasant class, in a wide revolutionary movement, having for its avowed object the destruction of all existing institutions, would be inexplicable, but for the peculiar characteristics of Russian history—as already set forth; with other reasons now to be indicated. Mr. Gladstone has said of Alexander II.: "The present emperor of Russia has, during a reign now approaching a quarter of a century, given ample evidence of a just and philanthropic mind. No greater triumph of peaceful legislation is anywhere recorded than the emancipation of the Russian serfs which he has effected." Of these very serfs, or peasants, he has said: "They are a peaceful and a submissive race, whose courage in the field is that of a determined and uncalculating obedience."

We have referred, as one of the starting points of Russian nihilism, to the nature of the Russian people. This is not what has been generally supposed, particularly by Americans, who have received their conclusions ready-made from always antagonistic and contemptuous English sources—to whose utterances those of Mr. Gladstone stand as a relief. The current opinion as to the result of "scratching a Russian," derived from the emperor Napoleon I., who had no great cause to love the race, has been that this would be to disturb the Tartar savage beneath, and bring to light a disposition cruel, vindictive, and stubborn; and a temperament stolid and lethargic; a combination of the merciless Asiatic, and the boorish and phlegmatic Hollander of the picture-books. This conception is far from truth. The race is probably similar to the Irish in some characteristics; and to the French in its mercurial nature; while in strange combination it resembles the German in its fondness for abstract philosophical reasoning, and the Spaniard or Italian in its sensuousness and indolence. These latter characteristics give it an oriental stamp. As to the psychological tendencies of the Slave mind, Moritz Kaufmann writes that it is "singularly sensitive to the seductive influences of grand misty conceptions, while at the same time inclined to indolence and melancholy dejection"—again an oriental tinge. Keeping in view this fact; and remembering that in Russia there has been for centuries a struggle between the educated (aristocratic) class and the emperor; that while the individual administration of the government by the latter may have been excellent; that of his officials, from the highest to the lowest, has, confessedly, been infamous; that vast reforms were projected into the Russian system *en masse*, which elsewhere would have been the slow work of centuries; that these reforms, while they alienated from the emperor and autocracy the favor of the upper class, did not gain that of the lower; it may well appear that Russia needed only to be infused with an element powerful enough and insidious enough, to become distracted into any madness. The tendency of the emancipation act and the land act, however noble and beneficent these were in themselves, has been to undermine the confidence of the Russian peasant, by removing from him the only sure foothold that he knew. As the prisoner, long confined, pleads to return to his dungeon, the serf under his new condition of freedom, combined with that of proprietorship, is prostrated beneath an endowment which is an actual burden. For the peasant has to a certain extent merely changed owners—since as to his payments for land, he is obliged to depend on some principal man in the village. And, meanwhile, the old commune principle is being slowly eaten away, and that of

individualism with its consequent responsibilities and antagonisms—both utterly foreign to the experience and taste of the Russian peasant—assumes its place.

Michael Bakunin, supposed by some to have formulated nihilism out of the Hegelian philosophy, but whose theories are more naturally traceable to an utter materialism acting on the revolutionary ideas afloat in Europe during the first half of the 19th c., was born in 1814, and died in 1876. He was of a family high in rank and position, a near relative being aid-de-camp general to the late czar, and another governor-general of e. Siberia; was educated in the school for cadets in St. Petersburg; and on graduating was appointed an ensign in the artillery. In 1841 he went to Berlin and studied Hegel, where the master had taught a dozen years before; removing afterwards to Dresden, where he continued his studies with Arnold Ruge, and where he began to write on philosophical subjects. In 1843 he was in Paris, and by this time had become closely associated with the Polish refugees; and from there he visited Switzerland, where he was introduced into the communist and socialist societies. In 1847, in a speech made in Paris, he advocated a general Russian and Polish uprising against the emperor; this occasioned a request from the Russian government which procured his expulsion from France. A reward of 10,000 rubles was offered by the Russian government for his apprehension, and he fled to Brussels, but returned to Paris after the revolution in 1848. He attended the Slavic congress at Prague, and was involved in the revolutionary movement which followed; was one of the organizers and leaders of the riots in Dresden, from which city he fled after their suppression; and on May 10 was captured at Chemnitz. He was now tried, condemned, and sentenced to death in three countries—Prussia, Austria, and Russia; his punishment being in each instance commuted to that of imprisonment for life. He was confined for several years in the fortress of St. Petersburg, and then transported to e. Siberia, where he remained for several more years as a penal colonist, when he was permitted to settle in the Russian territory of the Amoor. Thence escaping by an American vessel, he proceeded by way of Japan and California to London. Here he was active in endeavors to incite the Russians and Poles to revolution, with the view of forming a great Slavic federal republic. In 1863 he went to Stockholm to aid the expeditions against the Baltic provinces. This enterprise failing, he proceeded to Switzerland, where he united with the internationals; but his attempt to create a secret society within their own, with the purpose of bringing about a condition of general anarchy, brought him into conflict with their leaders; and in 1872 he, with some of his friends, was expelled from the organization, when he retired from public action. In the meantime societies had been formed in Russia to promote the views of Bakunin and Hertzen, the "Young Russia," "Land and Freedom," etc.; and newspaper organs—the *Sovremiennik* and *Ruskoie Slowo*, were established and industriously circulated in the same interest. As presenting the strangely self-contradictory theories which dominated the new revolutionary order at this time, the following is quoted from a speech made at Geneva, in 1868, by Michael Bakunin—"the father of nihilism, the arch-conspirator:" "Brethren, I come to announce to you a new gospel which must penetrate unto the very ends of the world. This gospel admits of no half-measures and hesitations. The old world must be destroyed and replaced by a new one. The *lie* must be stamped out and give way to truth. It is our mission to destroy the *lie;* and to effect this we must begin at the very commencement. Now the beginning of all those lies which have ground down this poor world in slavery is God. For many hundred years monarchs and priests have inoculated the hearts and minds of mankind with this notion of a God ruling over the world. They have also invented for the people the notion of another world, in which their God is to punish with eternal torture those who have refused to obey their degrading laws here on earth. This God is nothing but the personification of absolute tyranny, and has been invented with a view of either frightening or alluring nine-tenths of the human race into submission to the remaining tenth. If there were really a God, surely he would use that lightning which he holds in his hand to destroy those thrones to the steps of which mankind is chained. He would, assuredly, use it to overthrow those altars where the truth is hidden by clouds of lying incense. Tear out of your hearts the belief in the existence of God; for as long as an atom of that silly superstition remains in your minds, you will never know what freedom is. When you have got rid of the belief in this priest-begotten God, and when, moreover, you are convinced that your existence and that of the surrounding world are due to the conglomeration of atoms, in accordance with the laws of gravity and attraction, then, and then only, you will have accomplished the first step toward liberty, and you will experience less difficulty in ridding your minds of that second lie which tyranny has invented. The first lie is *God*. The second lie is *right*. *Might* invented the fiction of right, in order to insure and strengthen her reign—that right which she herself does not heed, and which only serves as a barrier against any attacks which may be made by the trembling and stupid masses of mankind. *Might*, my friends, forms the sole groundwork of society. Might makes and unmakes laws, and that might should be in the hands of the majority. It should be in the possession of those nine-tenths of the human race whose immense power has been rendered subservient to the remaining tenth by means of that lying fiction of *right* before which you are accustomed to bow your heads and to drop your arms. Once penetrated with a clear conviction of your own

might, you will be able to destroy this mere notion of *right*. And when you have freed your mind from the fear of a God, and from that childish respect for the fiction of *right*, then all the remaining chains which bind you, and which are called science, civilization, property, marriage, morality, and justice, will snap asunder like threads. Let your own happiness be your only law. But in order to get this law recognized, and to bring about the proper relations which should exist between the majority and minority of mankind, you must destroy everything which exists in the shape of state or social organization. So educate yourselves and your children that, when the great moment for constituting the new world arrives, your eyes may not be blinded by the falsehoods of the tyrants of throne and altar. Our first work must be destruction and annihilation of everything as it now exists. You must accustom yourselves to destroy everything, the good with the bad; for if but an atom of this old world remains, the new will never be created. According to the priests' fables, in days of old a deluge destroyed all mankind; but their God specially saved Noah in order that the seeds of tyranny and falsehood might be perpetuated in the new world. When you once begin your work of destruction, and when the floods of enslaved masses of the people rise and engulf temples and palaces, then take heed that no ark be allowed to rescue any atom of this old world, which we consecrate to destruction."

Here, the very "right" whose existence is denied is invoked as the basis of action.

In one nihilist speech it is asserted that the deeds of political assassins and incendiaries are not the offspring of any sentiment of personal hatred or vengeance. They know full well that one emperor killed will merely be succeeded by another, who in his turn will again nominate the chiefs of police and of the third section. Such deeds are justified by the necessity of rooting out from men's minds the habitual respect for the powers that be. The more the attacks on the czar and his officials increased, the more would the people come to understand the absurdity of the veneration with which they have been regarded for centuries. In March, 1876, several nihilist proclamations on their way to Russia were seized by the Prussian authorities at Königsberg. Paragraph xvi. of one of the documents ran thus: "You should allow yourselves to be influenced (in the selection of your victims) only by the relative use which the revolution would derive from the death of any particular person. In the foremost rank of such cases stand those people who are most dangerous and injurious to our organization, and whose sudden and violent death would have the effect of terrifying the government, and shaking its power by robbing it of energetic and intelligent servants. § xxiii.—The only revolution which can remedy the ills of the people is that which will tear up every notion of government by its very roots, and which will upset all ranks of the Russian empire, with all their traditions. § xxiv.—Having this object in view, the revolutionary committee does not propose to subject the people to any directing organization. The future order of things will doubtless originate with the people themselves; but we must leave that to future generations. Our mission is only one of universal, relentless, and terror-striking destruction. § xxvi.—The object of our organization and of our conspiracy is to concentrate all the forces of this world into an invisible and all-destroying power." Among the papers found on the nihilist Lieut. Dubrowin, who was hanged for complicity with the regicide Solowjew, was a letter containing the following passage: "Our battalions are numerically so weak, and our enemies, on the other hand, are so mighty, that we are morally justified in making use of all attainable methods of proceeding which may enable us to carry on successfully active hostilities wheresoever it may become expedient." Again, the inevitable attempt at justification on the basis of the "right" whose existence is denied.

When one reads such propositions and declarations, and finds it difficult to conceive a sufficient reason for the existence of the sentiments and determination expressed, even in the most untutored and illy balanced, it is to be remembered that in Russia any tendency toward revolutionary expression has ever been met with instant and severe punishment. The knout and perpetual banishment at hard labor have been the modes in which autocracy has visited its displeasure on any movement against itself. While the czar of his own suggestion gave freedom and large actual possessions to 23,000,000 of his poorest and most unhappy subjects, he followed the traditions of the throne of Russia by sternly refusing to the higher classes anything resembling a constitution, or a national legislature. Attempts to gain these, and there were many such, served to people the penal colony of Siberia, precisely as did the more savage and mutinous attempts of the lower order in a similar direction. During many years the average number dispatched to Siberia, for all offenses, has been from 8,000 to 10,000 persons per annum; and of these, probably a large majority were for political crimes; very many of them educated, wealthy, and of high birth; among them not a few refined, cultivated, and gentle ladies. Siberia has the reputation among Russians of being a much worse place than it really is, and the officials in charge of the convicts are accused of a general line of cruelties which is foreign to their customary behavior. Recent visits to the Siberian penal settlements by intelligent travelers of different nationalities, have shown that the ill-treatment of convicts and the dismal character of existence in Siberia have been greatly exaggerated, and that both compare favorably with those in such settlements elsewhere. But to the prevailing Russian belief as to such matters may be laid somewhat of the revengeful and desperate frame of mind which results in nihilism. Again, the slight allusion which has been here made to

the course pursued by government officials in Russia, has in no wise fully presented the enormities committed by these wretches in the name and by the authority of the emperor, who could not possibly control or even direct in such instances. The outrages and brutalities committed by agents of the government in distant parts of the empire, were done in perfect security, and went unpunished. It was hardly to be wondered at that the rude and illiterate Russian peasant, robbed of all that he held most dear, by the highest government official in his neighborhood, should accept from the learned the proposition that there was no God. Neither should it appear so astonishing that the educated and cultivated Russian whose sister or sweetheart was subjected to the knout, for the expression of liberal opinions, or sent by imperial order into that Siberia of whose horrors he had heard, should view not unwillingly the possibility of a regeneration of society which began with the assassination of emperors.

After Bakunin, the one who did most to propagate nihilistic ideas in Russia was the novelist Tschernyschewsky, who edited a radical monthly until it was suppressed in 1862, and afterward wrote *What is to be Done*, a remarkable novel, which was forbidden circulation in Russia, but was printed in Berlin and in Switzerland. Disseminated thus through broadsides, periodicals, newspapers, handbills, and even fiction, the nihilist views have found many readers. The students in the universities have been apt and eager scholars in the new dispensation, mainly on account of mal-administration of their various colleges; but also from that volatile temperament and tendency to advanced speculative opinions which generally characterizes students everywhere. An absurd rule, that a knowledge of Greek and Latin should be the test in university and civil-service examinations, drove many students from the universities and into nihilism. In Russia the only field for the young man of education who is not noble, is the civil-service: commerce, the industries, and agriculture, offer them nothing; the priesthood is despised; there is little or no business for the lawyer, and the army positions are reserved to the nobility. Thus, to make a classical education a *sine qua non* for entrance to the university, was to set up an impenetrable barrier; since the students, for the most part, are the sons of poor trades-people, priests, and small government officials, to whom Greek and Latin are impossible as preliminaries to a university education. Thrown out of their destined career, these young men had neither position, means of existence, nor prospects; and in very desperation they grasped at the delusive subleties of nihilism. There are no means of knowing the number of nihilists; the organization seems wide spread, but careful investigators incline to consider the number as comparatively very small.

There remains only to recapitulate a few of the leading events in the history of the various revolutionary attempts made by this organization since its foundation. As early as 1859 nihilistic societies began to be formed in Russia among the students of the agricultural college of Petrovski, near Moscow, who had adopted the materialistic views taught by Büchner in his *Force and Matter*, and those on socialism set forth by the German, Max Stirner in his *Property and the Individual;* and who had read also, it it said, Buckle's *History of Civilization*. It was in this institution that the first political assassination occurred, when one of the students named Ivanoff was killed by the notorious Netchaïeff, who though an emissary of Bakunin, and of the chief committee of the nihilists, is accused of having been a common swindler, while he certainly proved himself to be an informer. This assassination, which did not happen until 1873, caused intense excitement, in the midst of which the perpetrator escaped to Switzerland, but only to be given up by the Swiss to the Russian government. He was tried in Moscow in 1874 with closed doors, and would have been executed, but that on account of the information which he afforded, his sentence was commuted to transportation for life and penal servitude in the mines of Siberia. By his confessions 183 persons were implicated, and these were all seized on the same day, May 20, 1875. Their trial lasted 18 months, terminating in Dec., 1877, when 99 of the accused were sentenced to penal servitude in Siberia, 36 subjected to police supervision for a certain number of years, and the remainder acquitted; those accused were chiefly sons and daughters of priests, trades-people, Jews, and small officials, and were charged with seeking to propagate nihilism among the lower classes. Many of them were young girls. The nihilists began to attract attention as a really formidable association about the time of the trial of Vera Sassulitch in 1878. Vera Sassulitch, a young woman 28 years of age, who had been under the surveillance of the government on account of the suspicion that she was concerned with the nihilists, attempted the assassination of Gen. Trepoff, one of the chiefs of secret police, in July, 1877. The officer in question had ordered a political prisoner to be flogged for some act of disrespect to him personally, and Vera Sassulitch, as she averred, committed the act in order to force the government to take note of the fact. She was tried by a jury of educated men, eight of whom held government positions, and to the general astonishment, was acquitted, a result with which the Russian press and public showed themselves in full agreement. Gen. Trepoff was removed from his position, but was made gen. of cavalry. Vera Sassulitch left the country after the trial in 1878, but her case was brought before the supreme court of revision, and the acquittal canceled on the ground of informality. In Aug., 1878, Gen. de Mezentzoff, the successor of Gen. Trepoff, was stabbed at St. Petersburg while walking, and died the same day. This and other similar attacks were ascribed to the nihilists, who were manifesting remarkable activity in all directions. A secret association called the "National Government" issued a circular in

April, 1878, containing a revolutionary programme, and calling upon the people to take up arms. Assemblages of the people in public places were now prohibited by a ministerial order. In a letter from Odessa to a Vienna newspaper, it was stated that there were several thousand members of the nihilist society in that city alone: that the organization had powerful supporters in the highest ranks of society; and that a lady who was one of the Russian fashionable leaders, had been arrested for being in correspondence with the chief of the nihilist committee at St. Petersburg. During Sept., 1878, a pamphlet entitled *Life for Life*, which was considered a manifesto of the nihilists, was published in St. Petersburg. Among other passages, it contained the following: "We are socialists. Our purpose is the destruction of the present economical organization and inequality which constitute, according to our convictions, the root of all the evils of mankind. The question of the political form is entirely indifferent to us." . . . "Our daggers will never be sheathed until our oppressors, who strangle and gag us, are expelled from the country; and a terrible vengeance will be taken if the Russian nation do not put an end to this mediæval barbarism." This declaration of socialism as a theory of governmental order, thus opposing the fundamental principle of nihilism, shows the heterogeneous elements and the blind fury of the whole movement. The assassination of Gen. Mezentzoff was in fact avowed by the nihilists in their journal *Land and Liberty*, in which they alleged that he deserved death because he had trampled right under foot; had tortured his prisoners; persecuted the innocent; and in his official capacity had murdered by brutal ill-treatment, by hunger, thirst, and the rod, a number of persons whose names were given. On Feb. 22, 1879, Prince Krapotchkin, governor of Kharkov, was assassinated by shooting; according to a nihilist circular, on account of certain inhuman acts against prisoners in his charge. Heyking, commander of gendarmerie at Kiev, was also among the victims of the nihilists, and on March 25, 1879, Gen. Dreuteln, chief of the gendarmerie or third section, was shot at, and being missed, was warned that he could not long escape. The number and character of the persons assassinated or attacked by order of the committee of the nihilists was so great in the several towns of the empire, as to cause general alarm. The period of murders was followed by one of conflagrations. In the month of June alone, in 1879, 3,500 fires broke out in St. Petersburg, Orenburg, Koslow, Irkutsk, and Uralsk, destroying property to the amount of 12,000,000 rubles. Only 900 of these fires could be properly accounted for, and the remaining 2,600 were attributed to nihilist incendiaries. On April 2, 1879, an attempt to assassinate the emperor Alexander II. was made by Solovieff, who fired four shots at him from a revolver, but missed his aim. Solovieff was captured and afterward hanged. In Nov., 1879, an attempt was made to blow up the train by which the emperor was expected to arrive at Moscow; this attempt failed from a change of programme on the part of the emperor, who was not on the train that was actually blown up by a mine fired by one Hartman, who escaped. In 1867 an attempt had been made on the emperor's life while he was in Paris, riding in the Bois de Boulogne with the Emperor Napoleon III. The assassin fired at him but missed him. The third effort was that of a man who entered the imperial apartments in disguise. The fourth, the terrible explosion at the Winter palace which killed several persons. The fifth and last occurred on the afternoon of Sunday, Mar. 13, 1881, and was a successful assassination. The emperor was returning from a parade in the Michel Manege, and when near the Winter palace, a bomb was thrown beneath the imperial carriage, and exploded, breaking through the back of the vehicle, but without injuring the czar, who alighted to examine the extent of the damage. At that moment a second bomb was exploded close to his feet, shattering both his legs, and otherwise injuring him so that he died in less than two hours. The two assassins were immediately arrested, and within a few days others were apprehended for complicity in the affair. The funeral of Alexander II. took place on March 20, 1881. His son, the czarovitch, assumed the crown under the title of Alexander III. The assassination, which chilled the civilized world with horror, was openly rejoiced in at socialist meetings in various countries.

A proclamation of the executive committee of the nihilists, drawn up shortly after the attack on the emperor by the assassin Solovieff or Solowfew, sums up the latest known published demands of nihilism as follows:—"A representative democratic form of government; permanent parliaments, with full powers to regulate all matters of state; extension of self-government in the provinces; complete autonomy of rural communes; the land to be put into the possession of the people; means to be found for placing the factories in the hands of the artels or artisan guilds; transformation of the army into a militia; liberty of the press, and industrial combination." This ceases to be nihilism proper, and attempts reconstruction, and it may mark a change in the direction of activity. See Stepniak, *Underground Russia* (1883); id. *Russia under the Tsars* (1885); Noble, *The Russian Revolt* (1885); Krapotkin, *In Russian and French Prisons* (1887); and the articles by Kennan in the *Century* (Dec. 1887–Nov. 1889).

NIIGATA, a seaport on the w coast of Japan, at the mouth of the Shinano river, seat of the ken or prefecture of the same name, which comprises the island of Sado and the province of Echigo (6,000 sq.m; pop. 1,503,174); pop. of city, '88, 44,761. Petroleum, coal, various minerals and metals abound. The soil is good; rice, silk, tea, and the lacquer tree are cultivated. The city was founded in 1655, and opened as a port of foreign commerce by the treaties of 1858. It is well provided with schools, banks, news-

papers, post-offices; and its streets, which cross each other at right angles, are lighted at night. A rich inland trade is done on pack horses; and river steamers, sea-junks, and the native coasting-steamships, make this port an active place.

NIJMEGEN, Nimeguen, the *Noviomagum* of the Romans (*magum* or *magen* being a Celtic word for a fixed dwelling), called by Tacitus *Batavorum oppidum*, in the middle ages *Numaga*, is the principal tour of the district of Nijmegen, or the Betuwe, in the Netherlands province of Gelderland. Pop. '95, 37,008, of whom three-fourths are Roman Catholic. It it pleasantly situated, 9 m. s. of Arnheim, on the several little hills, on the left bank of the Waal. Several of the streets are steep and narrow, passing up the Hoenderberg (*Hunnerberg*, or hill of the Huns), on which the Romans had a permanent camp in order to keep in subjection the country of the Bataviers, which lay between the Rhine and the Waal; others are broad and well built. On a height stood, till 1797, when it was demolished by the French, the castle of Valkenburg, said to have been built by Julius Cæsar. Here Charlemagne built a palace, and made the castle his residence. The site is now planted with trees, and forms a pleasant public walk overlooking the river and quay. On the brow of the hill there is a little sixteen-sided chapel or baptistery, which some think was originally a heathen temple of the Bataviers, and converted into a Christian church by Pope Leo III. in 799. On another eminence, where the chateau of the duke of Alva once stood, is a modern tower called Belvidere, from the summit of which there is an extensive view, including the rivers which branch off at the delta of the Rhine—viz., the Rhine, the Waal, and the Yssel, with the Maas flowing in the south. Nijmegen is strongly fortified and well garrisoned. The town-house, founded in 1554, is beautifully and antiquely fitted up within, and externally ornamented by several statues of emperors and kings of the Romans. St. Stephen's, or the great church, standing on the highest part of the city, is a handsome Gothic edifice in the form of a Greek cross, and before the reformation contained 30 altars. Nijmegen is a large market for cattle and agricultural produce, especially grain. Beer is extensively brewed, eau de cologne distilled, and there are factories for spinning and weaving; tin goods and earthenware stoves are manufactured.

Nijmegen is celebrated for the great peace congress of the European powers which was held here, and, Aug. 10, 1678, concluded a treaty between Spain and France; on Sep. 17, between France and the United Netherlands; and between the German empire and France, and the same empire and Sweden, Feb. 5, 1679.

NIJNI-NOVGOROD, an important government in the e. of great Russia, between the governments of Vladimir on the w. and Kazañ and Simbirsk on the east. Area (according to the *Almanach de Gotha*), 19,797 sq.m.; pop. '93, 1,586,764. The surface is divided into two distinct portions by the Volga with its tributary the Oka. On the left, the northern bank of the river, the surface is flat; on the right bank it is hilly. As the soil is not very fertile, and there are few rich meadow lands, neither agriculture nor cattle-breeding is pursued extensively. The inhabitants are principally engaged in manufactures. The chief rivers are the Volga, Oka, and their numerous tributaries. There is communication by water with 24 governments, and with the Baltic, the White, and the Caspian seas. The northern districts of the government abound in forests, and here wooden utensils and tools are manufactured for the adjoining governments. There are several large iron-works, and the town of Gorbatof is the Sheffield of its district. Leather, especially that variety called Russian leather, is largely manufactured, and sheep and lamb skin dressing is a staple employment. On the right bank of the Oka are several ship-building and dock yards. The towns and villages are filled with an industrious and thriving manufacturing population. Capital, Nijni-Novgorod (q.v.).

NIJNI-NOVGOROD (Lower Novgorod), a famous commercial and manufacturing city in the e. of Great Russia, capital of the government of the same name, is situated at the confluence of the Oka with the Volga, 276 m. by rail e. of Moscow. The fortified portion of the town occupies a hill overlooking the Volga, and is surrounded with a wall. It contains the kreml or citadel, 2 cathedrals, and the palaces of the governors. The manufactures of Nijni-Novgorod include cloth, leather, steel goods, wax candles, tobacco, beer, pottery, etc., and shipbuilding. The trade of the town is of great commercial importance, especially during the great annual fair, which brings buyers and sellers from all climes between Germany and China. For the convenience of those frequenting the fairs, an enormous market-hall has been built, and sixty blocks of buildings for booths, containing 2,530 apartments separated by fire-proof walls. The numerous churches of the citizens are supplemented by a mosque and an Armenian church for the visitors. There are three annual fairs, two of them of minor account. The third, beginning at the end of July and continuing into September, is by far the greatest in the world. The normal population (98,503 in '97) is then increased to near 300,000; and the total business transacted is estimated at $200,000,000. Nijni-Novgorod, which is favorably situated for purposes of commerce, carries on a brisk trade during the whole season of navigation.

Nijni-Novgorod, founded in 1221, was devastated on several occasions by the Tartars; and in 1612, when it was on the point of falling a prey to Poland, Minin, the famous butcher of Nijni-Novgorod, collected an armed force here, which, under Prince Pojarsky, drove the invaders from the capital. See Moscow. The prosperity of this town

dates from the year 1817, when the great fair was removed to Nijni-Novgorod from Makarief, on account of the destructive fire which broke out in the latter place.

NIJNI-TAGILSK, a t. of Russia, in the government of Perm, amid the Ural mountains, 150 m. e. of Perm. It is one of the most important mining towns in Russia, or in the world. The soil in the immediate vicinity is everywhere rich in iron, copper, gold, and platina; not far off is the famous magnetic mountain Blagodat, 1422 ft. high. Akimfi Demidoff (q.v.) established the first foundry here in 1725. The yield both of iron and copper is immensely large. Pop. '92, 30,000.

NIKKO, the seat of the mortuary shrines of Iyeyasu, and of Iyemitsu, the founder and the third of the line, respectively, of the Tokugawa family of shōguns (tycoons) who ruled Japan from 1603 to 1868. The wonders of nature and art combine to make it the goal of many thousands of pilgrims annually, and of all foreign tourists who have time to spare. As a holy place, it began to win reputation even in the 8th c., but the present magnificent shrines, masterpieces of Japanese art, date from 1617. Hachi-ishi is the village of hotels at the mountain foot. Nantaizan is the loftiest peak of the range. The lake Chiuzenji and the lofty water-fall of Kiri-furi (tumbling mist) are striking features famous in literature and art. The chief priest of the shrines was always a prince of the imperial blood, and an annual envoy was sent by the mikado to pay honor to the memory or Iyeyasu. Works of art in wood-carving, bronze, granite, and other stone, and gifts from daimios and pilgrims, from Holland, Loo Choo, Corea, etc., make this one of the historic spots for travelers of every nation.

NIKOLAEF, a t. of s. Russia, in the government of Kherson, 41 m. n.w. of the town of that name, stands 20 m. above the mouth of the Bug, and at the confluence of that river with the Ingul. It was founded in 1790, and its situation was found so convenient for ship-building purposes that it soon became the center of naval administration of the Black sea. It has broad, straight streets, containing several barracks, a cathedral, schools for pilots, hospitals, an observatory, and an arsenal. In the first half of the present century about 10,000 men were employed at Nikolaef in ship-building and other naval operations. Since the opening of the railway system, by which it has connection with Moscow, etc., the population and trade have greatly increased. Pop. '97, 92,060.

NIKOLAEVSK, district t. of the Amoor territory, in e. Siberia, situated on a well-wooded plateau on the left bank of the Amoor, and 23 m. from its mouth, 410 m. n.e. of Khabarovsk. The approaches to the town are defended by four batteries. The Amoor is here a mile and a quarter broad, but the landing place is available only for small craft, all large vessels being compelled to lie in mid-stream. Pop. about 3,000.

NI'KOLSBURG, or MI'KULOV, a t. of Austria, in the s. of Moravia, 26 m. s. of Brunn, lies at the foot of the Pollaver hills, famous for their rich red wines. The town belongs to the princely family of Dietrichstein. It has several steam-mills, and cotton and silk factories. In the middle of the town upon a rock, stands the castle of the Dietrichsteins, with a library of 20,000 volumes, and a vat in the cellars capable of containing 2,000 eimers (more than 30,000 gallons). Pop. 8,200.

NIKON, Patriarch of the Russian church, 1605–81 ; b. near Nijni-Novgorod, Russia, of humble parentage; received his education from a monk in the monastery of St. Macarius. He afterward became a priest, but was so much attached to the monastic life that he entered the hermitage of Anserche, on the island of Solowetz, in the White sea. He separated from his wife, with whom he had lived ten years, and persuaded her to enter the convent of St. Alexis at Moscow. His fellow-monks desiring to exchange their wooden church for one of stone, Nikon and Elizar (the founder and head of the hermitage), were sent to Moscow to procure contributions for the purpose. Elizar appropriated the money obtained to his own use. Nikon remonstrated; his associate became his enemy. Nikon, unable to endure his persecution, left the island in a small boat, and after exposure to great peril he reached the island of Kj, at the mouth of the Onega. Here he erected a wooden cross, and vowed to build a monastery on the spot, which vow he fulfilled. In 1646, having occasion to go to Moscow on business for the monastery of which he was abbot, the Czar Alexis Micailovid appointed him archimandrite of the Novaspasky convent at Moscow. He used his influence with the czar in behalf of poor widows, orphans, the persecuted, and oppressed. In 1648 he was made metropolitan of Novgorod, and became much endeared to the people. In 1650 he quelled a violent popular insurrection at the peril of his own life, and then obtained permission to go to the prisons and release those who had been unjustly incarcerated, as well as real criminals who were sincere penitents. He showed great kindness to the poor. He preached to crowds, revised the liturgy of the Russian church, and caused the clergy to perform divine service with more devotion. On the death of the patriarch Joseph, Nikon in 1652 was appointed patriarch. In 1654–55 he called a council of the church to take measures for making the church books conform to the Greek originals. The council compared with the Septuagint the Slavonic versions, some of which were five centuries old, and found them correct, and that the errors in the books in common use were owing to the carelessness of transcribers. A new edition, made at Moscow and set forth by Nikon, created a division in the church. Nikon endeavored to root out all abuses of the hier-

archy, to promote temperance, setting the people an example of abstemious habits. Sacred pictures to which he believed the people paid idolatrous veneration he removed. The baptisms of the western church, then and now considered by the Greek church invalid, he sanctioned. Education, begun by Ivan the Terrible but interrupted by war, he encouraged. The printing press was again set up. Greek and Latin were now for the first time taught in the schools. He made also many useful changes in the church service. The greatest reform was the revival of preaching. From Nikon was first heard, after many centuries, a living, practical sermon. These changes greatly agitated the church, but the czar's favor did not fail, until in 1658 his enemies succeeded in alienating the czar from him, and Nikon retired to the monastery of the Resurrection of Christ that he had himself built. The misunderstanding between him and the czar increasing, and Nikon refusing to return to Moscow, a council was called in 1666 to consider his case, under the presidency of the eastern patriarch; and on Dec. 12 of that year he was deposed, and banished as a common monk to the Bielvozersky Therapontic monastery. The Czar Feodor Alexievich allowed him to remove to the monastery of the Resurrection of Christ, but on the journey thither he died. He was buried in that monastery in the presence of the czar; his absolution was obtained from the eastern patriarch and he was again enrolled in the list of Russian patriarchs. "Nikon," says Stanley, "rests all but canonized in spite of his many faults, and in spite of his solemn condemnation and degradation by the nearest approach to a general council which the eastern church has witnessed since the second council of Nicæa. He rests far enough removed from the ideal of a saintly character, but yet having left behind him to his own church the example of a resolute, active, onward leader; to the world at large, the example, never without a touching lesson, of a sincere reformer recognized and honored when honor and recognition are too late." Many historians think that with more prudence he might have saved the Russian church from a schism which still exists, and that he lacked the wisdom and policy which are essential to men in high places of trust. In 1664 Nikon sent to the east and purchased 500 MSS. of Greek books dating from the 11th to the 17th century. He also made a collection of the Russian chronicles, the Stufen books, and the Greek chronologists, which reaches to the year 1630, and is known by the name of the *Chronicle of Nikon*. The academy of sciences of St. Petersburg published a fine edition of this in 8 vols. in 1767–92. He wrote also several theological treatises, of which the following are the most important: *A Table of Dogmatic Studies; Sermons; The Intellectual Paradise*, containing a description of the monasteries of mount Athos and of Valdaï; *A Canon*, or book of prayers. Stanley in his *History of the Eastern Church*, Palmer in the *Patriarch and the Tsar*, Eckardt in *Modern Russia*, and the *London Review*, have given a particular account of the patriarch Nikon. See illus., PRIESTS ETC., vol. XII.

NIKO'POL, a thriving t. of s. Russia, in the government of Ekaterinoslav, on the right bank of the Dnieper, about 200 m. from its mouth, in lat. 47° 33′ north. Nikopol is the center of an extensive agricultural district, the produce of which is here shipped to Odessa. Between Nikopol and the port of Odessa there is regular communication by steamboat. Pop. 8150.

NILE (*Nilus*), called by the Egyptians *Hapi Mu* (the genius of the waters), and by the Hebrews *Sihor* (the black), the river of n.e. Africa formed by the union of the Bahr-el-Abiad (the White or true Nile) and the Bahr-el-Azrek (Blue Nile). Capts. Speke and Grant discovered that the first of these, the true Nile, flowed out of the lake Victoria Nyanza, which extends from about lat. 0° 20′ n., to 2° 40′ s., and from long. 31° 40′ to 35° e., and is 3,800 ft. above the level of the sea; and the river Shimiyu, the largest tributary of this lake, flowing into its southern extremity, must now be regarded as the most southerly source of the Nile. The second, the Blue Nile, has its source in Abyssinia, in lat. 10° 59′ n., and long. 36° 55′ east.

The White Nile, from its outfall from the Victoria Nyanza at the "Ripon falls," lat. 0° 20′ n., long. 33° 30′ e., flows n.w. and w. for about 230 m., till it enters the lake Albert Nyanza, within 30 m. of its northern extremity, where the river again emerges. On issuing from the Victoria Nyanza the Nile rushes down due n. like a mountain-torrent, running off at last into long flats, and expanding so as to form what is called Ibrahim Pasha lake. In this part of its course the river is navigable, and continues to be so until it reaches the Karuma falls. From these falls to the Murchison falls (120 ft. in height), near the Albert Nyanza, the river forms a series of rapids. Between the two Nyanzas the Nile is known as the Victoria Nile, or Somerset river

After leaving the Albert Nyanza, the Nile begins its northward course to the Mediterranean, and has no further lake expansion. Between the Albert Nyanza and Gondokoro (Ismailia), in 4° 55′ n. lat., and 31° 51′ e. long., 1500 ft. above the sea, the Nile river descends several hundred feet in a series of rapids and cataracts. For about 500 m. after Gondokoro the Nile flows very tortuously, first in a north-westerly and then in a north-easterly direction, and is joined, in about lat. 9° 15′ n., long. 30° e., by its first great affluent, the Bahr-el-Gazal, which joins the Nile from the w. with hardly any perceptible current. The second tributary is the Giraffe river, about one-third the volume of the Nile at its point of junction, long. 31° east. From the Bahr-el-Gazal the Nile flows in a due easterly direction for about 80 m., then s. for 30 m., when it is joined by its third

tributary, the Sobat river, from the east. The Sobat is full and navigable. Between this and the town of Khartoum, a distance of about 460 m., the Nile runs in a northerly direction, with a width of from one to two m., and is joined by several streams from the e. side.

Khartoum, the capital of Nubia, is situated at the confluence of the Bahr-el-Azrek (Blue Nile) and the Bahr-el-Abiad (White Nile), 1188 ft. above the sea level, in lat. 15° 35′ n. long., 32° 30′ east. The Bahr-el-Azrek, long supposed to be the main branch of the true Nile, is formed by the junction of the Abai and the Blue river. The Abai has its source in Abyssinia, 50 m. from lake Dembea, which it enters from the s.w.; emerging on the s.e. of the lake, it flows for about 90 m. in that direction, when it describes a semicircle round the peninsula of Godjam, and continues north-westerly for about 150 miles. It is here joined by the Blue river from the s., and from this point the Blue Nile flows n.w. to Khartoum, receiving from the e. two large rivers running nearly parallel to each other, the Dender and the Rahad or Shimfa. From Khartoum, the united stream flows n. for about 60 m., passing the town of Halfaia and the ruins of Meroë to the first cataract, and thence n.e. past Shendy to its junction with the Atbara, which enters the Nile at El Damer, lat. 17° 45′ n., long. 34° east.

The Atbara, also called Bahr-el-Aswad, or Black river, because it carries down with it the greatest amount of the black mud and slime that manures and fertilizes Egypt, is the last tributary received by the Nile. The Goang seems to be the direct source of the Atbara. It rises in the heights to the n. of lake Dembea. About 150 m. from its source it receives the Basalam river, and about 30 m. further on, the Takazze or Setit river, both from the east. The Takazze has a far greater volume of water than either of the preceding rivers. It rises in the Samen mountains, round which it flows first easterly, then n., till in about lat. 13° 30′ n., long. 38° 50′ e. it turns n.w., and then almost due w., joining the Atbara at right angles. It has many tributaries.

From its junction with the Atbara the Nile continues to flow northerly through the populous and fertile district of Berber, full of villages, and then enters the desert. Turning westwards in lat. 19° n., it forms the large island of Mograt, and makes a curve to the south-westward, known as the "great bend," in which there are two cataracts. Entering Nubia, the Nile resumes its northwesterly course, with narrow strips of cultivated land on each bank. Here it forms another cataract, and bends round to the n.e. with a fifth cataract, in lat. 21° 40′ north. After this the valley of the Nile narrows, and at Assouan, in lat. 24° 10′ n., it forms the last cataract in descending.

From Assouan to the sea the average fall of the Nile is two inches to a m., and its mean velocity about three m. an hour. It waters and fertilizes the whole length of the land of Egypt. The delta of the Nile extends from lat. 30° 10′ n. to 31° 30′ n., and has a base on the Mediterranean of about 150 miles. In it the Nile spreads out into numerous streams, the two principal being those of Rosetta and Damietta. The total length of the Nile, from its exit from the lake to the sea, is about 3,670 m., of which about 3,100 are navigable.

A feature peculiar to the river of Egypt is that from its junction with the Atbara, to its mouth, a distance of upwards of 1500 m., it receives no affluent whatever, and yet it is able to contend with the burning sun, and scarcely less burning sands of Nubia. With the ancient Egyptians the river was held sacred: the god Nilus was one of the lesser divinities. Its annual overflow is one of the greatest marvels in the physical geography of the globe for it has risen to within a few hours of the same time, and to within a few inches of the same height, year after year for unknown ages. At Khartoum it begins to increase early in April, but in lower Egypt the inundation usually begins about the 25th of June, and attains its height in about three months. It remains stationary about twelve days, and then subsides. The cultivable soil of Egypt is wholly dependent on the rise of the Nile, and its failure causes a dearth; for, virtually, the country has no rain. Continuous south wind brings a good, and north wind a bad year. During a good inundation the rise is about 40 ft. on the tropic of Capricorn, 36 ft. at Thebes, and 4 ft. at the Damietta and Rosetta mouths in the Delta. If at Cairo the rise is only 18 or 20 ft. there is a scarcity; up to 24 ft., a deficiency; 25 to 27 ft. is good: more than that causes a flood, and fosters plague and murrain. During the inundation the whole valley is covered with water, from which the villages rise like islands, protected by dikes. Of late years the overflow has been greater than the average of many centuries. The rise and fall of the trunk stream of the lower Nile is owing to the periodicity of the rains on the mountains of Abyssinia and in the basin of lake Nyanza, where, on the equator, it rains, more or less, all the year round, most copiously during the equinoxes. The banks of the Nile swarm with birds, among which are vultures, cormorants, geese, pelicans, quails, and the white ibis; and its sweet, soft waters teem with fish. The average amount of alluvium brought down by the river is estimated at a deposit of 4½ inches in a century—by some it is made as high as 6 inches; the greater part of it is brought down by the Atbara.

The question of the source of the Nile is at once the oldest and the most recent of geography. That the sources of a river, at whose mouth one of the earliest and most civilized peoples was established, should have been so long veiled in obscurity is unparalleled in geographical research. The want of success in exploring the upper basin of the Nile may be attributed to the great length of the river, to the difficulties which beset the

traveler in the physical nature of the countries he must pass through, the climate, and the jealousy, ignorance, and barbarism of the native tribes. This problem of centuries may now be regarded as satisfactorily solved; for the question whether there may not yet be found important feeders of the White Nile carrying back its source to a still greater distance in the interior is practically excluded by Stanley's exploration of the Lualaba or Congo basin. The journeys of Krapf and Rebmann to the foot of Kilimandjaro and the other snowy mountains in the e. of Africa, believed by them to be the ancient "mountains of the moon," and the explorations of the White Nile, pointed to the conclusion that it was among these mountains that the sources of the great river would ultimately be discovered.

There was, however, another theory. Rumors gathered from the natives pointed to lakes in the regions s. of the equator as the true sources of the Nile. To explore this country the distinguished traveler, Capt. Richard Burton, accompanied by Capt. Speke started from the Zanzibar coast in 1857. Their enterprise was so far successful that they discovered lake Tanganyika, in lat. 5° s., long. 36° e., and a large crescent-shaped mass of mountains overhanging the northern half of the lake, and 10,000 ft. high, considered by Capt. Speke to be the true Mountains of the Moon. On the shores of lake Tanganyika Burton was laid up by illness, and his companion, after surveying the northern portion of the lake, left him there to recruit his health, while he (Speke) proceeded northwards to discover another huge "nyanza" or lake, of the existence of which he was informed by the natives. This he accomplished on Aug. 3, 1858, when he discovered the southern end of the Victoria Nyanza (q.v.). In his journal he says of this immense sheet of water: "I no longer felt any doubt that the lake at my feet gave birth to that interesting river, the source of which has been the subject of so much speculation and the object of so many explorers."

In 1861 Capt. Speke, taking with him Capt. Grant, returned to the lake region. The expedition approached the Victoria Nyanza again from the coast of Zanzibar; and the first place from which they obtained a view of it, during the second expedition, was the town of Mashonde on its western side. Thence they pursued their way along the shore northwards. Crossing the equator, they reached streams which are said to flow out of the lake, and further on, in the center of its northern coast, what they considered to be the parent stream of the Nile, 150 yards in breadth, flowing over rocks of an igneous character, and forming falls 12 ft. high, which Capt. Speke christened the "Ripon falls," in honor of the president of the royal geographical society at the time of his starting on the expedition.

In the kingdom of Karagwé Capt. Speke found a very superior negro race, much better disposed to strangers than any of the tribes he had formerly passed through. The country occupied by this race, and that of Uganda, stretches along the Nyanza, and covers half of its western and northeru shores, the Uganda being bounded on the e. by the main stream of the Nile. North of it lies the kingdom of Unyoro, where the dialects belonging to the language of s. Africa, and which up to this point are used by the various tribes, suddenly cease, and give place to those of the language of n. Africa.

At Gondokoro Speke and Grant were met by Mr. (now sir Samuel) Baker, who had come from Cairo to their relief. Baker, accompanied by his heroic wife, pushed still southwards, and had the happiness of discovering, in 1864, another great lake, which he called the Albert Nyanza. In 1869 he undertook a second great expedition, of a military character, at the expense of the pasha of Egypt, to suppress slavery in the upper regions of the Nile; and has reduced under the sway of that ruler the whole valley of the river as far as the Victoria Nyanza. Sir Samuel returned in Sept., 1873.

Meanwhile Dr. Livingstone had been working for many years, from another quarter, at the solution of the great African problem—the true source of the Nile. In 1866 he began the great journey from which he was destined never to return. Starting from the Rovuma river, in the far s., he passed round the s. end of lake Nyassa, proceeded northward, exploring the lakes Bangweolo and Moero; and in 1869 reached lake Tanganyika, now known to send its outflow towards the Congo, but which he sought in vain to connect with the Victoria Nyanza. In 1871 he was found by Mr. Stanley at Ujiji, on lake Tanganyika, and it was then his opinion that neither Tanganyika, nor the Albert Nyanza, nor the Victoria Nyanza was the true source of the Nile, nor any of the feeders of these lakes; but that it was to be sought in a basin lying westward of them, through which flow three large rivers, all called Lualaba, and which unite to form another great lake, which he called Lincoln. Out of this a river runs northward, which he conceived to be the main branch of the Nile. Geographers at home generally believed that Livingstone was mistaken, and had struck instead upon the source of the Congo; but the death of the great traveler before the completion of his explorations left the problem unsolved. It was not until Mr. Stanley in 1876–77 followed the course of the Lualaba to its mouth that this stream was definitely proved to be identical with the Congo. Mr. Stanley's explorations in 1875, ere he struck the Lualaba, have given us more accurate information as to the size and shape of the Victoria Nyanza (see Nyanza), and as to its affluent, the Shimiyu. See Africa.

NILES, a city in Berrien co., Mich.; on the St. Joseph river and the Cleveland, Cincinnati, Chicago and St. Louis railroad and the main and branch lines of the Michigan Central railroad; 38 miles s.w. of Kalamazoo. It was settled in 1828, derives excellent

power from the river by means of a dam, and has electric lights, national and savings banks, high and grammar schools, public school and ladies' libraries, hospital, and manufactories of wood pulp, paper, furniture, shovels, wool boots, and other articles. The surroundings are chiefly agricultural, and the river scenery is unusually fine. Pop. '90, 4,197.

NILES, Hezekiah, 1777–1839; b. Penn.; received an ordinary education and learned the printer's trade. In 1800 he became a member of the firm of Bonsall & Niles, printers and publishers, in Wilmington, Del. The business was not successful, and Niles for several years was a newspaper contributor and editor, being for six years the managing editor of a Baltimore daily. In 1811 he began the publication of *Niles's Register,* and continued it for 25 years. This weekly paper contained very valuable articles on political and financial subjects, and historical papers of great importance. Niles republished the work in book form (32 vols.) in 1828, and it was continued after his death by W. O. Niles, Jeremiah Hough, and George Beattie until 1849. Niles also published *Principles and Acts of the Revolution,* 1822. He was a strenuous advocate of a protective tariff.

NILES, John Milton, 1787–1856; b. Hartford, Conn., and was in early life a farmer. His education was mostly self-acquired, and before he was of age he began the study of law. After his admission to the bar he spent two years in Vermont, New York, and Pennsylvania, but in 1817 returned to Hartford and there founded the *Times,* a democratic newspaper, with which he was connected as editor and contributor for 30 years. He was for some years a county judge, was a member of the general assembly, and in 1829 was made city postmaster by President Jackson, resigning the position on his appointment to fill a vacancy as U. S. senator, 1835–39. He was made postmaster-general in 1840, and in 1843 was elected U. S. senator for a full term. He published, besides many addresses, orations, and speeches: *History of South America and Mexico, and a View of Texas* (1839); *Life of Commodore Oliver H. Perry* (1820); and other books.

NILES, Nathaniel, 1741–1828; b. R. I.; after graduating at the college of New Jersey in 1766, studied medicine and law, and afterwards theology with Dr. Bellamy, and taught school in New York city. He obtained a license to preach in Congregational churches, and settled in Norwich, Conn. He was confined to no pastorate, but preached as occasion offered, and was accounted earnest and zealous. He was versed in mechanics, and invented a process by which bar-iron could be made into wire by the use of water-power; first employed in a wool-carding factory. He was speaker of the house of representatives of the legislature of Vermont in 1784, having removed to West Fairlee, Orange co., in that state, and was prominent in the politics of his time. At the close of the revolutionary war he was a candidate for national honors, and was member of congress, 1791–95, and a judge of the supreme court. He was chosen presidential elector for six successive administrations, and was appointed one of the censors on the revision of the state constitution. During the revolutionary war he composed a war-song, *The American Hero,* which became very popular. He contributed a number of valuable essays to the *Theological Magazine,* and published several sermons, lectures, and essays. In 1773 he published *Two Discourses on Confession of Sin and Forgiveness,* and *Four Discourses on Secret Prayer.* In 1777 there appeared two sermons entitled *The Perfection of God* and *The Fountain of Good.* In 1809, *a Letter to a Friend.* He wrote a *History of the Indian Wars.*

NILES, Samuel, 1674–1762; b. on Block Island, R. I.; graduated at Harvard university, 1699; became a Congregational minister; preached in Kingston, R. I., from 1702 till 1710; was installed in May, 1711, as pastor of Second church, Braintree, Mass., where he remained till his death. He published *A Brief and Sorrowful Account of the Present Churches in New England,* 1745; *God's Wonder-working Providence for New England in the Reduction of Louisburg,* a poem, 1747; *Vindication of Divers Important Doctrines,* 1752; *Scripture Doctrine of Original Sin,* 1757; and was the author of an unfinished *History of the French and Indian Wars,* published in Massachusetts historical collection, 3d series, vol. vi.

NILES, William Woodruff, s.t.d., b. Canada, 1832, graduated at Trinity coll., Hartford, Conn., 1857, and at Berkeley divinity school, Middletown, Conn.; was ordained priest in the Prot. Epis. church at St. Phillip's church, Wiscasset, Me., 1862. He was a tutor at Trinity coll.; rector of St. Phillip's church, Wiscasset; prof. of Latin, Trinity coll.; rector of St. John's church, Warehouse Point, Conn. He was consecrated bishop of N. H., 1870. While at Hartford he was editor of the *Churchman.*

NIL-GHAU. See Nyl-Ghau.

NILOM'ETER (the measurer of the Nile), the name of two buildings existing in Egypt, one in the island of Rhoda, opposite to Cairo, the other at Elephantine, close to Assouan, in 24° 5′ 23″ n. lat. The first consists of a square well, in which is placed a graduated pillar of marble, and is called a *mekkïas* or measure; the pillar contains 24 *devakhs* or cubits, each of which measures 21.386 in., or according to Greaves, 1824 ft., and contains 24 digits; but in its present state it does not appear to have been intended to mark a rise of more than 16 cubits. This pillar is exceedingly slender. The building formerly had a dome, bearing a Cufic inscription, dated 847 A.D., and is said to have been erected by the calif Mamun, or his successor, Wathek Billáh. The first-mentioned

monarch is said to have erected another nilometer at the village of Banbenouda, in the Saeed, and to have repaired an old one at Ekhmin. The calif El Motawukkel built the present one. The mode of calculating the increase at the nilometer is rather complex, and to a certain extent arbitrary, political and financial reasons rendering the process a mystery even to the natives. At the present day the Nile is supposed to have risen to 18 cubits when the canals are cut; this is the height of the lowest inundation; 19 cubits are considered tolerable, 20 excellent, 21 adequate, and 22 complete; 24 are ruinous. In the time of Edrisi, however, 16 cubits were considered sufficient. The object of these nilometers was to measure the amount of taxation to be imposed on the country. The nilometer at Cairo is, however, much more recent than that existing at Elephantine, which consists of a staircase between two walls descending to the Nile. One of these walls has engraved on it a series of lines at proper intervals marking the different elevations to which the river rose under the Cæsars. The cubits here are divided into 14ths or double digits, and measure 1 foot 8.625 inches. This nilometer is described by Strabo. The probability is that many nilometers existed in the days of the Pharaohs, probably one in each city. In the days of Mœris 8 cubits were sufficient, but 15 or 16 were required in the time of Herodotus, 456 B.C., and this was the mean under the Romans. According to Pliny, if the inundation did not exceed 12 cubits it produced a famine, 13 starved the country, 14 rejoiced it, 15 was safety, and 16 delight, and this number is symbolically represented by the number of children playing round the river god on statues of the Roman period.

NILS'SON (MIRANDA), CHRISTINE, b. Sweden, 1843. At an early age showed a taste for music, and although her parents were in humble circumstances, became quite proficient on the violin, learned the flute, and attended fairs and other places of public resort, at which she sang, accompanying herself on the violin. While performing in this manner at a fair at Ljungby in 1857, her voice attracted the attention of F. G. Tornérhjèlm, a gentleman of influence, who sent her to Stockholm, where she received instruction from Franz Berwald. She made her début at Stockholm in 1860, and then went to Paris to continue her musical education, under Masset and Wartel. In 1864 she appeared at the Theâtre Lyrique of Paris, as Violetta in *Traviata*, with such success that she was engaged to sing for three years. She made her first appearance in London in 1867, where she immediately became a favorite. In 1868 she sang the part of Ophelia in the opera of *Hamlet*, by Ambroise Thomas, at the Grand Opera in Paris. During the same year she sang in England at the Handel festival at the Crystal Palace. In 1870 she came to America, appearing in concerts and operas, and achieved popularity wherever she was heard. She was married at Westminster Abbey in 1872, to Auguste Rouzaud, a merchant of Paris. After creating great enthusiasm at St. Petersburg, she returned to America with the Strakosch Italian opera troupe, containing such artists as Campanini-Maurel, Capoul, Del Puente, and Annie Louise Cary. She appeared as Elsa in Wagner's *Lohengrin*, and sang during the same season in opera with Pauline Lucca. She had retired from the operatic stage, when the failure and death of her husband, 1882, caused her return. She was married to Count Miranda, 1887, and retired permanently, 1888.

NIMBUS, in art, especially in sacred art, is the name given to the disc or halo which encircles the head of the sacred personage who is represented. Its use is almost universal in those religions of which we possess any artistic remains—the Indian, the Egyptian, the Etruscan, the Greek, and the Roman. In the Hebrew scriptures we trace, in the absence of representations, the same symbolized idea in the light which shone upon the face of Moses at his return from Sinai (Exod. xxxiv. 29–35), and in the light with which the Lord is clothed as with a garment, Ps. ciii. 1, Vulg. (civ. 1, auth. vers.); and in the New Testament in the transfiguration of our Lord (Luke ix. 31), and in the "crowns" of the just, to which allusion is so often made (2 Tim. iv. 8; 1 Peter v. 4; Apoc. iv. 4). Nevertheless, the nimbus, strictly so called, is comparatively recent in Christian art, appearing first toward the end of the 5th century. Later, in Christian art, it became almost a necessary appendage of all representations of God or of the saints. Its ordinary form is the circular or semicircular; a form, indeed, in which later symbolists discover an emblem of perfection and of eternity; but the nimbus of the Eternal Father is often in the form of a triangle, and that of the Trinity an emanation of light, the rays of which form the three arms of a cross. The nimbus of the Virgin is sometimes a simple ring, and sometimes a crown or diadems; occasionally it is encircled by an ornamental border, on which twelve stars are sometimes represented. Her nimbus, as well as that of the divine persons, is commonly of gold; but that of the Virgin Mary is occasionally in colors, as blue, red, purple, or white. The nimbus of the saints is ordinarily the semicircle or lunula. Dedron mentions the curious instance of a picture of the traitor Judas *with a black nimbus!* In later art the nimbus became lighter and more aërial, melting, as it were, into the picture; and in Raphael's saints it occasionally fades into the very faintest indication of a golden tinge around the head. In connection with the nimbus may also be mentioned two analogous forms—the *aureole* and the *glory*. The former is an illumination surrounding, not the head only, but the entire figure. If the figure be upright, the aureole is commonly oval, when it is called the *vesica piscis*, and is supposed to contain an allusion to the *icthys*. With a seated figure it becomes circular, and is occasionally divided by radiating bands, in the form of a

wheel; sometimes it taks a quatrefoil form. It is commonly of gold, but occasionally also is in colors. The glory is a combination of the nimbus and the aureole.

NIMEGUEN. See NIJMEGEN.

NÎMES (anc. *Nemausus*), a t. of France, capital of the department of Gard, stands in a fertile plain surrounded by vine-clad hills, 80 m. n.w. of Marseilles, with which it is connected by railway. It consists of the town proper (ill built and dirty), and of three handsome suburbs. In the vicinity are the beautiful remains of the Roman aqueduct called the *Pont du Gard*. The chief of the modern edifices are the *Palais-de-Justice*, the theater, and the hospitals. The *Grande Place* is embellished with one of the most magnificent fountains in France. Nîmes contains numerous and variously-constituted educational institutions, an important public library, Maria Theresa's museum (in the *Maison Carrée*), a museum of natural history, etc. It is the general entrepôt for the silks produced in the south of France, and its manufactures are principally silk and cotton fabrics. More than 10,000 looms are constantly in operation in the city, and about 6,000 in the immediate vicinity. Shawls, handkerchiefs, lace, brandy, wines, etc., are made. Within the town are numerous and beautiful Roman remains, the chief of which are the amphitheater; the *Maison Carrée* (square house), a fine specimen of Corinthian architecture; a temple and fountain consecrated to Diana; *La Tour Magne* (great tower); the baths, and two Roman gates. See Menard's *Antiquités de Nîmes* (1838), and his *Histoire de Nîmes* (7 vols. 1875). Pop. '91, 71,600.

Previously to the Roman invasion, Nîmes—which is supposed to have been founded by a colony from Massilia (Marseille)—was the chief city of the Volcæ Arecomici. It flourished under the Romans, and was one of the great cities of Gaul. It surrendered to the rule of the Visigoths between 465 and 535, and afterwards to that of the Franks. Subsequently it became a possession of Aragon, but was finally restored to France in 1259 by the treaty of Corbeil.

NIMROD. See BABYLON.

NIMRUD is the present Arabic name for the site of an ancient Assyrian city on the e. bank of the Tigris, about 20 m. below Mosul, thought by many to be Calah spoken of in Gen. x. It is one of a group of cities which anciently were known as Nineveh, or which clustered around the metropolis of that name. The ruins are in the fork formed at the junction of the Tigris and the Zab, are about 5 m. in circumference, and were inclosed by a wall, having towers and gates, the remains of which extend around nearly the whole distance. Excavations made by Layard, Rassam, Loftus, and George Smith, laid open the following buildings: 1. A tower on the n.w. corner of the mound, extending more than 160 ft. and faced with stone to the height of 20 ft.; 2. Temples around the tower; 3. The n.w. palace, 350 ft. square; 4. The center palace, s. of the former; 5. The s.w. palace, built with materials from the n.w. and center; 6. The s.e. palace; 7. The temple of Nebo. According to the inscriptions the city was built B.C. 1320, and having been destroyed in troublous times, was afterwards rebuilt, and continued a royal residence about 170 years. Shalmaneser II., who became king, B.C. 860, conquered the country of the Euphrates, and advancing into Syria met and defeated a confederacy of kings among whom were Benhadad of Damascus, Ahab of Israel, and Baasha the Ammonite. About 720 B.C. Calah ceased to be a capital of the empire, and was finally destroyed by the Medes and Babylonians when they conquered Assyria.

NIMRUD, BIRS. See BABEL, TOWER OF.

NINDE, WILLIAM XAVIER, D.D., b. Cortland, N. Y., 1832: graduated at Wesleyan univ., 1855; was pastor of Trinity Meth. Epis. church, Cincinnati, and Central church, Detroit. He became professor of pastoral theology at Garrett Biblical institute, Evanston, Ill., in 1873, and president in 1879, and was elected bp. of the Meth. Epis. church, 1884.

NINEVEH, or NI'NUS, a very ancient and famous city, the capital of the great Assyrian empire, said in scripture (Gen. x. 11) to have been founded by Ninus or Nimrod. It was situated on the e. bank of the Tigris, opposite to the present Mosul. According to the accounts of the classic writers, the city was of vast extent, 480 stadia, or more than 60 m. in circumference. Its walls were 100 ft. high, broad enough for three chariots, and furnished with 1500 towers, each 200 ft. in height. In the *Book of Jonah* it is described as an "exceeding great city of three days' journey," and one "wherein are more than six-score thousand persons that cannot discern between their right hand and their left hand" (children or infants are probably meant). After having been for many centuries the seat of empire, it was taken after a siege of several years and destroyed by the united armies of the Medes under Cyaxares, and the Babylonians under Nabopolassar, about 625 B.C. When Herodotus, not quite 200 years afterwards, and Xenophon visited the spot, there remained only ruins. Tradition continued to point pretty accurately to the site of Nineveh; but it is only of late years that actual explorations have been made. For an account of these see ASSYRIA.

NINGPO, town and treaty port in the province of Chekiang, China, comprising the city of that name, the Chusan group of islands, and the cities of Tsike, Funghwa, Chinhai, and Tsiangshan. The port of Ningpo is situated at the confluence of two small streams, in lat. 29° 55′ n., and long. 121° 22′ e., 12 m. from the sea, on an alluvial flat of extreme fertility, intersected by a network of rivulets and canals. Its walls are 4½ m. in circumference, about 25 ft. high, 22 ft. wide at the base, and 15 at the top, with six double gates.

URBANA

As is the case with all the cities in this part of China, Ningpo is permeated by canals communicating with a moat nearly surrounding the walls, and with the adjacent country. In one part of the city they expand into basins, and receive the name of lakes—the Sun lake and Moon lake. In the former is an island devoted to temples, and accessible by bridges. These bridges—good specimens of those aerial stone edifices which adorn this part of China—are required to sustain little more than their own weight, as the roads here are all mere footpaths, and no wheeled vehicles are found. One of the rivers is crossed by a bridge of boats 200 yds. long. The entire city is well paved; the streets are wider than those of most Chinese cities, and the display of shops is indicative of wealth and luxury. Nowhere, save at Hanchau, are such extensive and beautiful temples to be found. The most elegant and costly of these is dedicated to the queen of heaven; the goddess being the daughter of a Fuhkien fisherman, the people of that maritime province are her more special votaries. Elaborate stone sculpture, exquisitely fine wood carving, and a profusion of gilt and tinsel show that no expense has been spared to honor the popular goddess.

The center of the city is ornamented with an elegant seven-storied hexagonal tower—the heaven-bestowed pagoda, 160 ft. in height. A spiral flight of steps within the walls of the tower lead to the summit, from which the gazer beholds a splendid scene; innumerable villages dot the plain, which is reticulated by silvery water-courses, replete with evidence of successful commerce and agriculture. The population of the town in 1895 was about 255,000. On many of the hills which environ these cities, green tea is successfully cultivated; while the mulberry, the tallow-tree, and numerous other stimulants of industry abound. Two crops of rice are procured annually from the fields; while the fisheries of the rivers and adjacent coast give employment to a numerous class of the population. Ice-houses close to the river give the banks a picturesque appearance; the ice is used for curing fish. Ningpo has an extensive coasting trade; but no considerable foreign trade has been developed, owing mainly to porterages on the inland water-communications, and to the proximity of Shanghai, where no such obstructions exist. The district city of Chinhai, at the mouth of the Ningpo river, is also a port. A walled town, containing about 30,000 inhabitants, 10 m. to the e. of Chinhai, is Kingtang, the nearest of the Chusan archipelago. Tinghai is the district city of the island of Chusan, which is 20 m. long, from 6 to 10 wide, and 51 in circumference. It is mountainous, with fertile valleys in a high state of cultivation. It has an excellent harbor. Tinghai was garrisoned several years by her majesty's forces from 1841, and was again temporarily occupied by the allied forces in 1860.—Dr. Macgowan's *Lectures.*

NINIAN, Saint, the apostle of the Picts, lived in the latter half of the 4th and the beginning of the 5th century. Whether Christianity had been introduced among the Picts before the time of Ninian has been a subject of controversy; but although the details of the legendary account are uncertain, it seems, beyond all question, that some Christians were to be found, at least among the southern Picts, in what is now known as the lowlands of Scotland, from the end of the 2d century. Nevertheless, either their number was originally very small, or the rising church had fallen away under adverse circumstances; and it is certain that when Ninian appeared among them, the Picts were in the main a pagan people. He was a Briton, and of noble birth; but had been educated at Rome, and there ordained a bishop. The exact time of his preaching in Scotland is unknown. His labors appear to have commenced in Cumbria, and to have extended over the greater part of the district as far n. as the Grampian hills, his see being fixed at Candida Casa, or Whithorn, in the modern Wigtonshire. His death is placed by the Bollandists in 432; his festival is Sept. 16.

NINIGRET, about 1610–77; a Narragansett chief who figured in the Pequot war of 1632, and as an ally of the colonists in 1637. A visit to the Dutch on the island of Manhattan caused him to be suspected by the Connecticut colony of plotting against the English colonists. The commissioners of the united colonies in 1653 declared war against him while he was making war on the Indians of Long Island. A summons was sent him from Hartford to appear there, which he failed to comply with; whereupon Maj. Simon Willard was sent against him, and forced him to leave the country. In 1660–62 the colonists bought his lands.

NINON DE L'ENCLOS, a celebrated French woman, one of those characters that could have appeared only in the French society of the 17th c., was born of good family at Paris in 1615. Her mother tried to imbue her mind with a love of the principles of religion and morality, but her father, more successfully, with a taste for pleasure. Even as a child she was remarkable for her beauty and the exquisite grace of her person. She was carefully educated, spoke several foreign languages, excelled in music and dancing, and had a great fund of sharp and lively wit. At the age of ten she read Montaigne's *Essays.* Six years later, she commenced her long career of licentious gallantry by an amour with Gaspard de Coligny, then Comte de Chatillon. To Coligny succeeded innumerable favorites, but never more than one at a time. Among Ninon de Lenclos's lovers we may mention the Marquis de Villarceaux, the Marquis de Sevigné, the Marquis de Gersay, the great Condé, the Duc de Larochefoucauld, Marshal d'Albret, Marshal d'Estrées, the Abbé d'Effiat, Gourville, and La Châtre. She had two sons, but never

showed in regard to them the slightest instinct of maternity. The fate of one was horrible. Brought up in ignorance of his mother, he followed the rest of the world, and conceived a passion for her. When she informed him of the relation that subsisted between them, the unhappy youth was seized with horror, and blew out his brains in a frenzy of remorse. Even this calamity did not seriously affect Ninon de Lenclos; she was too well-bred to allow it to do that. Ninon de Lenclos was nearly as celebrated for her manners as for her beauty. The most respectable and virtuous women sent their children to her house to acquire taste, style, politeness. So great was her reputation, that when Queen Christina of Sweden came to Paris, she said she wished particularly to visit the French academy and Ninon de L'Enclos. We may gather some idea of her wit and sense from the fact that Larochefoucauld consulted her upon his maxims, Molière upon his comedies, and Scarron upon his romances. She died Oct. 17, 1705, at the age of 90, having preserved some remains of her beauty almost to the last. See Guyon de Sardière's *Vie de Ninon de L'Enclos;* Saint-Evremond's *Œuvres;* Douxmesnil's *Mémoires pour servir à l'Histoire de Mlle. de L'Enclos.*

NINTH, in music, the next interval above the octave, being the same interval which an octave lower is termed the second. See INTERVAL.

NI'OBĒ, in Greek mythology, the daughter of Tantalus and (according to the most popular version of the story) the sister of Pelops. She was the wife of Amphion, king of Thebes, and bore him six sons and six daughters. Proud of her children, she despised Leto or Latona, who had only two children, Apollo and Diana, and prevented the people from the worship of these divinities; whereupon Latona, enraged, moved her children to destroy all the children of Niobé with their arrows. They lay nine days in their blood unburied, when Jupiter changed them into stone, and on the tenth day they were buried by the gods themselves. Niobé wandered about in distress, and at last was changed into stone on Mount Sipylus, between Lydia and Phrygia, retaining, however, even as stone a sense of her woe. Such is the Homeric legend, which, however, was afterward much varied and enlarged. Niobé was a favorite subject of the ancient artists. The well-known group which may now be seen in the Uffizi gallery at Florence represents the killing of her sons by Apollo, and her daughters by Artemis. This group was discovered in Rome in 1853, and is not regarded by scholars as the same group which Pliny mentions as standing in the temple of Apollo Sosianus. This group was brought to Florence in 1775, and has never been removed. Portions of another and better group are now in Rome. It was an open question among the ancients whether the group mentioned by Pliny should be ascribed to Scopas or Praxiteles. See Stark, *Niobe und die Niobiden* (Leipzig, 1863), and his *Nach dem Orient* (1874), p. 243; and Schweisthal, *L'Image de Niobé et l'Autel de Zeus Hypatos au Mont Sipyle* in the *Revue Archéologique* (1887), pp. 213–232.

NIO'BIUM (symbol, Nb) is a supposed metal discovered in the mineral *tantalite.* It is obtained by reducing the double fluoride of niobium and potassium with sodium; and forms a black powder insoluble in nitric acid, but readily soluble in a mixture of nitric and hydrofluoric acids. With oxygen it forms three compounds, a dioxide, Nb_2O_2, a tetroxide, Nb_2O_4, and a pentoxide, Nb_2O_5; chlorine, bromine, fluorine, and sulphur compounds have been prepared and examined. Neither niobium itself nor any of its compounds are of any practical importance.

Niobium is now understood to be no separate metal at all, but the same with columbium. Pelopium, another supposed new metal, is merely the oxide of niobium or columbium.

NIOBRA'RA RIVER, or L'EAU QUI COURT, rises in Laramie co., Wyoming, and flows in a generally e. course through n. Nebraska, entering the Missouri about 36 m. s.w. of Yankton, S. Dakota; length about 450 m. The stream is shallow, not navigable, and very rapid in its course. In the upper part it flows through a very deep cañon, afterward passes through a sandy desert, but in the lower part winds through a fertile and well-watered region.

NIORT, a t. of France, capital of the department of Deux-Sèvres, on the Sèvre-Niortaise, is situated in an agreeable country, occupying the slope of two hills and the valley which intervenes, 110 m. n. of Bordeaux. Its principal edifices are the church of Notre-Dame, the town-hall, the theater, and the old castle. Besides these, the beautiful fountain du Vivier, the promenades, the library, and the college are worthy of notice. The dressing of chamois and the manufacture of gloves are the principal branches of industry. Dyeworks and tanneries are in operation. Pop. '91, 23,200.

Niort is an ancient town. In the 14th c. it was taken by the English, and held by them for 18 years.

NIPA, a genus of endogenous plants referred by some botanists to the order *pandanaceæ,* and by others to palms. *N. fruticans* is very common in the Eastern archipelago, and northwards as far as the Mergui river, but becomes rare further north. It flourishes with the mangrove in places inundated when the tide rises. It abounds in saccharine sap, from which a kind of *palm wine* is made, and also excellent sugar. The leaves are much employed for roofing houses, and large quantities are sent from the Tenesserim provinces northwards for this use.

NI'PADITES, a genus of fossil palm fruits found in the eocene clays of the island of Sheppey, in Kent. They are referred to *nipa* as their nearest living ally, and are con-

sidered to have resembled in habit that genus, and to have grown on the banks of an immense river which flowed from the tropical regions of a continent lying to the southward, and entered the sea at Sheppey, where it deposited the fruits and leaves borne down with the current, by the side of the starfishes and mollusca which inhabited the estuary. Some 13 different kinds have been described.

NIPIGON, or **NEPIGON,** LAKE, 35 m. n. of the most northerly part of lake Superior, in lat. 50° n., long. 88° w., about 60 m. long from n. to s., and 45 m. from e. to west. A coast line, with bold headlands, and deep bays, gives a total length of shore of 580 miles. Its surface is 813 ft. above lake Superior. A great number of mountain streams flow into it, and its waters flow out through the Nipigon river, 40 m. in length, southward, to Nipigon bay of lake Superior. The lake is very deep, studded with islands, and well stocked with fish.

NIP'ISSING, a co. in n. Ontario, Canada, having the Ottawa river for its e. boundary; having lake Nipissing (50 m. long and 35 m. wide), containing many islands, and numerous other lakes; its streams include French and Sturgeon rivers; 3,722 sq.m.; pop. '91, 13,023. Its surface is hilly, the portion s. of the lake being 1100 ft. above the level of the sea.

NIP'ISSING or **NEPISSING,** LAKE, in Ontario, Canada, nearly midway between lake Huron and the Ottawa river; length about 45 m.; greatest breadth, 28 miles. Its waters are mostly received from the n. by Sturgeon river, which connects it with a chain of smaller lakes. The only outlet is French river, by which the lake discharges into Georgian bay, an inlet of lake Huron. There are a number of small islands, and the vicinity is inhabited mostly by Indian tribes.

NIP'ISSINGS, an Indian tribe formerly living about the lake of the same name in the province of Ontario. They were known to Cartier and other French adventurers, and by them regarded as a peculiarly superstitious race. In the contests between the Hurons and Iroquois the latter drove the Nipissings n. and w. to the small lakes n. of lake Superior. They were accompanied by French priests who had already founded missions among them. After the conclusion of hostilities between the other tribes they returned eastward, and with other Algonquin tribes joined the Sulpician mission established near the lake of the Two Mountains. Their numbers have been greatly reduced.

NIPPERDEY, KARL, 1821–1875, German philologist, studied at the universities of Leipsic and Berlin, and, after teaching in the former university, became professor at Jena. He published a number of translations and critical studies of Latin prose, among them works on Cæsar, Nepos, and the *Annales* of Tacitus. These works passed through many editions, the translation of Nepos having reached its tenth edition in 1896, and the translation of the *Annales* of Tacitus, with exegetical notes, having passed through the ninth edition in 1892. See Schöll's collection of his works, under the title of *C. Nipperdeii Opuscula* (1877), and the biography by the same author (1875).

NIPPON, or NIPHON, the name improperly given by Europeans to the principal island of Japan, and borrowed from the Japanese name of the empire, which is *Dai Nihon* or Nippon. The chief island, or mainland, which is by far the largest part of the empire, had no separate name till lately, but is now officially called *Honshiu* or *Hondo*. The inland sea of Suonada separates it from the islands of Kiusiu and Sikopf, and the strait of Sangar on the n.e. from the island of Yesso. On the n. it is bounded by the sea of Japan, and on the s. and e. by the Pacific ocean. The length of Nippon is 900 m., and its breadth 240; and it has an estimated area of 86,300 sq. miles. Yedo or Tokio (q.v.), the capital of the empire and the present residence of the mikado, Miako (q.v.), his former residence, and Osaca (q.v.), are the largest towns. The chief treaty ports are Hiogo, the outlet for the trade of Osaka, Yokohama (q.v.), and Kanagawa (q.v.). According to the official census of Dec. 31, 1894, about three-fourths of the population of Japan were residents of Nippon or Honshiu. Bracing sea-breezes make the heat of summer very endurable. The spring and autumn months are delightful. See HONDO.

NIPPUR, an ancient city of Babylonia whose site is on the n.e. edge of the country of the Affek or Affech Arabs between the Tigris and Euphrates rivers, about 100 miles s.e. of Bagdad. Important excavations have been made here in recent years, revealing the fact that the city was once one of the chief centers of the ancient Babylonian and Assyrian kingdoms. Much was done to spread the knowledge of this city by the University of Pennsylvania expeditions to Babylonia in 1888–95. The temple of Bel is regarded by some as the oldest temple in the world, and, thousands of years before the Christian era, bore the same relation to the inhabitants of the surrounding region that the temple of Jerusalem bore to the ancient Jews. Traces of a civilization were brought to light by the expedition above mentioned, proving that over 6,000 years ago the city was by no means in its infancy. In fact, written records were discovered possessing fully that degree of antiquity. See Peters, *Nippur, or Explorations and Adventures on the Euphrates* (2 vols., 1897).

NIRUKTA, or "Explanation," is the name of one of the six *Vedângas* (see VEDA) which explains difficult Vedic words. That there have been several works engaged in such a task, even at a very remote period of Hindu antiquity, and that they bore the name of Nirukta, is probable, for "Nirukta authors" are quoted either generally or by name in several Sanskrit authors; but the work which is emphatically called *Nirukta,* and which,

for the present, is the only surviving representative of this important Vedânga, is that of *Yâska*, who was a predecessor of Pân'ini (q.v.). His work consists of three parts—the *Naighan't'uka*, where, for the most part, synonymous words are taught; the *Naigama*, which contains words that usually occur in the Vedas only; and the *Daivata*, which contains words chiefly relating to deities and sacrificial acts. A commentary on this work has been composed by the same Yâska, and it likewise bears the name of Nirukta. In the latter, Vedic passages are quoted in illustration of the words to be explained, and the comment given by Yâska on these passages is the oldest instance, known at present to Sanskrit philology, of a Vedic gloss. Besides the great importance which Yâska's *Nirukta* thus possesses for a proper understanding of the Vedic texts, it is valuable also on account of several discussions which it raises on grammatical and other questions, and on account of the insight it affords us into the scientific and religious condition of its time.—Text and Commentary of *Yâska's Nirukta* have been edited by prof. R. Roth (Göttingen, 1852).

NIRVÂNA (from the Sanskrit *nir*, out, and *vâna*, blown; hence, literally, that which is blown out or extinguished) is, in Buddhistic doctrine, the term denoting the final deliverance of the soul from transmigration. It implies, consequently, the last aim of Buddhistic existence, since transmigration is tantamount to a relapse into the evils or miseries of *sansâra*, or the world. But as Hinduism, or the Brahmanical doctrine, professes to lead to the same end, the difference between *nirvâna* and *moksha*, *apavarga*, or the other terms of Brahmanism designating eternal bliss, and consequent liberation from metempsychosis, rests on the difference of the ideas which both doctrines connect with the condition of the soul after that liberation. *Brahman*, according to the Brahmanical doctrine, being the existing and everlasting cause of the universe, eternal happiness is, to the Brahmanical Hindu, the absorption of the human soul into that cause whence it emanated, never to depart from it again. According to this doctrine, therefore, the liberation of the human soul from transmigration is equivalent to that state of felicity which religion and philosophy attribute to *that* entity (see INDIA—*Religion*). As, however, the ultimate cause of the universe, according to Buddhism, is the void or non-entity, the deliverance from transmigration is, to the Buddhists, the return to non-entity, or the absolute extinction of the soul. However much, then, the pious phraseology of their *oldest* works may embellish the state of nirvâna, and apparently deceive the believer on its real character, it cannot alter this fundamental idea inherent in it. We are told, for instance, that nirvâna is quietude and identity, whereas sansâra is turmoil and variety; that nirvâna is freedom from all conditions of existence, whereas sansâra is birth, disease, decrepitude, and death, sin and pain, merit and demerit, virtue and vice; that nirvâna is the shore of salvation for those who are in danger of being drowned in the sea of sansâra; that it is the free port ready to receive those who have escaped the dungeon of existence, the medicine which cures all diseases, the water which quenches the thirst of all desires, etc.; but to the mind of the orthodox Buddhist, all these definitions convey but the one idea, that the blessings promised in the condition of nirvâna are tantamount to the absolute "extinction of the human soul," *after* it has obeyed, in this life, all the injunctions of Buddhism, and become convinced of all its tenets on the nature of the world and the final destination of the soul.

Although this is the orthordox view of nirvâna, according to the oldest Buddhistic doctrine, it is necessary to point out two categories of different views which have obscured the original idea of nirvâna, and even induced some modern writers to believe that the final beatitude of the oldest Buddhistic doctrine is not equivalent to the absolute annihilation of the soul.

The first category of these latter, or, as we may call them, heterodox views, is that which confounds with nirvâna the preparatory labor of the mind to arrive at that end, and therefore assumes that nirvâna is the extinction of thought, or the cessation to thought, of all difference between subject and object, virtue and vice, etc., or certain speculations on a creative cause, the conditions of the universe, and so on. All these views the Buddha himself rejects, as appears from the work *Lankâvatâra* (q.v.), where relating his discourse on the real meaning of nirvâna, before the Bodhisattwa Mahâmati. The erroneousness of those views is obviously based on the fact, that the mind, even though in a state of unconsciousness, as when ceasing to think, or when speculating, is still within the pale of existence. Thus, to obviate the mistaken notion that such a state is the real nirvâna, Buddhistic works sometimes use the term *nirupadhisesha nirvâna*, or "the nirvâna *without* a remainder of substratum" (i.e., without a rest of existence), in contradistinction to the "nirvâna *with* a remainder;" meaning by the latter expression that condition of a saint which, in consequence of his bodily and mental austerities, immediately precedes his real nirvâna, but in which, nevertheless, he is still an occupant of the material world.

The second category of heterodox views on the nirvâna is that which, though acknowledging in principle the original notion of Buddhist salvation, represents, as it were, a compromise with the popular mind. It belongs to a later period of Buddhism, when this religion, in extending its conquests over Asia, had to encounter creeds which abhorred the idea of an absolute nihilism. This compromise coincides with the creation of a Buddhistic pantheon, and with the classification of Buddhist saints into three classes,

each of which has its own nirvâna; that of the two lower degrees consisting of a vast number of years, at the end of which, however, these saints are born again; while the absolute nirvâna is reserved for the highest class of saints. Hence Buddhistic salvation is then spoken of, either simply as *nirvâna*, or the lowest, or as *parinirvâna*, the middle, or as *mahâparinirvâna*, or the highest extinction of the soul; and as those who have not yet attained to the highest nirvâna must live in the heavens of the two inferior classes of saints until they reappear in this world, their condition of nirvâna is assimilated to that state of more or less material happiness which is also held out to the Brahmanical Hindu before he is completely absorbed into Brahman.

When, in its last stage, Buddhism is driven to the assumption of an Adi, or primitive, Buddha, as the creator of the universe, nirvâna, then meaning the absorption into him, ceases to have any real affinity with the original Buddhistic term. See BUDDHISM and LAMAISM.

NISAN. See ABIB.

NISARD, JEAN MARIE NAPOLEON DÉSIRÉ, b. France, 1806. In 1828 he became a contributor to the *Journal des Débats*, assuming a vigorous opposition to the government of Louis XVIII. After the revolution of 1830, for a short time he gave a warm support to the Louis Philippe government, then joined the opposition, and as one of the editors of the *National* was co-laborer with Armand Carrel in the most vigorous attacks upon the sinister divergence of Louis Philippe's administration from the path marked out for it by Lafayette. But soon changing, for the remainder of his life he was a champion of the past in politics, literature, and art; and cut to the quick, in his criticisms, the works of Hugo and other poets and dramatists of his own time. His works secured attention by their profuse and graceful diction, and an agreeable expression of imagination. Guizot, prime minister of Louis Phillippe, made him supervisor of normal schools in 1835, and promoted him to higher positions each year, until he loved the government better than his former opinions, and supported Louis Philippe as warmly as he had before satirized him. He sat as deputy in the chambers, 1842–48; and in his literary work, which was continued, plainly avowed that the French spirit was in its decadence, and looked back to the age of Louis XIV. for its brightest exemplars. Left in the shade by the revolution of 1848, he recovered place and power, political and literary, under the reign of Napoleon III. As lecturer in the college of France in 1855, he made such servile use of his opinions to defend the perjuries of the emperor that the students refused to listen, and gave him a *charavari*, which resulted in the imprisonment of 15 students, and the protection of subsequent lectures by a strong police force. Napoleon rewarded Nisard by naming him commander of the legion of honor in 1856, and director of the normal school in 1857. The latter position he retained till 1867, when he was raised to the dignity of a senator. He was elected a member of the Academy in 1850. Among his principal works are *Histoire de la littérature Française*, *Poètes latins de la décadence*, and an early article in the *Débats* entitled *De la littérature facile, et de la littérature difficile.* He d. 1888.

NISBET, CHARLES, D.D., 1736–1804; b. Scotland; graduated at Edinburgh university 1754; was for some years a prominent Presbyterian clergyman at Montrose, and by his wit and power in argument won considerable influence in the general assembly. He openly avowed his smpathy with the American colonies, and having accepted the presidency of Dickinson college, Pennsylvania, came to America in 1785, where he delivered lectures on logic, philosophy of the mind, *belles-lettres*, and systematic theology, and endeavored to bring the system of education up to his high standard. He was a great scholar, and possessed a wonderful memory. He died at Carlisle, Penn., and his posthumous works were published in 1806; his memoirs, by Dr. Miller, in 1840.

NISCE'MI, a t. of Sicily, in the province of Caltanisetta, 30 m. s.e. by s. of Caltanisetta, and on the right bank of the river Terranova. In 1790 this town was visited by an earthquake, and during seven shocks the ground gradually sank in one place to the depth of 30 feet. Fissures opened, which sent forth sulphur and petroleum. Pop. 12,200.

NISH, or NISSA, one of the principal towns of Servia, capital of the province of Nish, 53 m. n. of Vranja, and 130 m. s.e. of Belgrade. It stands on the river Nishava, a branch of the Morawa. The town is ill built; but many new houses and a well supplied bazar attest its present prosperity. Nish has long been noted as the point of meeting of many roads, of both military and commercial importance. Its importance would be greatly increased by the proposed construction of a railway from Belgrade to Constantinople and Thessalonica. In ancient times Nish bore the name of *Naissos*, and was a flourishing town of upper Mœsia; in it the emperor Constantine the Great was born. It was Slavonic in the 6th c., was taken by the Tartar Bulgarians in the 8th, by the Servians again in the 12th, and by the Turks in 1839. Near Nish, in 1689, the Markgraf Ludwig of Baden, with 17,000 men, destroyed a Turkish army of 40,000. Pop. 19,900.

NISHAPUR', or NÜSHAPUR, a t. of Persia, province of Khorassan, 44 m. s.w. of Meshed, is situated in a most beautiful and fertile valley. Pop. about 11,000. It is surrounded by a rampart and trench, and has a considerable trade in turquoises, which are obtained from mines in its vicinity.

NISI PRIUS is the name (borrowed from the first two words of the old writ which summoned juries) usually given in England to the sitting of juries in civil cases. Thus a judge sitting at *nisi prius*, means a judge presiding at a jury trial in a civil cause, and the *nisi prius* sittings are the jury sittings.

Nisi prius was originally the clause in the writ which commanded the sheriff to bring a jury to Westminster, "unless before" (*nisi prius*) a justice of assizes should come to the county where the cause of action arose. In course of time the phrase was used to designate a large class of business transacted at the assizes before superior courts, and the phrases *nisi prius* judge, *nisi prius* law, and *nisi prius* courts, came into use. At present, in England and the United States, *nisi prius* courts are those courts, or terms of courts, held for the trial of civil causes, with the presence and aid of a jury; and a *nisi prius* sitting is to be distinguished from a sitting of the court *in banco*, in full bench, for the hearing of appellate cases.

NISIBIS, the capital of ancient Mygdonia, the north-eastern part of Mesopotamia. It was situated in a fertile district, and was of importance, both as a place of strength and as an emporium of the trade between the east and west. Nisibis was a city of very great antiquity, but of its remoter history nothing is known. In the time of the Macedonio-Syrian kings it was also called *Antiochea Mygdoniæ*. It was twice taken by the Romans (under Lucullus and Trajan), and again given up by them to the Armenians; but being a third time taken by Lucius Verus, 165 A.D., it remained the chief bulwark of the Roman empire against the Persians, till it was surrendered to them by Jovian after the death of Julian in 363. The name *Nisibin* is retained by a small village in the Turkish ejalet of Diarbekr, round which are numerous remains of the ancient city.

NITER, or **SALTPETER**, as it is frequently called, is the nitrate of potash, KNO_3. It usually occurs in long, colorless, striated, six-sided prisms; its taste is cooling, and very saline; it is soluble in seven times its weight of water at 60° F., and in less than one-third of its weight of boiling water, but is insoluble in alcohol. When heated to about 642° F. (340° C.) it fuses without decomposition into a thin liquid, which, when cast in molds, solidifies into a white, fibrous, translucent mass, known as *sal prunelle*. At a higher temperature, part of the oxygen is evolved, and nitrite of potash is formed. Owing to the facility with which niter parts with its oxygen, it is much employed as an oxidizing agent. Mixtures of niter and carbon, or of niter and sulphur, or of niter, carbon, and sulphur, deflagrate on the application of heat with great energy; and if niter be thrown on glowing coals, it produces a brisk scintillation. *Touch-paper* is formed by dipping paper in a solution of niter and drying it.

Niter occurs as a natural product in the East Indies, Egypt, Persia, where it is found sometimes as an efflorescence upon the soil, and sometimes disseminated through its upper stratum. The crude salt is obtained by lixiviating the soil, and allowing the solution to crystallize. A large quantity of niter is artificially formed in many countries of Europe, by imitating the conditions under which it is naturally produced. The most essential of these conditions seem to be the presence of decaying organic matter whose nitrogen is oxidized by the action of the atmosphere into nitric acid, which combines with the bases (potash and lime) contained in the soil. "The method employed in the artificial production of niter consists in placing animal matters, mingled with ashes and lime rubbish, in loosely aggregated heaps, exposed to the air, but sheltered from rain. The heaps are watered from time to time with urine or stable runnings; at suitable intervals the earth is lixiviated, and the salt crystallized. Three years usually elapse before the niter bed is washed; after this interval a cubic foot of the debris should yield between 4 and 5 ounces of niter. As there is always a considerable quantity of the nitrates of lime and magnesia present, which will not crystallize, carbonate of potash, in the shape of wood-ashes, is added so long as any precipitate occurs. The nitrate of lime is decomposed, and the insolubte carbonate of lime separated:

Carbonate of Potash.		Nitrate of Lime.		Carbonate of Lime.		Nitrate of Potash.
K_2CO_3	+	$Ca(NO_3)_2$	=	$CaCO_3$	+	$2KNO_3$

The clear liquor is then evaporated and crystallized. It has been found that the earth in which niter has once been formed furnishes fresh niter more readily than on the first occasion. Care is taken that the *niter plantations*, as they are termed, shall rest upon an impervious flooring of clay, so that the liquid which drains away from them may be collected and preserved."—Miller's *Elements of Chemistry*, 2d ed. vol. ii. p. 359.

Niter does not occur in any living members of the animal kingdom, but it is found in the juices of various plants, amongst which may be named the sunflower, nettle, goose-foot, borage, tobacco, barley, etc.

All the niter used in this country comes from the East Indies. The common varieties, which have a dirty yellowish appearance, are termed *rough* or *crude saltpeter*, while the purer kinds are called *East India refined*. The purification or refining of niter is effected by dissolving it in water, boiling the solution, removing the scum, straining it while hot, and setting it aside to crystallize. The most common impurities are sulphate of potash, chlorides of sodium and potassium, and nitrate of lime. Chloride of barium will detect the first of these impurities, nitrate of silver the second, and oxalate of ammonia the third.

Niter is employed in the manufacture of sulphuric acid, in the preparation of nitric acid, as an oxidizing agent in numerous chemical processes, as an ingredient of fireworks, and especially in the manufacture of gunpowder. It is extensively used in medicine. In moderate doses (from ten grains to a scruple) it acts as a refrigerent, diuretic, and diaphoretic, and hence its use is indicated when we wish to diminish abnormal heat, and to reduce the action of the pulse, as in febrile disorders and hemorrhages. In acute rheumatism it is given in large doses with great benefit. Some physicians prescribe as much as one, two, or three ounces, largely diluted with water, to be given in the course of 20 hours; but as in several cases a single ounce has proved fatal in a few hours, the effects of such large doses should be carefully watched. It is a popular remedy in sore throat, either in the form of niter balls, or powdered and mixed with white sugar. In either case the remedy should be retained in the mouth till it melts, and the saliva impregnated with it gently swallowed. The inhalation of the fumes produced by the ignition of *touch-paper* often gives speedy relief in cases of spasmodic asthma.

Nitrate of potash is sometimes called *prismatic niter* or *potash saltpeter*, to distinguish it from nitrate of soda, which is known in commerce as *cubic niter* or *soda saltpeter*.

Cubic niter, or *nitrate of soda*, $NaNO_3$, occurs abundantly on the surface of the soil in Chili and Peru. It derives its name from its crystallizing in cube-like rhombohedrons. In most of its properties it resembles ordinary niter, but in consequence of its greater deliquescence it cannot be substituted for that salt in the preparation of gunpowder. Being considerably cheaper than the potash-salt, cubic niter is often substituted for it in the manufacture of nitric and sulphuric acids; and it is used in agriculture as a top-dressing for wheat and oats. In several experiments it has been found that one cwt. per acre has produced an increase of 12 bushels in the wheat crop, and of 4 or 5 sacks in the oat crop.

NI'TI-GHAUT, a pass of the Himalaya, between the British district of Kumaon and Thibet. It takes its name from the village of Niti, in Kumaon, 13 m. s. of the pass, in lat. 30° 47′ n., and long. 79° 56′ east. The pass is 16,570 ft. above the level of the sea. This is regarded as the easiest pass between Kumaon and Thibet, and is consequently one of the principal channels of trade between Hindustan and Chinese Tartary. The Bhotias of Niti subsist chiefly by the carrying of goods in this trade. The articles of merchandise are conveyed on yaks, goats, and even sheep. Travelers often suffer much from difficulty of respiration on the pass of Niti-Ghaut, on account of the rarefaction of the air.

NI'TRATE OF POTASH. See NITER.

NITRATE OF SODA. See NITER.

NITRATES are salts formed by the union of nitric acid with bases. Some are found in a natural mineral condition, as saltpeter and cubic niter. They are distinguished for their solubility in water. On being heated, they undergo decomposition, being converted either into free nitric acid and a base, or into oxygen and a nitrite. For potassium nitrate and sodium nitrate, see NITER. In many respects, one of the most important nitrates is the nitrate of silver, or lunar caustic (q.v.); see also SILVER. It is of great use in surgery and the arts. As a caustic it acts powerfully, but rather superficially, producing a white slough, which blackens soon on exposure to the light. It is used in a solid state, or in solutions of all strengths. If dissolved in pure water, it remains colorless; but the smallest particle of organic matter will cause the solution to turn dark. On this account it is employed for making marking-fluids for linen. Indelible ink is usually made by dissolving 1 part of nitrate of silver and 4 parts of gum-arabic in 4 parts of water, and adding a little India ink to give it color, so that it may be seen when the mixture is applied. The place which is to receive the impression is first moistened with a solution of carbonate of soda and dried. After the application of the ink, the writing is exposed to the sunlight. Lunar caustic markings may be readily removed by applying a few drops of tincture of iodine, and dissolving out the iodide of silver thus formed by a solution of hyposulphite of soda, or a dilute solution of caustic potash. Nitrate of silver is used in photography (q.v.). Nitrate of ammonia, NH_4NO_3, is said to be formed in the atmosphere by the electrical discharges during thunder-showers. It has also been produced by passing electric sparks through a mixture of oxygen, hydrogen, and nitrogen gases. It is usually prepared by adding a slight excess of aqua ammonia to nitric acid. If crystallization is conducted slowly, six-sided prisms, like those of nitrate of potash, will be formed, having a specific gravity of 1.635. It melts at 226° F., and at 482° decomposes into water and nitrous oxide, or laughing-gas. See NITROGEN. Nitrate of baryta, or baryta saltpeter, is made by treating the native carbonate of baryta with nitric acid. It crystallizes in anhydrous regular octahedrons, having a specific gravity of 3.184. When heated strongly it is converted into baryta, or baric oxide, with evolution of oxygen and nitrogen. Nitrate of bismuth and also sub-nitrate are important salts in the arts and medicine. See BISMUTH. Nitrate of cobalt, prepared by the action of nitric acid on the oxide, crystallizes from solutions in beautiful pink-red deliquescent crystals, having a specific gravity of 1.83. It is much used in the chemical laboratory, particularly as a blow-pipe reagent. With magnesium compounds, it yields a pink color; with those of zinc, green; and with aluminum compounds a beautiful blue; for this reason it is

much used in coloring porcelain and earthenware. Nitrate of copper is made by the action of diluted nitric acid on copper turnings. Nitric oxide gas is given off during the operation. It crystallizes from cold solutions in beautiful blue, deliquescent, rhomboidal prisms, containing four molecules of water. From solutions above 59° it crystallizes with three molecules of water in needles, having a specific gravity of 2.047, soluble in alcohol. Nitrate of copper is converted, by moderate heat, into an insoluble basic nitrate. By raising the heat, the acid is completely driven off, leaving only the black oxide of the metal. Nitrate of copper is sometimes useful in surgery, as an application to certain ill-conditioned ulcers. The nitrates of iron are important salts. The protonitrate, or ferrous nitrate, is formed by digesting iron-turnings in very dilute nitric acid. It crystallizes in pale green rhombohedrons, having the formula $Fe(NO_3)_2,6H_2O$. It is much used in dyeing. The pernitrate, or ferric nitrate, is made by dissolving iron-turnings in nitric acid of sp. gr. between 1.2 and 1.3. It is used in surgery. Nitric acid forms several salts with lead, the principal of which is the common nitrate, or plumbi nitrate, $Pb(NO_3)_2$. It crystallizes in anhydrous regular octahedrons, usually milk-white and opaque. It dissolves in $7\frac{1}{2}$ parts of cold water. It is decomposed by heat, with evolution of nitrogen tetroxide. Nitric acid forms a greater number of salts with mercury than with any other metal, one of which is used in medicine (see MERCURY, *ante*), and the other for the manufacture of corrosive sublimate.

NITRIC ACID is the most important of the five compounds which oxygen forms with nitrogen (q.v.). Until 1849 it was only known in the hydrated form (the *aqua-fortis* of the older chemists), but in that year Deville showed that *anhydrous nitric acid*, or *nitric anhydride*, N_2O_5, *nitrogen pentoxide*, might be obtained in transparent colorless crystals by the action of perfectly dry chlorine gas on well-dried crystals of nitrate of silver, the reaction being exhibited in the equation:

Nitrate of silver.		Chlorine.		Chloride of silver.		Nitric anhydride.		Oxygen.
$2AgNO_3$	+	$2Cl$	=	$2AgCl$	+	N_2O_5	+	O.

It is a very unstable compound, and sometimes explodes spontaneously. It dissolves in water with evolution of much heat, and forms hydrated nitric acid.

Hydrated nitric acid (symb. HNO_3, equiv. 63, sp. gr. 1.521), when perfectly pure, is a colorless, limpid, fuming, powerfully caustic fluid, possessing an intensely acid reaction, as shown by its action on litmus. It boils at 186.8° F. (86° C.), and freezes at about −40° F. (−40° C.). It parts very readily with a portion of its oxygen to most of the metals, and hence is much used in the laboratory as an oxidizing agent. Its mode of action on the metals requires a few remarks. In order that a metal should unite with nitric, or any other acid, it is necessary that it should be in the form of an oxide. This oxidation is, however, effected at the same time that the metal and nitric acid are brought in contact, by one portion of the latter becoming decomposed and converting the metal into an oxide, while the remaining portion combines with the oxide thus formed to produce a nitrate. The exact nature of the decomposition varies in the case of different metals.

Nitric acid, whether in the concentrated or in a more dilute form, acts energetically on organic matters. As examples of such actions, we may refer to its power of decolorizing indigo; of staining the skin and all albuminous tissues of a bright-yellow color; of coagulating fluid albumen; and of converting cotton fiber into an explosive substance. See GUN-COTTON.

The monohydrated acid, HNO_3, is by no means a stable compound. If it be exposed to the action of light it is decomposed into hyponitric acid, N_2O_4 (the peroxide of nitrogen of Graham), and oxygen; and mere distillation produces a similar effect. When it is mixed with water it emits a sensible amount of heat, owing to the formation of a much more stable hydrate, $HNO_3 + H_2O$, which distills at 250° F. (121° C.) without change, and is unaffected by exposure to light. Its specific gravity is 1.424; and it is found that a weaker acid when heated parts with its water, and a stronger acid with its acid, till each arrives at this density. The existence of this hydrate has, however, been recently called in question by Roscoe.

The so-called *fuming nitric acid* is merely a mixture of the pure acid with hyponitric acid.

Nitric acid does not occur naturally in a free state; but it is found tolerably abundant in combination with potash, soda, lime, and magnesia; and after thunder-storms traces of it, in combination with ammonia, are found in rain-water. It may be formed in small quantity by passing a series of electric sparks through a mixture of its component gases in the presence of water, which is a mere imitation, on a small scale, of the mode in which it is produced in the atmosphere by a storm. It is usually prepared in the laboratory by the application of heat to a mixture of equal weights of powdered niter (nitrate of potash) and oil of vitriol (hydrated sulphuric acid) placed in a retort. A combination of sulphuric acid and potash remains in the retort, while the nitric acid distils over, and is condensed in the receiver, which is kept cool by the application of a wet cloth. The reaction is explained by the equation:

Niter.		Sulphuric acid.		Nitric acid.		Bisulphate of potash.
KNO_3	+	H_2SO_4	=	HNO_3	+	$KHSO_4$.

During distillation red fumes appear, arising from the decomposition of a portion of the nitric acid and a formation of some of the lower oxides of nitrogen. In this operation *one* molecule of sulphuric acid is taken for *one* is of niter, these being the proportions found by experience to be most suitable. If they are taken, *one* molecule of sulphuric acid for *two* of niter, a very impure red fuming acid is the result. In the manufacture of nitric acid on the large scale, the glass retort is replaced by a cast-iron cylinder coated with fire-clay, and the receiver by a series of earthen condensing vessels connected by tubes; and nitrate of soda, found native in Peru, is substituted for niter, in consequence of its being a cheaper salt, and of its containing 9 per cent. more nitric acid.

Nitric acid combines with bases to form *nitrates*, some of which, as those of potassium, sodium, ammonium, silver, etc., are anhydrous, while others combine with a certain number (often six) equivalents of water of crystallization. Most of them are soluble in water, crystallizable, and readily fusible by heat; and at an elevated temperature they are all decomposed, usually leaving only the oxide of the metal. If paper be soaked in a solution of a nitrate, allowed to dry, and ignited, it burns in the smoldering mode characteristic of *touch-paper*. This property is, however, shared by a few other salts.

The tests for this acid when it is present in small quantities are less satisfactory than those for the other ordinary mineral acids. All its compounds are so soluble that no *precipitant* for this acid is known. The best method for its detection is mixing the fluid to be tested with a little concentrated sulphuric acid, and then pouring a strong solution of protosulphate of iron upon it, so as to form a separate layer. If much nitric acid be present, a black color is produced; if only a small quantity is present the liquid becomes reddish-brown or purple; the dark color being due to the formation of nitric oxide by the deoxidizing action of a portion of the iron salt on the nitric acid.

The applications of this acid in the arts, in manufactures, and in chemical processes are very extensive.

NITRIC ACID, The Medicinal Uses of. In the U. S. pharmacopœia there is both a strong and a dilute acid. The strong acid has a specific gravity of 1.5, and is represented by the formula $2HNO_3 + H_2O$, while the diluted acid is prepared by mixing two ounces of the former with thirteen of distilled water, and has a specific gravity of 1.101.

The dilute acid is used internally as a tonic in conjunction with bitter infusions. In many cases of chronic inflammation of the liver, and in syphilitic cases in which the employment of mercurials is inadmissible, it may be prescribed with great benefit, either alone or in conjunction with hydrochloric acid, externally as a bath or lotion, or internally in doses of about 20 minims properly diluted. The strong acid is useful as an escharotic; as to destroy warts, some kinds of polypi, the unhealthy tissue in sloughing ulcers, etc., and as an application to parts bitten by rabid or venomous animals. Largely diluted, as 50 or 60 drops of the strong acid to a pint or more of water, it forms an excellent stimulative application to torpid ulcers.

NITRITES, salts produced by the action of nitrous acid on bases. The principal metallic nitrites are those of potassium, sodium, barium, ammonium, copper, lead, and nickel. The common mode of preparation is to reduce the nitrates by heat. The alcoholic nitrites or nitrous ethers are of more practical interest than the metallic salts. Nitrite of amyl is an inflammable liquid having the odor of pears; sp. gr. 0.902; boiling-point, 210.2° F. (99° C.). It is formed by the action of nitrous acid upon amylic alcohol. Its inhalation greatly increases the action of the heart, followed by loss of power. It has the power of suspending respiration and producing a condition of trance, which may stop short of death. In experiments upon animals, the appearances after death differ with the mode of administration. When given rapidly the lungs and brain are not congested; left side of heart empty, but right side filled with blood. When given slowly, both sides of the heart contain blood, and the lungs and brain are also congested. For nitrite of ethyl, see Nitrous Ether.

NI'TRO-BEN'ZOL, or Nitro-Benzide, $C_6H_5NO_2$, is a yellow oily fluid, of specific gravity 1.2, which may be distilled without decomposition, crystallizes in needles at 37.4° F. (3° C.), and boils at 410° F. (210° C.). It has a sweet taste, is insoluble in water, but dissolves freely in alcohol and ether. Its odor is very similar to that of oil of bitter almonds, which has led to its use in perfumery, under the name of *essence of mirbane*. It is obtained by treating benzol, C_6H_6, with warm fuming nitric acid, when 1 atom of the hydrogen is replaced by 1 molecule of NO_2, the H so replaced combining with the HO of the nitric acid forming water H_2O, so that the benzol, C_6H_5H, becomes converted into nitro-benzol, $C_6H_5NO_2$. This substance has recently taken a prominent place amongst the narcotic poisons. Under the name of *essence of mirbane*, it is largely employed as a substitute, in perfumery and confectionery, for oil of bitter almonds, which it closely resembles in smell, and to confectionery it gives the smell, but not the agreeable taste of that oil. It is a pale, lemon-colored liquid, with a pungent, disagreeable taste, and distinguishable by its odor from all other liquids except oil of bitter almonds, from which it differs in the following reaction: Pour a few drops of each on a plate, and add a drop of strong sulphuric acid. The oil of almonds acquires a rich crimson color with a yellow border, while the nitro-benzol produces no such color. In 1859 prof. Casper of Berlin published an account of this liquid under the name a "A New Poison," and described its effects on dogs and rabbits. In 1862 and since that date

various cases of human poisoning have been published, both in this country and abroad. We shall briefly notice three cases, in two of which the patient died after swallowing a portion of the fluid; while in the other the inhalation of the vapor proved fatal. A boy aged 17, while drawing off some nitro-benzol by a siphon, swallowed a portion of the liquid. There were no immediate symptoms; but he soon felt sleepy, and when at dinner ate but little, and said he felt as if he was drunk. This was between two and three hours after he had swallowed the liquid. He fell into a stupor, which became deeper and deeper, until death took place, without vomiting or convulsions, twelve hours after the ingestion of the poison. In the case of a man aged 43, who spilled a quantity of nitro-benzol over his clothes, and went about for several hours breathing the vapor, the effects were nearly the same. The progress of each of these cases, both of which are described by Dr. Letheby in the *Proceedings of the Royal Society* for 1863, was much the same as that of slow intoxication, excepting that the mind was perfectly clear until the coming on of the fatal stupor, which was sudden, as in a fit of apoplexy. From that moment there was no return of consciousness or bodily power; the sufferer lay as in a deep sleep, and died without a struggle. The duration of each case was nearly the same, about four hours intervening between the swallowing or inhaling of the poison and the beginning of stupor or coma, which lasted five hours. Nitro-benzol, as well as aniline, into which it seems to have been partly converted in the body, was detected in the brain and stomach. It is unnecessary to describe the steps to be taken for the detection of the poison in all these cases, no one but a professed toxicologist should be intrusted with an investigation on the result of which the life and character of a human being may depend. It is satisfactory to read Dr. Taylor's opinion, that "there is no probability that this liquid will be successfully employed for the purposes of murder without the certainty of detection."—*Principles and Practice of Medical Jurisprudence*, p. 311. It is worthy of notice that the vapor of this substance, as it is evolved from almond glycerine soap, has seriously affected females; and Dr. Taylor mentions the case of a gentleman who, from using a cake of the soap in taking a warm bath, fainted from the effects of the vapor, and was ill for some months afterwards. The mode of treatment that should be adopted in poisoning by this substance is essentially the same as that which should be adopted in poisoning by opium.

NITROGEN (symbol, N; equiv. 14; sp. gr. 0.9713) derives its name from the Greek words *nitron*, niter, and *gen-*, to produce, in consequence of its being an essential constituent of that salt. It is frequently termed *azote* (Gr. *a*, priv., *zoe*, life), especially by the French chemists, in consequence of its being a gas incapable of supporting life, and for the same reason the German chemists term it *stick-stoff* ("choking substance"). It was discovered by Rutherford in 1772. Long regarded as a "permanent" gas, it was liquefied by Cailletet in 1878.

Nitrogen is a colorless, tasteless, inodorous, permanent gas, which in its appearance in no way differs from the atmospheric air, of which it is the main ingredient. It is somewhat lighter than atmospheric air, 100 cubic in. at 60° F., and barometer 30 in., weighing 30.119 grains, while the same volume of air weighs 30.935 grains. It is characterized rather by negative than by positive properties. It is not combustible, nor is it a supporter of combustion (a lighted taper being immediately extinguished if immersed in this gas); it is not respirable, although it is not positively poisonous; for when it is mixed with respirable gases (as with oxygen in atmospheric air) it may be breathed without injury. It is very sligthly soluble in water, and hence may be collected over that fluid. Its combining powers are very slight, and although it unites with oxygen, hydrogen, chlorine, and many other substances, the union is never effected by the direct action of the elements on one another, but only by complicated processes, and many of the resulting compounds are of an exceedingly unstable nature.

Nitrogen is one of the most widely diffused elementary substances. It forms about four-fifths of the bulk of the atmosphere; for air, after having been freed from the small quantities of carbonic acid and aqueous vapor which it contains, consists, according to the experiments of Dumas and Boussingault, of 20.81 per cent of oxygen and 79.19 per cent of nitrogen by volume, or 23.01 of oxygen and 76.99 of nitrogen by weight; the two gases in this case being uniformly mixed, but not in chemical combination with one another. It occurs, however, in combination with oxygen in the form of nitric acid HNO_3, in various nitrates, which are found as natural products in many parts of the globe. In combination with hydrogen it is abundantly found as ammonia, and combined with oxygen, hydrogen, and carbon, and sometimes additionally with sulphur and phosphorus, it forms the most important constituents of the solids and fluids of the animal body, and occurs in many vegetable products, especially in the alkaloids, such as morphia, strychnia, quinia, etc.

The ordinary methods of preparing and exhibiting this gas are based upon the removal of the oxygen from atmospheric air. This may be done: (1) By setting fire to a small piece of phosphorus placed in a capsule that floats on the water of the pneumatic trough, and by inverting a glass-receiver filled with air over it. The phosphorus combines with the oxygen of the air to form phosphoric acid, which dissolves in the water, while the nitrogen is left, and must be transferred to another vessel. (2) By placing a stick of phosphorus in a jar of air which is standing over water. In two or three days there will be the same results as in the former experiment—viz., phosphoric acid and nitrogen. (3) Or

by passing air through a tube containing heated copper filings, which absorb the oxygen. In the above cases a little carbonic acid is present, which may be removed by passing the gas through a solution of potash. Pure nitrogen may be directly obtained by the action of chlorine gas on a solution of the nitrogenous substance, ammonia.

Nitrogen forms with oxygen no less than 5 distinct compounds, containing, respectively, 1, 2, 3, 4, and 5 equivalents of oxygen, with 2 equivalents of nitrogen. These compounds are thus named and constituted: *Nitrogen monoxide* (known also as nitrous oxide and laughing gas), N_2O; *nitrogen dioxide* (known also as nitric oxide), N_2O_2; *nitrogen trioxide* (known also as nitrous acid), N_2O_3; *nitrogen tetroxide* or *peroxide* (known also as hyponitric acid), N_2O_4; *nitrogen pentoxide*, or nitric anhydride, N_2O_5.

Nitrogen monoxide is a transparent, colorless gas, with a sweetish taste and smell. It is much more soluble in cold than in hot water, and therefore should be collected over the latter. Under a pressure of 30 atmospheres at 32° F. (0° C.) it is reduced to a colorless liquid, and it may be frozen into a transparent solid at about −175° F. (−115° C.). This gas is about half as heavy again as atmospheric air, its specific gravity being 1.527. It supports the combustion of many bodies, such as carbon, sulphur, phosphorus, and iron, with a brilliancy similar to that which they exhibit in oxygen; and, like oxygen, when mixed with hydrogen, it forms a mixture which explodes on the application of a flame. The most remarkable property of the gas is its intoxicating power on the animal system. It may be respired for a short time if quite pure, or if only mixed with atmospheric air, without danger or serious inconvenience. The intoxication is frequently accompanied with an irresistible propensity to muscular exertion, and usually with uncontrollable bursts of laughter, and hence the gas has received the name of *laughing gas*. It is best obtained by heating solid nitrate of ammonia in a glass retort, when it is converted into nitrogen monoxide and water. It has recently come into frequent use as an anæsthetic in dentistry and similar cases. It is less suited to protracted operations, as the effects are transient. It produces much less disturbance of the system than chloroform.

Nitrogen dioxide is a colorless gas, very slightly soluble in water, and having a specific gravity of 1.039. Its taste and smell (if any) are unknown, since, in the presence of atmospheric air, it instantly becomes more highly oxidized, and forms yellowish-red fumes of nitrogen tetroxide. As it is of little importance, it is unnecessary here to describe the mode of obtaining it.

Nitrogen trioxide, or *nitrous anhydride*, is an orange-red gas, which may be condensed by cold and pressure to a dark blue, mobile liquid. This liquid decomposes at 32° F. (0° C.) into nitrogen dioxide and tetroxide. Gaseous nitrogen trioxide is prepared by the action of nitric acid upon arsenious acid, starch, sugar, and many other bodies. The aqueous solution of this gas is called *nitrous acid* (HNO_2), and is unstable, while its salts with metals, called nitrites, are permanent. Some of the nitrites occur in nature, and several are used in the chemical arts.

Nitrogen tetroxide presents a remarkable example of a body within comparatively small limits of temperature, occurring in a solid, a fluid, and a gaseous form. At a temperature of 15.8° F. (−9° C.) it forms colorless prismatic crystals; these soon melt to a colorless liquid, which turns yellow at 50° F. (+10° C.), orange at 59° F. (15° C.), and boils at 71.6° F. (22° C.), giving off a reddish-brown vapor. It is chiefly the vapor of nitrogen tetroxide that forms the orange fumes that are produced when nitrogen dioxide comes in contact with the air. It possesses a very disagreeable, suffocating odor, and a caustic action, and colors the skin yellow, like nitric acid. It does not enter into combination with bases, but is immediately decomposed by them into nitric and nitrous acids; and it is in consequence of its not possessing this essential character of an acid that Graham has given it the name of *peroxide of nitrogen*, a term that has since been adopted by Miller and other chemists.

Nitrogen pentoxide, also called *nitric anhydride*, is described under Nitric Acid.

Nitrogen combines with hydrogen in four proportions, but none of these compounds can be formed by the direct union of the component elements, and only one of them, viz., ammonia, has been obtained in the isolated form. They are—*imidogen*, NH, *amidogen*, NH_2, *ammonia*, NH_3, and *ammonium*, NH_4. Of these, the first two will be noticed under Organic Bases, while the last two are sufficiently described under Ammonia.

Nitrogen combines with chlorine, bromine, and iodine. The *chloride of nitrogen* is a heavy, oily, orange-colored fluid, insoluble in water, and evolving a vapor of a highly irritating nature. It is one of the most dangerous compounds known in chemistry, as it explodes with extreme violence when brought in contact with phosphorus, arsenic, potash, ammonia, caoutchouc, numerous oily matters, etc., at ordinary temperatures, and spontaneously when heated to above 200° F. It has occasioned so many serious accidents that we shall omit all details regarding its mode of preparation. Its exact formula is unknown. *Bromide of nitrogen* is an oily-looking detonating liquid, resembling the chloride in appearance and properties. *Iodide of nitrogen* occurs as a black powder, which when dry explodes upon the slightest touch, and often without assignable cause.

Nitrogen enters into combination with various metals, forming a class of compounds to which the term *nitrides* is applied.

NITRO-GLYCERINE, $C_3H_5N_3O_9$, or $C_3H_5(NO_3)_3$, known also as *glonoin* or *glonoin oil*, is a compound which is produced by the action of a mixture of strong nitric and sul-

phuric acids on glycerine at low temperatures. Two methods of preparing it are given in Watts's *Dictionary of Chemistry*, vol. ii., pp. 890, 891, to which we must refer the reader who seeks for details on this subject. According to whatever method it is prepared, it is obtained as a light yellow oily liquid, of specific gravity varying from 1.525 to 1.6, inodorous, but having a sweet, pungent, aromatic taste; a single drop, however, if placed on the back of the tongue, produces headache and pain in the back, which last for many hours. It is only slightly soluble in water, but dissolves readily in ether, alcohol, and methylated spirits. This substance was discovered in 1847 by Sobrero, then a student in the laboratory of Pelouze in Paris, and afterwards professor in Turin. But though its discoverer ascertained its remarkable properties as an explosive, it remained simply an object of scientific interest till 1864, when it began to be manufactured on a large scale for blasting purposes by Nobel, a Swede resident in Hamburg. If ignited in the open air, nitro-glycerine burns rapidly and with a brisk flame, without any explosion; if poured out in a thin sheet, it ignites with difficulty, and burns incompletely. But it explodes at once if it is exposed to a moderately strong blow or concussion, to the concussion due to the explosion of gunpowder, to contact with red-hot iron, and especially to the action of detonating mixtures and fulminates; it likewise explodes on exposure to a high temperature (see below); the explosion, however it is produced, being in all cases excessively rapid, and unaccompanied by smoke. It is this explosive power that renders this compound a useful agent in blasting. According to Dr. Rudolf Wagner, the distinguished Bavarian technologist, it may be cooled down to 4° without becoming solid; but recent authorities state that at a temperature of −4° F. (−20° C.), it solidifies in long needles, which are most dangerous to handle, since they explode, even on being gently broken, with appalling violence. At 320° F. (160° C.), nitro-glycerine begins (according to Dr. Adriani) to decompose, giving off red vapors; and if the heat be suddenly applied, or slightly raised above this point, the substance explodes with great violence; while, according to other observers, it is liable to explode at 240° F. (115.5° C.), or a little higher; and if exposed for a length of time to half that temperature, explosion may take place at 180° F. (82.2° C.) or less. A temperature of 494.6° F. (257° C.) is said to produce the most violent effect. It is obvious from the formula for nitro-glycerine that it may be assumed to consist of glycerine, $C_3H_5(OH)_3$, in which three atoms of hydrogen are replaced by three nitro groups (NO_2), thus: $C_3H_5(O\cdot NO_2)_3$. The products of the complete combustion of 100 parts of pure nitro-glycerine are—water, 20 parts; carbonic acid, 58; oxygen, 3.5; and nitrogen, 18.5; and hence it has been calculated that one volume (say, a cubic inch) of this compound, at a specific gravity of 1.6, yields, on combustion or explosion:

Aqueous vapor,	554	volumes (say cubic inches)	
Carbonic acid,	469	"	"
Oxygen,	39	"	"
Nitrogen,	236	"	"
	1298	"	"

According to Nobel, these gases expand, on explosion, to 8 times their bulk; in which case, one cubic measure (say, one cubic inch) of nitro-glycerine will yield 10,384 cubic measures (say, cubic inches) of gases; while one cubic measure of gunpowder will only yield 800 cubic measures of gases. Hence, it follows that, for equal bulks, nitro-glycerine is 13 times as strong as gunpowder, while for equal weights it is 8 times as strong.

The danger of using this compound in mining, etc., is greatly increased by its instability. Even when pure, it is liable, at a heat of 70° or less, to undergo slow, spontaneous decomposition into glycerine, oxalic and hydrocyanic acids, ammonia, etc., with a continuous escape of gaseous products, which, exerting pressure on the liquid, renders it so prone to explosion that even a slight concussion is attended with danger; and the impure commercial compound decomposes far more rapidly than the pure nitro-glycerine; indeed, impure nitro-glycerine may, from this cause, be regarded as "dangerously self-explosive even while standing quietly" (Adriani, *op. cit.*).

Many of our readers doubtless recollect the history of a terrific explosion that took place on board the ship *European*, when lying in harbor at Colon, Panama, on April 3, 1866. Amongst the cargo put on board at Liverpool were 70 cases of nitro-glycerine, and one case containing 70,000 percussion caps. At 7 A.M., on the 3d, a most tremendous explosion occurred in the after part of the ship. It was described as most rapid, without smoke, but with a great flame, and the ship was immediately after seen to be on fire. The whole of the deck and cabin aft were carried away, and the side of the ship was also much damaged, the plates above the water line being blown away, and the parts below it being much injured. For fear of further explosion, the ship was towed into the bay, where she shortly sunk. Nor was the injury confined to the *European;* the jetty was nearly blown away, and a vessel lying on the other side of it was much damaged. Houses in the town were also partially destroyed, the floors in many cases being torn up; and altogether about 50 lives were lost. When the bodies were recovered, they presented no sign of smoke nor any symptoms of scalding; and hence it was inferred that the explosion could not have been produced either by the percussion caps or by

steam. On these and other grounds, the conclusion was irresistible that the explosion was due to the nitro-glycerine. An action was (Aug. 1867) brought at Liverpool by the owners of the *European* against the shippers of the nitro-glycerine, on the ground that no due notice of the dangerous properties of that compound had been given; and at this trial, several of the important points regarding the explosive properties of nitro-glycerine, which we have noticed, were elicited from prof. Abel, chemist to the laboratory at Woolwich; col. Boxer, superintendent of the Woolwich laboratory; and prof. Roscoe, who appeared as scientific witnesses. To give some definite idea of the explosive force of this substance, prof. Roscoe stated that one case of it would have sufficed for the destruction of the *European*. It is used to a considerable extent in the slate quarries in Wales, and in mining operations. A workman at one of those quarries described how he had been set to clean a wagon which had held some of it, which he did by scraping it with a piece of slate; and inadvertently throwing the piece of slate into the wagon when he had finished, the percussion exploded the remnants of the oil, and the wagon was blown to pieces. He states that it is regarded as ten times as powerful an explosive agent as gunpowder.

Both nitro-glycerine and dynamite (see below) are now extensively employed in mining and other operations of a similar kind; and owing to certain peculiar characteristics, they are well adapted for all such purposes. When nitro-glycerine, or dynamite, or any other compound having nitro-glycerine for its basis, is exploded, unlike gunpowder or the majority of other explosives, the effect of the explosion is expended in the direction of those points in actual contact with the compound. Thus, if gunpowder was exploded on an iron plate in the open air, the disruptive effects would be nil; but if nitro-glycerine or dynamite was exploded under the same circumstances, the effects would be the indenting or shattering of the iron plate *downwards*. In the same way, a gun fired with nitro-glycerine would almost certainly burst, even though the quantity employed was not greater than that of an ordinary charge of gunpowder.

It will thus be seen how valuable this characteristic of the nitro-compounds is when applied to blasting operations, and it will also at once explain how the tedious process known to miners as "tamping" is rendered unnecessary. Tamping is simply the filling-up of the hole bored in the rock after the gunpowder has been introduced, so as to produce as much resistance as possible to the disruptive power of the gunpowder. The hole is filled with pieces of rock, sand, clay, and the like, and the whole beaten firmly together. In the case of nitro-glycerine or dynamite, however, tamping is not necessary; simple contact with the bottom and sides of the bore-hole being sufficient to produce the maximum disruptive effects. The mode of firing the compounds is exceedingly simple. They are introduced into the blast-holes in suitable cases; and a fuse, having a small charge of gunpowder at its extremity, is fixed immediately on the top of the compound, and the concussion produced by the exploding gunpowder explodes the nitro-compound. The ordinary fuse or the "straw" used in some blasting operations would be uncertain in its results, owing to the non-explosibility of the compounds under the application of an open flame.

We have already noticed Richter's observations on the slight inflammability of this compound; and as the employment of this explosive agent seems to be increasing, we shall give his other chief results, so as to bring up our knowledge to the latest possible date. The shaft in which the experiments were made was being sunk 30 ft. long by 8 ft. wide, in hard gray gneiss with occasional joints, which facilitated the working. From these experiments it appeared not only that its power was four or five times greater than that of the nitrate-of-soda gunpowder commonly used for mining purposes in Germany, but that other advantages accrued from its use, which may be summed up as follows: (1.) Fewer men are wanted for working out a certain-sized piece of ground, and fewer holes have to be bored than at present. (2.) Nitro-glycerine does not take fire easily (see above). (3.) The amount of smoke after a blast is small, as compared with that of powder; and workmen can return at once to the spot when the blast has taken place. (4.) Holes that have missed, or only partly torn, can be retamped and shot off, which, with the present arrangements, is impossible, or very dangerous. Against these advantages must be set off the following disadvantages: (1.) The gases formed during the explosion of nitro-glycerine have an injurious effect on the organs of sight and respiration. (2.) Nitro-glycerine explodes on being struck smartly, and easily freezes. (3.) The masses of rock which it removes are mostly very large, and considerable time has to be spent in breaking them up.

In another set of experiments, the relative cost of blasting by nitro-glycerine and gunpowder was compared, and it was found that a cubic fathom of ground could be removed by the former for $20.00; the cost amounted to some $25.00, when the latter was used.

Dynamite, called by the miners of Colorado and Nevada the "giant powder," has of late years superseded the nitro-glycerine which is its principal component. Induced by the calamitous and inexplicable accidents that so often attended the use of nitro-glycerine, and which it seemed impossible to guard against, Nobel sought, by soaking various inert substances with nitro-glycerine, to obtain some composition which should have the valuable powers of the explosive oil without its deadly risks. In 1867 he gave the name of dynamite to the successful outcome of his experiments. Dynamite, as generally

manufactured, consists of infusorial earth, porcelain earth, coal-dust, siliceous ashes or the like, saturated with about three times its weight of nitro-glycerine—though the proportion varies with different makers. According to its elements, it is to the eye a grayish-brown, reddish, or blackish powder, damp and greasy to the touch, and without smell. In the open air it burns quietly, and gives off fumes of carbonic acid and nitrogen with a watery vapor. If properly made, it ought not to be exploded by heat up to 212° F. (100° C.), by a spark, or by any ordinary shock; though cases are said to have occurred where one of these causes singly has sufficed. In order to take advantage of its enormous blasting power, it is pretty tightly packed in paper or parchment cartridges, and exploded by means of a fulminating fuse or cap. It leaves a white ash, with little or no smoke. In the hands of careful workmen who know what they are about, its use is comparatively free of danger, and it may be easily transported. It is now regarded as one of the safest of explosives, though its manufacture is still attended with great risks. Over gunpowder it has the advantage that it is not injured by damp; it also saves labor, fewer and smaller holes sufficing in blasting operations. It costs about four times as much as gunpowder, but performs eight or ten times as much work. The violence and rapidity of its explosion renders dynamite unfit for use in fire-arms. It is reckoned that in 1875 at least 100,000 cwts. of dynamite were manufactured in Europe.

Various other nitro-glycerine powders or compounds have been patented. *Dualline* is said to consist of wood gunpowder soaked with the oil; or of nitro-glycerine, fine sawdust, and a little niter. The improved *lithofracteur* contains 52 parts of nitro-glycerine, 30 of silex, 12 of coal-dust, and 2 of sulphur. Colonia powder, fulminatine, lignose, sebastine, heracline, are all names for compositions in which nitro-glycerine is the chief ingredient, and are all more or less valuable as explosives. See EXPLOSIVES.

NITRO-MURIATIC ACID is a mixture of nitric and hydrochloric acids. On account of having the power of dissolving gold, the king of metals, it was called *aqua-regia*. Hydrochloric acid does not possess the power of dissolving gold, or in other words the metal has not sufficient power to take the chlorine from the hydrogen. In the presence of nitric acid, however, the oxygen of which appears to have a decomposing influence upon the hydrochloric acid, the gold steps in, so to speak, and bears off the chlorine. Platinum also requires the action of *aqua-regia* to enable it to combine with chlorine. Chlorine in a nascent state (just liberated from combination) has more power to combine with gold or platinum than after it has been collected; its power is also increased by the polarized condition of the molecules of all the elements present. It is not only useful in chemistry, but has been employed in medicine with great benefit in certain cases of disease of the liver, administered internally, and also as a bath, diluted with large quantities of water.

NITROUS ACID. See *nitrogen trioxide*, under NITROGEN.

NITROUS ETHER, or ETHYL NITRITE, is represented by the formula C_2H_5, NO_2, or $AeNO_2$, Ae being the symbol for ethyl, C_2H_5. It is a pale yellow fluid, having a specific gravity of 0.900, and evolving an agreeable odor of apples. On evaporation, it produces a great degree of cold; it boils at 64.4° F. (18° C.), and it is very inflammable. It does not mix with water, but is readily miscible with alcohol. When kept in contact with water it soon decomposes, and an acid mixture of a very complicated character is formed. It may be obtained by mixing 1 part of starch and 10 of nitric acid in a capacious retort, which must be gently heated. The vapor of nitrogen trioxide, which is evolved by the action of the starch on the nitric acid, is conducted into alcohol, mixed with half its weight of water, contained in a two-necked bottle, which is to be plunged into cold water. The second neck of this bottle is connected with a good cooling apparatus; and the vapor, in its passage through the liquid, combines with the alcohol and forms ethyl nitrite, which distills in a continuous stream. This, which is known as Liebig's method, is the best process, but it is usually prepared by the direct action of nitric acid on alcohol, in which case the nitric acid is reduced by the hydrogen of part of the alcohol; the nitrous acid so formed then combines with the rest of the alcohol.

The *spirit of nitrous ether*, or *sweet spirit of niter*, used in medicine, is a mixture of nitrous ether with about four times its volume of rectified spirit. Its specific gravity should not exceed 0.85. It is used, in conjunction with other medicines, as a diuretic, especially in the dropsy which follows scarlatina; and it is employed, in combination with acetate of ammonia and tartarized antimony, in febrile affections. The dose in febrile cases is from half a dram to a couple of drams, and if we wish it to act as a diuretic, two or three drams should be given. It is a rather expensive medicine, and consequently is extremely liable to adulteration. In the new British pharmacopœia it is recommended that this substance should be directly obtained by the distillation of nitrite of soda (five ounces), sulphuric acid (four fluid ounces), and rectified spirit (two pints)—a process open to many practical objections.

NITROUS OXIDE, or LAUGHING GAS. See NITROGEN (monoxide).

NITZSCH, KARL IMMANUEL, one of the most distinguished theologians that modern Germany has produced, was b. Sept. 21, 1787, at Borna. He studied for the church at Wittenberg, where he took his degree in 1810, and where, in 1813, he became parish minister. Here his religious opinions underwent a great modification, through the influ-

ence of Schleiermacher and Daub, and he awoke to a clearer perception of the essence of religion. From this time forward Nitzsch is to be regarded as one of that new school—of which Neander is the greatest representative—who endeavored to reconcile faith and science, not by forced and unnatural methods, but by pointing out their distinctive spheres, and by exhibiting in their own spiritual life that union of reason and reverence for which they argued in their writings. In 1822 Nitzsch was called to Bonn as ordinary professor of theology and university preacher, where he labored with great diligence for more than twenty years, not only in theology, but in all matters affecting the welfare of the Prussian church. In 1847 he succeeded Marheineke at Berlin, and as professor, university preacher, and upper consistorial councilor, he exercised with prudence and moderation a wide ecclesiastical influence. In his political (perhaps also in his religious) views he may be classed with the late chevalier Bunsen. The high Lutheran party having denounced liberal politics as irreligious, Nitzsch and Bunsen and others have vindicated them on the ground of Christianity, not without success. In theology his position will be best understood when we say that he subordinated dogma to ethics, or rather that he believed the only dogmas which can hope to permanently maintain themselves are those that result from an ethical apprehension of Christianity. Besides numerous smaller treatises on dogmatics, the history of dogmas and liturgies, three larger works call for special mention. These are his *System der Christlichen Lehre* (Bonn, 1829; 6th edit. 1851); his *Praktische Theologie* (Bonn, 1847–48); and his *Predigten*, or sermons, of which several collections have appeared, and which are remarkable for their extraordinary richness of thought. He died in 1868. NITZSCH, GREGOR WILHELM (born in 1790), brother of the preceding, acquired a high reputation as a philologist, and was professor of archæology at Leipsic till his death in 1861. He was considered one of the ablest opponents of Wolf's Homeric theories. His chief work is *Die Sagenpoesie der Griechen* (Brunswick, 1852).

NIVELLES (Flem. *Nyvel*), a t. of Belgium, in the province of Brabant, 13½ m. n.n.w. of Charleroi. It has a fine church, called the church of St. Gertrude (built in the Romanesque style of architecture, 1048 A.D.), which claims to contain the relics of St. Gertrude, daughter of Pépin, maire du palais. They are deposited in a shrine placed over the high altar. Nivelles has manufactures of linen, cotton, lace, etc. Population in 1890, 10,642.

NIVERNAIS, formerly a province in the middle of France, nearly corresponding to the present department of Nièvre. It was divided into eight territorial districts, and its towns enjoyed municipal privileges at a very early period. The principal landowners were the counts, afterwards dukes, of Nevers, who held under their vassalage more than 1800 fiefs.

NIX, in the masculine, and *nixe* in the feminine (Old High Ger. *nihhus;* Anglo-Saxon, *nicor;* Dutch, *nikker;* Old Norse, *nikr;* Swed. *näk, nek;* Dan. *nök, nok*—whence our name for the devil, *Nick*, not as some absurdly suppose, from *Nicholas* Machiavelli), the common name for all water spirits in the Teutonic mythology. They are represented as of human form, or sometimes as passing into that of a fish or of a horse. They love music and dances, and possess the gift of prophecy, like the Greek muses, sirens, and other water-gods. The nix taught, in return for a good gift, the art of playing on a stringed instrument; and often in the evening sunshine the nixes, combing their long hair, were wont to mingle in the dances of mortals; but their company was dangerous, for though sometimes wearing a mild appearance, they were more frequently cruel and malignant. The *water-kelpie* of Scotland must be reckoned a member of the genus nix, but in him the evil element alone exists. He generally, if not always, assumed the form of a water-horse; frequented fords and ferries, especially during storms; allured travelers to mount him, and then dashed furiously with them into the stream which he had flooded by his devilish power, and submerged them in the roaring currents.

NIZAM'S DOMINIONS, or HYDERABAD, a large native state of India, lying to the n.w. of the presidency of Madras, in lat. 15° 10′ to 21° 41′ n., and long. 74° 40′ to 81° 31′ e. Length from s.w. to n.e., 480 m.; extreme breadth, 340 miles. Area, 82,698 sq. m., and population estimated at 11,537,040. The surface is a slightly-elevated table-land. The principal rivers are the Godavari (Godavery), with its tributaries the Dudhna, Manjera, and Pranhita; and the Kistna (Krishna), with its tributaries the Bimah and Tungabhadro. The soil is naturally very fertile, but poorly cultivated; yet, wherever it receives moderate attention, it yields harvests all the year round. The products are rice, wheat, maize, mustard, castor-oil, sugar-cane, cotton, indigo, fruits (including grapes and melons), and all kinds of kitchen vegetables. The pasturages are extensive, and sheep and horned cattle are numerous. Marsh and jungle, however, occupy a great space, and originate fevers, agues, diseases of the spleen, etc., though the climate is quite healthy where these do not abound. The mean temperature of the capital, Hyderabad, in January is 74° 30′, and in May 93°. The inhabitants manufacture for home use woolen and cotton fabrics, and export silk, dressed hides, dye-stuffs, gums, and resins. Good military roads traverse the territory. The revenue of the Nizam is reckoned at 3,819,440 rupees (1891). The ruler is a Mohammedan, but his subjects are mostly Hindus.

In 1687 the territory now known as the Nizam's Dominions became a province of the Mogul empire; but in 1719 the governor or viceroy of the Deccan, Azof Jah, made

himself independent, and took the title of *nizam-ul-mulk* (regulator of the state). After his death, in 1748, two claimants appeared for the throne, his son Nazir Jung, and his grandson Mirzapha Jung. The cause of the former was espoused by the East India company, and that of the latter by a body of French adventurers under Gen. Dupleix. Then followed a period of strife and anarchy. In 1761 Nizam Ali obtained the supreme power, and after some vacillation signed a treaty of alliance with the English in 1768. He aided them in the war with Tippoo, Sultan of Mysore, and at the termination of that war, in 1799, a new treaty was formed, by which, in return for certain territorial concessions, the East India company bound itself to maintain a subsidiary force of 8000 men for the defense of the Nizam's Dominions. The Nizam remained faithful to the British during the mutiny of 1857–58. The territory is frequently called Hyderabad or Haidarabad. A British resident advises the Nizam.

NIZH'NI-NOVGOROD'. See NIJNI-NOVGOROD.

NIZH'NI-TAGILSK'. See NIJNI-TAGILSK.

NOAH, 2115–2065 B.C., a son of Lamech, remarkable in character, deeds, and history. He was just in his dealings with men, pious in his relations to God, and preserved his uprightness in the midst of abounding and defiant wickedness. The great things in his life are recorded only in outline, and as such are familiar to all readers of the Bible. 1. He was a preacher of righteousness. 2. He built the ark (see ARK). 3. He and his family were brought safely through the flood, in which all the rest of mankind were drowned. 4. After the flood he commenced anew the work of cultivating the ground and planted a vineyard, the wine from which led to the one sin recorded against him, producing dishonor to himself and occasioning transgression and punishment among his descendants.

NOAH, MORDECAI MANUEL, 1785–1851; b. Philadelphia; studied law, removed to Charleston, S. C., was appointed consul at Riga 1811, and at Morocco 1813. Returning to the United States in 1816, he edited the *National Advocate*, a New York democratic paper, till 1826, when he founded the *New York Enquirer*, afterwards merged in the *Courier and Enquirer*. He established the *Evening Star* in 1834, but soon withdrew from connection with the daily press, and became one of the founders of the weekly *Sunday Times*. He held at various times the offices of sheriff of New York co., surveyor of the port of New York, and judge of the court of sessions. He was a Jew, adhered to the Jewish religion, and attempted to found a Jewish colony on Grand Island in the Niagara river. He wrote a number of dramas and other works.

NOAILLES, LOUIS MARIE, Vicomte de, 1756–1804; of an illustrious French family, b. in Paris, and associated with Lafayette (their wives were sisters) in the aid given to the American colonies in their struggle for independence. In 1789, at the opening of the French states-general, he was a deputy among the nobles representing Nemours, and on Aug. 4 made the memorable proposition for the abolition of titles and feudal privileges of all kinds, the interdiction of liveries, and the abolition of slavery in the dominions of France. During the excesses of the Jacobins he went to the United States, but returned to France as soon as the persecution of the old nobility ceased, and a few years later was made brigadier-general in San Domingo, where he died from wounds received in the capture of an English sloop of war near Havana by one of the most remarkable feats of naval *ruse* and daring on record.

NO'BILE OFFIC'IUM, the term used in the law of Scotland to denote the high prerogative right of the court of session to exercise jurisdiction in certain cases—as, for example, to appoint a judicial factor to young children or to lunatics.

NOBILITY, that distinction of rank in civil society which raises a man above the condition of the mass of the people. Society has a tendency to inequality of condition, arising from the natural inequality, physical, moral, and intellectual, of those who compose it, aided by the diversity of external advantages, and of the principles and habits imbibed at an early age. This inequality is apt to increase; the son, inheriting the faculties of his father, is more favorably situated than his father was for making use of them; and hence, in almost every nation, in even the very early stages of civilization, we find something like a hereditary nobility. Privileges originally acquired by wealth or political power are secured to the family of the possessor of them; and the privileged class come to constitute an order, admission into which requires the consent of society or of the order itself.

The ancient Romans were divided into *nobiles* and *ignobiles*, a distinction at first corresponding to that of patricians and plebeians. A new nobility afterwards sprung out of the plebeian order, and obtained (336 B.C.) the right to rise to high offices in the state; and in course of time the descendants of those who had filled curule magistracies inherited the *jus imaginum*, or right of having images of their ancestors—a privilege which, like the coat-of-arms in later ages, was considered the criterion of nobility. The man entitled to have his own image was a *novus homo*, while the *ignobilis* could neither have his ancestor's image nor his own.

The origin of the feudal aristocracy of Europe is in part connected with the accidents which influenced the division of conquered lands among the leaders and warriors of the nations that overthrew the Roman empire. Those who had acquired a large share of

territorial possession, and their posterity to whom it was transmitted, were naturally looked on as the fittest persons to occupy the great offices of state and wield political power. The Frankish kingdom in Gaul was divided into governments, each under the authority of a chieftain called a count or *comes*—a designation derived from the *comes* of the Roman empire—whose Teutonic equivalent was *graf*. A higher dignity and more extensive jurisdiction was conferred on the *dux* or duke, a term also of Roman origin, and implying the duty of leading the armies of the country. In the Lombard kingdom of Italy, the same term was applied to the great officers who were intrusted with the military and civil administration of cities and their surrounding provinces. The marquises were guardians of the frontier marches. In the subinfeudations of the greater nobility originated a secondary sort of nobility, under the name of vavasours, castellans, and lesser barons; and a third order below them comprised vassals, whose tenure, by the military obligation known in England as knight's service, admitted them within the ranks of the aristocracy. In France the allegiance of the lesser nobles to their intermediary lord long continued a reality; in England, on the other hand, William the Conqueror obliged not only his barons who held in fief of the crown, but their vassals also, to take an oath of fealty to himself; and his successors altogether abolished subinfeudation.

The military tenant who held but a portion of a knight's fee participated in all the privileges of nobility, and an impassable barrier existed between his order and the common people. Over continental Europe in general, the nobles, greater and lesser, were in use, after the 10th c., to assume a territorial name from their castles or the principal town or village on their demesne; hence the prefex "de," or its German equivalent "von," still considered over a great part of the continent as the criterion of nobility or gentility. Britain was, to a great extent, an exception to this rule, many of the most distinguished family names of the aristocracy not having a territorial origin. See NAME.

Under the feeble successors of Charlemagne, the dukes, marquises, and counts of the empire encroached more and more on the royal authority; and in course of time many of them openly asserted an independence and sovereignty with little more than a nominal reservation of superiority to the king. By the end of the 9th c. the Carlovingian empire had been parceled into separate and independent principalities, under the dominion of powerful nobles, against whom, in Germany, the crown never recovered its power. In France, however, the royal authority gradually revived under the Capetian race, the great fiefs of the higher nobility being one by one absorbed by the crown. In England, where the subjection of the feudal aristocracy to the crown always was, and continued to be a reality, the resistance of the nobles to the royal encroachments was the means of rearing the great fabric of constitutional liberty. All those who, after the conquest, held *in capite* from William belonged to the nobility. Such of them as held by barony (the highest form of tenure) are enumerated in *Domesday*. Their dignity was territorial, not personal, having no existence apart from baronial possession. The *comes* was a baron of superior dignity and greater estates; and these were in England the only names of dignity till the time of Henry III. The rest of the landholders, who held by other tenures than barony, also belonged to the nobility or gentry.

After the introduction of heraldry, and its reduction to a system, the possession of a coat of arms was a recognized distinction between the noble and the plebeian. In the words of sir James Lawrence (*Nobility of the British Gentry*): "Any individual who distinguishes himself may be said to ennoble himself. A prince judging an individual worthy of notice gave him patent letters of nobility. In these letters were blazoned the arms that were to distinguish his shield. By this shield he was to be known or *nobilis*. A plebeian had no blazonry on his shield, because he was *ignobilis*, or unworthy of notice. Hence arms are the criterion of nobility. Every nobleman must have a shield of arms. Whoever has a shield of arms is a nobleman. In every country of Europe, without exception, a grant of arms, or letters of nobility, is conferred on all the descendants." On the continent the term noble is still generally used in this sense; in England it is now more common to restrict the words noble and nobility to the five ranks of the peerage constituting the greater nobility, and to the head of the family, to whom alone the title belongs. Gentility, in its more strict sense, corresponds to the nobility of sir J. Lawrence and of continental countries. This difference of usage is a frequent source of misapprehension on both sides of the channel; at some of the minor German courts the untitled member of an English family of ancient and distinguished blood and lineage has sometimes been postponed to a recently-created baron or "herr von," who has received that title, and the gentility accompanying it, along with his commission in the army. It has been taken for granted that the latter belongs to the "adel" or nobility, and not the former.

The original higher nobility of Germany consisted of the dynasty nobles, i.e., the electoral and princely houses of the realm, with those counts and barons who had a seat in the diet or estates of the realm. These last have, since 1815, all been elevated to higher titles; most of the counts, in recompense for their acquiescence in the abolition of the German empire, receiving the diploma of prince, a title to which our dukes, marquises, and earls have also an undoubted right. The lower German nobility, corresponding to our gentry, were the merely titular counts and barons (i.e., those who had no seat in the diet), the edel-herren and banner-herren (something like our bannerets) the knights of the holy Roman empire, the "edlen von" (who now take the style of

baron), and the common nobles distinguished only by the prefix "von." Throughout the middle ages the lesser nobility of Britain preserved a position above that of most continental countries, being, unlike the corresponding class in Germany, allowed to intermarry with the high nobility, and even with the blood-royal of their country.

The higher nobility, or nobility in the exclusive sense of England, consist of the five temporal ranks of the peerage—duke, marquis, earl, viscount, and baron) in the restricted signification of the word), who are members of the upper house of parliament. Formerly all the barons or tenants-in-chief of the sovereign were bound to attend his councils; but after the reign of Edward I. only a select number of them were summoned, the rest appeared by representatives—the former were considered the greater, the latter the lesser barons. See MINOR BARONS. In Scotland the whole barons continued to sit in parliament till a much later period; and after the minor barons attended only by representatives from their body, these representatives sat in the same house with the greater nobility, and, up to the union, their votes were recorded as those of the "small barrounis." By the act of union between England and Scotland the Scotch peers elect 16 of their number to represent their body in the house of lords in each parliament. The peers of Ireland, in virtue of the Irish act of union, elect 28 of their number to sit in the house of lords for life. The act of union with Scotland has been understood to debar the sovereign from creating any new Scotch peerages; all peers created in either England or Scotland between that date and the union with Ireland are peers of Great Britain; and peers created in any of the three kingdoms subsequently to the union with Ireland are peers of the United Kingdom, with this exception that one new peerage of Ireland may be created on the extinction of three existing peerages. When the Irish peers are reduced to 100, then, on the extinction of one peerage another may be created. All peers of Great Britain or of the United Kingdom have a seat in the house of lords. A Scotch peer, though not one of the 16 representative peers, is debarred from sitting in the house of commons, a disability which does not attach to Irish peers. The peerage is, from time to time, recruited by new additions, the persons selected being in general peers of Scotland or Ireland; younger members of the families of peers; persons distinguished for naval, military, political, or diplomatic services; eminent lawyers promoted to high judicial appointments; persons of large property and ancient family, noble in the more extended sense; and occasionally, but rarely, persons who have by commerce acquired large fortunes and social importance. At present the peerage comprehends about 575 individuals—the number of peerage titles being much greater, as several titles often merge in one person. Five royal dukes are included in this enumeration, as also 87 peers of Scotland and 183 of Ireland. Only 25 of the present Scotch and 89 Irish peers are without seats in the house of lords, in consequence of there being, besides the representative peers, 40 peers of Scotland and 80 of Ireland who are at the same time peers either of England, Great Britain, or of the United Kingdom. The privileges belonging to peers as members of parliament will be explained under PARLIAMENT; as peers, they also possess the following immunities: They can only be tried by their peers for felony, treason, or misprision of treason when the whole members of the peerage are summoned, and the accused is acquitted or condemned by the voice of the majority, given not on oath, but "on honor." This privilege, which extends to peeresses, either in their own right or by marriage, is in Scotland further regulated by act 6 Geo. IV. c. 66. A peer answers to bills in chancery upon his honor, and not on oath; but when examined as a witness in civil or criminal cases, or in parliament, he must be sworn. He cannot be bound over to keep the peace elsewhere than in the court of queen's bench or of chancery. Scandal against a peer is "*scandalum magnatum*," a more heinous offense than slander against another person, and subjects the offender, by various English acts, to statutory punishments. All the privileges belonging to the English peers, except the right of sitting in the house of lords, were extended to the peers of Scotland by the treaty of union. A peer who has different titles in the peerage takes in ordinary parlance his highest title, one of the inferior titles being given by courtesy to his eldest son. Certain courtesy titles (q.v.) belong also to the daughters and younger sons of a peer, but do not extend to their children.

In France a limited body of the higher nobility, styled the peers, were in the enjoyment of privileges not possessed by the rest. The title of duke was subject to strict rule, but many titles of marquis and count, believed to be pure assumptions, were recognized by the courtesy of society. The head of a noble family often assumed at his own hand the title of marquis; and if an estate was purchased which had belonged to a titled family, the purchaser was in the habit of transferring to himself the honors possessed by his predecessor—a practice to which Louis XV. put a stop. Immediately before the revolution 80,000 families claimed nobility, many of them of obscure station, and less than 3,000 of ancient lineage. Nobles and clergy together possessed two-thirds of the land. Practically the estimation in which a member of the French nobility was held depended not so much on the degree of his title as on its antiquity, and the distinction of those who had borne it. The higher titles of nobility were not borne by all members of a family; each son assumed a title from one of the family estates—a custom productive of no small confusion. Unlike "roturier" lands, which divided among all the children equally, noble fiefs went to the eldest son. The revolution overthrew all distinction of ranks. On June 18, 1790, the national assembly decreed that hereditary nobility

was an institution incompatible with a free state, and that titles, arms, and liveries should be abolished. Two years later the records of the nobility were burned. A new nobility was created by the emperor Napoleon I. in 1808, with titles descending to the eldest son. The old nobility was again revived at the restoration. All marquises and viscounts are of pre-revolution titles, none having been created in later times.

Commercial pursuits have more or less in different countries been considered incompatible with nobility. In England this was less the case than in France and Germany, where for long a gentleman could not engage in any trade without losing his rank. A sort of commercial "Bürger-Adel," or half-gentleman class, was constituted out of the patrician families of some of the great German cities, particularly Augsburg, Nuremberg, and Frankfort, on whom the emperors bestowed coats-of-arms. In semi-feudal Italy there was on the whole less antagonism between nobility and trade than north of the Alps. The aristocracy of Venice had its origin in commerce; and though untitled, they were among the most distinguished class of nobles in Europe. On the other hand, in Florence, in the 14th c., under a constitution purely mercantile, nobility became a disqualification from holding any office of the state. In order to the enjoyment of civil right, the nobleman had to be struck off the rolls of nobility; and an unpopular plebeian was sometimes ennobled, in order to disfranchise him. A little later there grew up, side by side with the old nobility, a race of plebeian nobles—as the Ricci, the Medici—whose pretensions were originally derived from wealth, and who eventually came to be regarded as aristocrats by the democratic party.

Italian nobility has this peculiarity, that it does not, for the most part, flow from the sovereign, but from the municipal authorities of the towns acting in entire independence of him. The municipalities can confer nobility on whom they please, by inscribing his name in their respective *Libri d'oro*. The registers of nobility of most of the Tuscan towns are deposited in the *Archivio della Nobiltà*, or herald's office, at Florence—an institution created by the first sovereign of the house of Lorraine. The municipalities have, however, no power to confer titles, though at one time several persons, a few Englishmen included, on the strength of their names being in the *Libro d'oro* of Fiesole, assumed the titles of marquis, count, and baron—an abuse put a stop to by the late grand duke of Tuscany. In Rome there is a small number of nobles—as the Colonnas, Caetanis, and Orsinis—who hold their fiefs as sovereign princes; the rest of the nobility, many of them of very ancient lineage, are municipal, the power of creation being vested in the senator, himself a nominee of the pontiff, and the *Conservatori*, chosen by lot from the Capitoline nobles. In last century so many undistinguished persons had been added to the roll of nobility, that pope Benedict XIV. found it necessary to prohibit by a bull the admission of any one whose ancestors had not filled certain high offices in the state. The same decree limited the number of noble families to 187, designed the *Patriziato Romano*, out of whom 60 of the oldest and most illustrious were chosen as *Nobili Conscritti*, otherwise called the capitoline nobles, and restricted the admission to the patriziato for the future to persons who had rendered important services to the city, and whose names were approved by the *Congregazione araldica*, an exception being made in favor of members of the reigning pontiff's family. As the families of the conscritti became extinct, other patrician families, designated *Nobili Ascritti*, were added by the municipality to make up the number. The titles at present borne by the Roman nobility are: 1. Prince or duke, generally so called, but officially designed "barone Romano"—a title acquired by the Borghesi, Rospigliosi, and others from popes of their respective families; in the case of the Colonnas, Dorias, Odescalchi, etc., from royal or imperial erection; and in other instances—as the Caetani and Massimi—from investiture by the pope as a temporal sovereign. 2. Marquis and count; many of these are provincial nobles, with titles generally derived from small feudal tenures, of which, in some instances, it would be difficult to show the diploma, or point out the period of creation. In some parts of the Papal States it is understood that every head of a noble house is a marquis; and in the march of Ancona, Sixtus V. conferred the right to bear the title of count on all who were of noble blood at the period. 3. Knights (*cavalieri*), a designation given to all who wear a Roman order, to knights of Malta, and generally to younger sons of the titled nobility. 4. Princes, who, with the sanction of the pope, have purchased honors along with ancient fiefs, that carried with them ducal or princely titles, most of them *novi homines*, as the Torlonias. Titles do not descend to the younger members of the family; it is the general usage for the head of the house to bear the most ancient title, while the eldest son, on his marriage, assumes the second in point of antiquity. The title is sometimes the family name, sometimes the name of a feudal possession. The proper designation of the younger branches of titled families is "dei principi," "dei duchi," "dei marchesi," etc.

The nobility of Spain boasts of a special antiquity and purity of blood, a descent from warriors and conquerors alone, without the infusion of any of the elements derived from the church, law, and commerce that are to be found in other countries. "Hidalgo" (*hijo d'algo*, son of somebody, not *filius nullius*) is a term which implies gentility or nobility. The hidalgo alone has in strictness a right to the title "don," which, like "sir" of our knights and baronets, requires the adjunct of the Christian name. When the Christian name is omitted, the title "señor" instead is prefixed with the addition of "de." "Don" has latterly been used by persons who have no proper claim to it about as extensively as "esquire" in England. Hidalguia, till recently, conferred important privileges

and immunities. The higher nobility are styled grandees; formerly the title was "ricohombre," and the ceremonial of creation consisted in granting the right of assuming the pennon and caldron (*peñon y caldera*)—the one the rallying ensign of command, the other of maintenance of followers. In contradistinction from the grandees, the class of nobility below them are called "los Titulados de Castilla." Red blood is said to flow in the veins of the hidalgo, blue in that of the grandee. Formerly there were three classes of grandees, whose mark of distinction was this—that a grandee of the first class was entitled to put on his hat in the royal presence before the king spoke to him; the second, after the king spoke to him; the third, after the king had spoken and he had replied. The second and third classes are now absorbed into the first. Of the grandees, some bear the title of duke, some of marquis, some of count; but it is the ambition of every grandee to unite in himself as many grandeeships, or have as many *hats*, as the phrase is, as he can. This is effected by the marriage of heiresses through whom *grandezza* descends, and whose names and titles are assumed by their husbands. An enormous accumulation of titles is sometimes found in the person of one grandee. Titles as well as estates go only to heirs of entail. The titulars of Castile are designed "vuestra señoria;" in common parlance, "ucia." The title of baron is little used in Spain. Physically and mentally, the grandees have degenerated from their ancestors, and they have not the influence at court and in the country which landed property ought to give them. Most of them reside at Madrid, clinging to their nominal rank and real nullity, while they are practically excluded from all the functions of state.

In Russia what nobility existed before Peter the Great was of a patriarchal not a feudal kind; but in his anxiety to assimilate everything to a western standard, the czar took the existing aristocracies of states quite differently situated as the model to which to approximate the fortunate of his own subjects. The Russian nobles have ever since been enlarging their privileges by encroachments on those under them. Before Moscow was burned, the mass of the nobles connected with the court lived there in great splendor, and along with their domestic serfs constituted half the population of that city.

The preservation of noble blood, untainted by plebeian intermixture, has often been reckoned a matter of much moment. In Spain most of all this purity of lineage has been jealously guarded. In the German empire no succession was allowed to feus holding immediately of the emperor, unless both parents belonged to the higher nobility. In France the offspring of a gentleman by a plebeian mother was noble in a question of inheritance or exemption from tribute, but could not be received into any order of chivalry. Letters of nobility were sometimes granted to reinstate persons in this position. It is in Germany still important for many purposes to possess eight or sixteen quarterings, i.e., to be able to show purity of blood for four or five generations, the father and mother, the two grandmothers, the four great-grandmothers; and also, in case of the sixteen quarterings, the eight great-great-grandmothers, having all been entitled to coat-armor. Among the higher grades of the peerage in England, a considerable number may be pointed out who do not possess this complete nobility. It is in Scotland more usual and more regarded, both among peers and untitled gentry, where the eight or sixteen quarterings are still in use to be displayed on the funeral escutcheon. At some of the minor German courts, the sixteen quarterings were not unfrequently an illusion, diplomas being granted in the absence of a full pedigree, to declare the parties as noble as if they had had sixteen ancestors.

NOBLE, a co. in n.e. Indiana, intersected by the Lake Shore and Michigan Southern railroad, the Grand Rapids and Indiana, and the Chicago division of the Baltimore and Ohio railroad, with junctions at Kendallville and Avilla; 420 sq.m.; pop. '90, 23,359, of American birth, with colored. It is drained by Elkhart river and Blue creek. Its surface is largely prairie, with groves of building timber and sugar maple trees. Its soil is fertile and produces live stock, grain, dairy products, fruit, and maple sugar. Its most important industries are the manufacture of carriages, furniture, iron castings, leather, cigars, and harness. It has flour and saw mills, woolen factories, foundries, and machine shops. Co. seat, Albion.

NOBLE, a co. in s.e. Ohio, intersected by the Cleveland and Marietta and the Bellaire, Zanesville, and Cincinnati railroads, drained by Seneca and other small creeks; 415 sq.m.; pop. '90, 20,753, chiefly of American birth. Its surface is well timbered and undulating; its mineral products are coal, limestone used for building purposes, petroleum, iron ore, and salt. Its soil is fertile. Live stock is raised; also tobacco, wool, grain, dairy products, and sorghum. It has flour and saw mills, and its most important industries are the manufacture of saddlery and harness, sashes, doors and blinds, and woolen goods. Co. seat, Caldwell.

NOBLE, John Willock, b. Lancaster, O., 1831. His boyhood was spent in Columbus and Cincinnati; he spent a year in Miami univ. and then entered Yale coll., and was graduated in 1851. He studied law in Columbus and Cincinnati; in 1855 removed to St. Louis, and in 1856 to Keokuk, Iowa, where he became prominent, and from 1859–60 was city attorney. In 1861 he enlisted as a private in the 3d Iowa cavalry; became first lieut., adjutant, and col. of his regiment; brevet brig.-gen., in 1865. In 1867, after a residence in Keokuk, he settled in St. Louis, and 1867–70 was U. S. district

attorney for the eastern district of Missouri. In 1889 he became sec. of the interior in Pres. Harrison's cabinet.

NOBLES, a co. in s.w. Minnesota, has the state line of Iowa for its s. boundary; 720 sq. m.; pop. '90, 7958. It is intersected by the Chicago, St. Paul, Minneapolis, and Omaha and the Burlington, Cedar Rapids, and Northern railroad. It is drained by the Des Moines, Rock, and Little Sioux rivers, and several lakes, lake Graham and Okabena lake being the largest. Its surface is rolling, poorly timbered, and has a soil adapted to the cultivation of grain. It embraces some of the highest land in the state, being in its s. portion 1607 ft. above the level of the sea. Some attention is paid to the raising of stock. Co. seat, Worthington.

NOBUNA'GA, 1533–82; b. Japan; a member of the Ota family, and son of a great landed proprietor. A civil war was raging in Japan at the beginning of his career, and he at first adhered to the shogun, but afterwards fought against and deposed him. He governed Japan, as vice-gerent of the mikado, till 1582, when he was attacked by one of his generals in his own residence, and committed suicide. He was bitterly hostile to Buddhism, and favored the Portuguese Jesuit missionaries, who came to Japan for the first time in his reign. Nobunaga was really hostile to the Jesuits also; but he used them to reduce the power of the bonzes. The Japanese Buddhist sects were then rich and powerful; they hired armies, and continually interfered in politics. In 1571 Nobunaga destroyed the great Buddhist monastery of Hiyeizan, where he burned several hundred temples, and killed all the bonzes and their adherents and families. Soon afterwards the fortified monastery of Ozaka surrendered to him. This persecution broke the power of Japanese Buddhism.

NOCE'RA, or NOCERA DEI PAGA'NI, a t. of s. Italy, in the province of Salerno, 8 m. n.w. of the town of Salerno, and on the highway from that town to Naples. It carries on linen and woolen manufactures. Pop. 8,519.

NOCTES AMBROSIANÆ, the fanciful name of a long series of critical, political, and poetical disquisitions in dialogue published in *Blackwood's Magazine*, and purporting to be the verbatim report of the meetings at Ambrose's tavern, Edinburgh, and elsewhere, of several of the literary celebrities of the day. They were almost entirely the work of "Christopher North," John Wilson (q.v.). The only foundation for the thread of connection and assumption of different personalities is that the first of the papers was written by Lockhart, after some such meeting at Ambrose's as is described. This was in 1822, and in 1825 Wilson began to publish the *Noctes* in regular succession. Of the seventy printed up to 1836, at least sixty are by his pen. For the part supposed to be taken by Hogg, the Ettrick Shepherd, there was no foundation in fact. The work is described by lord Cockburn as "a most singular and delightful outpouring of criticism, politics, and descriptions of feeling, character, and scenery. . . . . It breathes the very essence of the bacchanalian revel of clever men." The papers are not, however, free from the charge of coarseness, are very personal, bitterly and abusively tory, and have, of course, lost much of their interest from their local and ephemeral nature.

NOCTILIONIDÆ, a family of insectivorous bats, inhabiting the tropical regions of both hemispheres. Their habits are not well known. The members of the genus *noctules* of South America are commonly known as "bull-dog bats" on account of their short thick muzzles, which in some species are cleft like the lip of a hare. The tail sometimes projects behind the membrane which connects the hind legs, and the claws of the hind-feet are large and strong. The length of the body is 4 or 5 in., and the spread of the wings about 18 inches. An East Indian genus, *dysopus*, has a spread of wing of two feet, and the hinder thumb is placed at a distance from the rest of the toes, similar to the arrangement in the quadrumana. In this genus the tail is short and the membrane connecting the hind legs is very small. The *cheiroptera* are variously classified. M. Lesson placed the *noctilionidæ* as a sub-family of *vespertilionidæ*, under the name *noctilionina*, consisting of ten genera—*noctilio, dysopes, mollossus, cheiromedes, nyctinomus, dinops, stenoderma, celæno, œllo,* and *scotophilus.* The frugivorous (fruit-eating) bats were also placed as a sub-family of vespertilionidæ (see BAT) by M. Lesson and others; but they are now usually classed apart, the order cheiroptera being divided into two sections, *insectivora* and *frugivora*, the insectivora comprising four families: *vespertilionidæ, rhinolophidæ, noctilionidæ,* and *phyllostomidæ* (see Phyllostoma in art. VAMPIRE; also SPECTER BAT). The frugivora embrace only one family, the *pteropidæ* (q.v.), or the fox bats, including several genera. In the classification of Linnæus the vespertilionidæ were equivalent to our cheiroptera.

NOCTILUCINE, an organic substance supposed to be the cause of many of the phenomena of phosphorescence in fish, insects, and decaying matter. The name was given by Dr. Phipson, after a long series of investigations. Some of his earlier observations are mentioned in this work. See LUMINOSITY OF ORGANIC BEINGS. Noctilucine has a syrupy consistence at ordinary temperatures, and a whitish color. It is said to be secreted in a pure form by the luminous centipede. Its spectrum is nearly monochromatic. Its luminosity appears to be owing to oxidation, and it is more luminous in ozone or allotropic oxygen than in normal oxygen. When moist it gives off carbonic acid as the result of oxidation. It is slightly soluble in water, but insoluble in alcohol and ether.

NOC'TULE, *Vespertilio noctula*, the largest British species of bat (q.v.), being nearly three inches long without the tail, which is fully an inch and a half. The ears are oval-triangular, shorter than the head: the muzzle is short and blunt. The noctule is only seen on the wing during a short part of the year, retiring early in autumn to hollow trees, caves, or under the eaves of buildings, where many are sometimes found together.

NOC'TURN (Lat. *nocturnum*, recited "by night"). Under the head Breviary (q.v.) has been explained the general order of the services of the canonical hours in the Roman Catholic church. The service of MATINS on Sundays and festivals is divided into three nocturns, each of which consists of three (or more) psalms and three *lessons*. The lessons are either from the Scriptures, from the life of a saint, or from a homily of some father. The name is derived from the recitation of the service "by night."

NOCTURNE (Italian, *notturno*), name in music given to a form of composition which originated with John Field. It is a night-piece or serenade. Chopin's nocturnes, written on Field's form, are among the most beautiful compositions for the pianoforte.

NODAWAY, a co. in n.w. Missouri, has the state line of Iowa for its n. boundary; intersected by the Nodaway river, forming its s.w. boundary; 848 sq.m.; pop. '90, 30,914, chiefly of American birth, with colored. It is drained by the One Hundred and Two and Little Platte rivers, and traversed by the Omaha and St. Louis and the Burlington route railroads. Its surface is uneven. Co. seat, Maryville.

NODAL POINTS, LINES, AND **SECTIONS**. When a string or metallic cord, under strong tension, is made to vibrate, we hear, besides the principal sound, several secondary and shriller sounds; these are denominated harmonic sounds, and are produced each by a certain portion of the cord which vibrates independently. Further investigation has shown that every vibrating string is divided into a number of portions alternately vibrating in opposite directions, and that the points which separate these portions from each other are at rest. These points are known as *nodal points*, and their situation may be found by placing small pieces of paper on an extended string, and causing it to vibrate; the points from which the pieces of paper have not been displaced are the nodal points. If a plate of glass or metal be held in the hand, and a well-resined fiddle-bow be drawn across the edge, particles of fine dust, previously placed on the plate, will arrange themselves in lines, showing that along these lines no vibration has taken place; these lines are *nodal lines*, and are found in most cases to group themselves together into geometrical figures, and occasionally to present the most beautiful designs. The arrangement of the nodal lines depends on the point by which the plate is held, and on the form of the plate itself. Similarly, if a column of air in a wholly or partially closed tube be acted upon by the force of the breath applied through a hole at any point in its length, the column will divide itself into cylindrical portions each in a state of vibration, and separated from one another by transverse sectional portions in which the air is at rest; these latter sections are known as *nodal sections*.

NODDY, *Megalopterus* or *Anöus*, a genus of birds of the family *laridæ*, differing from terns in having the bill slightly angular, thus exhibiting an approach to gulls, and the tail not forked but somewhat wedge-shaped. Only one species is known (*M.* or *A. stolidus*), a bird widely diffused both in the northern and southern hemispheres, and familiar to sailors, not only as often seen skimming over the water in quest of fishes, but also as not unfrequently alighting on vessels, and, particularly during the night, suffering itself to be taken by the hand. At its breeding-places also, where not accustomed to the visits of man, it scarcely gets out of the way, and the female sits undisturbed on the nest. Hence it commonly shares with the booby the reputation of unusual stupidity. It is about 15 or 16 in. long, from the tip of the bill to the end of the tail, the general color being a brownish-black. The noddy is a rare visitant of the British shores, but is very abundant in warmer latitudes; and on some of the *keys* of the West Indies, and other islets of different parts of the world, it breeds in immense numbers. Particular islets seem to be specially selected as the breeding-places of noddies; and there their nests are sometimes so closely placed that it is not easy to walk among them. Each nest generally contains three eggs about two inches long, which are very good to eat, and are in some places collected in great numbers.

NODE (Latin, nodus, a knot), in music, the point of complete rest between the segments of a string vibrating in a simple form, or the point where the vibration is least on a string vibrating in a complicated form. The segments where the vibration is greatest are called loops. If a vibrating string be lightly touched at one half, one third, or one fourth of its length, the nodes become marked, and harmonic notes are produced. Portions of the vibrating string may be touched, producing harmonic sounds, while other portions are unimpeded. The column of air in an open pipe has its node in the centre, if vibrating as a whole. At the node the air changes in density. The open ends of the pipe are the loops. In a stopped pipe the closed end is the node, and the open end the loop. Here, as in the case of strings, the node is not the point of absolute rest, but that of the least motion.

NODES, in astronomy, are the two points in which the orbit of a planet intersects the plane of the ecliptic, the one through which the planet passes from the s. to the n. side of the ecliptic being called the *ascending node* (☊), and the other the *descending node* (☋). As all the bodies of the solar system, whether planets or comets, move in orbits variously

inclined to the ecliptic, the orbit of each possesses two nodes, and a line drawn joining these two points is called the *line of nodes* of each body. It is scarcely necessary to add that, as the earth moves in the plane of the ecliptic, she has no nodes. The places of the nodes are not fixed points on the plane of the ecliptic, but are in a constant state of fluctuation, sometimes *advancing* (eastward), and at other times *receding* (moving westward). This motion is produced by the mutual attractions of the planets, which tend to draw each of them out of the plane of its orbit; and it depends upon the relative positions of the planets with respect to another planet whether that planet's nodes shall advance or recede. On the whole, however, the majority of possible "relative positions," or *configurations*, as they are called, is in favor of a retrograde motion; and we find by observation that, in an average of many revolutions round the sun, a constant retrogradation of the node takes place. The determination of this retrogradation in the case of the planets is a most complicated problem, as the separate action of each on the others has to be taken into account; but in the case of the moon's nodes, the immensely preponderating attraction of the earth, and its great relative magnitude as compared with the moon, enable us to throw out of account any other disturbing influence, and at the same time to exhibit clearly the cause of this motion of the nodes. Suppose the moon to have attained her greatest n. latitude, and to be descending towards the ecliptic, and the earth to be in longitude between her and her previous descending node, then the earth's attraction will tend to *depress* the moon's orbit, and cause her to descend to the plane of the ecliptic sooner than she would otherwise have done; in this case we have a retrogradation of the node. Again, supposing the moon placed as before, but the earth in advance of the line of nodes, then the earth's attraction will tend to draw the moon forward in her orbit so as to meet the ecliptic in a point beyond the previous descending node; in this case, the moon's node has advanced. As in the case of the planets, however, the retrograding tendency preponderates. The average annual retrogradation of the nodes is very small in the case of the planets, but considerable in that of the moon. See Moon. In calculating the courses of the planets, the "length" of the ascending node, or its distance in longitude from the vernal equinox, is a most important element. See Orbit.

NODES, in botany. See Stem.

NODES are swellings, most commonly of an oblong form, which occur on superficial bones, such as the tibia, ulna, clavicle, and frontal bone, and are due to a syphilitic taint, to scrofula, or to rheumatism. Their immediate cause is the infiltration of lymph or serum into the periosteum, or between it and the bone. The treatment depends so essentially on the constitution of the patient, and the primary cause of the swelling, that it would be inexpedient to enter into any detail regarding it.

NODIER, Charles Emmanuel, an eminent French littérateur, was b. at Besançon, France, April 29, 1780. His father was a distinguished lawyer, who warmly embraced the side of the revolution, and brought up his son in the same principles. At the age of 12 he was a member of the famous society of *Amis de la Constitution*, and hated tyranny with a most ideal and classical hatred: but he soon afterward became a royalist; then again, under Napoleon, a republican; and, indeed, during his whole career showed a want of that robust opinionativeness without which it is impossible for a man to become a genuine politician. He died — after a life of the hardest literary work, in which time, and even admirable talents, were wasted on inferior subjects — Jan. 26, 1844. Besides editions of the French classics, grammatical, lexicographical, and poetical works, he wrote numerous tales and memoirs. A portion of his writings was collected and published in 12 vols. at Paris, 1832–34, under the incorrect title of *Œuvres Complètes*.

NOÉ, Amadée de. See Cham.

NOEL, Baptist Wriothesley, The Honorable, 1799–1873; b. Scotland; educated at Cambridge, and ordained in the church of England. He was appointed chaplain to the queen, and as pastor of St John's chapel, London, became one of the most popular preachers in England. In 1848, having become a believer in immersion, he left the English church and was baptized, and became a Baptist minister. He defended his course in his *Essay on the Union of Church and State*, and in his treatise on *Christian Baptism*. Among his numerous works may be mentioned: *Sermons on the First Five Centuries of the Church* (1839); *Protestant Thoughts in Rhyme* (1845); *Christianity Compared with Unitarianism* (1851); *Essay on the Duty of Englishmen to the Hindus* (1858); and *Freedom and Slavery in the United States of America* (1863).

NOE'TIANS. See Patripassians.

NOGGING. Brickwork built in the panels of a timber-framed house. Nogging-pieces are horizontal timbers, introduced to strengthen the brickwork.

NOILS', a technical term employed for the short and broken hairs which are removed from wool in the process of combing and preparing it for worsted manufactures. The *noils* are used for making inferior yarns, and are valuable for *felting* purposes, in which they are largely employed.

NOIRÉ, Ludwig, 1829–89; German philosophical writer, born at Alzey. From 1846–48 he pursued his studies at Giessen, after which he became a teacher at the Mayence gymnasium. His study of the works of Spinoza, Schopenhauer, and Lazarus

Geiger led him to turn his attention to philosophy, and in 1874 he published *Die Welt als Entwickelung des Geistes.* This was followed by *Der Monistische Gedanke; Die Doppelmature der Kausalität; Der Ursprung der Sprache;* and in 1881 he published in English his *Historical Sketch of the Development of Philosophy before Kant.*

NO'LA, an episcopal city of s. Italy, in the province of Caserta, 15 m. e.n.e. of Naples, is built on the site of one of the oldest cities of Campania. The ancient Nola was founded by the Ausonians, and fell into the hands of the Romans in the Samnite war, 313 B.C. For its protection, Marcellus in the second Punic war fought in its vicinity the first battles in which the Romans were victorious over Hannibal. Augustus died at Nola, 14 A.D. The first bells for Christian churches are said to have been cast here in the 5th century. See BELL. Numerous coins, and beautiful vases made of a pale-yellow clay, with figures painted in crimson and maroon, and supposed to have been manufactured here by potters from Corinth, have been found in the vicinity. Pop. 7,500.

NOLAN, a co. in n.w. Texas; formed in 1876; organized in 1881; 900 sq. m. Pop. '90, 1573. Co. seat, Sweetwater.

NÖLDEKE, THEODOR, 1836–75; b. Germany; educated at Göttingen, where he manifested a taste for oriental studies, in which he soon became proficient. He was appointed professor in the university of Kiel in 1864, and remained there till 1872, when he was called to a chair at Strasburg. His studies were directed mainly to the Hebrew and Syriac languages, and to Arabian literature, and the history of Islamism. Among his works may be mention a *History of the Koran,* 1860; *Life of Mohammed,* 1863; *Contributions to a Knowledge of Ancient Arabian Poetry,* 1864; *The Literature of the Old Testament,* 1868; *Critical Researches on the Old Testament,* 1869; and *The Inscription of King Mesa of Moab,* 1870.

NO'LI ME TAN'GERÉ, a popular name for one form of the disease which has been already described under the term lupus (q.v.).

NOLLE PROSEQUI, an entry upon the records of a court by the plaintiff in a civil, or the prosecutor in a criminal, cause, declaring that the proceedings against the defendant shall be discontinued. In a criminal case a *nolle prosequi* may be entered at any time before a jury is impaneled without the defendant's consent, but not afterwards without his consent. A *nolle prosequi* is not equivalent to an acquittal, but acts merely as a stay of proceedings, and the defendant is liable at any time to be re-indicted. It may be entered as to one of several defendants, and is often done so to allow his testimony to be introduced against the others. It is generally in the discretion of the prosecuting officer to enter a *nolle prosequi,* but in some states leave must be obtained from the court.

NOLLEKENS, JOSEPH, was b. in London in 1737. His father, who was from Antwerp, and by profession a painter, died when he was young, and his mother, a Frenchwoman, not remaining long a widow, he received but little education. Being placed in the studio of Scheemakers, the sculptor, in Vine street, Piccadilly, he worked hard and made such progress that in 1759 the society of arts awarded him fifteen guineas for a group in clay; in 1760 thirty guineas for a bas-relief; and during the same year, ten guineas for a model in clay of a dancing faun. Soon after this Nollekens set out for Rome. He was then in his 23d year; his purse was light, he had no patron to support him; but he was independent in spirit, and had been trained to habits of economy. A bas-relief he carved in stone brought him ten guineas from England, and the Society of Arts voted him fifty guineas for his group in marble of Timoclea before Alexander. But one of the most important events for him, after settling in Rome, was his meeting Garrick in the Vatican, who immediately recognized his countryman as the young sculptor to whom the prizes had been awarded by the society of arts, sat to him for his bust, and paid him handsomely for it. This was the first bust he had been commissioned to model, and it gave him the opportunity of proving where his strength lay. He also executed in Rome a bust of Sterne in terra cotta, which added greatly to his reputation. After residing 10 years in Rome he returned to London, took a lease of extensive premises in Mortimer street, where he set up his studio; and the reputation he had acquired in Rome was such that he immediately had full employment, and within a year (in 1771) was elected an associate of the academy, and a royal academician the following year. His forte was in modeling busts. Into these he infused much truth and character, and he has handed down the likenesses of most of the important personages who figured in Gt. Britain in the end of the last and at the commencement of this century—of Samuel Johnson, who was his friend and frequent visitor—of Fox, Pitt, and other political characters. George III. also sat to him; and his manner, which exhibited pretty strongly what is popularly set down as blunt and manly English character, made him a great favorite with the king. Besides busts, Nollekens executed numerous commissions for public monuments and statues. He was selected by the academy, with whom the choice lay, to execute the government commission of a monument to the three captains, Manners, Bayne, and Blair, who fell in Rodney's great battle of April 12, 1782; but in this he did not rise above the allegories of Neptune and his sea-horse, and Britannia and her lion. His statue of Pitt for Cambridge was much praised at the time. He also executed, either in the course of his studies, or to meet the views of connoisseurs, a considerable number of classical and mythological statues. He died Apr. 23, 1823.

NOLO EPISCOPARI, Latin, "I am unwilling to accept the office of bishop." These words are generally but erroneously supposed to be the utterance of every bishop to whom a bishopric is offered. It is stated that in early times it was customary to modestly refuse the office of bishop twice before accepting it upon the third offer. This custom, however, never existed in England, and is not known to be practised in any country at the present day. When the see of Bath and Wells was offered to Bishop Beveridge (q.v.) he is said to have exclaimed *Nolo episcopari*, but the words were the sincere expression of his purpose, not a matter of form. At the present day this expression is ironically applied to one who affects a reluctance for promotion to office.

NO'MADS (Gr. *nemein*, to tend or feed), the name given (originally by the Greeks) to those tribes which, depending chiefly on their flocks and herds, have no fixed habitation, but move about for convenience of pasture. The nomad tribes are of a higher grade of civilization than those that live by hunting and fishing, but much inferior to those engaged in agriculture and manufactures. They are very generally addicted to robbery, and readily engage in aggressive war, so that they have frequently become conquerors of extensive cultivated countries, as in the instances of the Huns, Arabs, and Tartars. There are now few nomads in Europe, and these only in the steppes near the Black sea, and the regions of the utmost north, where cultivation is impossible. Almost all the Finnish, Mongolian, and Turkish tribes, and the tribes formed by mixture of these races, in the steppes and deserts of central and northern Asia are nomads, also the Kurds and the Bedouins, many of the tribes of Africa, and the Gauchos and some of the other Indian tribes in North and South America.

NOM'BRÉ DE DIOS, a t. of Mexico, 35 m. s.e. from Durango, in a mountainous district. Near it are rich silver mines. Pop. about 6000.

NOM DE PLUME. Fr. "pen-name"; the fictitious name assumed by an author.

NOME, a term used in the ancient Greek music to denote any melody determined by inviolable rules.

NOMENCLATURE, Chemical. See Chemical Nomenclature.

NOMINALISM. This word refers to a celebrated controversy of the middle ages, respecting the nature of our general or abstract ideas. It was contended by some that abstractions—as a circle in the abstract, beauty, right—had a real existence apart from round things, beautiful objects, right actions. This was called realism. Those that held the opposite view were called Nominalists, because they maintained that there is nothing general but *names;* the name "circle" is applied to everything that is round, and is a general name; but no independent fact or property exists corresponding to the name. There is nothing in a general name, they say, but a declaration of resemblance among a number of things; all things that the name is applied to, resemble one another in some point, which point of resemblance the mind can consider apart from the points of difference; this act of isolated consideration being what is called the power of abstraction. We can be engaged in thinking of the smell of a rose, we can compare it with other sweet odors, and speculate as to the nature of the material that gives the odor, or as to the pleasure that we derive from it; all this is a process of abstract thinking, but it would not of itself suffice to prove that the odor has a separate existence. We might also confine our attention to the mere form, or outline of the rose, and compare it with other forms; but we should be still less able to affirm the independent existence of this particular form.

Realism must be traced back to Plato's system of ideas, or the eternal and independent existence of general attributes, from which the concrete embodiments were derived. There existed in the Divine Mind, according to Plato, patterns, models, or archetypes, according to which individuals were formed. The archetype circle was the origin of all actual round things. Aristotle denied the separate existence of these general forms, and held that they existed only in connection with matter, or with objects in the concrete. The Stoics repudiated universals in both senses. The Aristotelian view constituted the scholastic realism, and prevailed until the 11th c., when a re-action took place in favor of the Stoical doctrine, headed by Roscelin of Compiègne and John the sophist. This was the commencement of Nominalism. The celebrated Abelard was a disciple of Roscelin, and induced large numbers to depart from the realistic notions, which were identified at the time with religious orthodoxy. The controversy raged with great violence through the 12th century. Thomas Aquinas and Duns Scotus, in the following century gave their powerful adhesion to realism. In the 14th c. William Occam, an English Franciscan friar, and a pupil of Scotus, revived the advocacy of Nominalism, which was once more maintained by a number of eminent men, in spite of the hostility of the church, carried the length of persecution. The controversy subsided at the reformation.

A middle view between Nominalism and Realism was held by a few persons when the contest was at its height; which was, that although general properties have no separate existence in nature, they can be conceived in the mind apart from any concrete embodiment. Thus we may form an idea of a circle, irrespective of any individual round body. This view is specious, and is tacitly implied in many opinions that have never ceased to be held. See Generalization.

NOMINATIVE. See Declension.

NON-APPEARANCE, the term used in the law of England to denote that a party against whom an action or suit has been commenced has not entered an appearance,

which is the way by which he comes before the court to defend is right. In many cases, if he does not appear, the suit will go on in his absence, provided he was duly served with the writ of summons or bill.

NON-ASSUMPSIT, is in English law the usual plea or defense to an action for breach of a contract not by deed, and means that the defendant denies that he broke the contract, or that there was any contract.

NON-COMMISSIONED OFFICERS rank as follows: Sergeant-major, quartermaster sergeant (regimental), ordnance, commissary, and post quartermaster-sergeant, hospital steward, chief musician, principal musician, chief trumpeter, and saddler sergeant, first sergeant, sergeant and acting hospital steward, corporal. The post non-commissioned staff consists of ordnance, commissary, and post-quartermaster-sergeants appointed by the secretary of war from sergeants in the line who have been three or four years non-commissioned officers. To be an ordnance sergeant there must have been 8 years previous service in the army, a commissary sergeant 5 years, and a quartermaster-sergeant 4 years. While the law contemplates in these appointments the better preservation of public property at the several posts, there is also a further consideration—that of offering a reward to faithful and well tried sergeants, and of giving encouragement to deserving soldiers to hope for substantial promotion. Before the appointment is made the applicant is examined by a board of officers convened for the purpose by the department commander, who report upon the age, character, service, and physical condition of the applicant, upon his education, clerical proficiency, and general fitness. Their duties are to assist the officers of the departments to which they belong and when practicable to act as storekeepers and clerks. They are not, as a rule, detailed upon any duty which interferes with their regular functions. Non-commissioned officers are appointed by regimental commanders on the recommendation of their company commanders, and they are carefully selected and instructed. The captain selects the first sergeant from the sergeants of his company, and may return him to the grade of sergeant, without reference to higher authority. Every non-commissioned officer is furnished with a certificate or warrant of his rank, signed by the colonel and countersigned by the adjutant. Non-commissioned officers can be reduced to the ranks by sentence of court-martial. The desertion of a non-commissioned officer, or his absence without leave, not satisfactorily accounted for, during a period of ten days, vacates his appointment from the date of such desertion or absence. All officers are enjoined to be cautious in reproving non-commissioned officers in the presence or hearing of privates. Vacancies in the grade of second lieutenant are filled by appointment from the graduates of the Military Academy, so long as any such remain in service unassigned; vacancies thereafter are filled by the appointment of meritorious non-commissioned officers. As a rule, the appointee must be between 21 and 30 years of age, and must have served not less than two years in the army. Boards of officers are appointed to make preliminary examinations into the qualifications of the non-commissioned officers, and the meritorious ones recommended receive certificates, are known as "candidates for promotion," and are entitled to wear on each sleeve a stripe of gilt lace so long as they occupy the specially honorable position of candidate. Those who become ineligible by reason of age are entitled to wear the gilt stripe on their left sleeve so long as they maintain their good standing as non-commissioned officers. As far as practicable candidates are promoted in their own regiments. There is a sergeant major, a quartermaster-sergeant, and a chief musician to each regiment of cavalry, artillery, and infantry, and to the engineer battalion, two principal musicians to each regiment of artillery and infantry, one saddler sergeant and one chief trumpeter to each regiment of cavalry. There are twelve first sergeants to each regiment of cavalry and artillery, and ten to each infantry regiment, sixty sergeants to a cavalry regiment, fifty-two to a regiment of artillery, forty to a regiment of infantry, and thirty-four to the engineer battalion. There are forty-eight corporals to the cavalry and artillery regiments, forty to an infantry regiment, and thirty-four to the engineer battalion.

Table of monthly pay of non-commissioned officers:

Sergeant major	$23 A. C. I.	$36 E.	....
Quartermaster-sergeant (regimental)	23 "	36 "	....
Ordnance sergeant	.....	.....	$34
Commissary "	.....	.....	34
Post-quartermaster-sergeant	.....	.....	34
Hospital steward	.....	.....	45
Chief musician	60 A. C. I.	.....	....
Principal "	22 A. I.	.....	....
Chief trumpeter	22 C.	.....	....
Saddler sergeant	22 "	.....	....
First "	22 A. C. I.	.....	....
Sergeants	17 "	.....	....
	34 A. O. S.	34 E.	....
Acting hospital steward	.....	.....	25
Corporal	15 A. C. I.	.....	....
	20 O. S.	20 E.	....

NON COMPOS MENTIS. See LUNACY.

NON-CONDUCTOR is a substance which does not readily transmit electricity (q.v.), heat, or other aëriform fluids. No body is a perfect non-conductor except, possibly, dry gases. Among the best non-conductors of electricity may be mentioned (in the order of their merit) shellac, amber, resins, sulphur, wax, glass, mica, and diamond. More familiar examples are silk, wool, rubber, feathers, dry wood, etc. Silk and wool are non-conductors of heat.

NONCONFORMISTS, a name sometimes given generally to all sectaries who, at any period in English history since the establishment of Protestantism, have refused to conform to the doctrine and practices of the Church of England. It is more frequently used in a restricted sense to denote the 2000 clergymen who in 1662—two years after the restoration—left the Church of England rather than submit to the conditions of the act of uniformity, which required of every beneficed minister, every fellow of a college, and even every schoolmaster, unfeigned assent to all and everything contained in the book of common prayer. The ejected ministers swelled the ranks of the Presbyterians and Independents, the latter of whom are sometimes called Nonconformists.

NONE (Lat. *nona*, "ninth"), one of the lesser canonical hours (q.v.), so called from its recitation being primitively fixed at the ninth hour.

NON-EFFECTIVE (Fr. *non-activité*), is the term applied to the portion of the personnel of the army or navy not on active service or in immediate readiness for active service. It thus comprises all officers on retired or half-pay, pensioners, and superannuated officers. In a force liable to frequent augmentations and reductions, the non-effective charge must be considerable, and a large retirement is necessary, in order to rapid promotion.

NONES. See CALENDS.

NON EST INVENTUS, a technical term used in that part of the law where, after judgment, the sheriff endeavors to arrest a party. If after a reasonable search he cannot find the debtor, he makes a return to the court that he has not been able to find the debtor, which is shortly called a return of *non est inventus*, and his duty is then discharged until a fresh writ is issued to him.

NONJURORS, the name given to that portion of the Episcopal clergy of England who at the coronation of William and Mary refused to take the oath of allegiance to these sovereigns, believing that they had unlawfully possessed themselves of the throne abdicated by James II. They were great champions of the doctrine of passive obedience on the part of subjects towards kings; and as the triumph of the prince of Orange was obtained at the expense of that doctrine, it was impossible that they could, consistently with their antecedents, acknowledge him as their rightful king. The House of Commons allowed them six months longer than laymen to make up their minds, but declined to adopt the amendment of the lords, viz., that the oath should not be imposed on the clergy. They refused, and were consequently deprived of their sees and benefices. The nonjurors comprised Archbishop Sancroft, 8 bishops, and about 400 of the inferior clergy.

NONPAREIL is a French term meaning unequaled in excellence or quality. The term is used by printers to specify a kind of type, and it is the fourth in size of the types commonly used in the U. S.

NON SEQUITUR (Lat., "it does not follow") is a term which frequently occurs in logic with reference to an illogical conclusion, and may be rendered, "It is not a necessary deduction;" "It does not follow as a matter of course." For example (first premise). Gold and silver are wealth; (second premise), lands are not gold and silver; *Non seq.* land is not wealth. The term is often abbreviated to *Non seq.*

NONSUIT is a legal term in America, which means that where a plaintiff in a jury trial finds he will lose his case, owing to some defect or accident, he is allowed to be nonsuited, instead of allowing a verdict and judgment to go for the defendant. The consequence is that the plaintiff has to pay the defendant's costs; but he can bring a fresh action if he can get over the difficulty that rendered a nonsuit necessary or expedient. Nonsuit may be voluntary, as where the plaintiff purposely absents himself in order to abandon his cause and allow a judgment for costs to be entered against him; or involuntary, when, on being called on the trial of the case, plaintiff fails to appear. A nonsuit is no bar to another action for the same cause. In many of the states, and in the U. S. courts, nonsuit cannot be given against a plaintiff who has already given evidence to support his claim, or against his consent, but in others, like New York, where there has been a final submission of the cause, and the evidence is not sufficient to uphold the action, nonsuit may be ordered; while in Alabama the courts cannot enter a nonsuit unless specially authorized to do so by statute.

NOOR-ED-DEEN' MAHMOOD. See NOUREDDIN-MAHMOUD.

NOOT'KA DOG, a large kind of dog, common in a domesticated state among the natives of the vicinity of Nootka Sound. It has erect, pointed ears.

NOOTKAS, or AHTS, a family of Indian tribes, in a province of the Dominion of Canada, on Vancouver Island; they gave the name to Nootka Sound, on the w. side of the island. They occupy a portion of the main-land near the island. The Ahts proper live on the w. side of the island, and number 3500. Those called Nootka by Capt. Cook are now said to be the Mooachahts. There are also the Quakewith, subdivided into many tribes, on the w, and e, sides of the island, and on the main-land, which amount

to as many more, and on the e. side of the island the Cowichans number 7,000. The god of the Ahts proper, and the one whom they worship as their progenitor, is Quawte-aht; they also worship the sun and moon, and a bird, Totooch, which they believe to be endowed with supernatural powers. The laws governing the tribe are strict and peculiar, especially in regard to consanguinity. A brave cannot marry in his own clan, and the children are claimed by the mother's clan. One member of a clan cannot invite a member of the same clan to a feast; this rule applying to the male sex only, the squaws not being considered in society. They live in houses, the posts of which are set permanently at the stations habitually visited. The posts are set in a row for a distance of about 100 ft., and on either side, about 20 ft. from the central row, are two other rows, attached to it by string-pieces. These are covered with cedar slabs and mats, adjusted at will. Their canoes are convenient dug-outs, capable of transporting houses and household goods. Their chief occupation is fishing—catching salmon, herring, halibut, and occasionally whales. They travel for long distances to go on the hunt in the season, and add to their store by collecting shell-fish, camash roots, and sea-weed. They are ingenious in the manufacture of clothing, making capes of white pine bark, hats of cedar and pine bark, and blankets of cypress bark. They make their own dishes and dippers, of wood, and are accomplished in the art of carving. They wear masks on the war-path, which they carve out of wood, and they ornament their door-posts. They place their dead in boxes and hang them up in the trees or lay them on the ground, and cover them with mounds of sticks and stones. They have a bad reputation among the whites, who have greatly increased since the discovery of gold on the main-land. Their allies, the Cowichans, are partially civilized, doing their own farming and working for the whites; missionaries of all faiths have been encouraged to visit them, and have made a study of their language. A vocabulary of the Aht language is contained in Sproat's *Scenes and Studies of Savage Life.*

NOOTKA SOUND, an inlet on the w. coast of Vancouver Island, British North America, in lat. 49° 35′ n., long. 126° 34′ west. Its entrance is protected by an island of the same name, and the sound can be entered on both sides of the island. It extends inland for 10 m. in a n.n.e. direction; but the greatest breadth of water is not more than 500 yards. Numerous small coves and inlets are found around the rocky shores. It affords good anchorage.

NORD, the most northerly department in France (whence its name), corresponding with the former province of French Flanders, and bordering on Belgium and the strait of Dover. Area 2193 sq. m.; pop. '96, 1,811,868. It is composed of two parts, or at least narrows near the middle at Armentières, on the Lys, almost to a line. It is watered by the Scheldt and the Sambre, with their affluents, and by numerous canals. Next to that of the Seine, it is the most densely peopled department in France. The soil is fertile, and well cultivated. It is divided into 12 arrondissements:—Lille (the capital), Avesnes, Cambrai, Douai, Dunkerque, Hazebrouck, and Valenciennes. The principal products are wheat, hemp, beet-root, vegetables, tobacco, and fruits. Manufactures of lace, cambric, linens, and beet-root sugar are extensively carried on. It has a much larger proportion of railways, roads, and canals than any of the other departments, as well as the most important coal and iron mines. No other department has so many populous towns and strong fortresses; none adds so much to the national revenue; in none are the people so intelligent, so susceptible of culture, or so industrious.

NORDAU, Max Simon. A German writer of Jewish parentage, born in Budapest in 1849. He studied medicine, and after traveling extensively practiced in his native city and afterward in Paris, where he has since resided. He has written for the German newspapers, and these contributions have afterward been collected in book form. His chief works are *Vom Kreml zur Alhambra* (1879); *Paris unter der dritten Republik* (1880); *Die konventionellen Lügen der Kulturmenschheit* (1883); *Paradoxe* (1885); two novels, four plays, *Entartung* (1893), which under its English title *Degeneration*, made a great sensation in England and America as attacking the so-called "decadent" school of literature; *The Comedy of Sentiment* (1895), etc.

NORDENSKJÖLD, Adolf Eric, b. Finland, 1832; educated at Borgo and Helsingfors, and was appointed director of the faculty of mathematics and physics at the latter university, but removed for political reasons in 1855. In 1858 he became state mineralogist at Stockholm. He went with Torell in the Arctic expeditions of 1859 and 1861, and himself led expeditions in 1864, 1868, 1872, and 1875. The expedition of 1868 resulted in accurately fixing the position of Spitzbergen. In 1870 he made a scientific exploration of Greenland. His most important expedition was undertaken in 1878, for the purpose of exploring the n. polar sea from the mouth of the Yenisei e. to Behring strait. He left Gothenburg in July, 1878, and reached Yokohama in Sept., 1879. Nordenskjöld believes that his last voyage has demonstrated that communication by sea for commercial purposes may easily be had between Europe and the Obi-Yenisei; that the voyage from the Atlantic to the Pacific, in the Siberian sea, is practicable, but useless to commerce, and that further exploration is necessary to determine whether sea communication between the Pacific and the mouth of the Lena can be established. He was created a baron in 1880.

NORDERNEY, a small island of the Prussian province of Hanover, lies 3 m. off the coast of East Friesland, and forms one of a string of islands that line that coast. Area about 4 sq.m.; permanent pop. 1770. It has enjoyed, since 1797, a great reputation as

a place for sea-bathing, and in the summer season has from 1600 to 2,000 visitors. The little village at the w. end of the island has a very tastefully built *Conversationshaus*, 130 ft. long. Trees do not grow here. Pop. about 2,000.

NORDHAUSEN, a flourishing t. of Prussian Saxony, pleasantly situated at the southern base of the Harz mountains, on the Zorge, 38 m. n.n.w. of Erfurt. The surrounding country is very fertile in corn, and in the vicinity commences the *Goldene Aue* (golden plain), a fertile valley watered by the Helme. It contains a gymnasium, numerous churches, one of which, St. Blasius, contains two pictures by Luke Cranach. It carries on a thriving general trade, is the depot from which the Harz mountains are supplied with necessaries, and has most extensive distilleries and considerable manufactures of tobacco, succory, chemicals, cloth, leather, etc. Its spirit distilleries, of which there are 60 in almost constant operation, produce annually for export upwards of 100,000 hogsheads of corn-brandy. Pop. '90, 26,852.

NORDHEIMER, Isaac, ph.d., 1809–42; b. Memelsdorf, Germany, of Jewish parents. Having acquired the rudiments of education at a Jewish school, he entered the gymnasium of Würzburg, to fit himself, by the study of the classics, theology, and philosophy, for a Jewish public teacher. After studying two years at the gymnasium, he was transferred to the university, from which, in 1832, he went to the university of Munich, taking his degree of doctor of philosophy in 1834. Two American students who took private lessons of him in 1832 having informed him that there were favorable openings in America, he left his home in 1835, and soon after his arrival in New York was appointed professor of Arabic and other oriental languages and acting professor of Hebrew in the university of the city of New York. Soon afterwards he was appointed instructor in the Union theological seminary. He was one of the most eminent Hebrew scholars of modern times. He was intimate with Dr. Addison Alexander, Dr. Robinson, and Prof. Stuart. On his way to this country he began the preparation of a Hebrew grammar on a philosophical basis. In 1838 he published the first volume, and in 1841 the second. Prof. Alexander, reviewing it, says, "This new work requires no painful effort of memory to keep its parts in order; the perusal in it of the most thorny part of Hebrew grammar opens a vista superior in clearness, extent, and beauty to that exhibited by any other writer. Nothing but the fear of being thought to deal in sweeping panegyric prevents our speaking in the highest terms." Horne styles it "the most elaborate and philosophical Hebrew grammar in the English language." Besides this he published *A Grammatical Analysis of Select Portions of Scripture, or a Chrestomathy; The Philosophy of Ecclesiastes, being an Introduction to the Book of Ecclesiastes,* in the *Biblical Repository.* He contributed other valuable articles to the *Biblical Repository.* He left also the following works in manuscript: *A Chaldee and Syriac Grammar,* in German; *Arabic Grammar,* in German; *A Larger Arabic Grammar,* in English; *A Translation and Exposition of the Book of Ecclesiastes,* in German; *Hebrew Concordance,* incomplete; *Philological Memoranda;* etc. Dr. Nordheimer continued through life in the Jewish faith.

NORDHOFF, Charles; born Prussia, 1830; came with his parents to the United States in 1835, attended school at Cincinnati, and was apprenticed to a printer at the age of 13. He shipped in the U. S. navy in 1844, and during his service of three years made a voyage around the world. He stayed at sea till 1853, finding employment in the merchant, whaling, and mackerel fishery service. He was then engaged in Philadelphia, and afterward in Indianapolis in a newspaper office. From 1857 to 1861 he was employed by Harper & Brothers in an editorial capacity, and from 1861 to 1871 he was on the staff of the *New York Evening Post.* He visited California in 1871, and on a second trip in 1872 visited the Hawaiian islands. From 1874 till 1890 he was the Washington correspondent of the *New York Herald,* and was then retired. Among the books he has written are *Man-of-War Life; The Merchant Vessel; Whaling and Fishing* (1856); *Stories of the Island World; Cape Cod and All Along Shore* (1868); *California for Health, Pleasure, and Residence; Northern California, Oregon, and the Sandwich Islands* (1874); *Politics for Young Americans* (1875); *The Communistic Societies of the United States; God and the Future Life* (1883); *Peninsular California* (1888). Some of them have been reprinted in England and in Germany.

NORDKÖPING. See Norrköping.

NORDLINGEN, a t. in the w. of Bavaria, is situated on the river Eger, 44 m. n.w. of Augsburg by the Munich and Nuremberg railway. It has a Gothic church, with a high tower and fine organ, and manufactures of Tyrolese carpets, linens, and woolens, besides a large trade in feathers. Pop. '95, 8236. Nordlingen is historically interesting as the scene of several battles, the most famous of which was fought, Sept. 6, 1634, between 24,000 Swedes, under count Horn and duke Bernhard of Saxe-Weimar, and 45,000 imperialists under king Ferdinand. The former were defeated with the loss of 12,000 killed and wounded, 300 banners and standards, 80 cannons, and several thousand prisoners, among whom was Horn himself.

NORE is a sand-bank in the estuary of the river Thames, 4 m. n.e. of Sheerness, on which there is a floating light, called the Nore light, in lat. 51° 29′ n., long. 0° 48′ west.

The name, however, is more commonly applied to the portion of the estuary in the vicinity of the Nore light and sandbank.

NORFOLK, a co. in e. Massachusetts, bounded on the n.e. by Massachusetts bay; drained by the Charles and Neponset rivers; on the New York, New Haven, and Hartford and the New England railroads; 494 sq. m.; pop. '90, 118,950, chiefly of American birth. The surface is diversified and hilly, and much of it heavily wooded with ash, elm, hickory, oak, and other timber trees. The soil is rocky, but fertile in many portions, producing Indian corn, oats, potatoes, etc. The Quincy quarries afford excellent granite. A large capital is invested in manufactures, and among the articles made are boots and shoes, leather, cotton, woolen, and straw goods, forged and rolled iron, carriages, harness, and metal wares. Co. seat, Dedham.

NORFOLK, a co. in s.e. Virginia, adjoining North Carolina, bounded on the n. and n.e. by Hampton roads and Chesapeake bay; drained by Elizabeth and North rivers and Deep creek; on the Atlantic and Danville, the Atlantic Coast line, and several other railroads, and the Dismal Swamp canal; 476 sq. m.; pop. '90, 77,038, chiefly of American birth, incl colored. The surface is level, and heavily wooded with cypress and other trees. A large part of the Dismal swamp lies within this county. The soil is sandy, and the principal productions are Indian corn, potatoes, and sweet potatoes. There are flour and saw mills, and manufactories of machinery, carriages, cars, and metal wares. Co. seat, Portsmouth.

NORFOLK, a co. in s. Ontario, Canada; bounded on the s. by lake Erie; drained by tributaries of that lake; situated on the Canada Southern railroad; 635 sq.m.; pop. '91, 37,180 chiefly English, with a considerable admixture of Germans, Scotch, and Irish. The surface is mostly even, and the soil fertile. Co. seat, Simcoe.

NORFOLK, a large and important maritime co. of England, bounded on the n. and n.e. by the North sea, and on the s. by the county of Suffolk. Area 1,308,440 acres; pop. '91, 458,516. Its coast-line, extending from Yarmouth, on the e., to the mouth of the Nen in the Wash, is about 100 m. in length. From Yarmouth to Happisburgh the coast is low and sandy; from Happisburgh to Weybourne it is skirted by low cliffs; and w. of Weybourne to the entrance to the Wash, where the banks are in great part dry at low water, and where a considerable extent of land has been reclaimed from the sea (see WASH), it is low, and covered with sand or shingle. The surface of the county is level, or nearly so, none of the rising grounds being considered worthy of being called hills. The principal rivers are the Ouse, the Yare, with its affluents the Wensum and the Waveney, and the Bure. Communication is kept up by the navigable rivers, and by the Great Eastern railway. The climate is affected in spring particularly by cold n.e. winds, but the air is in general dry and healthy. The soil consists chiefly of light sands and loams, and comprises a great extent of land, which though naturally not fertile, has been made so by judicious management. The agriculture of the county is in an advanced condition, and all the usual crops are extensively grown; while that of barley is especially celebrated. Half the acreage is devoted to rearing food for cattle, and thus the necessary supply of manure is secured. Geese and turkeys are extensively reared for the London market. The capital is Norwich.

NORFOLK, a city and port of entry in Norfolk co., Va., on the Elizabeth river, an arm of Chesapeake bay, 18 miles from Fort Monroe, and about 106 miles s.e. of Richmond, is with Portsmouth, on the other side of the river, the largest naval station in the United States, and is the second city in Virginia. It became a borough in 1736, and a city in 1845; in 1776 was burned by the order of Lord Dunmore. During the early part of the civil war it was the chief naval depot of the confederacy, and was not abandoned till May 3d, 1862. The city is irregularly built, on low ground, but contains some fine public buildings. It is connected by steamer with European ports and with New York, Boston, Philadelphia and Richmond, is entered by the Norfolk and Western, Norfolk and Southern, Norfolk and Virginia Beach, Chesapeake and Ohio, and other railroads. The Dismal Swamp and the Albemarle and Chesapeake canals afford additional communication with inland towns. The harbor is large and deep and well defended. It contains a city park of 114 acres; U. S. custom-house; U. S. naval hospital; St. Vincent de Paul hospital; retreat for the sick (Prot.); public library; high school; Leach-Wood seminary; Norfolk academy; Norfolk mission college (Pres.); Phillips-West school for girls; Norfolk college for young ladies; and separate graded schools for white and colored children. The city owns a waterworks plant on the Holly system, and has good sewerage, gas and electric lights, electric street railroads, several national and state banks, about 20 churches, and daily and weekly newspapers. It has important manufactories, and a large trade in vegetables, fruit, oysters, peanuts, cotton, grain, cattle, lumber, and coal. Pop. '90, 34,871.

NORFOLK, DUKE OF. See HOWARD.

NORFOLK ISLAND lies in the Pacific ocean, 1200 m. e.n.e. of Sydney in Australia, in lat. 29° 4′ s., and long. 168° e. Length, 5 m.; breadth, 2½ m.; area, 13½ sq. m. It is the largest of a smaller cluster of islands, comprising Norfolk, Nepean, and Philip islands, together with several rocky islets. The coasts are high and steep, and the surface generally uneven, rising in Mount Pitt to upwards of 1000 ft. in height. The soil is fertile and well watered, and the climate healthy. In 1825 Norfolk Island was made a penal settlement by the British government for the worst class of convicts sent out to New South Wales; but the experiment was a failure, and the establishment was broken up in

1855. In 1856 the inhabitants of Pitcairn Island (q. v.)—194 in number, descendants of the mutineers of the *Bounty*—were transferred hither by the British government. In 1891 the pop. was 738.

NO'RIC ALPS. See ALPS.

NOR'ICUM, a province of the Roman empire, corresponding to Bavaria and other parts of the Austro-Hungarian empire; bounded n. by the Danube, e. and s. by Pannonia; also s. by Illyricum and cisalpine Gaul; w. by Vindelicia. The region is mountainous, the Noric Alps stretching through the center of the province; the chief rivers were Œnus (modern Inn), Dravas (Drave), and Murius (Mur). The chief town was Noreia, mentioned by Cæsar in his commentaries. The province was subdued by the generals of Augustus about 13 B.C. The Romans obtained iron and salt from the region, and, it is said, gold.

NO'RIUM is the name assigned by Svanberg to a metal, whose earth (or oxide) is associated with zirconia in certain varieties of the mineral zircon. Its existence is not as yet definitely established.

NORMAL SCHOOLS, institutions where teachers are instructed in the principles of their profession and trained in the practice of it. The name of normal school is of French origin (*École Normale,* from Lat. *norma,* a rule or model), and is that generally used in Scotland; such institutions, in England, are oftener called, "training colleges;" and in Germany "seminaries." There have been established in Great Britain, America, France, Germany, and Switzerland, schools in which the principles of teaching form the subject of study, and in which model specimens of the art are given. Italy, and even Russia, are following in the wake of the countries named. These schools also afford a thorough course of instruction in the subjects which are taught in elementary schools. The only normal school for training the higher class of teachers for colleges and academies exists in Paris.

One of the earliest, if not the earliest, normal school in Great Britain was the sessional school of Edinburgh (1830), afterwards developed into the "general assembly's normal institution." The first attempt of a similar kind in England was that of the Battersea Training College, instituted by Mr., afterward sir J. P. K. Shuttleworth and Mr. Tuffnell. Sir J. P. K. Shuttleworth subsequently, acting as secretary to the committee of privy council on education, suggested measures which have resulted in the institution of about fifty colleges for the training of teachers in Great Britain in connection with the Established and Dissenting churches. These turn out hundreds of male and female teachers annually, who having, after a two years' course of training, received government certificates of merit, become teachers. The establishment of these schools in the United States is due, it is said, to a suggestion by Prof. Denison Olmsted in an oration delivered in New Haven, Conn., in 1816, and to various recommendations in the official messages of De Witt Clinton while governor of New York. In 1838 a gentleman in Massachusetts, Mr. Edmund Dwight, offered $10,000 for the purpose of establishing such a school on condition that the state would appropriate an equal amount. This was accepted, and the first school was established at Lexington in July, 1839. Others soon came into existence in Massachusetts and elsewhere; and now nearly every state in the union has one or more either sustained by a county, city, or the state itself. In 1889 the total number of these public normal schools reporting was 133, the number of instructors connected with them was 1189, and the students, 32,314. They usually embrace the model or pattern school together with the academical features of the ordinary school. The conditions of admission are about the same in each, and require that the candidate be not less than sixteen years of age, and that he be able to pass a satisfactory examination in reading, spelling, writing, arithmetic, and the elements of English grammar. He must also intend to teach after graduating during a certain specified time. The courses of study are principally limited to the branches required to be taught in the public schools, together with a thorough theoretical and practical preparation for the special duties of a teacher. In some of the schools, however the classics and modern languages are taught. In the accounts of the various states mention will be found of these schools individually.

NORMAN, a co. in n.w. Minn., on Red river, formed 1881; 1440 sq.m.; pop. '90, 10,618. It is drained by Marsh river. Co. seat, Ada.

NORMAN, HENRY, b. Leicester, England, Sept. 19, 1858; graduated from Harvard university and studied at Leipzig university; for some years on the *Pall Mall Gazette,* and later became associate editor of the *Daily Chronicle.* Has traveled through the United States and Canada, Japan, China, Siberia, Korea, Siam, the Malay Peninsula and Egypt. He has published *An Account of the Harvard Greek Play* (1881); *The Real Japan* (1892); *The Peoples and Politics of the Far East* (1895); and *The Near East* and *Sketches and Studies in the Balkans* (1897).

NORMAN ARCHITECTURE. As its name implies, this style was originated and chiefly used by the Normans. Soon after their conquest of the north of France, they began to erect churches and cathedrals in memory of their victories. Their conquests supplied them with the means for making these large edifices. They were not contented with the small churches then common in France, but desired to erect monuments worthy of their great conquests. They accordingly expanded the dimensions, while to a great extent retaining the style of the buildings they found in France. They seem also to have borrowed some of their ideas from the Rhine. See GOTHIC ARCHITECTURE.

The leading characteristics of their style were size and massiveness. They adopted the old Latin plan (derived from the Basilica) of central and side aisles; and at the east end, they invariably placed a semicircular apse. They seized on the tower as a distinguishing feature, and developed it as their style progressed. The ornaments are simple and of great variety; but the most common and distinctive are the zigzag, billet, chevron, nail-head, etc. The windows and doors are simple, with semicircular arched heads—the former without tracery. The tympanum of the door-arch is occasionally filled with sculpture.

The nave arches are carried sometimes on single pillars, but more frequently, especially as the style advanced, on piers with shafts. The shafts are almost always recessed in nooks (or "nook shafts"). Owing to the great size of the buildings, the architects were unable at first to vault the main aisle, which, accordingly, had usually a wooden roof, the side aisles only being vaulted.

The masonry is rude; the joints being large, and the stones generally unhewn. The style prevailed from about the beginning of the 10th c., till the death of William the conqueror, near the end of the 11th century. There are many examples in Normandy, the churches at Caen being well-known buildings of the date of William.

This style of architecture was brought into England by the Normans at the conquest, 1066. They there extended the scale of the buildings, as they had done in Normandy, preserving, however, many local peculiarities of the Saxon style, which they found in the country. The chapel in the white tower of the tower of London is the earliest example of pure Norman work in England. There are, however, many buildings, both in England and Scotland, which date from before the end of the 12th c., when the pointed style began to be used. Durham, Lindisfarne, Canterbury, Dunfermline are partially Norman, besides many other churches and castles. The Anglo-Norman is heavier than the French-Norman, the cylindrical nave piers of the above buildings being much more massive than those of French works. To relieve this heaviness, the chevron, spiral, and other groovings were cut in the piers. The mouldings and forms of doors, windows, etc., are the same as those of Normandy. There is one remarkable difference in the plans of the early Norman churches in the two countries: in France, the apse at the east end is always semicircular; in England, this form was gradually given up; and towards the end of the style, the square east end was universally adopted.

NORMANBY, Constantine Henry **PHIPPS,** Marquis of, 1797–1863, b. England; son of the first earl Mulgrave. He was educated at Harrow and Cambridge, and returned to parliament for Scarborough in 1818. He acted with the liberals, though his family had always been tories; his first speech was in favor of the political claims of the Roman Catholics, and his second advocated lord John Russell's proposals for parliamentary reform. He left parliament, which he re-entered after a residence of two years in Italy. While in the commons, he secured the abolition of the sinecure office of joint postmaster-general, and advocated the extension of the suffrage in the great manufacturing towns. He succeeded to the title in 1831, and soon after was made governor of Jamaica, where he successfully executed the act for the emancipation of the slaves, and suppressed without loss of life a mutiny of the soldiers. Returning to England, he succeeded the earl of Carlisle as lord privy seal in 1834. He was lord-lieutenant of Ireland, 1835–39, displaying an impartiality which won the approbation of O'Connell himself. He was made a marquis at the coronation of Victoria, and was colonial secretary for a short time in 1839, but was soon transferred to the home department, where he remained till 1841. From 1846 to 1852, he was ambassador at Paris, France, and from 1854 to 1858, to Florence. He published *A Year of Revolution* (1857), containing his personal observations at Paris, and a number of novels, including *Matilda*, *Yes and No*, and *The Contrast*.

NORMANDY (Fr. *Normandie*), formerly a province in the north of France, bordering on the English channel; now divided into the departments of Seine-Inférieure, Eure, Orne, Calvados, and Manche. It is in general a very fertile, richly-cultivated land, resembling a garden in many districts. Its chief agricultural products are corn, flax, and fruits (from which cider is largely made); its fisheries and manufactures of great importance, and its horses the best in the kingdom. The inhabitants are for the most part descendants of the old Normans, and bear the stamp of their splendid ancestors. They are intelligent, strongly built, and of a noble and energetic character; warm-hearted and patriotic, they produce the boldest sailors, the most skillful fishermen, agriculturists, cattle-rearers, and gardeners in all France. In the north-eastern and more level part (formerly *Upper Normandy*), the principal towns are Rouen, Dieppe, Havre-de-Grace, Harfleur, Honfleur, Lisieux, Evreux, Yvetot; in the south-western and hilly part (*Lower Normandy*), the principal towns are Caen, Falaise, St-Lo, Bayeux, Coutances, Avranches, Granville, Alençon, Cherbourg, and Mont-St-Michel.

In the time of the Romans, the country bore the name of *Gallia Lugdunensis II.* Under the Frankish monarchs it formed a part of Neustria, and was first called Normandy after Charles the simple, in 912, had given it to Rolf or Rollo, the leader of a band of Norse rovers (see Normans), to be held by him and his posterity as a fief of the French crown. From Rolf (baptized into Christianity under the name of Robert) and Gisela, the daughter of Charles, sprung the latter dukes of Normandy, of whom Richard I., grandson of Rolf, vigorously maintained his authority against his liege lords, Louis IV.

and Lothaire. William II., son of Robert II., became duke of Normandy in 1036; and in 1066, established a Norman dynasty on the throne of England (see WILLIAM THE CONQUEROR), thereby politically uniting Normandy with the latter country. In 1077 his eldest son, Robert, wrested Normandy from him, but it was again united to England under Henry I. in 1105. With this monarch, Rolf's male line became extinct. Henry II., the son of Henry I.'s daughter, Matilda, after the death of Stephen of Blois, obtained in 1154 the government of England and Normandy; but in the reign of his son, John Lackland, it was conquered by Philippe Auguste (1203–04). It remained a portion of the French monarchy for more than 200 years; but after the battle of Agincourt (1415) it was reconquered by the English, who held it till 1449, when it was finally wrested from them by Charles VII. See Liquet's *Historie de la Normandie* (1835); Palgrave's *History of Normandy and of England* (1851–64).

NORMANDY, CUSTOMARY LAW OF (Fr. *Coutumier de Normandie*). The ancient provinces of France were governed principally by a system of laws called *Coutumes,* which had originated in local usages, and been in the course of time reduced to writing and formally sanctioned by the sovereign. *Coutume* was distinguished both from *loi,* which originated with the king, and from *us,* or usage not reduced to writing. Of the codes of customary law, one of the oldest and most famous was the *Coutumier de Normandie.* It was divided into the ancient and modern custom. The former was first reduced to a written form, in 1229 under St. Louis; the latter was the ancient *coutumier,* modified and reformed in 1585 by commissioners appointed by Henry III., with the concurrence of the three estates of the nobility, clergy, and people of Normandy. The ancient *coutumier* treats principally of the duties of the judicial officers, the proceedings in the different courts, and the rights and obligations of the kings of France, the dukes of Normandy, the feudal lords, and the people. In the modern *coutumier* are minute regulations regarding the transmission of property by will and inheritance. Each of the 22 vicomtés, into which Normandy was divided, had a different mode of devising real property. The law by which the Channel islands are still governed is based on the customary law of Normandy. The chief judge in Jersey, Guernsey, and Alderney retains the Norman name of bailli or bailiff, and his authority is much the same as that officer possessed under the Norman law. One of the most remarkable remnants of the *coutumier* still subsisting in the Channel Islands is the *Clameur de Haro.* Any one who considers that his rights of property are infringed, protests in the presence of two witnesses, and calling out three times "Haro" (said to be a way of invoking duke Rollo, noted for his justice), summons the trespasser to desist. He then applies to the authorities, relating what he has done, and proceeds to the record office, where note is taken of the circumstances; all which ceremonial must be gone through before bringing an action of trespass. The decision is generally referred to *une vue de justice,* and the losing party is subjected to a fine, and liable in costs: he had formerly also to undergo *un regard de château,* or twenty-four hours' imprisonment, for having implored the aid of the prince without cause.

NORMAN-NERUDA, WILHELMINE, a violinist of reputation upon the continent and in England, b. at Brünn in Moravia, where her father was organist of the cathedral, 1840. She became a pupil of Jansa, and made her first appearance at Vienna, in 1846. In 1849 she went to London to play at the Philharmonic in one of De Beriot's concerts. She then returned to the continent and passed several years traveling as an *artiste,* chiefly in Russia. In 1864 she visited Paris and played with great success at the Pasdeloup concerts, the Conservatoire, and elsewhere. In the same year she was married to Ludwig Norman, a Swedish musician. She returned to London in 1869, again taking part in the Philharmonic; in the winter following she took the first violin at the Monday Popular Concerts; and, 1888, married sir Charles Halle.

NORMAN-FRENCH. The well-known "oaths of Strasburg" A.D. 842, though by no means showing any pronounced dialects, are indicative of the state of the Romance languages when the Northmen first began their incursions into France. Rollo (Hrolf, whether contracted for Hárulf, Hraudulf, or Hroarulf, that is, high, red, or fierce wolf, is hard to say) received Neustria as a fief in 911. The number of his men was evidently much exaggerated by the monkish chroniclers of the time, and though the Saxons had long possessed settlements there, though there had once been a ruling Frank population, and though the Northmen must, in their usual fashion, have continued a desultory immigration for years, yet the proportion of Teutonic words (except sea-terms) is little larger than in the other Languedoil dialects, and by the third generation, except at Bayeux, only Norman French was in general use. The northern Romance, or langue d'oil, ultimately counts five dialects, Walloon, Picard, Norman, Frankés, Bourgoin. The fifth of these is the parent of modern French, yet, until the Italian campaigns of Francis I., there is, from the modern point of view, no French language. Each man writes his own patois, and it follows, from varying influences and successive dynasties, that French, the ultimate survivor, will contain a certain admixture of other dialects. It happens that many of the Normand peculiarities have appeared in modern French, and this it is which gives a certain color to those works which institute comparison between English and modern French, a process applicable to a certain number of technical and scientific words which, in truth, are neither French nor English, hardly even Latin. The rule of transformation from Latin to any neo-Latin dialect is, the accented syllable (tonic) is preserved, unaccented syllables (toneless) are dropped or contracted; precession is

applied sparingly, but later generation of secondary mutes takes place throughout. Vowels undergo changes which vary with the dialects. The only apparent exceptions to these rules are formed, not from the Latin, but from a rustic word, usually derivative, and with its accent corresponding to the French. The infliction of Norman-French upon English, little in the 12th c., becomes overbearing in the 13th. From 1220 to 1290 at least one-seventh of the Teutonic words are lost, including the power of compounding. The gaps are filled by French importations. In examining Norman-French from the stand-point of its bearing on English, it is particularly necessary to direct our attention to this century, to the spelling and form of Norman words at that time; the changes in English since are simply these: The Norman accent, already called identical with the Latin, is, in two-syllabled words, on the first, if the word is female (poetically speaking), on the second if male. The English throws back (and the process was evidently only half finished in the time of Shakespeare) this accent to the first syllable, and it is this retrocession which makes it difficult to distinguish between a modern and hybrid word from the French, and an old though wrongly accented word from the Norman. We have, besides, applied a cumbrous and arbitrary system to indicate secondary mutes, notably *g* and *j*, and have, under the influence of the pedants of the 17th c., restored many letters, dropped or contracted in passing from Latin to Norman. These are the rules of change from Latin to old French, most examples being either Normand or Frankés (Ile de France); the particular distinctions for Norman will follow:

I. Toneless Syllables after the Accent.

a. Paroxytons:—disappear—frúctus—fruict; dámnum—dam; —or change to mute e: rosa—rose; granum—graine—grain. *b.* Proparoxytons:—contract—ángulus—ang'lus —angle. Both syllables become *e* mute; dómina—dom'ne—dame; or disappear entirely; dóminus—dom—Eng. dan. (Blasphémus, in lingua Rustica blásphemus, blasme, Eng. blame. Encáustum, pronounced like Greek égkauston, enque—Eng. ink, Fr. encre.) *c.* Formative terminations, two-syllabled and toneless: *ĭcus—ĭca—ĭcum; i* drops, *c* precessed—fábrica—farge and forge; gránica—granche, grange; *áticus*, contracted first into atge—missáticus—message; *ĭcus—ĭca—ĭcum=e* mute—públicus—pople, not publíc; scholásticus—escolastre, scollard. Termination wholly dropped: láicus—laic or lay (bárica, Fr. Gr. báris, barge, modern barque; phantásticus, fantasche, mod. fantasque). There are a few exceptions, liturgical words or technical: *ĭcus, i* long = *ic* or *i; ĭca* = *ic—amĭcus*, amic, ami; *ĭcem—i* drops, *c* is softened or precessed—panticem, pance, paunch; *ĭcem—i* long = *is, isse, iche*—cornícem, corniche; *ĭdus, ĭdis, ĭda. i* drops, *d* final should be *t*—vápidus, fade; víridis, vert. Without final *d*—pállidus, palle, pale; *ĭlis, ĭlos, ĭla.* Contraction—áquila, aigle, eagle; útilis, utle, not utíle; *ĭlis = il*—avrílis, April; gentílis, gentil, genteel; *ŭlus, ŭla, ŭlum.* Dropping of *u*, and contraction—tabula, table, etc. Vocalization of the consonant: bájulus, bail; mácula, mail; *áculus, ículus, úculus*—trabáculum, travail, travel. Change of *l* to *r:* Reflex action of *u* in the penult; régula, ricule, rule; *ŏlus, ŏ* drops, *tl = tr* in French, but remains in English—apóstolus, apostle, Fr. apôtre; *ĭmus, ĭ* drops, final *e* mute—décimus, disme, dime; *ĭnus, ĭnem.* As before, and *u* drops—ásinus, asne, Eng. ass; *n* changes to *m*—consuetúdinem, coustume; *n* changes to *r*—cóphinus, coffre; *n* drops—imáginem, image; *ĕrem*, etc., *ŏrem, ŭra*—cucúmerem, cucumbre, Fr. concombre; *ĭtem*, etc.; *i* drops—cucúrbita, goourds, gourd. Without *e* mute: paepósitus, prevost. (Spíritus, made in Norman espri, though in Fr. esprit, which is contrary to rule. The English word is later.) *ĕus, ĭos* (a. um.). The short vowel becomes *j*, or *ch*—calúmnia, calonge, challenge. The vowel becomes liquid in Fr., but not in Eng.: fóliuum, foil, Fr. feuille. Reflex action of the vowel when dropped: ingénium, engein, engine. Vowel disappears: fácies, face, etc.

Note an exception: A low-Latin termination, *ĭa*, which, especially in Languedoc, serves as a derivative, and is applied to a bastard Latin form, itself derived from a neo-Latin word. Such are: compaing, compagnie, company; jalos, jalousie, jealousy, etc. Strengthened by *r*, it applies even to words derived from the Teutonic, viz., fladdha, old Eng. to flyte, flatter, to flatter. And from this *ie* came our true English geographical forms in *y*, Italy, Araby, etc. *Verbs in ĕre.*—When the *ĕ* drops they become verbs of the French conjugation in *re;* so they were, but after the invention of the third in *oir* they were, owing to a too close juxtaposition of consonants, changed to others. Thus, empreindre, to imprint, is in mod. Fr. émprimer. But as most Norman verbs are changed to English by the summary process of chopping off their tails, little shows of the old forms in our language. But some mistaken transformations of *ēre* can still be discerned: morēre, muevre, to move; placēre, plaiser, to please.

II.—Toneless Syllables before the Accent.

a. Immediately before, they persist: coróna, couronue, legális, léal, loyal. Exception: thériaca, triacle, treacle. When a consonant drops, and two vowels touch, they are contracted: aetáticum, eage, age, or fused: magíster, maëstre, master; but if the syllable begins with a vowel, it is often dropped: arúnculus, oncle; but if not initial, the short vowel immediately before the tone vowel drops: bonitátem, bonté, bounty. If the vowel is long it generally persists: labōráre, labourer, labor. *b.* Unaccented syllables not immediately preceding the tone: dominicélla, doncele, donzel.

III.—Latin Vowels.

If toneless, they are treated without method in spelling; but if accented, *a* continues, sáccus, sack; even if a toneless vowel has dropped: at(i)cus, ab(i)lis = age, able, etc., grace, grátia. The vowels of the Norman, whether influenced or not by the nasality and burr of the Norsk, show a constant tendency to too great broadness and too great fineness, as compared with a standard approaching the Latin, and this standard is best furnished by modern English spelling, when that remarkable system has been left to itself. The Norman changes will be recognized on sight as characteristic of old, notably from Chaucer to Heywood, English, or of provincialisms still current, even in America. Norman *a* is Danish *á*, Gothic *au*, English *aw:* graud, sometimes spelled graunt; but when followed by gutturals or nasals, French turns *a* to *ai:* pácem, pais. This *ai* is in Norman a diphthong, often represented by *ae;* and the Irish pronunciation of English peace is of course only English of Spenser's time, and rightly descends from it; *ai* in mountain is rightly placed in French to Montaigne's time, and marks the vowel as short. Norman varies between *al* = *al*, as in poiterui, or *al* = *aul*, *l* becoming silent, which is modern French, but the *a* is always very long. Phantasma, fantôme, Eng. phantom (!), is a true Norman broad *a;* but we say tax, while the French is still taux. Most short vowels are liquefied in Norman, just as in Icelandic; thus short *a* in căput, chapt, chief, and even long, grávis, graef, grief. These are, as compared with Norman or French, so few in English that it would seem a late introduction with us. *E* is in French raised in pronunciation, but in English persists: féstum, feste, feast; *el* final is often replaced by *ian*, mod. *ean;* *e* before a dental fluctuated between *ei*, pronounced as *ai* in straight, and *oi*, pronounced in Norman like *oy* in boy. This struggle continues in modern French, but there is little trace of it in English: peusum, pois, Nor. and Eng. peiz (averdupeiz is etymologically correct); heres, hoir, Nor. and Eng. heir; but monéta, monoie, old Fr. and Nor.; monnaie, mod. Fr. = Eng. money. *Ē* = *i* in verbs of modern conjugation: poenitēre, repentir, repent; and in English varies in racēmus, raisin. Exceptions: sēbum, soef, suet. *E* is liquidized: relevo, reliève, relief; but not in tenerum, tendre, tender. *E* tonic is liquidized: sédia, siege, sied, seat, and equals *i:* prétium, prix, price. *I* usually becomes *e*—crista, creste, crest; but remains before nasals—simplicem, simple, dignor, daigner, deign:—*isc* becomes *ois*—turchisca, turquois, turquoise: *ī* keeps in—ficus, fique, fig. *ĭ* becomes *oi*, = Eng. *ĕ* or *ĭ*—picem, poix, peix, pitch, plico, plier, ploier, ply: *ī* or *ĭ* in certain cases—invidia, envie, envy. *O* generally persists: costa, coste, corselet, coast, cutlet; but cognitus, cointe, quaint. Variations from *ol* to *ou*, but pronounced long: follis, fol, fool; in other positions, persōna, personu, person, becomes *eu* and *ou*, in English more open or more closed: florem, flour, flower, fleur, ferocem, farouche, feërs, fierce, domitare, domter, daunt.

In Fr. an *i* has a reflex action on *o;* not so in English. This and other indications point to the final *e* being sounded until about 1100: gloria, gloïre, glory, ostrea, oistre, oyster, puitre, solium, seuil, sill. *U* changes to *ou* in French, and in English remains *u:* crusta, crouste, crust; changes to *o* in French, in English remains: columna, colomne, column; changes to *oi*, both French and English: punctum, point; but truncus, tronc, trunk; and *oi* to *ui*, but not always in English: fructus, froict, fruit; *u* long, Latin, is sometimes long, sometimes short in English, but in Norman was always long: cupa, coupe, cup; *u* short varies: cupreum, coipre, copper; and though influenced by the reflex of an *i* in French, in English varies: angustia, angois, anguish. *Y*. The latin *y*, a Greek letter, was reproduced in Norman and in English, but is *i* in French: lyra, lyre, Fr. lire; muxa, mesche, match. *Æ*. Treated as an *e* long, and even as an *e* short: quæstum, queste, quest. *Œ*. Same treatment: pœna, poine, pine, pain. *A U*. Already interchanged in late Latin with *ō*. English, Norman, modern French, all vary in treatment: Lat. frauda, thesaurus, nausea; Nor. frode, thésore, noise; Fr. fraude, trésor; Eng. fraud, treasure, noise. *E U*. No Latin words in the Norman, but the Celtic: leuga, line, lieue, league. *U I*. Diphthong rare in Latin. The two vowels occur in circuitus, circuit.

IV.—Vowels and Diphthongs Unaccented.

The cases of anomalous change in toned vowels shown in the exceptions just stated are usually the same as those of the toneless sound corresponding. A few cases of persistence or change may be shown more at length: *A*. Remains in place: carnalis, charnal, charnel. *E*, mercēdem, merci, mercy. *I*, imáginem, imaige image. *O*, obscúrus, obscur, obscure. *U*, humánus, humain, human. Where French takes *e*, English often keeps *A*, canális, chenal, canal; *E*, fenúculum, fenoil, fennel; *I*, minútus, menu, mean, fidéles, féal, feal(ty), fiau; *O*, commendo, quemande, command; *U*, succúrere, secourre, succor. Other changes will be found in exceptions, and can be expected from the character of the Norman vowels already described. It is singular that Norsk and Norman, being unusually nasal, English, especially old, is not, misspelling by preference any open vowel followed by *m* or *n*.

V.—Hiatus and Semi-Consonants.

Hiatus is produced much more frequently in Norman than in French, final *e* being preserved before a vowel, *s* in the nominative retained, and probably, under form of *s*, *x*, *z*, pronounced. Vowels not *i* and *e* before an open vowel (they are always liquid) are

separated in pronunciation. Both rules are Norse. *Ge, gi, de, di,* before vowels are certainly not *j* before 1200, and *zh* even later. *Ci, ki, qui, ce, ke, que,* before vowels are not Picardized into *ch* and *sh* till the same time. *Te* and *ti* may have equaled *se* and *si,* but certainly not *sh*. *Hi* is of not the slightest consequence—as often absent as present. *Ch* of early Norman simply equals *k*. On the whole, English is likely to keep a Latin letter and avoid hiatus, where Norman would drop it.

VI.—Consonants.

Taken as initial, medial, or final, of course after disappearance of the Latin covering syllable. Modern French dislikes double consonants, unless one be liquid or nasal; Norman and English show such feeling in some instances: captivus, chaitif, captive; but judicare, juger, judge. Also, true of these consonants when the last drops: blasphemare, blâmer, blame. Changes of consonants are: precession, assimilation, transposition, and all are much less common in Norman, and therefore in English, than in modern French. *D* gutturals *c* and the *ch* it replaces.

Initial.

Chorus, queir, quire (= *k*); but capelletam, goubelet, goblet; calx, chaulx, chalk, (= *ch*); capulum, chable, cable; cedere, ceder, cede (= *s*); chirurgianus, siurgien, surgeon.

Medial.

Pertica, perche, perch; but laxus, lasche, lax; pacare, payer, pay—disappears; ducatus, duché, duchy, various; licére, loysir, leasure; jocus, jocs, joke.

In combination

Cc, accentus, accent; *ct,* fluctuare, floter, float; placitum, plait, plea; factionem, façon, fashion; *cs* or *x,* extraneus, estrainge, strange; exilium, cissil, exile; *x,* taxa, tasche, task (= *sk*); but fixare, ficher, fix; *cm,* Jacomus, Jaimes, James, etc. *Qv* has persisted in English, though less in French; but aquila, aigle, eagle. *G,* initial and medial, or final: gobinem, gougeon, gudgeon (= *g*); but gagátes, jayet, jet; angelus, angiel, angel (= *j*); flagellum, flael, flail, disappears.

In combination.

Gva, gve, languere, languir, languish; *gr, gl,* peregrinus, pélérin, pilgrim; but integrum, entier, entire; *ugr, ugl,* plaugere, plaindre, plain; *gn,* pugnare, pogner, punch; amygdala, amandle, almond. *J,* Latin, a real *g* is now in French *zh,* but English *j:* projectus, progeict, project; raja, raie, ray. *H* invariable in Norman, only in Teutonic words: hairon, heron; hair, hate. English has from it two words which do not deserve the *h;* the French is entirely arbitrary: eremita, hermit; upupa, hoopoe. *P* almost intact, but cupitare, couvoiter, covet, pulpitulum, poulpitre, pulpit; but caput, chief.

In combination.

Ps, psalmus, saulme, psalm (pedantic); *pl,* duplex, double; *pr,* aprilis, avril, april; *ps,* capsa, chasse, caisse, case; *pt, pd,* ruptus, raout, rout, and examples already given; *pi, pe,* pipionem, pichon, pigeon; *pp,* mappa, nappe, nap(ery). *B* almost always persists: but taberna, taverne, tavern; subundare, soonder, sound, etc.; *br,* brevis, brief; febris, fièbre, fever; *bl,* fabula, fable; debilis, deueil, dule; *bt,* subitanus, soudein, sudden; *bs,* absolvere, assouldre, assoil; *bi, bm, bv,* subvenire, souvenir. *F. ph,* which was always replaced by *f,* generally persists, yet bifax, viais, bias. *V.* initial low Latin *v* represents *v, w, gu,* even *qu* of the Teutonic languages, and most of these words in English in which *g* represents Norman *gu* have another form in *w,* the true one: vadium, gaige, gage = wage; guarder, guard = ward; guigue, jig = gig(gle), Danish, and the word never has come into English; elsewhere *v* persists: novellus, novel, estridge; but avisstruthio, austruche, ostrich; salvus, saulf, safe. *M* persists, but comestabulus, connestable, constable; stramen, estrain, strain; *mr, ml,* camera, chambre, chamber; marmor, marbre, marble; *mu,* adluminare, alluminer, allume; *mi, md, mc, mi, mg,* in all *m* changes to *u:* comitem, counte, count; cambiare, changier, change; *mb, mp,* gamba, geambe, gam(mon). *T, th,* which is replaced by *t,* disappears: potere, pooir, power; but many old words keep *t* between two vowels: materies, matière, matter. And the Languedoc words: metallea, médaille, medal; intybum, endive, change t to d; bombitare, boundir, bound; *st,* culcitinum, coulsin, cusheon; *tc,* silvaticus, saulvage, savage; *tm, tn,* platanus, plane, plane; *tr,* latrocinium, lareçin, larcen(y); *tl,* voltulare, vaultrer, vault. *T* final, saved though mute in many French words, is even more preserved in Norman, always when originally preceded by a consonant. In past participles it keeps *ct,* and the old *t* final, which is now *ct.* *T* before toneless *i* or *e* and a vowel is always soft in French, but Norman had preserved the spelling, though hardly the pronunciation: potionem, poison. *D* initial persists; medial is lost: predicare, preecher, preach; *d* between two vowels is almost never Norman, yet estude, rude, odeur; *d* final, drops: gradus, grée, degree; *d* and another consonant, *d* drops, but not always in English. *D* intrudes in tenerum, tendre, tender; *ds* assimilates: adsecurare, assurer, assure. *S* almost unchangeable: but sicera, cidre, cider; designare, desseiner, design. In combination *s* usually drops, but not as much as in modern French: *sc,* vascellum, vaissel, vessel; *sp,* despectus, despeit, despite; *su,* asinus, asne, asse; *sl,* vassaletus,

vaslet, valet (Danish.) *Sr* or *cr*, insert *t*, antecessor, ancestre, ancestor. *Dis*, *ex*, in French *dé* and *é* are preserved in Norman, as well as *st*; in modern French *e*, with *sp* initial, makes *ê*. English makes *sc*, *sp*, *st*, initial; late Norman makes *esc* or *esch*, *esp* and *est*; the inference is evident.

Latin.	English.	Late Norman.	French.
scala,	scale,	eschiel,	échelle.
sparsus,	spare,	espars,	êpars.
strictus,	straight,	estreict,	êtroit.

Not all of these words are technical, and borrowed by Saxon before 1000 A.D., and though it is an exception to Romance rule, it seems likely that Norman was more like English than French in this up to 1150. Other changes are: staunum, estein, tain, tin, stationem, saison, season. *Z* Latin, in verbal terminations, should always be *s*: baptizare, baptiser, baptize. Before mentioned: zelosus, jaloux, jealous. *N*, initial, medial, and final remains: sanus, sain, sane; but quaternum, quahier, quire; and diurnum, jour, jour(nal). Latin, udinem: consuetudinem, coustume, custum; couchylium, coquille, cockle. Other cases mentioned already. *N* before short *e* or *i*: seniorem, seigneur, seignior. *N* inserted: laterna, lantern; reddere, rendre, render; but joculari, jongler, juggle. The groups *ndr* for *nr*, and *ngl* for *gl*, are decidedly Norsk; so is *mbl* for *ml*. *L* generally rests initial, medial, or final: filius, filz, fitz; vocalis, voielle, vowel. Note, digitalis, deel; détale, ditany. *L* in combination: followed by *ly* consonant, *l* = *u* in French, but not in Norman and English: Note, marla (for marg'la), marne, marl; scandalum, scandale, scandal; esclandre, slander. *R* remains, except changing with *s* seldom, and *l* sometimes; remains in English: kaemmer-leik-ing, chamberlenc, chamberlain. Often transposes: fimbria, freinge, fringe. The proportion of Norman words in English, and the history of the connection between the two languages, may be found in so many treatises that no attempt has here been made to do more than carefully indicate the true derivation and spelling of Norman words in English. The grammar and the literature of the language belong to the study of French dialects; and as written by even the second generation after the conquest, always excepting Richard cœur de lion and a few troubadours, the English productions in the tongue are so bald and corrupt as scarcely to repay translation into the pure dialect of their time. They never had a possessive nor any serviceable particles; they forgot the two cases of the noun and the double formation of object and subject; they neglected the subjunctive of their verbs, and forged abstracts by hitching a termination to the first word they happened to remember.

NORMANS (i.e., Northmen), a name generally limited in its application to those sea rovers who established themselves in that part of France called after them, Normandy; but sometimes embracing also the early inhabitants of Norway. During the middle ages, the name Northmen, or Norsemen, was often used in a broader sense, to denote the entire population of Scandinavia, and still more frequently, perhaps, to designate the Danes and Norwegians, exclusive of the Swedes. The Germans and French called the piratical hordes who ravaged their shores Normans or Northmen; the Saxons, usually Danes or Eastmen. They were also distinguished by the latter as *Mark*- or March-men (from Den-*mark*), as *Ash*-men (i. e. men of the *ashen*-ships), and as the *Heathen*. The primary cause of the plundering expeditions southward and westward across the seas, undertaken by the Norse Vikings (*Vikingar*, meaning dwellers on the *vics*, i. e., bays or fiords), as they called themselves, under leaders, who took the name of "Sea-Kings," was doubtless the over-population and consequent scarcity of food in their native homes; besides, the relish for a life of warlike adventure, conjoined with the hope of rich booty, strongly attracted them; while—at least as long as the old Scandinavian religion lasted (i.e., till about the end of the 10th c.)—death in battle was not a thing to be dreaded, for the slain hero passed into a region of eternal strife in the Walhalla of Odin. Finally, discontent with the ever-increasing power of the greater chiefs or kings, induced many of the nobles with their followers to seek new homes.

The first Danish Norsemen made their appearance on the eastern and southern coasts of England in 787. After 832, their invasions were repeated almost every year. To one of these belongs the *legend* of Ragnar Lodbrok (i.e., Ragnar of the "Shaggy Brogues"), who is said to have been taken prisoner by Ella, king of Northumbria, and thrown into a dungeon filled with vipers, where, while expiring amid horrible torments, he sung with heroic exultation the story of his life. The very existence, however, of such a person as Ragnar Lodbrok is questioned by many Scandinavian scholars. In 851, the Norsemen wintered for the first time in the island, and after 866 obtained firm footing there. The Anglo-Saxon Ethelred I. fell in battle against them in 871. His brother Alfred, known as Alfred the Great (q.v.), after a long and doubtful struggle, partially reduced them to subjection; nevertheless, he was compelled to leave them in possession of Northumbria and East Anglia; and had not only to defend himself against a new and fierce invasion led by the famous rover Hastings (q.v.), but like his immediate successors, to contend against the revolts of his Dano-Norman subjects. A period of external peace now ensued; but in 991 the invasions of the Danes and Norwegians began anew. The Saxon king, Ethelred II., at first sought to buy them off by paying a sort of tribute money, called *Danegelt* (q.v.); but the massacre of the Danes living in England, by com-

mand of that monarch, Nov. 13, 1002, was avenged by four expeditions under the Danish king, Swen, who frightfully wasted the country, and finally conquered it in 1013, dying the following year. His son Knut, or Canute (q.v.), after carrying on a struggle for the supreme power with Ethelred and his successor Edmund Ironside (q.v.), at length, on the death of the latter, became sole monarch of England, which now remained under Danish or Norse rulers till 1042. The government of the country then reverted into the Saxon hands of Edward the Confessor (q.v.), who was succeeded in 1066 by Harold II. (q.v.), son of the powerful Godwin, earl of Wessex (q.v.); but in October of the same year, Harold lost his life and crown at the battle of Hastings, and William the Conqueror, a descendant of a Norwegian chief who had settled in Normandy, once more established a Norse dynasty on the throne of England, but one greatly refined and improved by long residence in a comparatively civilized region.

It was also Danish Norsemen, in particular, who ravaged the western coasts of European mainland, from the Elbe to the Garonne. As early as 810, the Danish king, Gottfried, had overrun Friesland; but the power of the great Charlemagne was too much for these undisciplined barbarians, and they were overawed and subdued for a time. Soon after his death, however, they recommenced (*circa* 820) their piratical expeditions, and favored by the weaknesses and dissensions of the Carlovingian rulers, became, during the 9th c., the terror and scourge of north-western Germany and France. They plundered Hamburg several times, ravaged the coasts of the Frisians (which then extended as far as the Scheldt), and in 843 firmly planted themselves at the mouth of the Loire. But ere long they ceased to be satisfied with making descents and settlements on the coasts, and in their small piratical craft they swarmed up the great rivers into the interior of the country, which they devastated far and wide. Thus in 845, they ascended the Seine and plundered Paris—an exploit which was frequently repeated. In 885, not less than 40,000 of these Vikings are said to have ascended the river from Rouen, under the leadership of one Siegfried in 700 vessels, and besieged the capital for ten months. It was only saved at the expense of Burgundy, which was abandoned to their ravages. In 881, Louis or Ludwig III., king of the West Franks, inflicted a severe defeat on the invaders at Vineu, near Abbeville in Picardy, the memory of which has been preserved in a song still popular among the country people; but neither that, nor the repulse which they sustained from the brave German monarch Arnulf, near Louvain in 891, could hinder them from making fresh irruptions. In 892, they appeared before Bonn, and tradition says that bands of Danish rovers penetrated even into Switzerland, and established themselves in the canton of Schweiz and the vale of Hasli. From their settlements in Aquitania they proceeded at an early period to Spain, plundered the coasts of Galicia in 844, and subsequently landed in Andalusia, but were defeated near Seville by the Moorish prince Abd-ur-Rahman. During 859–60, they forced their way into the Mediterranean, wasted the shores of Spain, Africa, and the Balearic Isles, penetrated up the Rhone as far as Valence; then turning their piratical prows in the direction of Italy, entered the Tyrrhene sea, burned Pisa and Lucca, and actually touched the distant isles of Greece before their passion for destruction was satiated, or before they dreamed of returning west.

Doubtless Norwegian rovers also took part in these so-called Danish expeditions. We know that as early as the beginning of the 9th c. they made voyages to the n. of Ireland, Scotland, the Hebrides, the Orkney and Shetland isles; and the increasing power of Harald Haarfager in the 9th and 10th centuries, exciting great discontent among the smaller chiefs, great emigrations took place, and these islands became the new homes of these Norwegian Vikings. About the same period, colonies were settled in the Faröe Isles and Iceland, from which some Vikings proceeded westward across the North Atlantic to Greenland in 982, and thence in 1002, south to a region which they called *Vinland*, now universally believed to be the coast of New England, thus anticipating the discovery of America by Columbus by nearly 500 years. From Norway also issued the last and most important expedition against the coast of France. It was led by Rolf or Rollo, who had been banished by Harald Haarfager on account of his piracies. Rolf forced Charles the Simple to grant him possession of all the land in the valley of the Seine, from the Epte and Eure to the sea. By the time of Charles the Bald the invaders had firmly planted themselves in the country, which then went by the name of Normandy (q.v.). They and their descendants are strictly speaking, the Normans of history—warlike, vigorous, and a most brilliant race. They rapidly adopted the more civilized form of life that prevailed in the Frankish kingdom—its religion, language, and manners, but inspired everything they borrowed with their own splendid vitality. At a later period (the 12th c.), they even developed a great school of narrative poetry, whose cultivators, the *Trouveurs*, or *Trouvères*, rivaled in celebrity the lyrical troubadours of southern France. Their conquest of England, in 1066, gave that country an energetic race of kings and nobles, on the whole well fit to rule a brave, sturdy, but somewhat torpid people like the Anglo-Saxons. But though the Normans had acquired comparatively settled habits in France, the old passion for adventure was still strong in their blood; and in the course of the 11th c., many nobles with their followers betook themselves to southern Italy, where the strifes of the native princes, Greeks and Arabs, opened up a fine prospect for ambitious designs. In 1059, Robert Guiscard, one of the ten sons of the Norman count, Tancred de Hauteville, all of whom had gone thither

was recognized by Pope Nicholas II. as duke of Apulia and Calabria, and in 1071 as lord of all lower Italy. His brother and liegeman, Roger, conquered Sicily, 1060–89. Roger II. of Sicily united the two dominions in 1127; but in the person of his grandson, William II., the Norman dynasty became extinct, and the kingdom passed into the hands of the Hohenstauffen family.

The Swedish Norsemen directed their expeditions chiefly against the eastern coasts of the Baltic—Courland, Esthonia, and Finnland, where they made their appearance in the 9th c.—the very time when their Danish and Norwegian brethren were roving over the North Sea, the English Channel, the Bay of Biscay, and were establishing themselves on the shores of England and France. According to the narrative of the Russian annalist, Nestor, they appear to have penetrated into the interior as far as Novgorod, whence they were quickly banished by the native Slavic and Finnish inhabitants, but were as quickly solicited to return and assume the reins of government. Hither, consequently, in 862, accompanied by other noted warriors, came three Swedish chiefs, Rurik, Sineus, and Truwor, sons of the same father, and belonging to the tribe of *Ros* (whence *Russ* and *Russians*). Rurik founded one kingdom at Novgorod, which stretched northward as far as the White sea. His successor, Oleg, united with that a second established by other Swedish adventurers at Kiev, which town now became the capital of the wide-extended Russo-Swedish kingdom. See Russia. For a long period these Norsemen, who, it appears, became completely identified with their Slavic-speaking subjects in the 10th c., were dangerous enemies of the Byzantine empire, whose coasts they reached by way of the Black Sea, and whose capital, Constantinople, they frequently menaced, as, for instance, in 941, when Igor is said to have appeared before the city with upwards of 1000 ships or boats. Earlier in the same century, these Swedo-Russian warriors had found their way into the Caspian Sea, and actually penetrated to the coasts of Tartary and Persia. Partly from them, and partly from native Scandinavians, came those soldiers who from the 9th to the 12th c. formed the body-guard of the Byzantine emperors.—See Deppings's *Histoire des Expéditions Maritimes des Normands et de leur Etablissement en France au 10me Siècle* (2 vols. 2d edit. 1843); Wheaton's *History of the Northmen from the Earliest Times to the Conquest of England* (1831); Worsaae's *Minder om de Danske og Normändene i England, Skotland, og Irland* (1851); Freeman's *History of the Norman Conquest* (1867–76).

NORNÆ, the *Parcæ* of the northern mythology. They were three young women, by name Urd, Verdandi, and Skuld—i.e., past, present, and future. They sit by the Urdarwell under the world-tree Yggdrasil, and there determine the fate both of gods and men. Every day they draw water from the spring, and with it and the clay that lies around the wells, sprinkle the ash-tree Yggdrasil, that its branches may not rot and wither away. Besides these three great norns, there are also many inferior ones, both good and bad; for, says the prose Edda, when a man is born there is a norn to determine his fate; and the same authority tells us that the unequal destinies of men in the world are attributable to the different dispositions of the norns. These lesser norns corresponded to the *genii* of classic mythology. Women who possessed the power of prediction or magic also bore this name.

NORRBOTTEN, the extreme n. province of Sweden, adjoining Russia and the gulf of Bothnia, separated from Lapland by the Torneo and Muonio rivers, drained by the Lulea, Pitea and Kalix rivers; 40,870 sq. m.; pop. '95, 115,500. It contains many lakes and rivers. The summers are hot, but the climate not unhealthy. The principal articles of export are ore and timber. Capital, Pitea.

NORRIS, William Edward, English novelist, noted for his fine character-drawing; b. in London, 1847. He was educated at Eton, and then went to the continent to study languages, with the intention of entering the diplomatic service, but, changing his plans, he studied law, and was admitted to the bar in 1874, though he has never practiced. His home is at Torquay, "that most balmy and charming of southern coast sanatoriums for English invalids," though, on account of the extremely delicate health of Mrs. Norris, he spends his winters either in the Riviera or in Egypt. His first contributions to literature were in the form of short stories to the *Cornhill Magazine*, and these were of such a character, that Mr. Leslie Stephens, editor of the magazine, induced him to attempt novel-writing. His first novel, *Heaps of Money*, appeared in 1877; *Mademoiselle de Mersac* appeared as a serial in *Cornhill* in 1879. His other works include: *Matrimony* (1880); *No New Thing* (1882); *Thirlby Hall* (1883); *Adrian Vidal* (1884); *A Bachelor's Blunder* (1885); *My Friend Jim* (1886); *Major and Minor* (1887); *Chris* (1888); *The Rogue* (1888); *Miss Shafto* (1889); *Mrs. Fenton* (1889); *Marcia* (1890); *Mr. Chaine's Sons* (1891); *His Grace* (1892); *A Deplorable Affair* (1893); *Billy Bellew* (1895), etc.

NORRISTOWN, a borough and co. seat of Montgomery co., Pa.; on the Schuylkill river, the Schuylkill canal, and the Pennsylvania, the Philadelphia and Reading, and the Stony Creek railroads; 16 miles n.w. of Philadelphia. It was incorporated in 1812 and enlarged in 1853; is regularly laid out on high land; and in its vicinity are Valley Forge and valuable marble quarries. The borough contains the state hospital for the insane, Charity hospital, Friends' home for the aged, the Norristown, McCann, and Montgomery co. law libraries, Oakview park, public square, waterworks supplied from the river, electric light and street railroad plants, several national banks, and over 25 churches. There are cotton, woolen, rolling, and wire mills, cigar factories, glass works, carpet mills, machine shops, shirt factories, and steel casting and pipe covering works. Pop. '90, 19,791.

NORR'KÖPING, t. and port of Sweden, province of Östergötland, is the first industrial town of Sweden, and is situated at the junction of the Motala with the gulf of Bravik, in 58° 30′ n. lat., and 16° 15′ e. longitude. Pop. in '95, 36,075. It is a fine, well-built town, with broad streets, large squares, and numerous churches and charitable institutions. The rapid river Motala, which is spanned by several substantial bridges and lined with commodious wharves, affords very considerable water-power, by which numerous systems of machinery are worked. The manufactures are cloths, stockings, starch, tobacco, soap, etc., while in the neighborhood are the extensive ironworks and cannon foundries of Finspäng. Norrköping is a good salmon station, and is the principal Swedish port for the importation of wines and foreign spirits.

NORSEMEN, or **NORTHMEN**. See NORMANS.

NORSE MYTHOLOGY. See ÆSIR; SCANDINAVIAN MYTHOLOGY.

NORTH, CHRISTOPHER (*pseud.*). See WILSON, JOHN.

NORTH, EDWARD, L.H.D., b. Conn., 1820; educated at Hamilton college, and since his graduation in 1841 has been one of the most active members of the faculty. In 1843 he was made professor of ancient languages, and since 1863 has occupied the Greek professorship. For many years he was chairman of the Hamilton alumni association. He edited the triennial catalogue and also a biographical catalogue; contributed articles to the *North American Review* and several educational journals; delivered lectures on literary topics. The degree of L.H.D. was conferred upon him in 1862 by the university of the State of New York.

NORTH, FRANCIS, Baron Guilford, 1637–85; second son of Sir Dudley North, the fourth baron of the line; educated at St John's college, Cambridge, and after 2 years study there became a member of the middle temple. He was called to the bar in 1655. He had always been a student of great application, and upon entering into practice he used every means (not always dignified or honorable), to advance himself and obtain the favor of the great. He was made solicitor-general in 1671, attorney-general in 1673, lord chief-justice of the common pleas in 1675, and in 1682 was made lord-keeper of the great seal. The memoirs of the lord-keeper by his brother, Roger North, represent him as selfish, cowardly, trimming in politics, and capable of descending to baseness to increase his own power. He was a strong upholder of the prerogative, and only at the last moment warned James II., of the ruin to which that monarch's infatuation was hastening him. As a lawyer, his ability and learning were undoubted, and his decisions did much to increase the extent of the jurisdiction of the courts of common pleas. Lord Campbell characterizes his professional qualities by saying, "He had as much law as he could contain, but he was incapable of taking an enlarged and commanding view of any subject."

NORTH, FREDERIC, Lord, English minister, was b. April 13, 1732, and educated at Eton, and Trinity college, Oxford. His father, baron Guilford, a descendant of Roger, baron North (*temp.* Henry VIII.), was created an earl in 1752. North entered the house of commons at an early age, was made a lord of the Treasury in 1763, and inherited the tory politics which, in the days of Charles II., had placed his ancestor in the highest ranks of the law and the state. It was his boast in the house of commons, that "since he had had a seat there he had voted against all popular, and in favor of all unpopular measures." On the death of Charles Townshend, in 1769, he was made chancellor of the exchequer and leader of the house of commons, a post for which he was well qualified by his eloquence, good humor, wit, and readiness of resource. His folly was, however, one of the immediate causes of the American war. Earl Russell, in his *Life and Times of C. J. Fox*, says that "for £100,000 a year of revenue George Grenville provoked America, and that for £16,000 a year of revenue lord North lost America." In 1770, he succeeded the duke of Grafton as prime-minister. As a minister he was too ready to surrender his own judgment to that of George III., who, with a narrower understanding, had a stronger will, and was determined to subdue America. North was called by Horace Walpole the ostensible minister; the real minister was the king. North had to encounter an ardent and powerful opposition, led by C. J. Fox and supported by Burke. It has since been proved that North "so early as 1776 was of opinion that the system he was pursuing would end in ruin to the king and to the country." In 1778, he renounced the right of taxing the colonies. In 1782, it being impossible to carry on the war with America any longer, North resigned. "A more amiable man never lived," says earl Russell; "a worse minister never since the revolution governed this country." With North's retirement came to an end George III.'s scheme of governing the country by his own will, and ruling the house of commons by court favor and thinly disguised corruption. North was succeeded by the marquis of Rockingham, on whose death lord Shelburne became premier. Fox's dislike of the terms of peace with America led him to enter into a coalition with North, whom he had for so many years inveighed against as a minister without foresight, treacherous, vacillating, and incapable. North and Fox took office under the duke of Portland in 1783, but the coalition destroyed Fox's popularity, and the Portland administration only lasted a few months. North was afflicted by blindness during the last five years of his life. He succeeded to the earldom of Guilford, in 1790, on the death of his father, and died in Aug. 1792.

NORTH, Simeon, d.d., ll.d., b. Conn., 1802, after graduating at Yale College in 1825, was for 2 years a tutor in that institution. In 1829 he was appointed professor of ancient languages in Hamilton college, New York, and from 1839 to 1857 was president of that college. He printed several orations and sermons. He d. 1884.

NORTH, William, 1755–1836; b. at Fort Frederick, Maine, and in 1775 entered the revolutionary army; rose from the ranks, and in 1778 was a captain and present at the battle of Monmouth. The next year he was appointed aid to Baron Steuben, and remained with him until the surrender of Cornwallis. At the death of Steuben half of his estate was left to Gen. North, as he was then by brevet. He continued to serve in the army as inspector and adjutant-general until 1800; was afterwards a prominent federalist, speaker of the N. Y. legislature, and U. S. senator.

NORTH ADAMS, a city in Berkshire co., Mass.; on the Hoosac river and the Boston and Albany and the Fitchburg railroads; 21 miles n. of Pittsfield. It contains the villages of Beaver, Blackington, Braytonville, and Greylock, and was incorporated as a town in 1878 and a city in 1895. There are a state normal school, North Adams library, the A. J. Houghton public library, North Adams hospital, high school, electric railway to Adams and Williamstown, electric lights, city waterworks with large reservoirs, and several national and savings banks. The principal industries are the manufacture of cotton, woolen, and print goods, boots and shoes, machinery, iron castings, lumber, and tanned leather, for which there are many large plants. North Adams was one of the first places in the United States east of the Pacific slope where Chinamen were employed. Pop. '90, 16,074.

NORTHALLERTON, a t. and parish, 250 m. n.n.w. of London, and 30 m. n.n.w. of York by railway. It stands near the left bank of the Wiske. It contains a large number of public schools, and other institutions. Manufactures of linen and leather, brick-making, and malting are carried on on a limited scale. Pop. (1891) about 4000. The battle of the "Standard," so called from a high standard erected on a car by the English, was fought here, Aug. 22, 1138, between the English under the earls of Albemarle and Ferrers, and the Scotch under King David. The latter were defeated, and forced to retreat with great loss.

NORTH AMERICA. See America.

NORTHAMPTON, a co. in n.e. North Carolina, adjoining Virginia, drained by the Roanoke and Meherrin rivers; on the Atlantic Coast and the Seaboard Air Line railroads; 568 sq. m.; pop. '90, 21,242. The surface is generally level and the soil fertile. The principal productions are Indian corn, wheat, oats, tobacco, cotton, potatoes, and sweet potatoes. Co. seat, Jackson.

NORTHAMPTON, a co. in e. Pennsylvania, adjoining New Jersey; bounded on the e. by Delaware river, on the s.w. by the Lehigh river; crossed in the s. by the Lehigh river, on the Lehigh Valley the Lehigh and Hudson, and several other railroads; 380 sq. m.; pop. '90, 84,220, chiefly of American birth. The Kittatinny or Blue mountains run along the n.w., and the South mountain along the southeast. The surface in the center is level and the soil fertile. The principal products are Indian corn, wheat, rye, buckwheat, hay, potatoes, and wool. Co. seat, Easton.

NORTHAMPTON, a co. in s.e. Virginia, between the Atlantic ocean and Chesapeake bay, forming the s. part of a narrow peninsula the extremity of which is cape Charles; 290 sq. m.; pop. '90, 10,313, chiefly of American birth, includ. colored. The surface is level, and heavily wooded in parts. The soil is sandy, and the principal productions are Indian corn, oats, potatoes, and sweet potatoes. Co. seat, Eastville.

NORTHAMPTON, a tp. in Burlington co., N. J. Pop. '90, 5376.

NORTHAMPTON, city and co. seat of Hampshire co., Mass.; on the Connecticut river and the Boston and Maine and the New York, New Haven, and Hartford railroads; 17 miles n. of Springfield. It contains the villages of Bay State, Florence, Leeds, Loudville, Mt. Tom, Smith's Ferry, and West Farms, and was founded in 1656 and chartered as a city in 1883. The city occupies elevated ground and is noted for its beautiful scenery. Among the noteworthy institutions are Smith college (q.v.), the Clarke institute for deaf mutes, endowed with $3,000,000 by John Clarke, the State lunatic hospital, Dickinson hospital, the Burnham and Capen schools; Clarke, Forbes and Lilly libraries, the Soldiers' and Sailors' memorial hall, Old Ladies' home, the First Congregational church, in which Jonathan Edwards preached; the Hillyer art gallery, academy of music, Cosmian hall, etc. The city is lighted by electricity, and has electric street railroads, waterworks with three large reservoirs, several national and savings banks, and many objects of scenic interest. The principal industries are the manufacture of cotton and woolen goods, cutlery, sewing silk, oil stoves, silk goods, buttons, sewing machines, bicycles, baskets, brushes, wire, paper, pocket-books, furniture, hoes, and shovels, caskets, etc. The city has become widely noted as a summer resort. Pop. '90, 14,990.

NORTHAMPTON, capital of the co. of the same name, a market-t., and parliamentary and municipal borough, on a rising ground on the left bank of the Nen, 67 m. n.w. of

London by railway. In the center of the town is a spacious market-square. The principal edifices are the shire hall, the new and handsome town-hall, the corn exchange, the numerous churches, several of which are unusually interesting, as St. Peter's, a recently restored and beautiful specimen of enriched Norman, and St. Sepulchre's, much improved in 1865, one of the very few round churches in the empire, and referred to the twelfth century. Pop. '81, 57,553; '91, 61,016.

NORTH ATTLEBORO, a town in Bristol co., Mass., on New York, New Haven, and Hartford railroad, 32 miles s.s.w. of Boston, has a high school, several churches, Richards memorial library, G. A. R. memorial hall, the Holmes memorial building, Simmons park, electric lights and street railroad, high school, and extensive manufactories of jewelry, braid, silverware, and cotton yarn. Pop. '90, 6727.

NORTH BAY, a village in Nipissing district, Ontario, Canada; on lake Nipissing and the Canadian Pacific and Grand Trunk railroads. Small steamers ply on the lake, and the place is much visited by tourists and fishing parties. There are several hotels, outfitting stores, churches, and mills. Pop. '91, 1,482.

NORTHBRIDGE, a town in Worcester co., Mass.; on the Blackstone and Mumford rivers and the New York, New Haven, and Hartford railroads; 13 miles s.e. of Worcester. It contains the villages of Whitinsville, Linwood, Rockdale, Riverdale, Northbridge Centre, Adams Corners, Prentice Corner, Quaker District, and Stone District, and was incorporated in 1772. There are the Whitin Park, Whitin memorial building, public library, national and savings banks, electric lights, and large manufactories of cotton goods and cotton and woolen machinery. Pop. '90, 4,603.

NORTHBROOK, Lord. See Baring.

NORTH BROOKFIELD, a town in Worcester co., Mass.; on the Boston and Albany railroad; 23 miles w. of Worcester. It was incorporated in 1812, and has a high school, public library, savings bank, and large boot and shoe factories. Pop. '90, 3,871.

NORTH CAPE. See Magerøé.

NORTH CAROLINA, a Southern Atlantic state, and one of the original 13; between lat. 33° 49′ 45″ and 36° 33′ n.; long. 75° 27′ and 84° 20′ w.; bounded on the n. by Virginia and Tennessee; on the e. by the Atlantic ocean; on the s. by Georgia and South Carolina; on the w. by Tennessee; greatest length, from e. to w., 503 m.; greatest breadth, 187 m.; land area, 48,580 sq. m.; gross area, 52,250 sq. m., or 33,440,000 acres.

History.—North Carolina, popularly called the Old North State, was first explored by a party of 108 persons sent from England by Sir Walter Raleigh in 1584, and the first settlement was made on Roanoke island in 1585. Trouble with the Indians, however, caused the colonists eventually to return to England. Two other colonies were equally unsuccessful, and the second, sent out in 1587, disappeared mysteriously.

In 1663 and 1665 Charles II. made a grant of the province, which included both of the Carolinas, to eight noblemen, by whom great efforts were made to induce colonization, and shortly afterward colonies of French, German, and Swiss Protestants came over. About 1700 the province was divided into North and South Carolina, and separate governments were organized, and subsequently there was a large immigration of Scotch and Scotch Irish. From 1729 up to the revolution, North Carolina was ruled by successive governors appointed by the English king, the rights and franchises of the lords proprietors having been bought by the crown. The royal authority was not recognized after Mar., 1774; in August delegates were appointed to the Continental Congress at Philadelphia; in May, 1775, some inhabitants of Mecklenburg co. renounced allegiance to the crown and issued the "Mecklenburg Declaration of Independence" (q.v.). The colony ratified the Declaration of Independence, Aug. 1, 1776, and on Dec. 18 held a convention at Halifax and framed a constitution for the state, which remained the organic law until 1835. The U. S. constitution of 1787 was rejected by the state in 1788, but ratified, 1789. After the revolution the state enjoyed much prosperity, and its history is marked by no particularly eventful period until the breaking out of the civil war. The popular sentiment in the state at the beginning of 1861 was apparently in favor of the Union; but after the surrender of Fort Sumter and the declaration of war, an extra session of the legislature was called, and an ordinance of secession passed, May 21. The state thenceforth during the next four years suffered many disasters of war. In Aug., 1861, Fort Hatteras and Fort Clark were seized by federal forces; Roanoke island and Newbern were next captured by Burnside's expedition; and later the region about Plymouth, Kinston, and Washington was taken and occupied by federal troops. Other important battles fought in the state during the war were at Averysboro, Bentonville, and the taking of Fort Fisher. As soon as peace was declared, a provisional governor, W. W. Holden, was appointed, and on Oct. 2, 1865, a convention, assembled at Raleigh, declared the ordinance of secession null, abolished slavery, and repudiated the state debt created to carry on the war. An election was held soon after, and a governor, legislature, and members of congress chosen. But as the reorganized government refused to ratify the fourteenth amendment to the constitution of the United States, the state was declared to be still under military authority, and was placed under the command of Gen. D. E. Sickles. Another convention, there-

INTERNATIONAL CYCLOPÆDIA.

COPYRIGHT, 1891, BY DODD, MEAD & COMPANY.

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

fore, was called; the delegates met in Raleigh in Feb., 1868, and prepared a new constitution, and in July the state retook her place in the union.

Topography.—Two great divisions of the Appalachian range cross the extreme western part of the state, the one forming the boundary with Tennessee, bearing different names, according to locality, such as the Smoky, Black, and Stone Mts. Six peaks in this range exceed Mt. Washington (6286 ft.). Clingman's Peak rises 6619 ft. above the sea, and Mt. Mitchell, 6732 ft. The eastern or Blue Ridge contains Sugar Mt., 5312 ft., and Grandfather Mt., 5897 ft. These chains enclose an uneven but fertile plateau. From the Blue Ridge an undulating country descends toward the low and marshy coast. The coast line, over 400 m. in length, consists of a succession of low, sandy islands or banks, separated from the mainland by broad and sheltered sounds, Albemarle, Pamlico, etc., giving access to the ocean at different points, and projecting outward the dangerous promontories of Capes Hatteras, Lookout, and Fear. Few of the rivers are deep enough for large vessels. The principal ones flowing directly to the sea are the Cape Fear, 200 m. long; the Roanoke, 150 m. long; the Neuse, the Tar, and the Chowan. The Roanoke and Chowan rise in Virginia. The Yadkin, Catawba, and Broad flow into South Carolina; the Little Tennessee and French Broad into Tennessee. There are many swamps and small lakes in the lowlands, and the Dismal Swamp of Virginia extends into this state. The scenery of the mountain region is grand.

Geology and Mineralogy.—The sandy country from the coast to the lowest falls of the rivers is tertiary and quaternary; the remaining portion is azoic, chiefly gneissic and schistose, with belts and areas of slates. The mineral wealth is remarkable. There is a coalfield in Stokes and Rockingham cos., with an area of 30 sq. m., and another in Chatham and Moore cos., with an area of 40 sq. m., and the total coal-bearing area of the state is officially estimated at 2,700 sq. m. The beds have been mined to some extent, principally at Egypt, Farmville, and Homsville. Gold has been found in 23 cos., and it has been mined to a considerable extent for nearly half a century. The most productive mines are the Gold Hill mines in Rowan co., which were discovered in 1842. Other regular veins have been worked in Davidson, Cabarrus, Stanley, Montgomery, and Mecklenburg cos.; also irregular veins and surface gold to some extent, in Catawba, Randolph, Union, Franklin, and other cos. Silver is found in Davidson and Clay cos., but the mines have been little worked. Copper ores of various kinds exist in several parts of the state; tin, near Kings Mt.; lead, zinc, antimony, nickel, and other metals are known to exist. Mica is profitably mined in Mitchell and Yancey cos. Alum, graphite, bismuth, buhrstone, granite, kaolin, limestone, whetstone, grindstone, soapstone, and corundum are found, the latter in great abundance; also diamonds, amethysts, garnets, tourmalines, sapphires, monazite, zircon, and petroleum is obtained from the coal-bearing slates. A belt of phosphate beds 15 to 20 m. wide extends from the South Carolina border to the Neuse River.

Zoölogy.—The wild animals, fowls, and birds include the bear, deer, wolf, gray, black, and red fox, wild-cat, opossum, pekan, marten, raccoon, rabbit, flying squirrel, cotton-rat; the swan, goose, brant, pelican, duck, marsh-hen, curlew, snipe, quail, partridge, plover, pheasant, turkey, woodcock, bald eagle, gray eagle, hawk, falcon, crow, raven, dove, robin, mocking-bird, rice-bird, lark, whippoorwill, etc. The rivers and coast waters abound in shad, sheepshead, mackerel, alewives, flounders, blue-fish, red-fish, black-fish, herring, mullet, soles, and bass. The swamps and marshes furnish terrapin and turtles, and the rattlesnake, kingsnake, viper, etc., are among the reptiles.

Botany.—Few if any states have so varied and beautiful a flora. The forest trees of the mountains and uplands are the 8 species of pine, the hemlock, Carolina hemlock, spruce, red, black, white, chestnut, and Spanish, and 14 other species of oak, chestnut, 3 species of birch, ash, elm, black and white gums, 6 species of hickory; 5 of maple, walnut, locust, lime; 3 species of mulberry, dogwood, sycamore, rhododendron. The lower and coast lands abound with the long-leaf pine, evergreen, oak, white and red cedar, holly, juniper, cypress, maple, poplar. An extent of territory, stretching across the state and varying in width from 30 to 80 m., is covered with long-leaved pine, and yields a large part of the world's supply of resin, turpentine, tar, pitch, and lumber. The vines and trailing plants include the honeysuckle, trumpet vine, yellow jessamine, and several indigenous grapes, from which have been derived the cultivated Isabella, Catawba, and Scuppernong. The swamps are overgrown with cane.

Climate, Soil, and Agriculture.—The temperature of the lowlands is hot and humid; but in the interior, particularly in the Piedmont and the mountain section, the air is singularly pure, dry, and elastic. The mean annual temperature at Raleigh is 60°; at Asheville, 50°; at Wilmington, 63°; and the average rainfall is about 45 ins. Severe frosts are sometimes experienced in the north. Many charming health resorts are to be found in the state; of these, the favorite are Asheville, with its mild and equable climate, Waynesville and Cæsar's Head, and a number of mineral springs.

The swamp lands along the coast when drained, and the river bottoms, are very fertile, and produce annually 6,000,000 pounds of rice. Cotton can be raised throughout the state, except in the higher mountain regions, but its production is confined chiefly to the southern section; the annual yield exceeds 465,000 bales. Wheat, corn, oats and tobacco are also important crops. The northern counties, known as the Bright Tobacco Belt, produce a large percentage of the yellow tobacco of the United States, which is particularly free from nicotine, and therefore commands the highest market prices. The mountainous sections are devoted to stock raising and dairy farming. Small fruits are

extensively produced. The Scuppernong grape, native to North Carolina, is the only known variety that withstands the ravages of the phylloxera. The peanut crop exceeds 100,000 bushels annually. This state is the first in the value of its medicinal herbs, of which hellebore, ginseng, and spikenard are the chief. The increased interest of the farmers is shown by the number of agricultural societies, and by the large number of members of the Farmers' Alliance (q.v.) and of Grangers (q.v.). Much intelligent work has also been done by the state agricultural department in analysis of fertilizers, and the exploration of marl and phosphate beds.

INDUSTRIES.—The leading manufacturing industries are the sawing of lumber and the production of resin, tar, pitch, turpentine oil, cotton-seed oil, tobacco, flour, and the smelting of ores. Manufacturing interests have developed greatly since 1880, particularly in cotton goods and tobacco, and there are indications of a still greater development at an early day. Raleigh has iron foundries, car and machine shops and other manufacturing establishments; Durham is a great tobacco manufacturing town, and Burlington has cotton mills. This state produces nearly half the smelted and rolled zinc made in this country. The fisheries are increasing in importance, over 100,000 barrels being taken annually. Hatcheries have been established for shad, rock-fish and herring. Surveys have been made and oyster beds located.

COMMERCE.—The customs districts are Albemarle, Wilmington, Pamlico, and Beaufort, and the chief exports, domestic and foreign, are tar, turpentine, resin, lumber, cotton, tobacco, flour, and fish. This state is very deficient in good harbors, though the harbor of Wilmington has been much improved by the national government, so that vessels drawing twenty feet of water can now come to its wharves. Wilmington is the metropolis of the state, has a large foreign commerce, is a leading market for naval stores, and has steamship lines to New York, Philadelphia, and Baltimore. Newbern has a large trade in naval stores, also in early vegetables, and has several steamship lines.

RAILROADS.—The principal railroad systems are the Seaboard Air Line, Atlantic Coast Line, the Southern System, and Norfolk and Western, with their branches, and a number of lesser lines connecting with these main lines. The total mileage in the state exceeds 3,600; capital nearly $23,000,000; cost over $45,000,000. The Dismal Swamp canal affords communication between Albemarle sound and Chesapeake bay.

BANKS.—In 1896 there were 28 national banks in operation, with combined capital $2,766,000, deposits $4,947,482, and reserve $1,389,794; 41 state banks, capital $1,997,635, deposits $3,472,545, resources $6,339,829; 6 stock savings banks, capital $350,525, deposits $638,209, resources $1,357,613; and 17 private banks, capital $306,485, deposits $839,264, resources $1,368,459.

RELIGIOUS DENOMINATIONS, EDUCATION, ETC.—The leading denominations according to strength are the Baptist, South; Baptist, Colored; African Methodist; Methodist Episcopal, South; Presbyterian, South; Methodist Episcopal; Methodist Protestant; Christian, and Disciples of Christ. Education, especially for the poorer classes, developed very slowly in the early colonial days. After the immigration of the Scotch Irish in 1736, numerous classical schools were founded by them, but these could be only for the children of the better classes. The public school system still suffers from the loss of the school fund during the civil war; 600,000 acres of public swamp lands have been set aside toward the fund, but the expense of drainage renders them for the present of little value. Fine graded schools, supported by special taxation, are found in all the cities and larger towns, but it is impossible to provide by general taxation for keeping country schools open the proper length of time, on account of the clause in the constitution in reference to taxation. The enrollment (1896) was 348,610; average daily attendance, 204,203. Several normal schools for white teachers are held in different parts of the state for about a month each summer, also five normal schools for colored, open for several months. The State university, opened in 1795, was the only southern institution of its rank that remained open during the war. Among higher institutions are Wake Forest college (Bapt.), Wake Forest station; Biddle university (Pres.), Charlotte; Davidson college (Pres.), Davidson station; Trinity college (M. E., S.), Durham; Shaw university (Bapt.), Raleigh; Livingstone college (A. M. E. Zion), Salisbury; and Lenoir college (Luth.), Hickory. There are several denominational colleges for women; state normal schools at Elizabeth City, Fayetteville, Goldsboro, Greensboro, Plymouth, and Salisbury; and separate agricultural colleges for white and colored pupils. There are theological schools for both white and colored, also medical; and law schools for whites.

GOVERNMENT, ETC.—The capital is Raleigh. The state officers are elected for four years, and the governor receives a salary of $5000. The legislature, consisting of fifty senators and one hundred and twenty representatives, all members elected for two years and receiving $4 a day, meets biennially, on the Wednesday after the first Monday in January, and is limited to a session of sixty days. State elections are held biennially on the Tuesday after the first Monday in November. The supreme court consists of a chief-justice and two associates, elected by the people for eight years, and receiving $2500 salary each. The national guard consists of 1410 men; total available for service in time of war, 240,000. The state was one of the first to organize a naval reserve force. The state institutions not educational are the asylums for the insane at Raleigh, Morganton, and Goldsboro, and the penitentiary at Raleigh.

The right to vote is conferred upon every male citizen twenty-one years of age, who shall have resided in the state one year and the county ninety days previous to election. The registration of voters is required, but new ballot laws have not yet been adopted. Atheists are disqualified for office, and also all persons who have been convicted of trea-

* No population.

son, perjury, or other infamous crimes, and not legally restored to the rights of citizenship Defendants and their wives are allowed to testify in criminal actions. The property of a married woman is her own, and not liable for the debts of her husband. A local-option liquor law was passed in 1887. The legal rate of interest is 6 per cent. ; 8 is allowed by contract; the penalty for usury is forfeiture of the entire interest.

The electoral votes have been cast as follows: 1792, Washington and Clinton, 12 ; 1796, Adams and Pinckney, 12 ; 1800, Jefferson and Burr, 12 ; 1804, Jefferson and Clinton, 14 ; 1808, Madison, for president, 11 ; 1812, Madison and Gerry, 15 ; 1816, Monroe and Tompkins, 15, 1820, Monroe and Tompkins, 15 ; 1824, Jackson and Calhoun, 15 ; 1828, Jackson and Calhoun, 15 ; 1832, Jackson and Van Buren, 15 ; 1836, Van Buren and Johnson, 15 ; 1840, Harrison and Tyler, 15 ; 1844, Clay and Frelinghuysen, 11 ; 1848, Taylor and Fillmore, 11 ; 1852, Pierce and King, 10 ; 1856, Buchanan and Breckenridge, 10 ; 1860, Breckenridge and Lane, 10 ; 1868, Grant and Colfax, 9 ; 1872, Grant and Wilson, 10 ; 1876, Tilden and Hendricks, 10 ; 1880, Hancock and English, 10 ; 1884, Cleveland and Hendricks, 11 ; 1888, Cleveland and Thurman, 11 ; 1892, Cleveland and Stevenson, 11; 1896, Bryan and Sewall, 11.

Finances.—The total assessed valuation of real and personal property in the state, according to the last United States census reports, was $212,697,287; state debt, $7,703,100; total bonded debt, 1896, $3,360,700; total assessed valuation, $256,316,092.

Population.—In 1790, 393,751—100,572 slave, 4975 free colored ; 1800, 487,103—133,296 slave, 7043 free colored ; 1820, 638,829—204,917 slave, 14,712 free colored ; 1840, 753,419—245,817 slave, 22,732 free colored ; 1860, 992,622—331,059 slave, 30,463 free colored ; 1880, 1,399,750—532,508 colored, including 1230 Indians and 1 Japanese ; male, 687,908 ; female, 711,842 ; foreign born, 3742 ; dwellings, 264,305 ; families, 270,994 ; persons to sq.m., 28.8 ; engaged in agriculture, 360,937 ; rank of state, 15 in population, 18 in value agricultural products, and 29 in value manufactures ; pop. 1890, 1,617,947. There are 96 cos. ; for pop. 1890, see census tables, vol. XV. The largest cities, 1890, were Wilmington, 20,056 ; Raleigh, 12,678 ; Charlotte, 11,557.

NORTHCOTE, Sir Stafford Henry, b. London, 1818 ; educated at Eton, and Oxford univ., graduating at Balliol coll. in 1839 with high honors. His first position in political life was that of private secretary to Mr. Gladstone, when the latter was president of the board of trade. In 1847 he was called to the bar and was made legal secretary to the board of trade. In 1851 he succeeded to the family title and estates as eighth baronet of the line. For the next 3 years he was occupied in examining the state of the English civil service, and the report made by him and his colleague, sir C. E. Trevelyan, led to the establishment of the present system of competitive examinations. He was member of parliament from Dudley and Stamford from 1855–66, and was then returned from North Devon, which place he continued to represent in the interest of the conservative party. He was president of the board of trade (1866–67), and in 1867 was made secretary of state for India. He was appointed a member of the joint high commission which signed the treaty of Washington on May 8, 1871. On the formation of Disraeli's cabinet in 1874, sir Stafford Northcote was made chancellor of the exchequer, and when his leader was elevated to the peerage under the title of lord Beaconsfield, Northcote became himself the leader of the house. He was a magistrate and deputy-lieutenant of Devonshire, a fellow of the royal society, and received from Oxford the honorary title of D.C.L. He published a number of political and financial pamphlets such as *Twenty Years of Financial Policy* (London, 1862). He became Baron Iddesleigh, 1885, and died 1887.

NORTH DAKOTA, a n. western state, situated between lat. 46° and 49° n. and long. 96° 25′ and 104° 5′ w.; is bounded on the n. by Canada (Assiniboia and Manitoba) ; on the e. by Minnesota ; on the s. by South Dakota ; on the w. by Montana ; length from e. to w., about 360 m.; breadth, 215 m.; area, 70,795 sq.m., or 45,298,600 acres.

History.—The first permanent white settlement was made by French Canadians in 1780, near Pembina. Early in the present century fur-trading posts were established within the limits of the present state, and in 1810 lord Selkirk built a fort near Pembina, supposing the region to be British soil. In 1851 a treaty with the Dakota Indians opened a part of the vast region to settlement. In 1861, Mar. 2, the territory of Dakota was organized, with Yankton as the capital, and included what are now Idaho, Montana, and Wyoming. Troubles with the Indians and the occurrence of the civil war retarded immigration until 1866. In 1883 Bismarck was made the capital. In Feb., 1889, congress passed an enabling act, in accordance with which conventions were held on May 14, in North and South D., when the division of Dakota territory was decided upon, and delegates to constitutional conventions were elected. The convention of North D. assembled at Bismarck, July 4; the constitution framed was adopted by the people, Oct. 1; on Oct. 2, senators and a representative were elected; on Nov. 3, North D. was admitted to the union; on Nov. 4, the state govt. was organized; on Nov. 19 the first legislature convened.

Topography.—The great plateau of the Missouri extends n.e. and s.w. across the state, e. of that river, and is broken here and there by low hills. The rest of the surface is chiefly undulating prairie, with occasional ranges of low hills. The Turtle mts., on the Canadian border, cover an area of 3200 sq.m. in the state, but their highest peaks, butte St. Paul and Pear butte, have an elevation of only 700 ft. above the surrounding country. The Missouri, which is navigable throughout North D., receives

its chief affluents from the w.—the Little Missouri, Heart, and Cannon Ball. The Souris or Mouse enters from Canada, and after a long circuit returns, to empty into the Assiniboine. The principal streams in the e. are the James or Dakota, the longest unnavigable river in the world, the Sheyenne, and the Red River of the North, which forms the eastern boundary. Of the numerous lakes, Devil's, Spirit, or Minniwaukon lake, in the n.e., is the only one of size, its area being about 100 sq.m., while its elevation is 1200 ft. above the sea. Its waters are saline, and it has no outlet.

Geology and Mineralogy.—The whole surface of the state appears to have been several times submerged, forming part of a great inland sea, and later to have been covered with shallow lakes. The evidences of glacial and alluvial action are evident in the drift, which overlies the whole surface, varying in depth from 40 to 100 ft., and in the granite, gneiss, and quartzite boulders which abound e. of the Missouri. All of the state w. of the Missouri and much of the northern part is underlaid with lignite or brown coal, which burns readily, and makes superior gas. Natural gas has been found in several localities, and brick and potter's clays are widely distributed.

Zoology and Botany.—The wild animals are like those found in Minnesota. The lakes and streams abound in wild fowl, such as the swan, goose, duck, brant, snipe, curlew, and gull. The Turtle Mts. are well wooded with oaks, aspens, and birches; the Devil's lake region has large belts of timber; oaks and other trees of large size grow in the Red river valley, and along the Missouri, Souris, and other streams are found the cottonwood, ash, willow, aspen, box-elder, plum, bull cherry, grape, etc. The prairies abound in bunch, buffalo, blue-joint, and other grasses, and are covered with flowers, such as the compass plant, lupine, sunflower, pasque-flower, evening primrose, etc.

Climate, Soil, and Agriculture.—The winters are cold but dry, and the summer days, though warm, are followed by cool nights. The snowfall is comparatively light, and the only disagreeable winds ("blizzards") are those from the n.w. Autumn is a delightful season, the number of sunny days in winter is large, and spring, as a rule, begins abruptly in March. The mean annual temperature at Bismarck is 39.4°; at Pembina, 34.3°; at Fargo, 37°; and at Fort Buford, 38.7°. The mean annual rainfall at Bismarck is 20.10 ins.; at Pembina, 21.91 ins. Spring begins a week earlier at Mandan than in the same lat. e. of the James river. The soil is chiefly black loam underlaid with clays, gravels, and sands, impregnated with sulphates and salts. The clay subsoil is as fertile as the topsoil, and both are light, porous, and free from stones. The Red river valley is noted for its spring wheat. Corn, oats, barley, buckwheat, rye, flax, and potatoes are among the products of the state. Cabbages, beets, pumpkins, potatoes, and other vegetables of remarkable size are grown; also apples, gooseberries, raspberries, currants, and all kinds of small fruits. The most important industries are agriculture, stock-raising, and the manufacture of flour, lumber, butter, leather, cigars, bricks, and woolen goods. The value of the cereal, potato, and hay crops exceeds $30,000,000 per annum, the state ranking first in production of wheat (over 61,000,000 bushels), and the value of farm and ranch animals, $16,000,000.

The principal railroads are the Northern Pacific; Great Northern; Chicago, Milwaukee, and St. Paul; Chicago and Northwestern; and the Minneapolis, St. Paul, and Sault Ste. Marie. The total mileage exceeds 2,500; the capital of local roads is about $1,000,000, and the cost of roads and equipment was nearly $2,000,000.

Banks.—In 1896 there were 29 national banks in operation, with combined capital $2,060, and deposits $5,020,500; and 72 state banks, with capital $1,051,500, and deposits $2,483,000.

Religious Denominations, Education, etc.—The leading denominations, numerically, are the Roman Catholic, Lutheran, Methodist Episcopal, Presbyterian, Baptist, and Congregational. Each organized county has a superintendent of schools, elected by the people. The township school organization is controlled by a board of directors, one for each subdistrict and one at large. Women 21 years of age are eligible to any school office, and those having the care and custody of children may vote at school elections. In 1895 the public school enrollment was over 47,000; average attendance, 32,300; value of school property, about $2,000,000; annual expenditure, over $1,000,000. The institutions of superior rank are the univ. of North Dakota and the School of Mines, Grand Forks; the state agricultural college, Fargo; state normal schools at Valley City and Mayville; Fargo college (Cong.); Tower university (Bap.), Tower City; Jamestown college (Presb.). There are about 20 public high schools; denominational academies at Devils Lake, Grand Forks, Jamestown and Portland; and a state industrial school at Ellendale.

Government.—The capital is Bismarck, and in 1892 the question of choosing some other locality was decided in the negative. The gov. and lieut.-gov. are elected for 2 years. The senate must consist of not less than 30 nor more than 50 members; the house of representatives of not less than 60 nor more than 140 members. Sessions are biennial, and are limited to 60 days. The supreme court consists of 3 judges, holding office 6 years. The legislature has the right to control transportation rates, and municipal corporations are under its control. Trusts and combinations are unlawful. Elections must be by secret ballot. The right to vote depends on a previous residence of one year in the state, 6 months in the co., and 90 days in the precinct. A prohibitory liquor law was adopted in 1889. In 1892, the state divided its 3 electoral votes equally between Cleveland, Harrison, and Weaver; 1896, McKinley and Hobart, 3.

The total bonded indebtedness assumed by North D., when the territory was divided,

was $546,300, but thereafter is limited to $200,000; the assessed value of real and personal property was $70,039,902. The votes for member of congress, in 1890, numbered 36,195. The penitentiary is at Bismarck. Other institutions are an asylum for the deaf and dumb at Devils Lake; a soldiers' home at Lisbon; a hospital for the insane and a home for feeble-minded persons, both at Jamestown. There are land offices at Fargo, Grand Forks, Devils Lake, and Bismarck.

POPULATION.—In 1880 the territory of Dakota had 135,177 inhabitants, all but about 2,000 white; in 1890 the number was 182,719. Those of foreign birth are chiefly Norwegians, Swedes, Canadians, and Germans. There were, in 1890, 53 counties, but by abolition and consolidation these have been reduced to 39. The largest places, 1890, were Fargo, 5664; Grand Forks, 4979, Jamestown, 2,296, and Bismarck, 2,186.

NORTH-EAST AND NORTH-WEST PASSAGES. The numerous and important discoveries made by the Portuguese and Spaniards in the southern latitudes of Asia, and the reports circulated of the fabulous wealth of those regions, prompted the other maritime nations of Europe to send expeditions to the East Indies, but Spain, monopolizing the lucrative traffic, summarily shut out her rivals from the Atlantic and Indian oceans. Determined not to abandon their designs, they resolved to reach India and Cathay (China) by some other route. Two plans appeared most feasible—the one to reach Eastern Asia by coasting along the north of Europe and Asia, the *north-east passage;* the other by sailing westward across the Atlantic. The latter was first attempted by John Cabot in 1497, but he found his progress barred by the American continent, or, at least, those parts of it known as Newfoundland and Labrador. Three years afterward Gaspard Cortereal and his brother made three several voyages in the same direction; and on reaching Newfoundland sailed northward, but were stopped on the coast of Labrador, in lat. 60° n. Both brothers afterward perished with their followers. Several futile voyages were soon after made to discover if a passage for ships existed to the n. of America (the *north-west passage*).

North-East Passage.—The search for a north-east passage was now vigorously prosecuted, and England had the honor of sending out the first expedition for this purpose in 1553. It consisted of three ships, commanded by sir Hugh Willoughby, and was fitted out under the direction of the celebrated Sebastian Cabot; but on rounding the North cape, one of the ships was separated from the others during a violent storm, and subsequently entered the White sea, then unknown to western Europeans. The other two, under Willoughby, drifted hither and thither, in the vast waste of water surrounding the pole, till the navigators sighted Nova Zembla. Being unable to land, they sailed back along the north of Russia, and took up their winter quarters on the coast of Russian Lapland, where they were subsequently found frozen to death. Several other expeditions were, at different times, sent out by the English and Dutch, but none of them ever succeeded in penetrating further than the e. coast of Nova Zembla, though they rendered good service to geography by making accurate surveys of Northern Europe and the adjacent islands of Spitzbergen, Nova Zembla, Waygatz, etc. It was for a long time believed that the promontory which forms the eastern boundary of the gulf of Obi was the *tabis* of Pliny, and formed the n.e. corner of Asia; and this opinion, which received the assent of the celebrated Gerard Mercator, tended greatly to encourage renewed explorations, as, according to it, the eastern coast of Asia was not more than 400 m. from Nova Zembla. The chief expeditions for the discovery of the north-east passage were those of Willoughby and Chancelor, 1553, Burroughs, 1556, Pet and Jackman, 1580, all English; the 3 undertaken by the Dutchman, William Barentz, 1594–96; the English expedition under Henry Hudson, 1608; and the Dutch expeditions under Hudson, 1609, and Wood, 1676. In his third expedition, Barentz nearly reached Icy cape, about long. 100° e., but was imprisoned by the ice and died before the return of spring. The Russian government next took up the search, partly by overland expeditions and by vessels starting from points on the n. and e. coasts of Siberia; among the expeditions were those of Behring, 1741, which was stopped at the East cape; of Shalaroff, and of Billings. In 1875 and 1876 Nordenskiöld, the Swedish explorer, reached the eastern shores of the gulf of Obi; and starting again in July, 1878, rounded cape Chelyu-skin, from September to July following, was frozen in Behring's strait, and reached Yokohama, September 2.

North-West Passage.—As was formerly mentioned, Sebastian Cabot and the brothers Cortereal were the first who attempted to double the n. coast of America; Cabot had reached as far n. as lat. 67° 30′, in the strait between Greenland and America, but the courage of his crew failing, he was compelled to return. Notwithstanding his urgent representations, he was unable to prevail upon the English monarch to send out another expedition, and it was not till after several unsuccessful attempts had been made to discover a n.e. passage that investigations of the northern coast of America were resumed. In all, more than 200 voyages were made in search of a n.w. passage, so that only the most important of them can be even mentioned. The first expedition, after that of Cabot, was sent out in 1576, under Martin Frobisher, who made a second and third voyage in the two following years, but without any important discovery. In 1585–88 northern enterprise received an impetus from the successful expeditions of Capt. John Davis. This navigator sailed up the strait which bears his name, as far as lat. 72° n., and reported open sea still further n.; he then surveyed the e. and w. sides of the strait,

but without further results. Henry Hudson (q.v.), who had previously attempted the n.e. passage, followed in 1610, and discovered the Hudson's strait and bay, believing the latter to be none other than an inlet of the Pacific ocean, an opinion which was proved erroneous by the investigations of Button in 1612; the latter, however, disseminated on his return the equally erroneous opinion that the bay was closed in on all sides, with the exception of the two eastern entrances. Button's account was not universally credited, and accordingly, in 1615, Capt. Bylot, who had been one of Hudson's company, was sent out, accompanied by Baffin, the most skillful navigator and scientific observer of the time; but their first expedition, which was to Hudson's bay, was devoid of results. In their next voyage (1616), they sailed up Davis's strait, reaching lat. 78° n., and satisfying themselves by a very superficial investigation that there was no northern outlet, the bay (as it was then believed to be) was named in honor of its explorer Baffin's bay. On their return southwards, they coasted along the w. side, and discovered an opening to the w. which they named Lancaster sound, but believing it to be only an inlet, did not explore further. On his return, Baffin gave it as his decided opinion that no outlet to the w. existed from Baffin's bay, and the attention of explorers was again directed to discover an outlet from Hudson's bay. In 1619 the solitary attempt by foreign powers to aid in the search was undertaken by Jens Munk, a Dane, but he made no discoveries, and the attempt was not renewed. The expedition of Fox and James, in 1631, led to the partial exploration of the channel since known as the Fox channel, which forms the northern outlet to Hudson's bay, and from this time the spirit of discovery slumbered till 1741. Between this date and 1746, several expeditions were sent out to discover an outlet from the n.w. corner of Hudson's bay, but their united researches satisfactorily proved that no such outlet existed. Owing to these disappointments, the search for a n.w. passage was discontinued for more than half a century, notwithstanding the fact of the British parliament having promised a reward of £20,000 to the fortunate discoverer. In 1818 the admiralty took up the search, and sent out Capt. John Ross and Lieut. Parry, who sailed up Davis's strait, and ascended Lancaster sound for 30 m.; here Capt. Ross gave up the search, considering it to be hopeless. But this opinion was by no means coincided in by Parry, who was accordingly sent out in the following year, and succeeded in far outstripping all his predecessors in the career of northern discovery. He entered Lancaster sound on July 30, and a few days afterward discovered a large inlet, 30 m. broad, which he named Prince Regent inlet. After exploring this inlet for some distance, he returned, and continued his course westward, as the ice allowed him, passing through a strait which he named after sir John Barrow, the promoter of the expedition. Continuing his westward course, he reached long. 110° w., in Melville sound, where he was stopped by the ice; and after wintering here, and giving names to the numerous islands, seas, and straits he had discovered, returned to Britain, with the glory of having advanced 30° of longitude further w. than any previous explorer. On his arrival he was welcomed with the utmost enthusiasm, and his discoveries imparted renewed energy to the half-dormant maritime enterprise of the British. There was now no doubt in what direction the n.w. passage was to be sought, but Parry's second expedition (1821–23) was for the purpose of determining whether the Fox channel was connected with the Arctic sea of his previous voyage; it was, however, unsuccessful. A little before this time the coast-line of North America from Behring's strait to Point Turnagain, in long. 109° w., had been fully traced, so that it only remained to find some navigable passage from Regent inlet to this point, and the long-wished-for result would be attained. For this purpose Capt. John Ross was sent out with an expedition in 1829, and after a laborious and difficult voyage up Prince Regent Inlet, reached a point only 200 m. from point Turnagain. It was during this voyage that he discovered the magnetic pole. Dease and Simpson, in 1838, extended the survey of the American coast from point Turnagain to within 90 m. of the magnetic pole, but the hopes of a channel between these points were dashed by the discovery made by Dr. John Rae, in 1847, that Boothia (the land which bounds Regent Inlet on the w.) is a peninsula of the American continent. We now come to the unfortunate expedition of sir John Franklin, which, it was fondly hoped, would settle the question of a n.w. passage. It sailed from England, May 19 1845, and was last seen in Baffin's bay. Franklin is believed to have sailed through Lancaster sound, and ascended Wellington channel to lat. 77° n., and thence returned southwards, crossing Barrow strait, and sailing down the channel (now called Franklin Channel) which separates North Somerset and Boothia Felix from Prince of Wales island to the w., where, in lat. 70° n., long 98° 30′ w,, his ships were beset with ice, Sept. 12, 1846, and Franklin died June 11, 1847. The survivors abandoned the vessels 20 m. s.w. of this point, and perished in the attempt to reach the American mainland. Many expeditions were sent out to search for the missing voyagers, and one of these expeditions, under Collinson and M'Clure, sailed from Plymouth, Jan. 20, 1850, and reached Behring's strait in August the same year. Sailing eastward the following spring, M'Clure's ship became fixed in the ice, about 60 m. w. of Barrow strait, and the crew were picked up by sir Edward Belcher, who had been sent out in April 1852 to their assistance. Belcher, who had reached Melville sound by the eastern passage through Lancaster sound and Barrow strait, returned the same way; and thus M'Clure and his company enjoyed the envied honor of being the only ship's crew who had ever penetrated from Behring's strait to Baffin's bay. To M'Clure, then, belongs the honor

of having finally set at rest all doubts as to the existence of a n.w. passage. By the various English and American expeditions (1848–59) sent out to search for sir John Franklin, the whole region to the n. of the American mainland as far as lat. 77° n., and long. 106° w., has been thoroughly explored, and various channels of communication between Davis's and Behring's straits have been discovered, such as the route by Hudson's bay, Fox Channel, Fury and Hecla strait and Bellot strait, into Franklin Channel and thence by either the M'Clintock or the Victoria Channel, or the routes by Lancaster sound, and the M'Clintock Channel, Prince Regent Inlet, or Prince of Wales strait, to the open sea n. of Alaska ; but all these routes are useless in a mercantile point of view. See POLAR EXPEDITIONS.

NORTHERN LIGHTS. See AURORA BOREALIS.

NORTH HOLLAND CANAL. Designed by Herr Blanken, and finished in 1825. It runs from Amsterdam to the Helder, 50 m., and has a water-level width of 123½ ft., with a depth of 18½, and a bottom width of 31.

NORTH HUNTINGDON, a tp. in Westmoreland co., Penn. Pop. '90, 7125.

NORTH POLE, MAGNETIC, THE, is that point on the earth's surface at which the magnetic needle points vertical with its north end downward. The existence of a magnetic pole was first discovered by Robert Norman in 1576, and its actual location was first found by Captain Ross in April, 1831, to be in the northern part of the Dominion of Canada in lat. 70° 5′ and long. 96° 46′ W. The south magnetic pole is in the Southern Ocean near lat. 73° and long. 150° E.

NORTH RIVER, a magisterial dist., Augusta co., Va. Pop. '90, 4153.

NORTH RIVER. See HUDSON RIVER.

NORTHROP, CYRUS, b. in Ridgefield, Conn., Sept. 30, 1834. He graduated from Yale in 1857, and from the law school in 1859; and was clerk of the Conn. house of representatives and of the senate from 1861 to 1863; in 1863 he was made professor of rhetoric and English literature in Yale, and held this professorship until 1884 when he became president of the university of Minnesota. He was collector of the port of New Haven, Conn., from 1869 to 1881.

NORTH SEA (*Germanicum Mare;* Ger. *Nord See*), that arm of the Atlantic ocean which separates the British islands on the w. from the continent on the east. It is 700 m. in extreme length (from n. to s.), about 400 m, in greatest breadth, and has an area of not less than 140,000 sq. miles The great commercial highways from the North sea to the Atlantic are by the Pentland firth and the strait of Dover; while on the e. it communicates with the Baltic by the Skagerrack, the Cattegat, Sound, and Great and Little Belts. Along its south-eastern and southern coasts the shores are low, and are skirted by sand-banks, formed by the sand deposits carried to the sea by the waters of the Elbe, Weser, Rhine and Scheldt, which are the principal rivers that flow into the sea from the east. The shores of England, especially in the s., are also low, and here sand has also accumulated, though not nearly to the same extent as on the continental coasts. The chief British rivers that fall into the North sea are the Thames, Ouse, Humber, Tyne, Tweed, Forth, and Tay. Besides the sand-banks on the coast already referred to, there are others extending to the middle of the sea-bed, and similar in their origin to those on the coasts, and occupying altogether about three-fourths of the entire area. Of these, the principal are the bank running n.e. from the mouth of the firth of Forth for 110 m.; the one extending n.w. from the mouth of the Elbe for about the same distance; the Dogger-bank (q.v.), etc. These sand-banks, combined with the storms and fogs so common in the North sea, render its navigation unusually dangerous. Another peculiarity of the bed of this sea is, the number of extraordinary "holes" which have been found in it. Of these the most remarkable are the Little Silver Pitt off Holderness in Yorkshire, and the North-north-east Hole, 8 leagues further east. Little Silver Pitt is 25 m. in length, and from half a mile to 2 m. in width. At its edges there is a depth from 50 to 80 ft. of water, but the "hole" has a depth of 330 feet. In the n., along the Norwegian coasts, the shores are steep and rocky, and there is a depth of about 190 fathoms. The depth (31 fathoms on an average) increases from s. to north. The currents of this ocean are extremely various, and demand the greatest caution on the part of the navigator. Owing to the prevalence of s.w. winds, the currents show a general tendency towards the north-east. On the south-western coast of Ireland, the great tidal wave of the Atlantic is broken into two portions, one of which, coursing up the channel, passes through the strait of Dover; while the other, sweeping n., passes round the n. of Scotland, and then southward along the e. coast of Britain, and meets the southern wave off the coast of Essex. The northern portion of the tidal wave spreads over the whole of the German ocean, and though on its entrance into the North sea it is only 12 ft. in height, it rises in its progress southward, as the sea becomes narrower, in the same way as the *bore* (q.v.) is formed in a contracting estuary. In the estuary of the Humber it rises to the height of 20 feet. This sea yields immense quantities of fish, the most important kinds being cod, hake, ling, turbot, sole, mackerel and herring, also lobsters. The fisheries employ many thousand people. On all available points of the coasts, light-houses have been erected, and there are numerous floating-light vessels moored to detached banks. The traffic on the North sea is enormous. It is surrounded by countries whose inhabitants

have from the earliest times been famous on the seas, and whose vast commercial enterprise is but another form of the early Scandinavian love for navigation and conquest.

NORTHUMBERLAND, a co. in e. central Pennsylvania, bounded on the w. by the Susquehanna river and its w. branch; drained by them and the n. branch of the Susquehanna, and by Shamokin and Mahonoy creeks; on the Delaware, Lackawanna, and Western, Northern Central, Philadelphia and Reading, and branches of the Pennsylvania railroads; 463 sq. m.; pop. '90, 74,698, chiefly of American birth. The surface is irregular and hilly, with fertile valleys between. The principal productions are Indian corn, oats, wheat, buckwheat, potatoes, and hay. There are many tanneries, curriers' shops, saw, flour, and planing mills, manufactories of machinery, metal wares, clothing, carriages and harness. Co. seat, Sunbury.

NORTHUMBERLAND, a co. in e. Virginia, bounded on the e. by Chesapeake bay, and on the n.e. by the mouth of the Potomac river; 180 sq.m.; pop. '90, 7885, chiefly of American birth, inclu. colored. The surface is undulating and heavily wooded in parts, and much of the soil fertile. The principal productions are Indian corn, wheat, oats, potatoes, and sweet potatoes, wool, and sorghum molasses. Co. seat, Heathsville.

NORTHUMBERLAND, the most northern co. of England, is bounded on the e. by the North sea, and on the n.w. by the Scottish counties of Roxburgh and Berwick. Area, 1,289,756 statute acres; pop. '91, 506,030. The surface of the county has a rugged, and especially in the w. and s.w. a naked and barren aspect. The Cheviots run along the western border of the county, and send out spurs toward the e., which, gradually declining, are separated by fertile valleys, that widen as they approach the coast. About one-third of the area of the county is occupied by moorland, and along the Cumberland border the broken and bleak-looking hills are valuable for their lead mines. Allenheads, the center of the lead mining district, is the highest inhabited spot in England, being 1400 ft. above sea-level. The inclination of the surface toward the e. is indicated by the direction of the rivers Alne, Coquet, and north Tyne, which with the Tyne and Till are the principal rivers of the county. The Tweed forms the boundary of the county on the n. for about 5 miles, and the s. boundary is formed in part by the Derwent and Tyne. The climate is cold, but is milder on the coast than amid the hills, which, however, produce sufficient herbage for the maintenance of large flocks of "Cheviot" sheep. The principal agricultural tracts occur along the coast, and inland along the river valleys for several miles. In these districts, the soil, for the most part, is a strong fertile clayey loam, productive in wheat, barley, beans, and clover. Agriculture is pursued on the most improved methods, and cattle, chiefly short-horned, are extensively reared. The s.e. portion of the county forms a part of the great Northumberland and Durham coal-fields.

NORTHUMBERLAND, a co. in n.e. New Brunswick, on the gulf of St. Lawrence, drained by the Miramichi river and its branches; 4760 sq. m.; pop. '91, 25,713. Co. seat, Newcastle.

NORTHUMBERLAND, a co. in Ontario, Can., bounded on the s. by lake Ontario, intersected by the Grand Trunk, and Cobourg, Peterboro, and Marmora railroads; 745 sq. m.; pop. '91, 36,492. Co. seat, Cobourg.

NORTHUMBERLAND, DUKES OF. See PERCY.

NORTHUMBRIA, a kingdom in the Saxon heptarchy, made a separate kingdom by Ida in 547, who united the two kingdoms of Bernicia and Deira. It stretched to the firth of Forth, and comprised the territory n. of the Humber. Again divided upon Ida's death, it was once more organized into one kingdom by Ethelfrith in 593. Under Oswald, in the middle of the 7th c., it was the strongest kingdom in the heptarchy. Its separate existence was brought to an end by Egbert in 827. The name survives in the modern county of Northumberland.

NORTH-WEST PROVINCES, a great political division of British India (see INDIA), between Nepaul and Oude on the n.e., and Rajpootana and the Indore agency on the s.w., consisting of seven subordinate divisions—Meerut, Kumaon, Rohilcund, Agra, Jhansi, Allahabad, and Benares. Each of these divisions comprises from three to six districts. They are treated under separate articles.

NORTHWEST TERRITORIES, formerly the designation of all that portion of British North America under the dominion of Canada, except the provinces of Manitoba and British Columbia, lying w. and n. of the provinces of Quebec and Ontario. Up to 1870 the whole region, including Manitoba, was known as the Hudsons Bay territory and was governed by the Hudsons Bay company, by whom it was divided into four large departments or regions, which were subdivided into 33 districts, including 155 trading posts. The government was administered by a chief governor and council, and the various departments by chief factors and traders. But in 1869 the company relinquished governmental functions, and during the following year the Northwest Territories came into the possession of Canada and were made a province. In 1876 the district of Keewatin (q.v.) was detached, and in 1881 the area of the territories was again slightly reduced by the enlargement of Manitoba. In 1882 the districts of Assiniboia, Saskatchewan, Alberta, and Athabasca were formed, and now constitute the Northwest Territories, although properly the vast and unorganized region to the n. is included in that title. These districts are under the authority of a lieut.-gov. and a council partly

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

elected and partly nominated, and since 1891 sends four members to the house of commons. In 1883 the seat of government was removed from Battleford, in Saskatchewan, to Regina, in Assiniboia. In 1881 the pop. of the territories was 56,446; in 1891, 98,967. See CANADA.

NORTHWEST TERRITORY. The portion of the United States known in its early history as the Northwest Territory was all that tract lying between the Ohio River, the Mississippi, and the Great Lakes, immediately west of the original states, and now comprised in the states of Ohio, Indiana, Illinois, Michigan, and Wisconsin. The original states laid claim to this section by their charter limits, which extended "from ocean to ocean." These claims were finally ceded to the United States except a small tract retained by Connecticut as a foundation to her school fund, and still known as the Western Reserve (q.v.), and thus the national government became the owner of some 430,000 square miles. It is claimed by some that the foundations of all future national greatness were laid at this time by the way in which Congress dealt with the question of territorial government. The prominent features were, the entire control of all territory by the national government until such time as the people of the territory were capable of self-government; and the elevation of each territory into a state, with powers similar to the original states, as rapidly as possible.

In 1783 a committee, of which Jefferson was chairman, was appointed, to report a plan for its temporary government. Jefferson has been awarded much credit for this ordinance, which applied, also, to the territory south of the Ohio; but on account of a clause prohibiting slavery after 1800, it was lost for lack of the southern votes. In 1785 Rufus King submitted to Congress a resolution that slavery in the new territory be immediately prohibited, using the words of Jefferson in the ordinance of 1783, except the phrase "after the year 1800." This resolution was received favorably, but it was finally never acted upon. In September, 1786, the question of territorial government was again agitated, and a committee, of which Nathan Dane, of Massachusetts, was chairman, was appointed, and the so-called "ordinance of 1787" was framed. It is claimed by some that this was based on the Constitution and laws of Massachusetts, but a more impartial view would seem to be that the ordinance of 1783 had been taken as the basis, amplifying the provisions, and adding such new ones as seemed necessary. It began by securing to the inhabitants of the territory the equal division of real and personal property of intestates to the next of kin in equal degree; also the power to devise and convey property of every kind. At first, Congress was to appoint a governor, secretary, judges, and militia-generals; and the governor was to make such other appointments as were necessary until a general assembly was organized. The governor and judges were also to adopt all necessary state laws, subject to the veto of Congress, until there should be "5000 male inhabitants of full age." When the population reached this, they were to have an assembly of their own, to consist of the governor, a legislative council of five, to be selected by Congress from ten nominations by the lower house, and a lower house of representatives of one delegate for each 500 male inhabitants. The assembly was to select a delegate to Congress, who had not, however, the power to vote; and was to make laws for the government of the territory not repugnant to "the articles of fundamental compact" between the original states and the new territory, which were to "forever remain unalterable," and were as follows: freedom in religious belief and worship, the benefits of the writ of *habæs corpus*, trial by jury, proportionate representation in the legislature, bail, moderate fines and punishments, and the preservation of liberty, property, and private contracts; encouragement to education, and good faith toward the Indians; to remain forever a part of the United States; not to interfere with the disposal of the soil of the United States, or to tax the lands of the United States, or to tax any citizen of the United States for the use of the Mississippi or St. Lawrence rivers; not less than three, nor more than five states were to be formed from the new territory, and these were roughly plotted quite similar to the present boundaries; and whenever one of these divisions contained 60,000 inhabitants, it was to become a state, with all the powers and privileges of an original state. Then followed the famous clause on slavery: "There shall be neither slavery nor involuntary servitude in the said territory, otherwise than in the punishment of crimes whereof the party shall have been duly convicted: provided always, that any person escaping into the same from whom labor or service is lawfully claimed in any one of the original states, such fugitives may be lawfully reclaimed and conveyed to the person claiming his or her labor or service as aforesaid." The authorship of this clause has been the subject of frequent controversy, whether it belongs to Jefferson, King, or Dane; but from a comparison of the original documents, it is fair to conclude that both King and Dane followed Jefferson, after omitting the phrase previously alluded to, Dane also adding the fugitive slave clause. Furthermore, Dane, in a letter to King, who at the time of its passage was in Massachusetts, says, "I had no idea the states would agree to, and therefore omitted it in the draft; but finding the house favorably disposed on this subject, after we had completed the other parts, I moved the article, and it was agreed to without opposition." The ordinance was adopted by Congress without a single alteration, July 13, 1787, and has been the model used for all subsequent territorial governments. When the new government was inaugurated under the constitution in 1789, an act was

passed confirming the ordinance, but modifying it somewhat in order to conform to the new powers of the president and senate. A recent writer has advanced the idea that one reason for the favorable manner in which the ordinance was received by Congress, especially the clause on slavery, was that Manasseh Cutler, the agent of the Ohio land company, stood ready to purchase 5,000,000 acres of land, if it was organized as a free territory. This company made their first settlement at the present town of Marietta, Ohio, April 7, 1788, and in 1800 the population numbering 50,240, it was made a separate territory. Illinois became a territory the same year; Michigan, in 1805; Indiana, in 1809; and Wisconsin in 1836. See Johnston, in Lalor's *Cyclopedia of Political Science.*

NORTHWESTERN UNIVERSITY, at Evanston and Chicago, Illinois; the university was given a charter in 1851, but not opened until November, 1855. The endowment is in real estate, and estimated at $4,000,000; annual income, $300,000. The university grounds are on the shore of Lake Michigan and, together with the buildings of the College of Liberal Arts, are valued at $5,000,000—this does not include the value of the buildings of the professional schools, as these are not situated on the university campus. The principal buildings are University hall, Library building, Science hall, Woman's hall, Medical building, Medical and Pharmaceutical Laboratory building, Woman's Medical building, Memorial hall, Heck hall. The university includes the College of Liberal Arts, the School of Theology, and the School of Music, all at Evanston: the Medical school, Woman's Medical school, Law school, School of Pharmacy, and Dental school, all in Chicago. The libraries of the university amount to about 40,000 volumes, including that of the Theological school. The Garrett Biblical institute, on the university grounds, has a distinct charter and board of trustees, but sustains a co-operative relation with the university. The museum contains 70,000 specimens. Instructors in all departments (1896), 225. Students in all departments, 3016. President (1897), Henry Wade Rogers, LL.D.

NORTON, a co. in n. w. Kansas, adjoining Nebraska, drained by the n. fork of Solomon river, by Prairie Dog creek, and the tributaries of Republican river; 900 sq.m.; pop. '90, 10,617, chiefly of American birth. Co. seat, Norton.

NORTON, Andrews, Rev., American scholar and theologian, was b. at Hingham, Mass., Dec. 31, 1786. Having graduated at Harvard College in 1804, he was appointed, in 1809, a tutor of Bowdoin college, and in 1811 mathematical tutor at Harvard, and in 1813 librarian of the university, and succeeded Dr. Channing as lecturer on biblical criticism and interpretation. In 1819 he was appointed Dexter professor of sacred literature, which office he retained until failing health compelled his retirement in 1830. Dr. Norton was, after Dr. Channing, the most distinguished exponent of Unitarian theology, a clear and perspicuous lecturer, an able and conservative critic, and a voluminous writer. Rejecting the doctrine of the Trinity, and protesting against Calvinism, he also opposed the school of Theodore Parker and the naturalistic theology. Besides his contributions to the *General Repository and Review*, the *North American Review*, *Christian Examiner*, he published (1833) *A Statement of Reasons for not believing in the Doctrine of the Trinity;* (1837) *The Genuineness of the Gospels;* (1839) *On the Latest Forms of Infidelity;* and left some poems and a translation of the gospels. He d. Sept. 18, 1853.

NORTON, Mrs. (Caroline Elizabeth Sarah Sheridan), a poet and novelist of some reputation, the daughter of Thomas, and the granddaughter of Richard Brinsley Sheridan, was b. in 1808. Her father died while she was still a child, and her education, which embraced an unusually varied course of studies, was superintended by her mother. In 1827 she married the Hon. George Chappel Norton. In 1831 she first met lord Melbourne, then prime-minister, and the intimacy which succeeded having given rise to some scandalous rumors, Mr. Norton brought an action against lord Melbourne, which resulted in a verdict for the defendant. She died June 15, 1877, after having been for some months the wife of sir W. Stirling Maxwell. Her chief works are *The Sorrows of Rosalie* (1829); *The Undying One* (1830); *The Child of the Islands* (1845); *Stuart of Dunleath*, a novel (1851); *English Laws for Women in the Nineteenth Century* (1854); *The Lady of Garaye* (1862); *Lost and Saved*, a novel (1863); and *Old Sir Douglas* (1867).

NORTON, Charles Eliot, b. Mass. 1827; son of the Rev. Dr. Andrews Norton. After graduating at Harvard college, in 1846, he entered a commercial house in Boston to learn the details of the East India trade. In 1849 he went out as supercargo of a ship consigned to India, through which he traveled, returning to Boston by way of Europe. In 1855 he again went to Europe where he spent two years, and he was once more abroad 1868–73. In 1875 he was appointed professor of fine arts at Harvard college. In 1855 he edited, in conjunction with Dr. Ezra Abbot, his father's *Internal Evidences of the Genuineness of the Gospels*, and translation of the gospels. He edited the *North American Review*, in association with James Russell Lowell, 1864–68, and during the rebellion he edited the publications of the loyal publication society at Boston. His *Considerations on some recent Social Theories* appeared in 1853; *Notes of Travel and Study in Italy*, 1860; and his translation of Dante's *Vita Nuova* in 1867. He is an accomplished Dante scholar,

and Karl Witte's edition of the *Vita Nuova* is dedicated to him. He published in 1880 *Historical Studies on Church Building in the Middle Ages;* and edited the *Letters of James Russell Lowell* (2 vols. 1893). He was president of the archæological institute of America in 1879–90.

NORTON, John, 1606–63; b. Stortford, Hertfordshire, Eng.; educated at Cambridge, became curate of Stortford. Having embraced Puritanism, he came in 1636 to Plymouth, Mass., where he preached the first winter; was pastor of the church in Ipswich in 1636; was a member of the convention which framed the "Cambridge platform" in 1648; became colleague of the Rev. John Wilson, minister of the first church in Boston in 1652, and in 1662 went with Gov. Bradstreet as agent of the colony to present an address to Charles II. after his restoration. He wrote many works, one of which was a treatise against the Quakers, entitled *The Heart of New England rent by the Blasphemies of the Present Generation*, by which they were so enraged that after his death they informed the king that "John Norton, chief priest in Boston, was smitten and died by the immediate power of God."

NORTON, Sidney Augustus, American chemist, b. Ohio, 1835; graduated at Union College in 1856, and studied at Bonn, Leipsic, and Heidelberg. In 1873 he became professor of chemistry in Ohio State University. Author of *Physics* (1875); *Organic Chemistry* (1884), etc.

NORWALK, a town in Fairfield co., Conn.; on Long Island sound and the New York, New Haven and Hartford railroad; 60 miles s.w. of Hartford. It was incorporated in 1651, and contains the cities of South Norwalk, chartered in 1870, and Norwalk, chartered in 1893. The site was originally purchased from the Indians, and the town was burned by the Hessians in the Revolutionary war. The town contains the Norwalk and St. Mary's hospitals, the Norwalk and South Norwalk public libraries, Centre and Over River high schools, Roberts military school, Baird institute, Mead school for girls, Norwalk preparatory school (P. E.) and several national and savings banks. There are electric lights, electric street railroads, waterworks in each city, so arranged that either one can supply both cities in case of an emergency, about 15 churches, and several daily and weekly newspapers. The principal industries in the two cities are the manufacture of straw and fur hats, shoes, shirts, corsets, woolen goods, elastic webbing, cigars, locks, air compressors, builders' hardware, machinery, stone and earthenware, stoves, foundry products, paper boxes, etc. Outside of the cities the principal occupation is farming. Pop. '90, town, 17,747; city of Norwalk, 3,079; city of South Norwalk, 4,013.

NORWAY (Norweg. *Norge*), the western portion of the Scandinavian peninsula, which, though a separate kingdom, is united with Sweden, is situated between 57° 59′ and 71° 11′ n. lat., and 5° and 28° e. long. It is bounded on the e. by Sweden and Russia, and on every other side is surrounded by water, having the Skager Rack to the s., the German ocean to the w., and the Arctic sea to the n. Its length is about 1100 m., and its greatest width about 250 m.; but between the lats. of 67° and 68° it measures little more than 25 m. in breadth. The following table shows the areas and populations of the 20 aemter into which Norway is divided, as estimated in 1891.

Aemter.	Area in English Sq. Miles.	Population in 1891.
Smaalenene	1,600	120,360
Akershuus	2,055	99,111
Christiania	6	151,239
Hedemarken	10,621	119,129
Christians	9,793	108,076
Buskerud	5,790	104,769
Jarlsberg and Laurvik	896	100,957
Bratsberg	5,865	92,034
Nedenæs	3,609	81,043
Lister and Mandal	2,805	78,738
Stavanger	3,532	117,008
Söndre Bergenhuus	6,026	128,213
Bergen (town of)	5	53,684
N. Bergenhuus	7,132	87,552
Romsdal	5,788	127,806
S. Trondhjem	7,184	123,817
N. Trondhjem	8,791	81,236
Nordland	14,517	131,850
Tromsö	10,134	65,125
Finmarken	18,296	29,170
Total	124,445	2,000,917

Of this total only 474,129 (23.7 per cent.) lived in towns. The capital, Christiania, had in 1891 a population of 151,239. Other important towns are Bergen, with a pop '91 of 53,684; Trondhjem with 29,162 inhabitants; Stavanger, with 23,899; Drammen, with 20,687; Christiansand, with 12,813; and Fredrikstad, with 12,451.

The Scandinavian peninsula consists of more or less connected mountain masses, which, in the s. and w. parts of Norway, constitute one continuous tract of rocky highlands, with steep declivities dipping into the sea, and only here and there broken by narrow strips of arable land. South of Trondhjem (63° n. lat.), the ridge expands over nearly the entire breadth of Norway. The n. portions of the range, known as the Kjöllen Fjelle,* occupy a space of about 25 m. in width and form, as far n. as 69°, the boundary-line between Sweden and Norway. South of 63° n. lat. the range of the Scandinavian mountains is known as the Norska, or Dovre Fjelle, although the latter name belongs properly only to the part immediately in contact with the Kjöllen. The general elevation of the Norska Fjelle does not rise above the line of perpetual snow, whose average height in these latitudes is 5,000 ft.; but it ranges above that of the growth of trees, which may be stated to lie 1000 ft. lower. The Justedal glacier, in Bergen amt, is the largest on the continent of Europe, and covers an area of 588 sq. miles. The whole of the w. coast of Norway is densely fringed with islands and insulated rocky masses, which, n. of 68°, in the Lofoden (q. v.) group, assume larger dimensions, and form extensive insular districts. The more important are Hindö (357 sq. m.), on the borders of Nordland and Tromsö; Langö (147 sq. m.); Karmö (21 sq. m.); and Senjen (273 sq. m.). To the s. of the Anden group, near the little islands, Mosken and Værö, occurs that eddying whirl of counter-currents known to us as the Maelström; but with this and a few other similar exceptions, no serious obstacles impede navigation along the numerous channels of the coasts. The most important of the rivers are the Glommen (350 m. long, with a basin of 6,657 sq. m.), the Drams-elv, of less than half the length and basin, Tanæ, Pasvikel, Skiens, Laagen, and Vormen. These and numerous other streams are of more importance for floating down timber to the fjords than for navigation. The fjords or inlets form a characteristic feature of Norwegian scenery, and give an extensive coast-line.

The most considerable of the lakes of Norway is the Mjösen, near Christiania; but even this lake, which in some places is more than 1400 ft. deep, is scarcely 60 m. long, and has an area of less than 200 sq. miles. Swamps and morasses, which occupy a large area, have of late years engaged the attention of the government, which is endeavoring to drain and utilize them for agricultural purposes, and with a view of converting them into fields of turf and peat for fuel.

Climate, Soil, etc.—The peculiar physical character of Norway necessarily gives rise to great varieties of climate in different parts of the country. The influence of the sea and of the gulf stream, and the penetration into the interior of deep inlets, greatly modify the severity of the climate, more especially on the w. coast. Thus, while the mean annual temperature is for Christiania, on the e. coast, 41°, it is 46°.8 Fahr. for Bergen on the w. coast, which is only 30′ further north. On the coast generally, rain and fogs prevail; while in the regions near the North cape, storms are almost incessant. In the interior, the air is clear and dry, and the winters are cold and the summers hot, while on the coasts the opposite conditions prevail. The longest day, which in the s. is 18 hours, may be said to be nearly three months in the high latitudes of the n. districts, where the longest night lasts almost an equal length of time. The protracted winter of the n. regions follows almost suddenly on the disappearance of the sun, when the absence of solar lights is compensated for by the frequent appearance of the aurora borealis, which shines with sufficient intensity to allow the prosecution of ordinary occupations.

It is estimated that $\frac{1}{88}$th of the area of Norway lies within the region of perpetual snow, while elevations exceeding 2,000 feet above the level of the sea are unfitted for human habitations, although for a portion of the brief summers, the herdsmen can occupy *sætre* or huts at elevations of 3,000 feet and upwards. A large extent of the mountain districts yields no produce beyond scanty grasses, mosses, lichens, and a few hardy berry-yielding plants. Only birch and juniper grow n. of 67°, which is the boundary of the pine. The Scotch Fir, *Pinus sylvestris* (Norwegian, *Furn*), and Spruce, *P. abies* (Norwegian, *Gran*), cover extensive tracts, and with birch constitute the principal wealth of Norway. The hardier fruits, as strawberries, gooseberries, cherries, and raspberries, are abundant and excellent of their kind. Hemp, flax, rye, oats, and barley are grown as far north as 66°; but although agriculture has been more systematically pursued of late years, the crops are not always sufficient for home consumption, and hence it is found absolutely necessary annually to import considerable quantities of corn and potatoes. The frugal peasantry do not, however, rely wholly upon importation, but prepare a species of cake or bread from the bark of the pine when corn is scarce, and in plentiful years store away some of the produce of the harvest in the national corn-magazines, which are established in every part of Norway by way of a provision for an unfavorable season. Agriculture is most successfully prosecuted in the amts of Jarlsberg and Laur-

* *Fjelle* is the plural of *fjeld*, a mountain-side.

vik, and in the south generally; while in the northern parts, in the upper valleys, the rearing of cattle constitutes an important branch of industry. The herds and flocks are driven from the distant farms to the pasture-lands in these high mountain valleys, known as Sæterdale, where they remain till the approach of cold weather obliges the herdsmen to return with their charges to the shelter of the farms. Although the cattle and horses are small, they are generally strong and capable of bearing much hard labor.

Products, etc. — The fauna of Norway include the bear, wolf, lynx, elk, otter, reindeer, red deer, seal, the eider-duck and many other kinds of sea-fowl, blackcock, capercailzie, and a great variety of small game. Fish are caught in almost every stream and lake of the interior, as well as in the fjords of the coast, and in the bays and channels which encircle the numerous islands skirting the long sea-line of Norway. Herring, mackerel, and cod are of the greatest importance, and in 1894 gave employment to nearly 126,000 men. The salmon and sea trout catch is also very large. The lobster fishery is also important and there are some productive oyster beds. There are important mackerel fisheries in the North sea, and the Norse are successful in the taking of whales, walruses, seals, and sharks. In 1895 the exports of fish and fish products amounted to 46,512,700 kroner, or $12,465,036. Next to the fisheries one of the chief sources of wealth is the produce of its woods. The total area under forests was estimated, in 1895, at 26,320 sq. miles, of which nearly three-fourths consisted of pines. There is a staff under the supervision of the Ministry of the Interior which has charge of the extensive state forests. The industries of Norway are not important, but they have shown considerable progress in recent years. The wood-working industry is quite extensive and there are manufactures of matches, paper, textiles, tobacco, glass, beer, and spirits. Shipbuilding is actively followed in some parts of the country, but in many districts the long winter imposes compulsory leisure upon the tenants of the widely separated farms, and industry in many parts has not passed the domestic stage.

The mineral products, which comprise silver, copper, nickel, iron, steel, apatite, etc., do not yield a very considerable annual return. Besides these minerals, cobalt, zinc, chrome, meerschaum, granite and various kinds of stone used in the arts are found. A silver mine at Kongsberg, discovered in 1623, is still productive, but since the fall in the price of silver its output has greatly depreciated in value.

Trade, etc. — Among the principal seats of trade are Christiania, Drammen, Bergen, Stavanger and Trondhjem. The exports consist mainly of fish, animal produce, paper, and metals, of which the first three are by far the most important. Both in respect to imports and exports, Great Britain leads all the other countries with which Norway trades, but, in 1895, the imports from Germany did not fall far below those from Great Britain and Ireland. The other leading nations in respect to the foreign trade of Norway in that year were Sweden, Russia, Denmark, the Netherlands, Spain, France, Belgium, and America. The value of the imports in 1895 were 222,310,200 kroner, and of the exports 137,280,100 kroner, the value of the kroner, or crown, being, according to the official report of the United States treasury in 1897, 26.8 cents in United States currency. The principal imports into Norway are bread stuffs, groceries, textile manufactures, minerals, ships, carriages, machinery, metal goods, yarn, rope, etc. The country being so backward in manufactures, its imports include not only objects of luxury, but some of the most essential articles of consumption. The shipping of Norway is very important and, in respect to her merchant marine, she stands among the leading nations of the world. The number of Norwegian steamships engaged in the foreign trade in 1896 was 515, and of sailing vessels 3,377.

Revenue, etc. — Revenue is derived largely from customs, railways, excise on spirits and malt, income tax, post-offices, telegraphs, and state property, among which the most important source is customs. As to the expenditure, the state railways for 1896-97 constituted the largest item. The estimated revenue for 1897 was 64,700,000 kroner, which was balanced by the estimated expenditure. The debt on June 30, 1895, amounted to 144,313,440 kroner. Gold is the monetary standard, but in 1895 there was a comparatively small amount of it in circulation, the great bulk of the currency consisting of bank notes, which are issued by the bank of Norway for an amount equal to its gold reserve, plus a certain specified sum (about $6,500,000). The per capita circulation at the end of 1895 was about $7.50. Formerly the standard was silver, but the gold standard was adopted by the law of June 4, 1893, on account of the variations between the two metals and the adoption of the gold standard by most of the great countries of Europe. The mint is open to the free coinage of gold, and silver is coined only on account of the state. While nominal wages are low as compared with those prevailing in the United States, this is in part offset by the greater purchasing power of money in Norway. Between 1885 and 1895 statistics would seem to show an increase in wages, although exact figures are lacking for the period from 1890 to 1895.

Administration, etc. — Norway is divided into 20 amts, or administrative circles, as given in the table. The circles are subdivided into 39 towns and 56 fogderier (bailiwicks), each presided over by a rural magistrate, and containing in all 514 herreder, or administrative districts, which have similarly their own judicial or official heads. Norway has a representative government, based on the constitution which was established in 1814, and ratified at Eidsvold. The Storthing, or legislative chamber, meets annually, and is composed of representatives who are elected by deputies who have been selected for the

purpose of nominating the members. These deputies are elected by a system of almost unrestricted universal suffrage, the only qualifications necessary being the attainment of the age of 25, residence for one year in the electoral district, and the payment of an income tax on an income of 500 kroner in the rural districts and 800 kroner in the towns, or the possession of landed property, or the tenancy of such property for five years. The election of the deputies takes place every third year, when the electors meet in their respective parish churches, and choose deputies, whose number is in the proportion of 1 to 50 voters for towns, and 1 for 100 in rural districts. These deputies then select from their own body, or from among other eligible persons, the representatives for the Storthing, which is further subdivided into two district chambers, the Lagthing and Odelsthing, with the former of whom rests the framing of legislative and financial measures, and with the latter the power of accepting or rejecting them, and the right of taking cognizance of the conduct of the ministers, judges, and other officers of the state. The members of the Storthing receive an allowance for their time and traveling expenses during the session. The Storthing votes the taxes, which are collected by officers of the king of Sweden and Norway; it proposes laws, which must be ratified by the king: but if they pass the Storthing three times, they acquire validity even without the king's sanction. Although Norway constitutes one joint kingdom with Sweden in regard to succession, external policy and diplomacy, it is in all other respects an independent state, having its own government, legislative machinery, finances, army, and navy. The king is indeed commander-in-chief of all the forces of the country, whether military or naval; but he can neither augment nor decrease their number, nor proclaim peace or war without the assent of the Norwegian Council of State, which must consist of ten members, natives of the country; nor, excepting in time of war, can he bring foreign soldiers within the frontiers, or send native troops out of Norway. In accordance with the constitution, no title can be conferred independently of the tenure of office, and no one can be raised to the rank of a noble; while with the death of the members of the few still surviving noble families who were born before 1821, all personal honors, privileges, and distinctions belonging to the nobility will cease. The constitution may therefore be regarded as purely democratic in its character. The council of state constitutes the highest court of justice, under whose jurisdiction the provincial magistrates or *amtmaend* administer justice, in conjunction with the bailiffs and *sorenskriver* or advocates, who preside over petty rural courts. These lower courts are controlled by the *Stift* or diocesan courts of justice; while the latter are, in their turn, under the high court of appeal, or *Höieste Ret*, located at Christiania. Between 1880 and 1884 there was a fierce constitutional struggle as to the king's power of veto.

Religion, etc.—The Lutheran is the predominant church, and is endowed by the government, although freedom is allowed to all other Christian denominations and to Jews. The church is under the administration of six bishops, whose sees are Christiania, Christiansand, Trondhjem, Bergen, Hamar, and Tromsö. There are 83 archdeaconries and 474 clerical districts. The whole number of dissenters in 1891 numbered 30,685, including 8187 Methodists, 4228 Baptists and 1004 Roman Catholics. The clergy who are nominated by the king and receive tithes, exercise considerable influence in remote country districts, where they frequently are called upon to settle disputes, and exercise various judicial functions. Much has been done of late years in Norway for the diffusion of knowledge, and provision is now made to extend education to the inhabitants of the most inaccessible districts by means of itinerant teachers, a certain number of whom, corresponding to the number of farms in each parish, are nominated to the office of schoolmaster. These men proceed from house to house, being supplied with a schoolroom, and fed and entertained by each householder in succession for the number of days at which the farm is mulcted; and by the aid of these means, education is so universally diffused that it is rare to meet with Norwegians who cannot read and write. In 1892 there were upward of 300,000 pupils in the elementary schools. Besides these there were 81 secondary schools, and many private schools and institutions for special or technical instruction. The expenses incurred for elementary education were, for the country districts and for the towns, together, 7,522,918 kroner. The university of Christiania (q. v.), which was founded in 1811, was attended in 1895 by 1142 students, amongst whom are the sons of many of the peasant landowners, who receive a university education without intending to follow the learned professions. Education is compulsory for children between the ages of seven (six and a half in the towns) and fourteen years.

Army, etc.—By the terms of the laws of 1866, 1876, and 1885, the army of Norway is composed of troops of the line, the militia or *Landvaern*, and the final war levy or *Landstorm*. In 1894 the troops of the line numbered about 30,000 men and 900 officers. All young men above 22 years of age are liable to serve, with the exception of the inhabitants of the three northern amts of the kingdom. The strongest fortress in Norway is Oscarsborg; and other fortresses, though of far less importance, are Fredrikstad, Fredriksten, Carljohansvaern, Akershuus, etc. The fleet numbered, in 1896, 2 ironclads in process of construction; 4 ironclad monitors; 1 corvette, 32 gunboats, and a small torpedo flotilla. The personnel included, in 1896, 92 officers in active service, 53 in reserve, and 400 seamen and petty officers permanently engaged, but the men liable to conscription according to the law of 1892 numbered on the register nearly 25,000.

Owing to the physical character and consequent climatic relations of Norway, a very small proportion (according to some writers only about 3 per cent.) of the area is cultivated. About 22 per cent. is under forests. There are few villages, and the isolated farmsteads are often separated from one another by many miles. The cultivators of the land are in most instances also the proprietors, less than one-third of the whole number being tenants only. Allodial land, known as Udal or Odel, does not descend to the eldest son unconditionally, since all his relatives have a claim upon it, and if it should be sold, have the right of buying it back within the term of five years at the sale-price. There were 12,597 emigrants to the U. S. in 1889, and 6153 in 1895.

Roads, Railways, etc.—The public roads in Norway are excellent; and traveling is rendered cheap and expeditious by the system established and regulated by law, in accordance with which carriages and horses are provided at fixed rates of payment for travelers passing through the rural districts of the country. This system, which is known as "Skyds," is completely under the control and direction of the authorities, by whom the number of the guest-houses and stations are regulated. The length of the railways in Norway in 1895 was 1014 m.; and the number of letters that passed through the post was 33,852,500.

Race, Language, etc.—With the exception of 20,786 (1891) Lapps and 9378 Finns, living in the most remote northern regions, the inhabitants of Norway are generally a pure Scandinavian race, akin to the North German nations of Aryan descent. The genuine Norwegians are of middle height, with strong, well-knit, muscular frames, of fair skin, with light flaxen or yellow hair, and blue eyes. In character, they may be said to be frank, yet cautious and reserved, honest, religious, and superstitious, more from an inveterate love of clinging to the forms, thoughts, and creed of their ancestors, than from fanaticism. Their love of country, and the irrepressible fondness for the sea, by the very anomaly which these apparently contraditory propensities exhibit, show them to be the true descendants of the sea-roving Northmen of old. Of late years emigration has continued steadily to increase at a rate which threatens to be a serious evil to so badly populated a country as Norway, but which is easily explained by the small portion of land capable of cultivation. The general diffusion of education, and the perfect equality and practical independence which they have known how to secure and to retain themselves, notwithstanding this nominal incorporation with the other Scandinavian kingdoms, give to the poorest Norwegians a sense of self-respect and self-reliance which distinguish them favorably from those of the same class in other countries. The peasants, more especially in the amts remote from towns, retain their ancient provincial costumes, which are, for the most part, highly picturesque, consisting among the women, of ample woolen skirts and brightly-colored knit bodices, fastened and adorned with silver or brass clasps and buckles. Music is much cultivated by all classes of the people, and the national songs and melodies which are the favorites, are for the most part of a melancholy character.

Danish is the language in ordinary use both in writing and speaking, although dialects nearer akin to the old Norse are spoken by the dalesmen and mountaineers of special districts. Since the separation of the country from Denmark, a strongly national tendency has been manifested by some of the best Norwegian writers, and attempts have been made to reorganize these dialects into one general Norwegian language, and thus, in fact, to revive the ancient Norse, or Icelandic, which has been preserved in Iceland in almost perfect purity since its introduction to the island in the 9th c. by colonists from the Scandinavian mother-lands. Among the most zealous cultivators of the ancient and modern literature and history of Norway, we may instance Prof. P. A. Munch, whose able expositions of the laws and social conditions of his country have thrown new light on its history; Keyser, Unger, and Hohnboe, who have done much to elucidate the Norse tongue and literature; A. Munch, Bjerregaard, Hansen, and Welhaven the critic, successful cultivators of the national lyric; J. Moe and Asbjörnsen collectors and annotators of native sages; Ibsen the dramatist, and Björnsen the delineator of national peasant life. In the more abstruse departments of mathematical and physical science, Norwegians have gained for themselves a foremost place, as is sufficienty testified by the mention of names such as N. H. Abel, renowned for his discoveries in definite integrals; C. Hansteen, the astronomer; and Keilhau, the geologist.

History.—The early history of Norway is comprised in that of the other Scandinavian countries, and is, like theirs, for the most part fabulous. It is only towards the close of the 10th c., when Christianity was introduced under the rule of Olaf I., that the mythical obscurity in which the annals of the kingdom had been previously plunged begins to give place to the light of historical truth.

The introduction of Christianity, which was the result of the intercourse which the Norwegians had with the more civilized parts of Europe through their maritime expeditions, destroyed much of the old nationality of the people with the heathenism which they had hitherto cherished, although the sanguinary feuds which had raged among the rival chiefs of the land can scarcely be said to have lost their ferocity under the sway of a milder religion. Olaf II., or the Saint (1015–30), who zealously prosecuted the conversion of his countrymen, raised himself to supreme power in the land by the subjection of the small kings or chieftains, who in the times of heathenism had subdivided the kingdom among them. The war between Olaf and King Knud the Great of Denmark,

which terminated in 1030 with the battle of Stricklestad, in which the former was slain, brought Norway under the sway of the Danish conqueror; but at his death in 1036, Olaf's son, Magnus I., recovered possession of the throne, and thenceforth, till 1319, Norway continued to be governed by native kings. The death in that year of Hakon V. without male-heirs, threw the election of a new king into the hands of the national assembly, who, after many discussions, made choice of Magnus VIII. of Sweden, the son of Hakon's daughter. He was in turn succeeded by his son Hakon, and his grandson Olaf IV., who having been elected king of Denmark in 1376, became ruler of the sister Scandinavian kingdoms on the death of his father in 1380. This young king, who exercised only a nominal sway under the guidance of his mother queen Margaret, the only child of Valdemar III. of Denmark, died without heirs in 1387. Margaret's love of power and capacity for government brought about her election to the triple throne of the Scandinavian lands, and from this period till 1814, Norway continued united with Denmark; but while it shared in the general fortunes of the latter state, it retained its own constitutional mode of government, and exercised its right of electing to the throne, until, like the sister-kingdom, it agreed of its own free will to relinquish this privilege in favor of hereditary succession to the throne. See DENMARK (*History*). The Napoleonic crisis may be said to have severed this union, which had existed for more than 400 years, for Denmark, after having given unequivocal proofs of adhesion to the cause of Bonaparte, was compelled, after the disastrous war of 1813, to purchase peace at the cost of this long united partner of her state. Crippled in her resources, and almost bankrupt, she saw herself constrained to sign the treaty of Kiel in 1814, by which it was stipulated by the allied powers that she should resign Norway to Sweden, receiving in return, by way of indemnity, some portion of Swedish Pomerania and the island of Rügen, which were subsequently exchanged with Prussia for Lauenburg on the payment by that state of two million rix-dollars. The Norwegians, having refused to admit the validity of the treaty of Kiel, nominated Prince Christian, the heir-presumptive to the throne of Denmark, regent and subsequently king of Norway. The nomination was made by the national diet, or storthing, which met at Ejdsvold, where they drew up a constitution based on the French constitution of 1791. These measures found, however, neither supporters nor sympathizers among the other nations; and with the sanction of the great allied powers, Charles John Bernadotte, crown-prince of Sweden, led an army into Norway, and after taking Frederickstad and Frederickshald, threatened Christiania. Denmark being unable to support the cause of Prince Christian, and Norway being utterly destitute of the means necessary for prosecuting a war, resistance was of no avail, and the Norwegians in this untoward conjuncture of affairs, were glad to accept the proposals made to them by the Swedish king for a union with Sweden, on the understanding that they should retain the newly promulgated constitution, and enjoy full liberty and independence within their own boundaries. These conditions were agreed to, and strictly maintained; a few unimportant alterations in the constitution, necessitated by the altered conditions of the new union, being the only changes introduced in the machinery of government. Charles XIII. was declared joint king of Sweden and Norway in 1818, and while the latter has become an almost independent state, it is questionable whether the former has found in its nominal acquisition an equivalent for the loss of Finland, which was the price exacted for it by the allied powers, and made over to Russia. Since the union, Norway has firmly resisted every attempt on the part of the Swedish monarchs to infringe upon the constitutional prerogatives of the nation; and during the reign of the first of the Bernadottes, the relations between him and his Norwegian subjects were marked by jealousy and distrust on both sides; but, since his death, the people generally have been more contented. Much friction, however, has lately arisen between the Norwegian storthing and the king, by reason of the demand of the latter that Norway shall have separate diplomatic representatives abroad. In 1893, the refusal of the king to assent to this demand led to a strong movement for complete independence. See Sars, *Udsigt over Norges Historie* (1877); Boyesen, *History of Norway* (1890).

NORWAY HADDOCK. See BERGYLT.

NORWEGIAN LANGUAGE AND LITERATURE (see NORWAY). The great Teutonic stem divides at about the time of the invasion into four dialects; but whether these dialects antedate the year 500 A.D. is very doubtful. The Gothic of Ulfilas is, undoubtedly, the oldest; but the Saxon follows not long after. The high German, by the testimony of charters, only begins after the battle of Tolbiac (Zuelpich). The Norwegian, if by this we understand the *Izlendska tunga* (Icelandic), though at most of the 12th c. represents a dialect at least 100 years earlier, and allows us to supply missing Gothic forms better than any other. Perhaps its great changes may be referred to the 8th c.; and they are greater than those of either Saxon, or high German. They are: (*a*) great contraction and assimilation; (*b*) dropping of case-endings; (*c*) dropping of prefixes; (*d*) an harmonious system of vowels, but accomplished by umlaut and reflex, more like Saxon than German; (*e*) assimilation of vowels; (*f*) the suffixed article; (*g*) w before r, l, and u is dropped; (*h*) **j** initial dropped; (*i*) **w** is vocalized. The real test is the introduction of new terms, as georwa, Scotch gar, and taka, take, replace, thuwa, do, and nimma, niman, Ang.-Sax. Also, at, ok, replace, ettu, ekende, to, and. About 1120 A.D. lived Thorodd, the

grammarian; and in his time certain changes had already taken place in a contraction which involved the loss of *n* final in verbs and in weak nouns. He specifies vowels, *a* short, as in father; *a* long (an) as in hall; *æ* short, as in man; *æ* long, as in were; *e* short, as in red; *e* long, as in they; *i* short, as in it; *i* long, as in sweet; *o* short, as in not; *o* long, as in row; *u* short, as in foot; *u* long, as in food; *y* short, as in une (French), kuechen (German), *y* long, as in duke, nieuw (Dutch); *œ* short, as in hurt; *œ* long, as in earth; *eo* short, as in seuil (French); *eo* long, as in boy. Three diphthongs—*au, ei,* and *ey*—all with a distinct sound for each letter as above. Every vowel could be nasalized. *B, p, m, n, k, l, t,* and *d* as in English; *c* and *g* always hard; *s* always sharp; *r* always trilled; *f* initial, *f;* *f* medial and final, *v;* *v* initial, *v;* *v* medial, *w;* *i*=English *y;* *th* initial, elsewhere, *dh.* There was a sign for *ng, hr, hn, hl,* like our *when* =hwen. Double consonants kept separate, and, after the discontinuance of nasal vowels, *dhr*=*ndhr;* *br*=*mbr;* *llr*=*ldr;* short vowel and *d*=*nd;* short vowel and *k* or *g*=*nk, ng.* In short the rule seems to be pronunciation clear, and rather slow; words and phrases cut as short as possible. Accent on first, if not, on root syllable. Quantity entirely by accent. At the end of the 13th c. ensued a change of pronunciation and spelling; and in the 16th c. a whole new series of changes in pronunciation, making the language like modern English—spelled, not pronounced. The MS. was the Lombard; that is, Anglo-Saxon or Irish, gradually changing, as with us, to Gothic. Modification of words had been accomplished in vowels by (*a*) *umlaut,* as in Gothic, and more in Saxon; (*b*) *reflection* by *i*=*y,* and *v*=*w* from the next syllable. As in English these changes had been taken advantage of to show difference of meaning, as falla, to fall, and fella, to fell. This also liquidizes—the commonest sign of the language—all broad vowels, when a corresponding termination has dropped. Fjarr, Eng. far, fjodhr, feather, etc. Changes in consonants are (*a*) *assimilation: np*=*pp,* happ (*hap.*); *nk*=*kk*–drikka (drink) *nt* or *ndt*=*tt,* vettr (winter); *nth*=*nn*—sannr (south); *lth*=*ll*—gull (gold); *rd* (*zd*)=*dd*—odd (point); *rn* (*zn*)=*nn*—rann (house) ran (sack); *nnr* (*dnr*)=*dhr*—fidhr (finds). (*b*) *Inflection*: *lr* (*lz*)=*ll.*—gamall (old); *nr* (*nz*)=*nn*—steinn (stone); *sr*=*ss*—iss (ice); *dhd* =*dd*—faedda (fed); *dht*=*lt* gótt (good). Alone of all Indo-European languages (since the formation of case), it suffixes the article, and that to both noun and article, and the independent adjective has best preserved the old forms. There is a strong declension of nouns, *r* taking the place of *s* and a weak declension, but German *n* dropped already. Comparison much as in English: illr (ill); verri (worse); verstr (worst). Numerals between Saxon and Danish. Pronouns: *ek* (I), thú (thou); hann (he), hon (she); vit (we two) thit (ye two); vér (we); thér (ye); their (they, men); thaer (they, women); thau (they, things). Verbs have two tenses, present and past, other by help verbs, as in English; and four moods—indicative, subjunctive, imperative, and infinitive. Strong and weak verbs as in German and Saxon, and, as in English, the strong are becoming weak. It has a peculiar form. The reflexive is formed by adding *z* to verb, or *sék* as a pronoun. Adverbs vary between English and German. Adjectives are formed for the most part with terminals not found in English. The grammar is particularly noticeable for what may be called close contact in the parts of a sentence, for impersonal and reciprocal verbs, for prepositional verbs, with a different meaning as in English and Russian, and the use of the dative of near definition. Of the earliest works Heims-Kringla still shows traces of poetic arrangement; but the language can only be judged by Kormak's saga, rather antiquated, and by Laxdaela, and Niala, the latter heroic in brevity and pithiness. The poetry, though formed on some extinct model, which must have served for all the early memory, rhymes of the Indo-European races, having the additional advantage of alliteration, and later of rhyme, seldom it rises to the height of Eirik Blood-Axe's death-song; and for the most part it is a mere convolution of stereotyped allusions and forced alliterations.

NORWEGIUM, a metallic element discovered by Teleff Dahll, in copper-nickel from Kragaro in Skjaergaarden, Norway. The color of the pure metal is white, with a slight brownish cast. When freshly polished it has a perfect metallic luster, but after a time becomes covered with a thin film of oxide. In hardness it resembles copper. One oxide N_yO, has so far been obtained. A brown sulphide is formed by treatment with sulphureted hydrogen, which redissolves in ammonium sulphide. Solution in hydrochloric acid, green; in nitric acid, blue; and in sulphuric, colorless.

NORWICH, city and one of the co. seats of New London co., Conn.; on the Thames river at the head of navigation and the Central Vermont and the New England railroads; 13 miles n. of New London, the other co. seat. It was settled in 1660, was first chartered as a city in 1784, and re-chartered in 1871, and contains the villages of Norwich, Greeneville, Norwich Town, Yantic, Taftville, and Fair Ground. It is built on a series of terraced hills in the valleys of the Yantic and Shetucket, which, uniting here, form the Thames; and has a fine harbor, exceptional water power, and a large trade in lumber, coal, wool, cotton, etc. It is one of the prominent manufacturing centers of the state, and the chief articles produced here are firearms, cotton and woolen fabrics, locks, printing-presses, type, electrical supplies, bicycle chains, silk ribbons, rolled and cast iron, leather and belting, and a great variety of machinery. The city contains national and savings banks, over 25 churches, and daily, weekly, and monthly periodicals. Norwich is justly proud of her Free Academy, which was built and endowed by

private subscriptions from her wealthy citizens. A fine new building, including an art museum, and costing nearly $200,000, has been erected through the generosity of one gentleman, for various uses connected with the academy. The city is noted for its picturesque beauty, contains many fine residences, several public parks, streets shaded with beautiful elms and maples, public hospital, the Otis, Free Academy, and Norwich circulating libraries, gas and electric light plants, electric street railroads, and water and sewerage systems, and is popularly known as "the Rose of New England." Pop. '90, town of Norwich, which includes the city, 23,048; city of Norwich, 16,156.

NORWICH, town, village, and co. seat of Chenango co., N. Y.; on the Chenango river and the New York, Ontario, and Western, and the Delaware, Lackawanna, and Western railroads; 40 miles n.e. of Binghamton. It contains railroad shops, blast furnace, several creameries, circulating and school libraries, national banks, manufactories of drugs and medicines, chairs, silk goods, hammers, etc. Pop. '90, town, 6,524; village, 5,212.

NORWICH, a city of England, capital of the co. of Norfolk, and a co. in itself, on the Wensum, immediately above its confluence with the Yare, 20 m. w. of Yarmouth, and 98 m. n.n.e. of London. It covers an area about 5 m. in circumference, is skirted on its n, and e. sides by the river, and on the w. and s. it was formerly surrounded by walls, the last vestiges of which have been recently removed in order to make room for the extension of the city. The market-place (600 ft. long by 340 ft. wide) and its vicinity contain many large shops and good houses. The castle, finely situated on an elevation near the center of the town, originally covered, with its works, an area of about 23 acres. The bridge (150 ft. long) over the ditch has one of the largest and most perfect Anglo-Norman arches remaining. The massive quadrangular Norman keep is now used as a museum. The cathedral, almost wholly Norman in plan, was founded in 1094 by Bishop Herbert Losinga. It is 411 ft. long, 191 ft. broad at the transepts, and is surmounted by a spire 315 ft. high. Near the cathedral are a number of ancient and interesting structures now more or less in ruins, among which may be mentioned St. Ethelbert's and the Erpingham gate, the former in decorated English, the latter in late perpendicular, and both valuable and rich specimens of their styles. There are a large number of dissenting chapels and other places of worship, as well as numerous churches of the established faith, of which St. Peter's, Mancroft, a handsome cruciform edifice of the 15th c., with a remarkably fine peal of 12 bells, St. Andrew's, St. Clement's, St. George's, St. Giles, St. Michael's, and others, are worthy of mention. The Free Grammar school was founded by Edward VI., and the other educational establishments are numerous and various in character. The city possesses public recreation grounds covering an area of 200 acres. Norwich is the seat of extensive and flourishing manufactures, among which are mustard, starch, and beer; shoemaking is extensively carried on, and employs many hands. Iron-founding, dyeing, malting, etc., and agricultural implement-making, are also carried on. The city was one of the earliest towns in England to become a great manufacturing center, particularly for textiles. This branch of industry, however, has declined. The trade, which is facilitated by a canal and river system of communication with the sea, is chiefly in agricultural produce and coal. Annual fairs are held here. Norwich is the see of a bishop, and returns two members to parliament. Pop. of municipal and parliamentary borough in '91, 101,316.

About 3 m. s. of Norwich is Castor St. Edmunds, which, prior to the Roman era, was called Caister, and under the Romans received the name of *Venta Icenorum*. Norwich occupies a place in history from the time of the earlier Danish invasions, had its origin in the castle erected as a stronghold by the East Anglian kings, and resorted to as a place of safety by the inhabitants of *Venta Icenorum*, who gave it the name of North-wic, or northern station or town, on account, of its relative postion with respect to their own town. The bishopric of the East Angles was removed hither in 1094. About 4,000 Flemings settled at Norwich in the reign of Elizabeth, and greatly increased the prosperity of the town by the branches of manufacture which they introduced.

NORWICH CRAG, or MAMMALIFEROUS CRAG, a series of highly fossiliferous beds of sand, loam, and gravel, of Pleistocene age, occurring at several places within a few miles of Norwich, where they are popularly named "crag." They contain a mixture of marine and fresh-water mollusca, with ichthyolites and bones of mammalia. They are evidently estuary beds, the most common shells being the very species now abundant in such situations around the coasts of Britain; but with them are associated a few extinct species. The beds rest on the white chalk, the surface of which is frequently perforated by *pholas crispata*, the shell still remaining at the bottom of the cavity. The mammalian bones belong to species of elephant, horse, pig, deer, and field-mouse. With them are occasionally found the bones of *mastodon angustidens* and some mollusca, which belong to the red crag. Their occurrence here is believed to have arisen from their having been washed out of the Red into this, the Norwich crag.

NORWOOD, UPPER and LOWER, are two villages in Surrey, England, with a station on the London and Croydon railway, 6 m. s. of London. The public pleasure-ground, called the Beulah Spa, is prettily laid out around a mineral spring. The villages are worthy of mention, however, chiefly on account of their schools, among which are a district school for the pauper children of Lambeth parish.

NORWOOD, THOMAS MANSON, b. Talbot co., Ga., 1830; graduated at Emery coll., Ga., 1850, and at law, 1852; settled in Savannah, Ga., 1852. He was in the state legislature, 1861–2, and the U. S. Senate as a dem., 1871–77.

NOSE, AND THE SENSE OF SMELL. The nose is not only the organ of smell, but is likewise a part of the apparatus of respiration and voice. Considered anatomically, it may be divided into an external part—the projecting portion, to which the term *nose* is popularly restricted; and an internal part, consisting of two chief cavities, or *nasal fossæ*, separated from one another by a vertical septum, and subdivided by spongy or turbinated bones projecting from the outer wall into three passages or *meatuses*, with which various cells or *sinuses* in the ethmoid, sphenoid, frontal, and superior maxillary bones communicate by narrow apertures.

The external portion of this organ may be described as a triangular pyramid which projects from the center of the face, immediately above the upper lip. Its summit or root is connected with the forehead by means of a narrow bridge, formed on either side by the nasal bone and the nasal process of the superior maxillary bone. Its lower part presents two horizontal elliptical openings, the *nostrils*, which overhang the mouth, and are separated from one another by a vertical septum. The margins of the nostrils are usually provided with a number of stiff hairs (*vibrissæ*), which project across the openings, and serve to arrest the passage of foreign substances, such as dust, small insects, etc., which might otherwise be drawn up with current of air intended for respiration. The skeleton, or framework of the nose, is partly composed of the bones forming the top and sides of the bridge and partly of cartilages, there being on either side an upper lateral and a lower lateral cartilage, to the latter of which are attached three or four small cartilaginous plates, termed sesamoid cartilages; there is also the cartilage of the septum which separates the nostrils, and in association posteriorly with the perpendicular plate of the ethmoid, and with the vomer, forms a complete partition between the right and left nasal fossæ. It is the lower lateral, termed by some writers the alar cartilage, which by its flexibility and curved shape forms the dilatable chamber just within the nostril. The nasal cartilages are capable of being slightly moved, and the nostrils of being dilated or contracted by various small muscles, which it is unnecessary to describe. The integument of the nose is studded with the openings of sebaceous follicles, which are extremely large and abundant in this region. The oleaginous secretion of these follicles often becomes of a dark color near the surface; and hence the spotted appearance which the tip and lower parts of the sides, or *alæ*, of the nose frequently present. On firmly compressing or pinching the skin of these parts, the inspissated secretion is forced out of the follicles in the form of minute white worms with black heads.

The *nasal fossæ*, which constitute the internal part of the nose, are lofty, and of considerable depth. They open in front by the nostrils, and behind they terminate by a vertical slit on either side in the upper part of the pharynx, above the soft palate, and and near the orifices of the eustachian tubes, which proceed to the tympanic cavity of the ear.

The mucuous membrane lining the nose and its cavities is called *pituitary* [Lat. *pituita*, slime, rheum), from the nature of its secretion; or *Schneiderian*, from Schneider, the first anatomist who showed that the secretion proceeded from the mucous membrane, and not, as was previously imagined, from the brain; it is continuous with the skin of the face at the nostrils, with the mucous covering of the eye through the lachrymal duct (see EYE), and with that of the pharynx and middle ear posteriorly. This membrane varies in its structure in different parts of the organ. On the septum and spongy bones bounding the direct passage from the nostrils to the throat, the lining membrane is comparatively thick, partly in consequence of a multitude of glands being disseminated beneath it, and opening upon it, but chiefly, perhaps, from the presence of ample and capacious submucous plexuses of both arteries and veins, of which the latter are by far the more large and tortuous. These plexuses, lying as they do in a region exposed more than any other to external cooling influences, appear to be designed to promote the warmth of the part, and to elevate the temperature of the air on its passage to the lungs. They also serve to explain the tendency to hemorrhage from the nose in cases of general or local plethora. In the vicinity of the nostrils, the mucous membrane exhibits papillæ and a scaly epithelium, like the corresponding parts of the skin. In the sinuses, and in all the lower region of the nose, the epithelium is of extreme delicacy, being of the columnar variety, and clothed with cilia. In the upper third of the nose—which, as the proper seat of the sense of smell, may be termed the *olfactory region*—the epithelium ceases to be ciliated, assumes a more or less rich sienna-brown tint, and increases remarkably in thickness, so that it forms an opaque soft pulp upon the surface. It is composed of an aggregation of nucleated particles, of nearly uniform appearance throughout, except that the lowest ones are of a darker color than the rest, from their containing a brown pigment in their interior. Dr. Todd and Mr. Bowman remark, in their *Physiological Anatomy*, from which we have condensed the above account of the nasal mucous membrane, that the olfactory region abounds in glands, apparently identical with sweat glands, which dip down in the recesses of the submucous tissue among the ramifications of the olfactory nerve.

The nerves of the nose are the first pair or olfactory which are specially connected with the sense of smell, branches of the fifth pair which confer ordinary sensibility on

its skin and mucous membrane, and motor filaments, from the facial nerves to the nasal muscles. The olfactory nerve on each side is connected with the inferior surface of the brain (q.v.) by an external, a middle, and an internal root, which unite and form a flat band (or, more correctly, a prism), which, on reaching the cribriform plate of the ethmoid bone, expands into an oblong mass of grayish-white-substance, the *olfactory bulb*. From the lower surface of this bulb are given off the *olfactory filaments*, fifteen or twenty in number, which pass through the cibriform foramina, and are distributed to the mucous membrane of the olfactory region. These filaments differ essentially from the ordinary cerebral nerves. They contain no white substance of Schwann, are not divisible into elementary fibulæ, and resemble the gelatinous fibers in being nucleated, and of a finely granular texture. The branches of the fifth pair (or trifacial) given to the nose are the nasal nerve (derived from the ophthalmic division), which supplies the skin and mucous membrane in the vicinity of the nostrils, and the naso-palatine nerve (derived from Meckel's ganglion, which is connected with the superior maxillary division), which supplies the mucous membrane on the spongy bones and on the septum. The peculiar sensation that precedes sneezing is an affection of the nasal nerve, and the flow of tears that accompanies a severe fit of sneezing is explained by the common source of this and the lachrymal nerve; while the common sensibility of the nose, generally, is due to the branches of this and of the naso-palatine nerve.

The nature of odorous emanations is so little known, that it is impossible to give a definite account of the mode in which they produce sensory impressions. From the fact that most odorous substances are volatile, and *vice versâ*, it may be presumed that they consist of particles of extreme minuteness dissolved in the air; yet the most delicate experiments have failed to discover any loss of weight in musk, and other strongly odorous substances, after they have been freely evolving their effluvia for several years. But whatever may be the nature of the odorous matter, it is necessary that it should be transmitted by a respiratory current through the nostrils to the true olfactory region, whose membrane must be in a healthy condition. If it is too dry, or if there is an inordinate excretion of fluid from its surface (both of which conditions occur in catarrh or cold in the head), smell is impaired or lost, in consequence of the necessary penetration of the stimulating odor to the nervous filaments being prevented.

The acuteness of the sense of smell is far greater in many of the lower animals (dogs, for example) than in man, and they employ it in guiding them to their food, in warning them of approaching danger, and for other purposes. To civilized men its utility is comparatively small; but it is occasionally much increased when other senses are deficient. In the well-known case of James Mitchell, who was deaf and blind from his birth, it was the principal means of distinguishing persons, and enabled him at once to perceive the approach of a stranger. Amongst many savage tribes the sense is almost as acute as in many of the lower mammals. For example, the Peruvian Indians are able, according to Humboldt, to distinguish, in the middle of the night, whether an approaching stranger is a European, American Indian, or Negro.

Although all poisonous gases are not odorous, and all bad odors may not be positively deleterious to health, there can be no doubt that one of the principal objects for which the sense of smell is given to us is to enable us to detect atmospheric impurities, many of which are of a most noxious character, and give rise to the most serious forms of fever.

NOSE-RING. See Ring.

NOSING, the projecting edge of a molding, such as the bead or bottle used on the edge of steps, to which the term is most frequently applied.

NOSOL'OGY (Gr. *nŏsŏs*, disease) is that branch of the science of medicine which treats of the distribution and arrangement of diseases into classes, orders, etc. Many systems of nosology have at different times been adopted; some of which have been based upon the nature of the ascertained causes of diseases; others on the pathological states or conditions which attend diseases; others on the differences between structural and functional diseases, etc. It is hard to say which is the most perfect method; but that of Dr. Farr, one of the most distinguished living medical statists, is adopted by the registrar-general in the reports on the mortality of London and England, and is becoming more generally adopted than any other. It has the advantage over the antiquated but once popular system of Cullen (1792) of meeting the requirements of modern science, and (by illustrating great questions connected with public health) of showing those causes that are injurious or fatal to life, and of thus contributing to the removals of those evils (bad drainage, imperfect ventilation, etc.) which tend to shorten human existence.

We append Dr. Farr's system of nosology, which is arranged in four primary classes, each of which includes various orders:

Class I. Zymotic Diseases (Gr. *zymē*, a ferment).—Diseases that are either epidemic, endemic, or contagious, and that are induced by some specific body, or by want of food or by its bad quality. In this class there are four orders—viz., Order I. *Miasmatic Diseases* (Gr. *miasma*, a stain), such as small-pox, measles, scarlet-fever, diptheria, typhus and typhoid fevers, cholera, ague, etc. Order II. *Enthetic Diseases* (Gr. *enthĕtos*, put in or implanted), such as syphilis, gonorrhœa, glanders, hydrophobia, malignant pustule, etc. Order III. *Dietic Diseases* (Gr. *diaita*, way of life or diet), such as famine, fever,

scurvy, purpura, rickets, bronchocele, delirum tremens, etc. Order IV. *Parasitic Diseases*, such as scabies (or itch), and worm disorders from animal parasites and ringworm, scald-head, etc., from vegetable parasites or fungi.

Class II. Constitutional Diseases.—Diseases affecting several organs, in which new morbid products are often deposited; sometimes hereditary. This class contains two orders. Order I. *Diathetic Diseases* (Gr. *diathēsis*, condition or constitutional), including gout, anæmia, cancer, melanosis, lupus, etc. Order II. *Tubercular Diseases*, such as scrofula, phthisis, mesenteric, tubercular meningitis, etc.

Class III. Local Diseases.—Diseases in which the functions of particular organs or systems are disturbed or obliterated with or without inflammation; sometimes hereditary. This class includes eight orders. Order I. *Brain Diseases* (or more correctly, *Diseases of the Nervous System*), such as apoplexy, paralysis, epilepsy, chorea, hysteria, mania, etc. Order II. *Heart Diseases* (or more correctly, *Diseases of the Circulatory System*), such as pericarditis, endocarditis, aneurism, angina pectoris, atheroma, phlebitis, varicose, etc. Order III. *Lung Diseases* (or more correctly, *Diseases of the Respiratory System*), such as bronchitis, pneumonia, pleurisy, asthma, empyema, laryngitis, etc. Order IV. *Bowel Diseases* (or more correctly, *Diseases of the Digestive System*), such as stomatitis, gastritis, enteritis, peritonitis, jaundice, etc. Order V. *Kidney Diseases*, such as Bright's disease, nephritis, ischuria, diabetes, stone, gravel, etc. Order VI. *Genetic Diseases* (or *Diseases of the Generative System*). sueh as hydrocele, ovarian dropsy, etc. Order VII. *Bone and Muscle Diseases*, such as caries, necrosis, exostosis, synovitis, muscular atrophy, etc. Ordor VIII. *Skin Diseases*, such as urticaria, eczema, herpes, impetigo, acne, lichen, prurigo, etc.

Class IV. Developmental Diseases.—Special diseases, the incidental result of the formative, reproductive, and nutritive processes. It contains four orders. Order I. *Developmental Diseases of Children*, such as malformations, idiocy, teething, etc. Order II. *Developmental Diseases of Women*, such as amenorrhea, childbirth, change of life, etc. Order III. *Developmental Diseases of Old People*, such as old age, and its concomitant affections. Order IV. *Diseases of Nutrition*, such as atrophy, debility, etc.

NOSSI-BÉ, NOSSI-BARIN, VARIOU-BÉ or **HELLEVILLE**, an island on the n.w. coast of Madagascar, at the mouth of the bay of Pasoandava, and separated from the main land by a narrow channel. It is about 74 sq.m. in extent; its coast-land is very much indented; and its surface much diversified. The highest hill is 1700 ft. in height, and is clothed to the summit with magnificent trees; but much of the island has a bare aspect, the forest having been cut down in order to the cultivation of rice. Pop. '90, 7700.

NOSSIIBRAHIM, or Sainte Marie, an island on the e. coast of Madagascar, and separated from it by a strait of about 5 m. in width. Area, about 64 sq. m. It is about 40 m. in length from n.n.e. to s.s.w., but only a few miles in breadth. It is one of the much-prized possessions of the French on the coast of Madagascar; was taken by them in 1643, and the French India company founded a station on its western coast in 1750. The soil is generally arid, and the climate moist and unhealthy. Rain is of extreme frequency. All the French possessions on the coast of Madagascar were placed by an imperial decree of 1851 under one government, that of the Comoro Isles (q. v.); but in 1896 N. was placed with Diego-Suarez and Nossi-Bé under the authority of the Resident-General of Madagascar. Pop. '91, 7667.

NOSTALGIA is a feeling of melancholy, caused by grief on account of absence from one's home or country, of which the English equivalent is *homesickness*. The Swiss, with their simple nature and love of home, are said to be especially subject to this malady; and the Swiss troops employed as mercenaries in France during the seventeenth and eighteenth centuries were so affected by the simple Swiss melody, *Ranz des Vaches* (q.v.), "Bringing Home the Cows," a tune familiar to the shepherds and herdsmen of Switzerland, that it became necessary to prohibit its performance by the military bands.

NOSTOC, a genus of plants of the natural order *Algæ*, suborder *Confervaceæ*, found upon moist ground, rocks near streams, etc., and consisting of a somewhat gelatinous hollow tumid frond, filled with simple filaments resembling strings of beads. *N. commune* is frequent in Britain, springing up suddenly on gravel-walks and pasture-grounds after rain. It is a trembling gelatinous mass, often called Star Jelly, and vulgarity regarded, owing to the suddenness with which it makes it appearance, as having fallen from the skies, and as possessed of important medicinal virtues. *N. edule* is employed in China as an article of food.

NOSTRADAMUS, a celebrated astrologer of the 16th c., b. Dec. 14, 1503, at St. Remi, in Provence. His proper name was Michel Notre-Dame, and he was of Jewish descent. He studied first at the collége d'Avignon, where he exhibited remarkable scientific powers, and subsequently attended the celebrated school of medicine at Montpellier. Here he first acquired distinction during an epidemic that desolated the s. of France, by his humane attention to those stricken by the pestilence. After taking his degree, he acted for some time as professor, but was induced by his friend J. C. Scaliger to settle in Agen as a medical practitioner. After traveling for some time, he finally settled at Salon, a little town situated in the environs of Aix, about 1544. Already he must have been reckoned a man of note, for in the following year, when an epidemic was raging at Lyon, he was solemnly invited thither by the civic authorities, and is said to have rendered immense services. He first fell upon his prophetic vein about the year 1547, but

in what light he himself regarded his pretensions, it is now impossible to say. At any rate, he commenced to write his famous predictions (*Prophéties*) which first appeared at Lyon in 1555. The predictions were in rhymed quatrains, divided into centuries, of which there were seven; the 2d ed., published in 1558, contained ten. Astrology was then the fashion, and these quatrains, expressed generally in obscure and enigmatical terms, had a great success. Some, indeed, regarded the author as a quack, but the great majority as a genuine seer or predicter of the future. He was, consequently, much sought after by all sorts of people, high and low. Catherine de'Médicis invited him to visit her at Blois, to draw the horoscope of her sons, and on his departure loaded him with presents. The duke and duchess of Savoy went to Salon expressly to see him; and when Charles IV. became king, he appointed Nostradamus his physician-in-ordinary (1564). He died at Salon, July 2, 1566. Nostradamus's predictions have been the subject of an immense amount of illustrative and controversial literature. He also wrote an almanac, which served as the model of all subsequent ones, containing predictions about the weather.—See Jaubert's *Vie de M. Nostradamus, Apologie et Historie* (Amst. 1656); Astrue's *Mémoires pour servir à l'Histoire de la Faculté de Montpellier* (Paris, 1767); *Apologie pour les Grands Hommes Soupçonnés de Magie* (Paris, 1825); and E. Bareste's *Nostradamus* (Paris, 1842).

NOSTRILS, Diseases of the. Acute inflammation of the nasal mucous membrane is a very common and well-known affection, which has been already described under the title of catarrh (q.v.), or cold in the head; while the chronic form of inflammation is described in the article Ozena. Hemorrhage from the nostrils, or *Epistaxis* (Gr. a dropping), is by far the commonest form of bleeding from a mucous membrane. It may be produced (1) by direct injury, as by a blow on the nose, or a scratch in the interior of the nostrils; or (2) it may be an *active* hemorrhage, in which case it is often preceded by a feeling of tension and heat in the nostrils, pain in the forehead, giddiness, buzzing in the ears, and flushing of the face (these symptoms are, however, seldom all present in the same case, and not unfrequently the flow of blood is preceded by no apparent disorder); or (3) it may be of a *passive* character, and may be due either to a morbid condition of the blood, as in malignant scarlatina, typhoid and typhus fevers, scurvy, purpura, etc., or to obstruction of the circulation by disease of the liver and heart.

If the hemorrhage occur in a flushed plethoric subject, and is obviously of an active character, it may be regarded as a salutary effort of nature, and may be left alone till it ceases spontaneously; but if it continues so long as materially to weaken the patient, or if it be of the passive character, or if it arise from injury, then means should be taken to stop it with as little delay as possible. The patient should be placed in the sitting posture at an open window, with the head erect or slightly inclined backwards, and amongst the simpler means to be first tried, are compression of the nostrils by the fingers, the application of a key or other piece of cold metal to the back of the neck, and the occasional immersion of the face or whole head in cold water, especially if accompanied by a drawing-up of the water into the nostrils; or Dr. Negrier's plan of causing the patient, in a standing position, suddenly to raise his arms straight upwards, and to retain them for a short time in this position—a remedy which he states to have always succeeded, even in very bad cases, when other means had failed. Should these means fail, recourse must be had to astringent injections (for example, twenty grains of alum dissolved in an ounce of water) thrown up the nostrils by a syringe, or to astringent powders (as finely-powdered galls, kino, matico, alum, etc.), blown up the nostrils by means of a quill or other tube, or snuffed up by the patient. As a final resource, direct compression must be applied, Abernethy never failed in stopping the bleeding by winding a piece of moistened lint around a probe, so as to form a cylindrical plug, passing this along the floor of the nose for its entire length, then carefully withdrawing the probe, and allowing the lint to remain for three or four days. Cases occasionally occur in which it is necessary also to plug the posterior orifices of the nostrils by an operation, into the details of which it is not necessary to enter.

Polypus, which is an old term employed to signify any sort of pedunculated tumor firmly adhering (literally, "by many feet") to a mucous surface, is of common occurrence in the nostrils; its most usual seat of attachment being one of the turbinated bones. The ordinary kind is of the consistence of jelly, yellowish, streaked with blood-vessels, and of a pear-shaped form. The patient has a constant feeling of fullness in the nostril (as if he had a cold in the head); he cannot effectually blow his nose; and his voice is sometimes rendered more or less thick and indistinct. If he force his breath strongly through the affected nostril, and at the same time compress the other, and close the mouth, the polypus may generally be brought in view. The best treatment is to seize the neck or pedicle with the forceps, and twist it off. The consequent hemorrhage may be readily checked by the means already described. See Tuberculin.

Foreign bodies are often inserted into the nostrils by children, and become impacted. They may usually be extracted by a small scoop or a bent probe. If they cannot be removed by these means, they must be pushed back into the throat through the posterior nares.

Children are occasionally born with imperforated nostrils. This congenital malformation may, however, usually be remedied by surgical assistance.

NOSTRUM (Lat., "our own") is a term applied to patent or quack medicines whose ingredients are kept secret by the inventor for the purpose of controlling the manufacture of them; hence the term has come to be used in a derogatory sense.

NOTA BENE (Lat., "mark well") is an expression placed before a statement to call special attention to the fact or circumstance related therein. It is usually abbreviated into N. B.

NOTABLES, the name formerly given in France to persons of distinction and political importance. As the states general were inconvenient to the despotism of the monarchy, the kings of the House of Valois adopted the expedient of calling in their stead *Assemblies of the Notables*, the time of calling them and the composition of them being entirely dependent on the pleasure of the crown, by which also their whole proceedings were guided, so that they generally consented at once to whatever was proposed to them. They showed a particular readiness in granting subsidies, to which they themselves, as belonging to the privileged classes, were not to contribute. An Assembly of Notables, convened in Paris by Richelieu in 1626, and presided over by Gaston, brother of Louis XIII., consisted of only 35 members. For more than a century and a half even this poor acknowledgment of any other mind or will in the nation than that of the sovereign ceased to be made; but when the state of the finances brought the monarchy into difficulties and perils, Louis XVI., at the instigation of the minister Calonne, had recourse again to an Assembly of Notables, which met Feb. 22, 1787, and was dissolved May 25. It consisted of 137 members, among whom were 7 princes of the blood, 9 dukes and peers, 8 marshals, 11 archbishops, 23 nobles, 8 councilors of state, 4 masters of requests, 37 judges, 12 deputies of the Pays d'Etats, the civil lieutenant, and 25 persons belonging to the magistracy of different cities of the kingdom. Calonne's representations of the state of the finances induced the Notables to adopt many reforms in the matter of taxation; but no sooner was the assembly dissolved, than many of them joined the parliaments in opposition to resolutions adverse to their private interests, so that the king was compelled to determine upon assembling the states general. Necker, who had meanwhile been placed at the head of affairs, assembled the Notables again, Nov. 6, 1788, to consult them concerning the form in which the states general should be convened. The Notables declared against every innovation, and so compelled the court to half measures which helped to prepare the way for the Revolution. The parliament of the new principality of Bulgaria is spoken of as the Assembly of the Notables.

NOTACANTHIDÆ, a family of acantheropterous fishes, allied to the mackerels: indeed, they were formerly placed in the same family (*scomberidæ*). They have also been placed by recent writers in a separate order (*opisthomi*). They have an elongated eel-like form, and the caudal extremity is surrounded, as in eels, by a continuous fin. The body is covered with very small cycloid scales, and the lateral line is well marked. There are five species: 1. *notocanthus nasus*, Greenland; 2. *n. Bonapartii*; 3. *n. Mediterraneus*; 4. *n. Sexspinus*, Australia; 5. *n. rissoanus*, Mediterranean.

NOTARY PUBLIC is an officer introduced from the civil law, and known in ancient Rome as *tabellio forensis;* in England, appointed by the archbishop of Canterbury. In this country, the duties of a notary vary in the different states, being a matter of statutory regulation. But in general his duties are to protect bills of exchange, to take oaths and affirmations, to attest legal instruments, and to certify to documents. Notaries in England have always exercised the right of administering oaths, and that right has been confirmed by the statute, 5 and 6 Will. IV. In this country, the right can be exercised only where express statutory authorization is given, unless the oath administered is to be used in proceedings in the U. S. courts, or courts outside of the state. The act of Congress, Sept. 16, 1850, gave notaries equal authority with justices of the peace to administer oaths and take acknowledgments. A notary is liable for damages resulting from negligence in the discharge of his duties. He cannot as a rule delegate his notarial authority to another person. But a protest of a foreign bill of exchange by a notary's clerk, if such delegation be shown to be a commercial custom in the place fixed for the payment of the bill is valid. Where a notary is employed by an agent, and is guilty of negligence, the question arises whether the principal has a remedy against the agent, or against the notary: thus where an agent entrusted with the collection of a bill of exchange has it protested by a notary, whose negligence discharges the drawer and indorsers. Some courts hold that the principal may recover against the notary only when the latter's act is purely notarial, i.e. one that can be performed only by a notary; other courts hold that the remedy of the principal is against the notary only, whether the act be notarial or not.

NOTATION, the method of representing numbers and quantities by marks or signs. The representation of numbers is known as "arithmetical," and that of quantities as "symbolical" notation.

1. Arithmetical Notation.—The invention of arithmetical notation must have been coeval with the earliest use of writing, whether hieroglyphic or otherwise, and must have come into use about the time when it was felt that a mound, pile of stones, or huge misshapen pillar, was insufficient as a record of great events, and required to be supplemented by some means which would suffice to hand down to posterity the requisite

information. The most natural method undoubtedly was to signify "unity" by one stroke, "two" by two strokes, "three" by three strokes, etc.; and, as far as we know, this was the method adopted by most of those nations who invented systems of notation for themselves. It is shown on the earliest Latin and Greek records, and is the basis of the Roman Chinese, and other systems. We have thus a convenient division of the different notational systems into the *natural* and *artificial* groups, the latter including the systems of those nations who adopted distinct and separate symbols for at least each of the nine digits. The Roman and Chinese systems are the most important of the former, and the Hebrew, later Greek, and "decimal" systems of the latter group.

Roman System.—The system adopted by the Romans was most probably borrowed at first from the Greeks, and was distinguished equally by its simplicity and its cumbrousness. The following seems to be the most probable theory of its development. A simple series of strokes was the basis of the system; but the labor of writing and reading large numbers in this way, would soon suggest methods of abbreviation. The first and most natural step was the division of the strokes into parcels of tens, thus, , a plan which produced great facility in the reading of numbers. The next step was to discard these parcels of ten strokes each, retaining only the two cross strokes, thus, ×, as the symbol for 10. Continuing the same method as larger numbers came to be used, they invented a second new symbol for 100, thus, ⊏ (which was at first probably the canceling stroke for ten ×'s in the same way as × was originally the canceling stroke for ten units); and for the sake of facility in writing, subsequently employed the letter C, which resembled it, in its place. The circumstance that C was the initial letter of the word *centum*, "a hundred," was doubtless an additional reason for its substitution in place of the original symbol for 100. An extension of the same process produced M, the symbol for 1000, which was also written ↀ, ↀ, and very frequently CIↃ. This symbol was probably suggested by the circumstance that M was the initial letter of the Latin word *mille*, signifying a thousand. The early Roman system went no higher. But though the invention of these three symbols had greatly facilitated the labor of writing down and reading off numbers, further improvements were urgently required. The plan of "bisection of symbols" was now adopted; × was divided into two parts, and either half, ⋁ or ⋀, used as the symbol for 5; ⊏ was similarly divided, ⌐ or ⌊ standing for 50; and ↼, CI, or IↃ, was obtained in the same manner, and made the representative of 500. The resemblance of these three new symbols to the letters V, L, and D, caused the substitution of the latter as the numerical symbols for 5, 50, and 500. A final improvement was the substitution of IV for 4 (in place of IIII), IX for 9 (in place of VIIII), XC for 90 (instead of LXXXX), and similarly XL for 40, CD for 400, CM for 900, etc; the smaller number, when in front, being always understood as subtractive from the larger one after it. This last improvement is the sole departure from the purely additional mode of expressing numbers; and if the symbols for 4, 9, 90, etc., be considered as single symbols, which they practically are, the deviation may be looked upon as merely one of form. In later times, the Roman notation was extended by a multiplication of the symbol for 1000, thus CCIↃↃ represented 10,000; CCCIↃↃↃ represented 100,000, etc.; and the bisection of these symbols gave them IↃↃ and IↃↃↃ as representative of 5,000 and 50,000 respectively. This, in all probability, is the mode according to which the Roman system of notation was constructed. To found a system of arithmetic upon this notation, would have been well-nigh impossible; and so little inventive were the Romans, that the attempt seems never to have been made. They performed what few calculations they required by the aid of the *abacus* (q.v.).

Chinese System.—This system presents a strong resemblance to the former, but is, in facility of expression, much superior to it. Like the Roman, it retains the primitive symbols for the first three digits, and like it also expresses the last four by prefixing a new symbol to the symbols for the first four, and the analogy is continued up to "twenty." From this point onwards, the Chinese system departs from the "additive" principle, as 20, 30, etc., are represented not as in the Roman system by a repetition of the symbol for 10, but by affixing to the symbol for 10, on its left side, the symbols for 2, 3, etc., as multiples. The same method is adopted with the numbers 200, 300, etc.; and should the number contain units, they are annexed on the right-hand side. For small numbers up to 20, the Roman notation is more expeditious, on account of the greater simplicity of its characters; but for very large numbers, the Chinese is scarcely more cumbrous than our own. Some numbers which are expressed by the Chinese with 14 characters, require more than 100 symbols when expressed in the Roman notation.

Previous to the intercourse of the western European nations with China, their notation was much more cumbrous than it is at present; but the changes since made have affected merely the form of the characters, without altering the principle of the system.

Artificial Systems.—The first of these, in point of date, is the Hebrew; but as the knowledge we possess of it is very meager, and as its principle was adopted by the Greeks in the construction of their improved system, it will be sufficient to describe the latter.

Greek System.—The Greeks at first used a method similar to the Romans, though at the same time they appear to have employed the letters of the alphabet to denote the first 24 numbers. Such a cumbrous system was naturally distasteful to so fastidious a race, and they hit upon the happy expedient of dividing their alphabet into three portions—

using the first to symbolize the 9 digits, the second the 9 tens, and the third the 9 hundreds. But as they possessed only 24 letters, they had to use three additional symbols; their list of symbols of notation then stood as follows:

Units.		Tens.		Hundreds.	
α represents	1	ι represents	10	ρ represents	100
β	2	κ	20	σ	200
γ	3	λ	30	τ	300
δ	4	μ	40	υ	400
ε	5	ν	50	φ	500
ϛ (introduced)	6	ξ	60	χ	600
ζ	7	ο	70	ψ	700
η	8	π	80	ω	800
θ or ϑ	9	ϟ or ϙ (introduced)	90	Ϡ, Ϻ, Ϡ (introduced)	900

By these symbols, only numbers under 1000 could be expressed, but by putting a mark, called *iota*, under any symbol, its value was increased a thousand-fold, thus $\alpha = 1000$, $\alpha = 20{,}000$; or by subscribing the letter M, the value of a symbol was raised ten thousand-fold, thus, $\eta_{M} = 80{,}000$. For these two marks, single and double dots placed over the symbols were afterwards substituted. This improvement enabled them to express with facility all numbers as high as 9,990,000, a range amply sufficient for all ordinary purposes. Further improvements were made upon this system by Apollonius, who also by making 10,000 the root of the system, and thus dividing the symbols into tetrads, greatly simplified the expression of very large numbers. Both Apollonius and Archimedes had to a certain extent discovered and employed the principle of giving to symbols values depending on their position and multiplicative of their real value, but this principle was applied to tetrads or periods of four figures only, and the multitude of symbols seems to have stood in the way of further improvement. Had Apollonius, who was the chief improver of the system, discarded all but the first nine symbols, and applied the same principle to the single symbols which he applied to the "tetrad" groups, he would have anticipated the decimal notation.

The Greek arithmetic, founded upon such a system of notation, was necessarily lengthy and complicated in its operations, each number in the multiplicand forming with each number in the multiplier a separate product (not as in our system, where one product blends with another by the process of "carrying"), though by arranging these products in separate columns, according as they amounted to units, tens, hundreds, etc., the process was somewhat simplified. But when fractions formed part of the multiplier and multiplicand, the Greek arithmetic became almost unmanageable, till the invention of sexagesimals (q.v.) by Ptolemy superseded it. After Ptolemy's death, all improvement was arrested.

Decimal System.—The decimal system, which was introduced into Europe from the east (see Numerals), was first employed by the Spaniards, and was from them transmitted to the French and Germans, through whom its use was extended over Europe. The modern arithmetic was not practiced in England until about the middle of the 16th c., and for a long time after its introduction was taught only in the universities. The decimal system, possessing only 9 symbols—viz., 1, 2, 3, 4, 5, 6, 7, 8, 9 (called the nine digits)—adopts the principle of giving to each symbol or "figure" two values, one the absolute value, and the other a value depending upon its position. The numbers from "one" to "nine" inclusive, are expressed by the nine digits; ten is expressed by writing a cipher or zero after 1 (10), thus throwing it into the second place, and giving it a positional value ten times its absolute value. From the principle that a figure thus moved one place to the left is held to be increased in value ten times, this method of notation is called *decimal* notation (Lat. *decem*, ten), and *ten* is said to be the "radix" of the system. The numbers from "eleven" to "nineteen" inclusive are expressed by taking the symbol 10 and putting the digits from "one" to "nine" inclusive in place of the zero—e.g., twelve is written 12, 1 *in position* signifying ten units, and 2 two additional units. On the same principle, twenty is expressed by putting 2 in the second position (20), and so on to 99. To express a hundred, 1 is put in the third place (100), thus making its value ten times what it is in the second place, or ten times ten units; two hundred is similarly expressed by 200, etc.; and should a number of tens and units amounting to less than a hundred exist in the number, the symbols expressing them are substituted for the two zeros. This process can be similarly continued without limit.

There is another way of looking at this notation, which is perhaps simpler and clearer. In such a number, e.g., as 333, instead of attributing different values to the figure 3 in the different positions, we may consider it as symbolizing the same number throughout, namely, *three;* but three *what?* In the first place, it signifies three ones or units (e.g., three single pounds or sovereigns); in the second place, it still signifies three, but now it is three "tens" or decades (three parcels of ten sovereigns each); and in the third place, it still signifies three, but now three hundreds (three parcels of a hundred each). It is from this point of view that the first place to the right is called the *place of units*, or the *units' place;* the second, the *place of tens*, and so on. When such a number as 6473 is analyzed on this principle, it is seen to mean 6×1000 (6 times 1000) $+ 4 \times 100 + 7 \times 10 + 3 \times 1$;

and 6004 becomes $6 \times 1000 + 4 \times 1$. In this latter instance the peculiar importance of the figure 0 is seen (see NOTHING). Following out the method, the general formula for all numbers is $a \times 10^n + b \times 10^{n-1} + c \times 10^{n-2} + \ldots + m \times 10^3 + n \times 10^2 p \times 10 + q$, where $a, b, c, \ldots m, n, p, q$, stand for any of the nine digits or zero.

The special advantages of such a system are manifold. It enables us to express small numbers with the greatest ease, and as the smaller numbers are those most commonly used, this is a great point in favor of the system. It also gives to computation a unity which could never under any circumstances have existed in the systems of notation above described, and the most ordinary, and at the same time effective illustration of this is the process of "carrying" in multiplication, whereby one product is blended with another, and much time and trouble in the subsequent addition is saved. This simplification, however, is chiefly due to the introduction of the symbol 0, which, supplying the place of an absent digit, preserves to those figures on the left of it their true positional value. Another advantage of this system is the ease with which computations involving fractions are performed (see DECIMAL FRACTIONS). The use of the number 10 as *radix*, is universal in all systems of notation; but it has been often doubted, and in some respects with good reason, whether it is the number best fitted for this position, and many have proposed to substitute 12 for it. This question will be referred to under SCALES OF NOTATION.

2. SYMBOLICAL NOTATION, the general designation of those symbols which are used by mathematicians to express indefinite quantities. The symbols are generally taken from the English, Roman, and Greek alphabets, and are apportioned as follows: Algebraic quantities are expressed by the English alphabet; those which are known, by the earlier letters $a, b, c, \ldots$, and those which are unknown, by the later ones, $u, v, w, x, y, \ldots$. In trigonometry, the letters $a, b, c, \ldots$ denote measures of length, and A, B, C, ... are used to express angles. In mechanics and astronomy the Greek letters are generally used to express angles. When different sets of quantities are similarly related among themselves, the sets are, for convenience, expressed by the same letters; and to prevent confusion, each set has a peculiar mark attached to each symbol, thus, $a, b, c, \ldots$. denote one class; and $a', b', c', \ldots$. another class; $a'', b'', c'', \ldots$ a third class; and so on; or, $a_1, b_1, c_1, \ldots a_2, b_2, c_2, \ldots$, etc.

NOTE, in music, a character which by the degree it occupies on the staff represents a sound, and by its form the period of time or duration of that sound. The notes commonly in use in modern music are the semibreve, 𝅝; minim, 𝅗𝅥; crotchet, ♩; quaver, ♪; semiquaver, 𝅘𝅥𝅯; demisemiquaver, 𝅘𝅥𝅰; and semi-demisemiquaver, 𝅘𝅥𝅱. Taking the semibreve as unity, the minim is $\frac{1}{2}$ its duration, the crotchet $\frac{1}{4}$, the quaver $\frac{1}{8}$, the semiquaver $\frac{1}{16}$, the demisemiquaver $\frac{1}{32}$, and the semi-demisemiquaver $\frac{1}{64}$. Notes of greater length than the semibreve were formerly in use—viz., the breve, twice the duration of the semibreve; the long, four times; and the large, eight times the semibreve. Of these, the breve, 𝅜 or 𝅜, is still sometimes met with in ecclesiastical music.

NOTE. See PROMISSORY NOTE.

NOTES OF THE CHURCH are marks by which a true church is distinguished. Practically, as to human judgment, they vary according to the different theories held concerning the constitution of a church. Irenæus refers to the unity of the church's doctrines, and her succession of bishops from the apostles; Tertullian appeals to the antiquity of the church derived from the apostles, and its priority to all heretical communities. The creed of Constantinople defines the church as "One, holy, Catholic, and apostolic." Augustine discerned the church chiefly in the consent of nations, authority founded on miracles, sanctity of morals, succession of bishops from Peter, and even in the name "Catholic church." Jerome specifies the duration of the church from the apostles and the Christian name. Luther insists on the uncorrupted preaching of the gospel, administration of baptism, and of the eucharist, and the keys. Calvin regards chiefly truth of doctrine and right administration of the sacraments. Bellarmine multiplies the marks into catholicity, antiquity, duration, amplitude, episcopal succession, apostolical agreement, unity, sanctity, and efficacy of doctrine, holiness of life, miracles, prophecy, admission of adversaries, unhappy end of enemies, and temporal felicity.

NOT GUILTY is the form of verdict in a criminal prosecution, and also in some civil actions, when the jury find in favor of the defendant or accused party. The verdict is conclusive, and the accused cannot, in criminal cases, be tried a second time.

NOTHING, in mathematical language, denotes the total absence of quantity or number, as when equals are subtracted from equals, but it is often employed (see LIMITS) to indicate the limit to which a constantly decreasing positive quantity approaches. The absence of number or quantity could be equally well signified by the absence of any symbol whatever, but the presence of "0" shows that in its place some number or quantity might, and under other circumstances would, exist.

In physics, the symbol "0" is generally denominated *zero*, and has a different mean-

ing. Like the former, it is the starting-point from which magnitude is reckoned; but while the starting-point in the former case was absolute, in this case it is conventional, and by no means denotes the absence of all quantity or magnitude. Thus the zero-point of the thermometer must not be interpreted to signify that when the mercury has fallen to this point atmospheric heat has totally vanished, but must be understood as a mere conventional starting-point for graduation, chosen for convenience, and not even necessarily representing any fixed natural degree of temperature.

NOTHOPIDÆ, a family of non-venomous snakes, established by prof. Cope, for a peculiar genuine type made known by himself. It is related to the boas and pythons, but is of small size. The only known species is found in central America.

NOTICE, in law, denotes existing knowledge of some fact or the act of giving information. In the former sense it may be actual or constructive, actual when the party is directly informed of the fact by word of mouth or by letter; constructive, when the party is legally presumed to have information on grounds of public policy or has been "put upon inquiry" by his knowledge of facts intimately connected with the particular fact in dispute. Thus a party to a suit has constructive notice of a newspaper advertisement published by order of the court, and a person accepting a conveyance which refers to some other deed is bound to consult the latter or take the consequence of his negligence. But when the liability of a party to do or not to do a certain act is conditional on the occurrence of a fact which is best known to the other party, the plaintiff must prove that actual notice was given to the defendant. Averment of notice is the allegation in a pleading that notice has been properly given, and there must be such averment when the matter lies more properly in the knowledge of the plaintiff than the defendant; in common law pleading omission of averment is fatal on demurrer or a claim of judgment by default. Notice to plead before a fixed time must be given in writing before judgment can be signed for non-pleading, and, in general, notice must always be given to the opposing party of any new step in procedure. Secondary evidence cannot be offered of the contents of a written instrument until notice has been given to the opposing party to produce it on trial, except where the party in possession holds the paper by fraud or when he is supposed from the nature of the case to have constructive notice. The notice to produce should be in writing, should clearly describe what is required, and must be served on the party or his attorney a reasonable time before trial. Notice of dishonor must be given to an indorser of a promissory note and to the drawer or indorser of a bill of exchange, when demand for payment or acceptance has been made and refused by the maker of the note or by the drawer or acceptor of the bill of exchange, in order to change such indorser or drawer. Only persons who after dishonor are at once liable to an action on the negotiable paper need be immediately notified. Notice of dishonor must be immediate, must clearly describe the bill or note and the nature of the non-acceptance, may be oral though usually in writing, and may be served personally or by mail. Notice to quit from a landlord to a tenant is necessary only when the tenant holds at will or for an uncertain time. Notice in this case should be served by the owner or agent upon the tenant in person or some member of his family and at his usual place of abode. A time must be fixed at the end of which the premises must be vacated. This at common law was 6 months, but in this country is governed by statutory enactment, being, in many cases, 3 months. When there are joint tenants or tenants in common the notice must be addressed to all but may be served on one. After the specified time has passed any act of the landlord which recognizes the continuance of the tenant in possession of the premises is a waiver of the notice. The acceptance of rent, if not explained, would constitute such an act. Where A. assigns to C. a debt due from B., B. is not affected by the assignment without due notice. Thus where a mortgage has been assigned and subsequently the mortgageor not having notice, has made payments to the original mortgagee, such payments are good, and the assignee cannot recover from him. In a contract notice may be expressly required or may be implied from the nature of the agreement. If the act to be done is indefinite—as to pay for certain kinds of lumber as much as could be gotten by the vendor from any one else—it is obvious that notice is necessarily implied; not so, however, when the act is definite or specific, as to pay a fixed sum on the occurrence of a certain event. When a *bona fide* purchaser for consideration has had notice of the existence of fraud or unfairness in the contract by which his vendor obtained the possession of the article bought, that contract cannot be sustained on the ground that he is an innocent third party.

NOTICE TO QUIT, is the formal notice given by a landlord to a tenant, or by a tenant to a landlord, that the tenant ought or intends to quit at a future day named. See LANDLORD AND TENANT.

NOTIDANIDÆ, a family of sharks distinguished by the number of branchial apertures, which are six or seven. There are three genera, *hexanchus*, *heptanchus*, and *notorhynchus*, the latter inhabiting south African, and western North American shores, and the first two the Atlantic ocean and Mediterranean. The members of the family are small, none of them much exceeding 3 ft. in length.

NO'TO, a t. of Sicily, in the province of Syracuse, and 17 m., s.w. of the city of that name, 3 m. from the sea. It is of the highest antiquity, was a place of great strength

under the Saracens, and held out against the invading Northmen longer than any other town of Sicily. It is a very handsome town, contains rich churches, beautiful palaces, and broad and straight streets. Its academy has a library attached, and a collection of antiquities. A good trade is carried on in corn, wine, oil, and the other produce of the vicinity. Noto was destroyed by an earthquake in 1693, and rebuilt about 4½ m. from its former site. Pop. comm. 1820.

NOTOCHORD, the *chorda dorsalis* (q.v. in DEVELOPMENT OF THE EMBRYO).

NOTOPTERUS, a genus of fish belonging to the herring family (*clupeidæ*).

NOTOTHENIIDÆ, a family of acanthopterous fishes, inhabiting southern seas, and representing the cod-fishes of the northern. The greatest number of species belong to the typical genus *notothenia,* and they are abundant on the southern shores of South America.

NOTOR'NIS, a genus of birds of the family *Rallidæ,* nearly allied to the coots, although in some of its characters it resembles the ostrich family. One living species only is known, *Notornis Mantellii,* a native of New Zealand. It is particularly interesting, because the genus was originally established and the species characterized by Owen, from remains found along with those of *dinornis* and other large birds of the ostrich family, called moas by the New Zealanders. The bird was, however, ascertained in 1850 still to exist. It inhabits some of the most unfrequented parts of the middle island. It is larger than the other coots, but small in comparison with the true moas. The flesh is said to be delicious. It seems to be a bird likely soon to become extinct unless preserved by human care, and of which the domestication would be easy and desirable.

NOT PROVEN is a form of verdict used in Scotland in criminal prosecutions when the jury think there is some foundation for the charge, but the evidence is not strong enough against the prisoner to warrant a verdict of guilty. In such a case, a verdict of "Not Proven" is substantially a verdict of acquittal. The prisoner cannot be tried afterward, even though new and conclusive evidence come to light after the verdict.

NOTRE DAME, i.e., *Our Lady;* the old French appellation of the Virgin Mary, and therefore the name of a number of churches dedicated to the Virgin Mary in different parts of France, and particularly of the great cathedral of Paris.

NOTRE DAME, CATHEDRAL OF THE, is the most celebrated church among the many of that name in France. It is the cathedral of Paris; and by its great age, the majesty of its proportions, and the stirring scenes of seven centuries of history, of which it has been either theater or witness, it is one of the remarkable historical monuments of the world. History does not reach to the time when its site was not the site of a sanctuary. In the reign of the Roman emperor Tiberius, altars for pagan worship existed on the east end of the island in the Seine, where Notre Dame now stands. The remains of a temple of Jupiter and Cernunos, and the image of a horned god, were found on the spot about 375, when a church was erected on the same site; supposed to have been the first Christian church erected in north France. In the 6th c. there were two churches there, St. Etienne and Ste. Marie. Childebert rebuilt the latter about the year 520 in a Roman style, considered very grand. The first glass window now known of in France was placed in it. Fragments of mosaic and precious marbles supposed to be from the floor and columns of this church were discovered in excavations in 1847, and are now in the *Musée de Cluny.* This church was pillaged and partly destroyed by the Normans in 857, but it was repaired by "Anscheric, 50th bishop of Paris." In 1140 the abbé of St. Denis put in a glass window of great beauty. It was then called the *Eglise neuve,* to distinguish it from the *St. Etienne,* called *le vieux.* In the 12th c. both were falling into ruins, though they had for centuries been used for the great religious ceremonies and royal pageants of France. About 1160 Bishop Maurice de Sully resolved to replace both old churches with a single edifice worthy the capital of the kingdom, and in 1163 the foundation of the present majestic pile was begun, and its corner stone placed by the hands of Pope Alexander III. then a refugée in France. The work was pushed rapidly, so that, in 1182, on Wednesday of the pentecost, the great altar was consecrated by a legate of the pope. In 1185 Heraclius, patriarch of Jerusalem, came to Paris to officiate with the bishop in the dedication of the choir. Henry II., king of England, was interred before its high altar in Aug., 1186. Notwithstanding the completion for service of the body of the church in the 12th c., the grandest part of the cathedral—its western front with the two towers—was only begun by Bishop Pierre de Nemours, A.D., 1208. It rose at the rate of about one story in the life of one generation of men. The portal of the south transept façade was built still later, as shown by an inscription of the mason who began work upon it in 1257, in the reign of St. Louis. Other, and some of the most beautiful, portions were completed during the succeeding centuries. The environing chapels in the rear of the transepts were not a part of the original design, and were added in the last part of the 13th c., about which time, also, the towers of the west front were complete. In 1699 Louis XIII. was seized with the ambition to place in the cathedral an altar piece in the renaissance style, then just coming into vogue; and removed the original altar to give place to it. Other alterations were made by Soufflot, an eminent architect, in 1771–78. During the revolution, the masses of saintly carvings upon the church were threatened with destruction by the infidel mobs, and were saved at one time by a ruse of Chaumette, who assured

the people that information concerning the planetary system was embodied in some of the image sculpture. But the statues of the old kings of France, which were upon the gallery of the grand façade, did not escape the vandalism. In 1793 the cathedral became, by law of the revolutionists, the Temple of Reason. In 1845 the first thoroughly intelligent and comprehensive work for the restoration of Notre Dame was entered upon, under the control of architects Lassus and Viollet-Leduc. Their work was prosecuted uninterruptedly for ten years, so that by 1855 the marvelous blending of majesty of proportion with grace of detail and spirit in design in its west façade were exhibited in bolder relief than ever before in all its history. During the reign of Louis Napoleon the vast structure, on every side, from foundation to pinnacles, was cleaned and repaired; and for the first time in the seven hundred years of its growth could be seen with all its varied constructions as one completed whole. The year 1882 will be the 700th anniversary of its consecration. From 1182 to the present its lofty nave, its altars, and its chapels, have been the scenes of all the most important ceremonies of church and state in France. The baptism of princes, their marriages, coronations, royal funerals, the reception of the great dignitaries of the church, Te Deums for victories, and the surging masses of Parisian revolutions for seven hundred years have made historic procession under its lofty vaults. The architecture embraces nearly every noble feature peculiar to the era that witnessed the growth and culmination of Gothic architecture, and for simple majesty of expression its façade has no superior. The extreme length of the cathedral is 430 ft.; width at transept, 170 ft.; and area covered by it, 64,108 sq.ft.; height of towers, 223 ft.

NOTRE DAME, School Sisters of. See Schools, Brothers of Christian.

NOTRE DAME (du Lac), University of, at Notre Dame, St. Joseph co., Ind., a Roman Catholic institution, founded in 1842, chartered 1844. It has no endowment. It has 16 buildings, erected at a cost of $1,250,000, good laboratories and apparatus, with cabinets and collections of art, and a library of 50,000 volumes. It embraces a preparatory school, a commercial and classical department, and schools of art, science, medicine, civil, electrical, and mechanical engineering and law. The students are trained in gymnastic and military exercises. Jan. 1, 1897, it had 58 professors and other instructors, 684 students. President, the Rev. Andrew Morrissey, A.M.

NOTT, Eliphalet, D.D., LL.D., 1773–1866; b. Ashford, Conn. He enjoyed the careful training of an excellent mother, and at the age of four had read the Bible through. At the age of 16 he taught school, and at 20 took charge of the Plainfield academy, pursuing at the same time his classical and mathematical studies with the Rev. Dr. Benedict. He passed an examination for admission to the senior class of Brown university, and, though he did not enter, in 1795 he received the degree of master of arts. He then studied theology; was licensed by the New London Congregational association in 1795; was missionary and school teacher at Cherry Valley, N. Y., in 1796–97; pastor of the Presbyterian church in Albany in 1798–1804. In 1804 he was elected president of Union college, Schenectady, N. Y. He found the college in a low condition, "without funds, buildings, or library, and in debt," and its friends greatly disheartened; but he was successful in raising funds, and providing for its pressing needs. His remarkable executive abilities, and his power as a disciplinarian, were soon apparent, and young men came to the college from every state in the union. During his presidency of over 62 years, upwards of 4,000 students graduated. Dr. Nott was one of the most distinguished of American educators, and is spoken of as "one of the historical monuments of this country." In 1811 he was the moderator of the general assembly of the Presbyterian church. He published *Counsels to Young Men on the Formation of Character and the Principles which lead to Success and Happiness in Life; Lectures on Temperance,* presenting a convincing argument for the disuse of intoxicating liquors. He published also several baccalaureate and other sermons and addresses. His most remarkable discourse was on the occasion of the fatal duel between Hamilton and Burr. The sermon made a profound impression upon the public mind, and gave him wide fame as a pulpit orator. Dr. Nott had great mechanical talent, and in the "Digest of Patents" are found 30 in his name granted for the application of heat to steam-engines, the economical use of fuel, etc. Dr. Crook, of the *Methodist,* says of him: "Perhaps no American educator, no American preacher, who has seen the dawning of 1865, has had so unique a history—few, probably, so effective a career. Intellectually, he was a remarkable man—many-sided, and superior on most sides. His mechanical genius is well-known, and one of the most famous iron-manufactories (the 'Novelty Works') originated in one of his inventions, which, by its economical peculiarities, was first known as a 'novelty.' He was a great financier, and enriched himself and Union college by his masterly skill and enterprise." Dr. Nott was not only an able theologian, but probably the most finished pulpit orator in the country. "Strong, serene, dignified, beautiful in language, clear in thought." "His most striking characteristic as a preacher was his perfect grace of manner, toned by a perfect graciousness of religious feeling." His memory was extraordinary, contributing greatly to his eloquence, as he was able to go at once from the writing of his discourse to the pulpit without his manuscript, and deliver it without any effort at recollection.

NOTT, Josiah Clark, 1804–73; b. S. C.; educated at the college of South Carolina, and at the medical school of the university of Pennsylvania, where he was for a time demonstrator in anatomy. In 1829 he returned to South Carolina, and entered upon the prac-

tice of his profession. In 1835 he went to Europe, where he spent a year in the study of medicine and the natural sciences. On his return he settled in Mobile, where he continued to practice medicine, founding, in 1858, a medical college, which became a department of the university of Alabama. He gave much attention to ethnology, and published, besides many contributions to medical periodicals, *Two Lectures on the Connection between the Biblical and Physical History of Man*, 1849; *The Physical History of the Jewish Race*, 1850; *Types of Mankind*, 1854; and *Indigenous Races of the Earth*, 1857. He wrote the last two works in conjunction with George R. Gliddon. He attempted, in his books on ethnology, to disprove the unity of the human race. His theories were regarded, in general, as more original than profound.

NOTT, Samuel d.d., 1754–1852; b. Conn.; brother of Dr. Eliphalet, the president of Union college; graduated at Yale college in 1780; ordained pastor of the Congregational church in Franklin, Conn., Mar. 13, 1782, where he remained until his death, performing his pastoral duties up to his 94th year, and dying from the effects of a fall. He published several occasional *Sermons.*

NOTT, Samuel, 1788–1869; b. Conn.; son of the Rev. Samuel of Franklin, Conn., and nephew of the Rev. Dr. Eliphalet, president of Union college. He graduated at Union college, 1808; Andover seminary, 1810; ordained (Congregationalist), 1812, with Newell, Judson, Hall, and Rice; and embarked with Hall, Feb. 24, as a missionary of the American board to India. After some delays from the East India Company, they reached Bombay, where they began a mission. His health failing, he returned to his native land in 1815. His return caused great disaffection among the friends of missions in America, as in that day it was thought inconsistent for one who had undertaken to labor for Christ among the heathen to return home on any account. He was engaged in preaching, teaching, and writing for the press until 1850. Among his published works was *Slavery and the Remedy.* He died in Hartford, Conn.

NOTTINGHAM, an inland co. of England, between Lincolnshire on the e., and Yorkshire and Derbyshire on the west. Area, 539,752 acres; pop. '91, 445,823. It is 50 m. in length from n. to s., and 20 m. in average breadth. The meridian of 1° w. falls along the middle of the county, and may be said to divide it into two nearly equal portions, of which the eastern, comprising the vale of the Trent, is level, and the western is occupied by hills of no great elevation. In the s. of the co. are the wolds, consisting of upland moors and pasture-lands, broken up by many fertile hollows. In the w. are the remains of the royal forest of Sherwood, famous as the chief haunt of Robin Hood. The principal rivers are the Trent, and its tributaries, the Erewash, Mann, and Idle. The Nottingham and Grantham canal, in the s., connects the Trent with the Witham, and these two rivers are also connected by the Fosse Dyke canal, which, running n.w. from the city of Lincoln, joins the Trent on the n.e. boundary of the county. By the rivers, canals, and North Midland, Sheffield and Lincoln, and Great Northern railways, there is direct communication in every direction. The climate, especially in the e., is remarkably dry. The soil is various; and, with regard to productiveness, the land is not above mediocrity. The usual crops are raised; there are many hop-plantations, and much land is laid out in market-gardens. Extensive tracts have been planted recently. Four members of parliament are returned for the county.

NOTTINGHAM, a municipal, co. and parliamentary borough of England, capital of the county of the same name, and a county in itself, on the Leen, at its junction with the Trent, 130 m. n.n.w. of London. It is built principally on the slope and at the foot of a rocky eminence, and, in an architectural sense, it has, within recent years, been much improved. The market-place is 5½ acres in extent, and is surrounded by lofty buildings. The Trent, which passes about a mile s. of the town, and is here about 200 ft. wide, is crossed by railway bridges, and by an ancient bridge of 19 arches. The exchange, the town and county halls, the house of correction, St. Mary's church, the Roman Catholic chapel, and the new free grammar-school, erected in 1868, are edifices worthy of special mention. The free grammar school was founded in 1513. A free library was opened in April, 1868. There are numerous hospitals for the poor and infirm. Of the manufactures, which are various and important, the principal are bobbinet and lace, and cotton and silk hosiery. Cotton, silk, and flax mills, bleaching-works, and wire, iron, and brass works are in operation. Formerly it was noted for its manufactures of woolens. Nottingham sends three members to parliament. Pop. '91, 213,877.

The original castle of Nottingham was built by William the Conqueror. Ruined during the civil wars, it was rebuilt after the Restoration, and burnt during the reform bill riots. In 1878 it was restored and transformed into a museum and picture gallery.

NOTTINGHAM, Heneage Finch, d.c.l., first Earl of, 1621–82; b. England; son of the recorder of London, and connected with the family of the earls of Winchelsea. He was educated at Westminster school, and at Oxford, and on quitting the university, began to read law in the inner temple, London. In 1660, upon the restoration of Charles II., he became solicitor-general, and represented the crown in the prosecution of the regicides, of the proceedings against whom he published an account, in 1660. In 1661 he was returned to parliament for the university of Oxford, and made a baronet. He was conspicuous in the impeachment of the earl of Clarendon in 1667, and three years

later was made attorney-general. In 1676 he was made keeper of the great seal, in succession to lord Shaftesbury, and in 1675 he became lord chancellor. In 1680 he sat as lord steward, on the trial of viscount Stafford, against whom he delivered judgment with great eloquence. He was made earl of Nottingham in 1681. He published a number of legal arguments and a volume of *Reports of Cases decreed in the High Court of Chancery.*

NOTTOWAY, a co. in s.e. Virginia, bounded on the s. by the Nottoway river; on the Norfolk and Western and the Southern railroads; 281 sq. m.; pop. '90, 11,582, chiefly of American birth, includ. colored. The surface is uneven, and portions are heavily wooded. The principal productions are tobacco, of which great quantities are raised, Indian corn, wheat, and oats. Co. seat, Nottoway.

NOTTOWAYS, a tribe of Indians, who lived about the Nottoway river, in Virginia. They belonged to the Huron Iroquois family and spoke a language of that family, of which they formed one of the most southern divisions. They gave themselves the name of Cherohakah. They were at one time a powerful tribe, and survived the famous Powhatans. In 1700 they still numbered 130 warriors, and in 1729 they had increased to 200. They were then living in cabins surrounded by a palisade, on the w. bank of the Nottoway. Attempts were made by Governor Spottswood and others to civilize and educate them, but unsuccessfully. In 1781 they had a reservation of 27,000 acres, of which only a very small part was under cultivation; and, according to Jefferson, not a single male of the tribe was then left alive.

NOU'KHA, a district town of Asiatic Russia, in Trans-Caucasia, is built on the southern slope of the Caucasus mountains, 80 m s.w. of Derbend, in lat. 41° 12′ n., long. 47° 13′ e. Pop. 25,900, consisting of native Tartars belonging to the Mohammedan creed, of Armenians, and a few Russians, chiefly officials. Breeding the silk-worm is the staple branch of industry. The native breed of silk-worms is somewhat coarse, and is now being supplanted by the Italian breed.

NOUN (Lat. *nomen*, a name), in grammar, is the term applied to that class of words that "name" or designate the persons and things spoken about. In a wide sense, such words as *rich, tall*, are nouns, as well as *John, man, tree;* for they are names applicable to all objects possessing these attributes. But as words like John, man, tree, suffice of themselves to mark out or designate an object or a definite class of objects, while words expressive of a single attribute, like *rich, tall*, can be used only in conjunction with such a word as *man* or *tree*, the one class are called adjective nouns, or simply adjectives (q.v.), while the others are called substantive nouns, or simply substantives or nouns. Nouns or names, in this narrower sense, may be divided into classes in a variety of ways, according to the ground we take for our division. One of the distinctions commonly made by grammarians is into proper nouns and common nouns. A proper noun is usually defined to be "the name of any individual person, or place," as *John, London;* while a common noun is applicable to every individual of a class of objects, as *prince, city*. But this definition fails to point out the real difference; for there are several Londons, and there are more Johns than princes; other things also have proper names, besides persons and places, as ships (the *Minotaur*), and bells (Big Ben). Providence again, although applicable to only one being in the universe, is not a proper noun. Wherein, then, lies the difference? In order to answer this question, we must advert to an important distinction made by logicians with regard to the import of names. A word is said to *denote* all the objects to which it is applicable as a name; thus, the word *man* is a name for all the objects known individually, as James, John, Adam, Cæsar, etc., and therefore denotes the whole human race; but while thus denoting or naming them, it also implies something concerning them; in the language of logic, it *connotes* that they possess certain attributes, namely (1) a certain corporeal form, known as the human form; (2) animal life; (3) rationality. All this, at least, is included in the *meaning* or connotation of the word "man." Now, if we consider any noun of the class called common, we find that while it denotes, or names, or points out a certain object, or class of objects, it also conveys or implies some qualities or facts concerning them; in other words, all such names are *connotative*, or have a meaning. Not so with proper nouns. To say that a man is called John Butler, informs us of no quality he possesses, or of any fact except that such is his name. The name itself conveys no meaning; it is *nonconnotative*. And this is what really constitutes a proper name; it is affixed to an object, not to convey any fact concerning it, but merely to enable you to speak about it. Proper names, indeed, are often given at first on account of the object possessing certain attributes; but once given, they do not continue to connote those attributes. The first John Baker was probably so called because he exercised the trade of baking; but his ceasing to bake would not have made him lose the name; and his descendants were called Baker, regardless of their occupation.

Proper names are thus *meaningless marks*, to distinguish one individual from another; and the A, B, C, etc., which a geometrician affixes to the several angles of a figure, are as much proper names as Tom, Lawrie, etc., applied to the individual bells of a chime. The proper contrast then, to a proper noun is not a common noun—meaning by that a name common to a class of objects—but a significant noun.

Of significant nouns, by far the greater number are general or class names; that is, they can be applied to any individual of a class of objects, implying that all these indivi-

duals have certain attributes in common—as *quadruped, book.* The quadruped spoken of may perhaps be a *horse,* and here we have another class-name, applicable to the same object, but of less generality than "quadruped." *Animal,* again, is more general than quadruped; being applicable to a far wider class. But it is important to observe, that as the number of objects that the terms are applied to, or denote, increases, the number of attributes they imply—in other words, the amount of their meaning—diminishes. To call an object an "animal," merely implies that it is organized and is alive (with that kind of life called animal life); to call it a "quadruped," implies all this and a number of attributes in addition; and to call it a "horse" implies a still further addition.

It is to this class of words that the term common nouns is properly applicable; and the contrast to them is not proper nouns, but what might be called singular nouns, such as "God," "Providence," universe."

Collective names are such as *regiment, fleet, senate, shoal.* They form a subdivision of class names or common nouns; for *regiment* is applicable to all collections of men organized in a particular way.

Names of materials are such as *iron, water, sugar, wheat.* These two classes appear in many cases to merge into each other. In both the objects named consist of an aggregation; but in collective names the parts forming the collection are thought of as individual objects; as the *soldiers* of a regiment, the *fishes* composing a shoal. Substances, again, like iron, gold, water, are not made up of *definite* individual parts (at least to our senses); and in such as wheat, sand, the name of the individual visible part (*grain of wheat, grain of sand*) is derived from the name of the mass, showing that the idea of the individual is swallowed up in that of the mass.

A convenient term for names of materials or substances is that used by German grammarians—stuff-nouns. Sometimes the same word is used as a stuff-noun, and also as a class-noun. Thus: "The cow eats *grass*" (stuff-noun); "the botanist studies the *grasses* and has found a new *grass*" (class-noun); "they had *fish* (stuff-noun) for dinner, and consumed four large *fishes*" (class-noun).

Names of materials are not, like collective nouns, a subdivision of common nouns; they belong to the coutrasted class of singular nouns; and, when the substance is simple or invariable in composition, cannot be used in the plural; as *gold, water, beef.*

Abstract Nouns.—In the expression "hard steel," or "the steel is hard," the word *hard* implies a certain quality or attribute as belonging to the steel. This quality has no existence apart from steel or some other substance; but I can withdraw (*abstract*) my thoughts from the steel in other respects, and think of this quality as if it had an independent existence. The name of this imaginary existence or abstraction is *hardness.* All words expressive of the qualities, actions, or states of objects, have abstract nouns corresponding to them; as *brave—bravery; strike—stroke; well—health.* In opposition to abstract nouns, all others are *concrete* nouns—that is, the attributes implied in them are considered as embodied in (*concrete,* Lat. growing together) the actual existences named.

NOUREDDIN-MAHMOUD, Malek-al-Adel, one of the most illustrious men of his time, and the scourge of the Christians who had settled in Syria and Palestine, was born at Damascus, Feb. 21, 1116. His father, Omad-ed-din Zengui, originally governor of Mosul and Diarbekir on behalf of the Seljuk sultans, had established his independence, and extended his authority over Northern Syria, including Hems, Edessa, Hamah, and Aleppo. Noureddin-Mahmoud succeeded him in 1145, and the better to carry out his ambitious designs, changed the seat of government from Mosul to Aleppo. Count Joscelin of Edessa, thinking the accession of a young and inexperienced sovereign afforded him a favorable opportunity of regaining his territories, made an inroad at the head of a large force, but was signally discomfited under the walls of Edessa, his army, with the exception of 10,000 men, being completely annihilated. The report of Noureddin-Mahmoud's success being conveyed to western Europe, gave rise to the second crusade. The crusaders were, however, foiled by Noureddin-Mahmoud before Damascus, and being defeated in a number of partial conflicts, abandoned their enterprise in despair. Noureddin-Mahmoud next conquered Tripolis and Antioch, the prince of the latter territory being defeated and slain in a bloody conflict near Rugia (June 29, 1149), and before 1151 all the Christian strongholds in Syria were in his possession. He next cast his eyes on Egypt, which was in a state of almost complete anarchy under the feeble sway of the now effeminate Fatimites, and, as a preliminary step, he took possession of Damascus (which till this time had been ruled by an independent Seljuk prince) in 1156; but a terrible earthquake which at this time devastated Syria, leveling large portions of Antioch, Tripolis, Hamah, Hems, and other towns, put a stop to his scheme for the present, and compelled him to devote all his energies to the removal of the traces of this destructive visitation. An illness which prostrated him in 1159, enabled the Christians to recover some of their lost territories, and Noureddin-Mahmoud, in attempting their re-subjugation was totally defeated near the lake of Gennesaret by Baldwin III., king of Jerusalem; but undismayed by this reverse, he resumed the offensive, defeated the Christian princes of Tripolis and Antioch, making prisoners of both, and again invaded Palestine. Meanwhile, he had obtained the sanction of the caliph of Bagdad to his projects concerning Egypt, and the true believers flocking to his standard from all quarters, a large army was soon raised, which, under his lieut. Shirkoh, speedily overran Egypt. Shirkoh

URBANA

dying soon after, was succeeded by his nephew, the celebrated Saladin (q.v.), who completed the conquest of the country. Noureddin-Mahmoud, becoming jealous of his able young lieut., was preparing to march into Egypt in person, when he died at Damascus, May 15, 1174. Noureddin-Mahmoud is one of the great heroes of Moslem history. Brought up among warriors who were sworn to shed their blood for the cause of the prophet, he retained in his exalted station all the austere simplicity of the first caliphs. He was not, like the majority of his co-religionists, a mere conqueror, but zealously promoted the cultivation of the sciences, arts, and literature, and established a strict administration of justice throughout his extensive dominions. He was revered by his subjects, both Moslem and Christian, for his moderation and clemency, and even his most bitter enemies among the Christian princes extolled his chivalrous heroism and good faith. He possessed in an eminent degree the faculty of impressing his own fiery zeal for the supremacy of Islam upon his subjects, and their descendants at the present day have faithfully preserved both his name and principles.

NOVAC'ULITE, a silicious slate derived from the argillaceous schists of the paleozoic period. Novaculite is the compact and homogeneous portions of the rock. See HONES.

NOVALIS. See HARDENBERG.

NOVARA, a province in n.w. Italy, adjoining Switzerland; bounded on the e. by the lake Maggiore and the Ticino, on the s. by the Po, and on the w. by Turin; drained by the Toce and its affluents; 2553 sq. m.; pop. '96, (est.) 754,574. The surface is mountainous, intersected by the Alps, among whose ridges are fertile valleys. The principal productions are silk, hemp, grain, and rice. Capital, Novara.

NOVARA, a t. of northern Italy, and capital of the province of the same name, is situated in a fertile district about 60 m. n.e. of Turin. Pop. '94, 42,300. It commands fine Alpine views from its ancient dismantled fortifications, and contains several notable churches, especially the cathedral, with its fine frescos and sculptures, and grand high-altar. On March 23, 1849, Novara was the scene of a grand battle between the Sardinian forces and an Austrian army commanded by Radetzky, which resulted in the complete defeat of the Italians, and ultimately led to the abdication of Charles Albert in favor of his son, Victor Emmanuel.

NOVA SCOTIA, a province of the Dominion of Canada, is bounded on the n.w. by New Brunswick and the bay of Fundy, on the n. by the straits of Northumberland and the gulf of St. Lawrence, and on the other sides by the Atlantic ocean. It consists of two portions, Nova Scotia proper, a large peninsula connected with New Brunswick by an isthmus about 15 m. in width, and the island of Cape Breton (q.v.). The peninsula, about 280 m. in length, and from 50 to 100 m. broad, extends in an e.n.e. and w.s.w. direction. Cape Breton lies n.e. of Nova Scotia proper, separated from it by a narrow strait called the gut of Canso, 16 m. long, and from half a m. to 2 m. wide. Sable island, which is 25 m. in length by 1¼ in breadth, and is surrounded by a dangerous, widely-extended sand-bank, is situated about 90 m. from the nearest coast of Nova Scotia, in lat. 44° n. and long. 60° west. It is formed of sand-hills thrown up by the sea, some of them being about 80 ft. in height. The island is covered with wild grasses, which support herds of wild horses, known as Sable Island ponies. It is in the track of vessels trading between America and Britain, and owing to the number of wrecks that take place on its shores, a superintendent and several men are stationed here for the purpose of rescuing and aiding shipwrecked mariners. The area of the province is 20,600 sq.m.; pop. '91, 450,396. The coast-line is about 1000 m. in length, and the shores, which are much indented, abound in excellent bays and harbors, of which the chief are Chedabucto bay, Halifax harbor, St. Margaret's, Mahone, and St. Mary's bays, Annapolis, Minas, and Chignecto basins, and Pictou harbor. There are numerous rivers, but few of them are over 50 m. in length; the most important are the Avon, the Annapolis, and the Shubenacadie. Nova Scotia contains about 400 lakes, of which the Bras d'Or, in Cape Breton, covers an area of 500 sq.m., or about one-sixth of the entire area of the island. The surface is irregular and undulating, but not elevated. Ranges of hills traverse the center of Nova Scotia in the direction of its length. The Cobequid mountains, 60 m. from the Atlantic and 1100 ft. high, traverse the peninsula from the bay of Fundy to the straits of Canso. The soil in the valleys is rich and fertile, producing all the fruits of temperate climates; and, especially in the n., the uplands also are fertile. The climate is remarkably healthy, its rigor being modified by the insular character of the province, and by the influence of the gulf stream. The mean temperature for the year is 42.09° at Pictou, and 43.6° at Windsor. The extreme limits of the thermometer may be stated at 15° Fah. in winter, and 95° in the shade in summer. The province abounds in mineral riches, including gold, coal, and iron. Gold was first discovered in the colony in March, 1861, on Tangier river, about 40 m. e. of Halifax. The chief diggings are along the Atlantic coast, and gold has been found in nearly 100 different localities. The gold-bearing area is estimated at from 5,000 to 7,000 square miles, and the area from which gold has been obtained is less than 40 square miles. Nearly 40 mines are being worked, and the total output from the year of discovery to 1896 was valued at $11,000,000. Coal and iron are abundantly distributed; of the former, nearly

1,000,000 tons are annually raised. Of the entire area of the colony, 10,000,000 acres are considered good land, and of these 1,028,032 acres were under cultivation. Three-fourths of the whole area are comprised in the peninsula of Nova Scotia, and the remainder in the island of Cape Breton. The principal agricultural products are: hay, wheat, barley, buckwheat, oats, rye, Indian corn, potatoes, and turnips. The waters around the colony abound in fish, as mackerel, shad, herring, salmon, etc., and the fisheries are pursued with ardor and ever-increasing success. There are about 15,000 vessels, 25,000 men, and material of all kinds, valued at nearly $3,500,000, employed in the various fisheries, and the value of the total catch exceeds $6,500,000 per annum. The sea-going tonnage, carrying into and out of the province, is about 2,500,000 per annum. There are about 900 miles of railroad, besides 30 miles owned by coal companies. The principal educational institutions are King's, Dalhousie, Acadia, and St. Francis Xavier colleges. There are nearly 2,500 public schools, with over 100,000 enrolled pupils, which cost annually about $900,000.

Nova Scotia is supposed to have been visited and "discovered" by the Cabots in 1497. Its first colonists were a number of Frenchmen, who established themselves here in 1604, but were afterwards expelled by settlers from Virginia, who claimed the country by right of discovery. Under the French settlers it bore the name of Acadia (*Acadie*); but its name was changed for its present one in 1621, when a grant of the peninsula was obtained from James I. by sir William Alexander, whose intention was to colonize the whole country. Having found, however, that the localities they had fixed upon as suitable for settlement were already occupied, the colonists returned to the mother-country. In 1654 the French, who had regained a footing in the colony, were subdued by a force sent out by Cromwell. By the treaty of Breda, the country was ceded to the French in 1667, but it was restored to the English in 1713. After the middle of the 18th c., strenuous efforts were made to advance the interests of the colony. Settlers were sent out at the expense of the British government. The French, who had joined the Indians in hostilities against the English, were either expelled or completely mastered, and Cape Breton, which was French till 1763, and was subsequently a separate province, was united to Nova Scotia in 1819. Nova Scotia was incorporated with the Dominion of Canada in 1867, and is represented in the Canadian parliament by 10 senators, and 20 members of the lower house. It has also its own local legislature and lieutenant-governor; the legislature consisting of a council and a house of assembly elected by the counties—which are 18 in number—and the cities, the chief of which are Halifax, Yarmouth, Truro, and Pictou. Revenue, 1895, $835,455; expenditure, $831,230; net debt, $1,988,094.

NOVA'TIAN, a priest of the Roman church in the 3d c., and the leader of a sect called after his name. The place and time of his birth are not known with certainty. Novatian had been a stoic philosopher, but after his arrival in Rome was converted to Christianity, and being seized with sudden illness while still a catechumen, received what was called *clinical* baptism, that is, baptism administered on a sick-bed, and without the solemn ceremonial. Such baptism was, in ordinary circumstances, an impediment to holy orders. Notwithstanding this irregular baptism, Novatian was promoted to orders by Fabian the Roman bishop; and soon afterwards showed his weakness by flying during a persecution. At this time a controversy arose about the manner of dealing with the lapsed; that is, those who fell away in persecution. Novatian at first inclined to the milder side, but on the election of Cornelius to the Roman bishopric to which Novatian had aspired, and on Cornelius taking the indulgent course toward the lapsed, Novatian, together with Novatus and some other discontented priests of Carthage, opposed his authority, and eventually Novatian was chosen by a small party, and actually ordained bishop, in opposition to Cornelius. The party who espoused his cause was called by his name. They were confined mainly, in the first instance, to Rome and to Carthage, where a kindred conflict had arisen. They held that in the grievous crime of idolatry through fear of persecution, the church had no power to absolve the penitent: and therefore, although it does not appear that they excluded such sinners from all hope of heaven, yet they denied the lawfulness of re-admitting them to the communion of the church. This doctrine they extended at a later period to all grievous sins, of whatever character. Novatian may thus be regarded as the first antipope. The churches throughout Italy, Africa, and the East adhered to Cornelius; but the Novatian party set up bishops and established churches not only at Carthage, but at Constantinople, Alexandria, Nicomedia, Phrygia, Gaul, Spain, and elsewhere. They claimed for themselves a character of especial purity, and assumed the appellation of Cathari (Puritans). The time and manner of the death of Novatian is uncertain. According to Socrates (*Hist. Ecc.* iv. 28; v. 21; vii. 5, 12, 25), he died a martyr in the persecution of Valerian, but this is improbable. He was a man of considerable learning, and the work recently discovered in one of the monasteries of mount Athos, and published by Mr. Miller at Oxford in 1851, under the title of *Origenis Philosophumena*, is by some ascribed to him. His sect survived long after his death. An unsuccessful effort was made in the council of Nice to re-unite them to the church; and traces of them are still discoverable in the end of the 6th century.

NOVATION, in law, the extinguishment of an old obligation by the substitution of a new. The civil law distinguished 3 kinds of novation: 1. Where a new debt is substituted,

due by the same debtor to the same creditor, but with changed terms of payment. 2. Where a substituted new debtor assumes the old debt. This kind of novation is called *delegatio*, and differs from the other kinds in that it may be completed without the knowledge of the original debtor. It can be created by an assignment, by the debtor, of the debt to another person who agrees to become responsible for the debt, and whom the creditor agrees to accept in place of the original debtor. When the novation takes place without the action of the original debtor, the transaction is called *ex promissio*, and the accepted new debtor *ex-promissor*. 3. Where the old debt is made payable to a new creditor. This is also called *delegatio*, and requires the consent of all parties. A novation was not a matter of legal presumption, but an intent to innovate, *animus novandi*, must be distinctly shown. In the absence of proof of such intent to extinguish the old debt, the debtor is liable for that, and also liable under the new obligation. There must have been a precedent obligation, the place of which can be taken by the new. The new obligation is subject to the same conditions, if any, as the old one, and if the old be void, as against good morals, the new one will be void also; but otherwise, at least in some cases, where the old debt was merely voidable—the new promise being considered as a waiver of any disability which might have been a good defense. A consent by parties capable of consenting, is requisite to the validity of a novation, though the older civil law recognized a sort of involuntary novation. All obligations are subject to novation, so that debts by specialty, warranties, legacies, etc., are as capable of novation as debts by simple contract. But it has been held in New York, that an agreement by the obligee in a bond, not to sue the obligor within a certain time, is not a novation, but a covenant, for breach of which the usual action lies. A new debtor has no rights under the old obligation, nor have the creditors any remedy against the old debtor, though the latter be solvent, and the new debtor insolvent. A novation may be conditional, in which case the old obligation subsists, till the condition takes place. All liens attached to the original debt are extinguished by its extinction, unless expressly retained by the new contract; and in an action upon the new contract, no claims or set-offs between the parties to the old contracts can be set up in defense by the new parties. A single creditor may make a contract of novation with two or more debtors, all individually liable. The term novation, in the common law, is much less used than assignment and merger. With some differences, common law and civil law novation are in the main alike. There must have been an original and now extinguished debt, whose cancellation forms the consideration for the new contract, which alone can be the subject of the action. A simple agreement to change the contract is not sufficient; the change must be ratified by the parties, and actually carried into effect. As in the modern civil law, the consent of the debtor is necessary to the novation, and the substitution of a new creditor, nor can the latter, in the absence of such consent and privity, recover against the debtor. There is no privity of contract between them, and to recover, the creditor must show such privity by setting forth a new promise upon sufficient consideration. In equity, however, a debt may be assigned without the debtor's consent, and the assignee can maintain a suit in his own name. But at law, in the absence of consent or consideration, the assignee cannot sue for the debt in his own name, and in a suit upon it, all set-offs, accounts, or equitable defenses, which could be pleaded by the debtor against the original creditor, may be used. The extinction of the original debt is in itself a sufficient consideration, and no consideration need be stated in the new contract, though one must be proved to constitute a valid defense to a suit by creditors of the assignor. The most usual case of novation in modern law, is the substitution of a new bill of exchange, or promissory note for an old one surrendered and extinguished. Wherever an intention is shown to make the new note or bill an absolute payment, it will be so held. In Maine, Vermont, Massachusetts, and some other states, the receipt of a negotiable promissory note or bill is *prima facie* evidence of payment of the debt, and it is held in Louisiana, that the receipt by the creditor for a draft in payment of the account constitutes a novation. The general rule, however, in England and in this country is that the receipt of a promissory note does not make a novation, but is merely *prima facie* evidence of a conditional payment, made absolute payment by the occurrence of the condition, i.e., the payment of the note.

NOVA ZEMBLA (Russ. *Novaja Zemlja*, "new land"), the name given to a chain of islands lying in the Arctic ocean (lat. between 70° 30′ and 76° 30′ n., and long. between 52° and 69° e.), and included within the government of Archangel. Length of the chain, 600 m.; average breadth, 56 miles. The most southern island is specially called Nova Zembla; of the others the principal are Matthew's Land and Lütke's Land. They were discovered in 1553, and are wild, rocky, and desolate—the vegetation being chiefly moss, lichens, and a few shrubs. The highest point in the chain is 3,475 ft. above the level of the sea. Mean temperature in summer at the southern extremity, 35.51°; in winter, 3.21°. Nova Zembla has no permanent inhabitants, but as the coasts swarm with whales and walruses, and the interior with bears, reindeers, and foxes, they are periodically frequented by fishermen and hunters. Area, 35,163 sq. m.

NOVELDA, a t. of Spain, in the province of Alicante, and 15 m. w. by n. from Alicante, on the railway between Madrid and Alicante. There are corn and oil mills, brandy distilleries, and manufactures of lace. Pop. comm. 9600.

NOVELLÆ. See JUSTINIANUS.

NOVELLO, CLARA ANASTASIA, vocalist, daughter of the following, was b. in 1818. Her talent showed itself very early. At the age of 10 she became a pupil of the French academy of singing for church-music, and studied in Paris for several years, following up her studies in after years in Italy and Germany. Both in England and in Italy she created quite a *furore* from the year 1840 to 1848: her singing has indeed hardly ever been equaled in equality, flexibility, and executive skill. In 1843 she married count Gigliucci, and quitted the stage, returning to it, however, for a time from 1850 to 1860.

NOVELLO, VINCENT, an eminent musical performer and composer, was b. in London, of an Italian father and English mother, in 1781. At the age of 16 he was organist in the chapel of the Portuguese embassy; and even then had attained a large measure of that proficiency on the organ for which he was celebrated in later life. He was one of the founders of the Philharmonic Society. His musical compositions, which are very numerous, and chiefly sacred, are considered to have contributed much to the improvement of cathedral music. As a painstaking editor of unpublished works of eminent musicians, he has also done much for musical literature. He died at Nice, France, in 1861.

NOVELS. The novel and the so-called romance, inasmuch as they constantly merge in one another, and are only superficially distinguished by the preponderance in the one of ordinary and familiar incidents, in the other of incident more or less remote and marvelous, may conveniently be included here under the common definition of prose narrative fiction. Between the legendary epic, the drama into which portions of its available material from fluent become crystallized, and the wider prose fiction or novel, into which this again expands itself, there are obvious affinities, the distinctions being rather of form than of essence. It is of the later development, the novel, that we purpose to give here a historical sketch, omitting, however, any consideration of the remoter and but slightly known specimens produced in Hindustan and China.

1. *Ancient Classical Prose Fiction.*—The earliest Greek compositions of a fictitious character, of which we possess any knowledge, are the *Milesiaca*, or *Milesian Tales*, said to have been written chiefly by one Aristides. The Milesians were a colony of Ionic Greeks who settled in Asia Minor, and fell under the dominion of the Persians, 494 B.C. They were a voluptuous, brilliant, and inventive race, and are supposed to have caught from their eastern masters, whom they somewhat resembled, a liking for that particularly oriental species of literature—the imaginary story or narrative. None of the Milesian tales are extant, either in the original Greek or in the Latin version made by Sisenna, the Roman historian, about the time of Marius and Sulla; but we have some forty stories by Parthenius Nicæas, which are considered to be to a certain extent adaptations from them. The collection of Parthenius is entitled *Peri Erotikōn Pathēmatōn*, and is dedicated to Cornelius Gallus, the Latin poet, and the contemporary and friend of Virgil. If we may judge from this later set of fictions, which are mainly concerned with the description of all sorts of seduction, of criminal and incestuous passions, and of deplorable terminations to wretched lives, we have little cause, either morally or æsthetically, to regret the loss of their more famous prototypes. In Greece proper nothing was done, so far as we know, in the way of novel or romance until after the age of Alexander the great. It has been conjectured, not improbably, that his eastern conquests had a potent effect in giving this new bent to the fancy of his countrymen. Clearchus, a disciple of Aristotle, wrote a history of fictitious love-adventures, and is thus, perhaps, to be considered the first European Greek novelist, and the first of the long series of *erotikoi*, who reach down to the 13th c. after Christ. Not long after came Antonius Diogenes, whose romance, in 24 books, entitled *Ta hyper Thoulen Apista* (of the incredible things beyond Thule), was founded on the wanderings, adventures, and loves of Dinias and Dercyllis. It appears to have been held in high esteem, and was at least useful as a store-house, whence later writers, such as Achilles Tatius, derived materials for their more artistic fictions. The work has not been preserved, but Photius gives an outline of its contents in his *Bibliotheca Cod.*

A long interval, embracing, indeed, several centuries, now elapses before we come upon another Greek novelist or romancist. Be the cause of this what it may, the ever-increasing luxury and depravity of the pagan imperial world, combined to develop and intensify that morbid craving for horrible, magical, and supernatural incidents which in general fill the pages of the romancists of the empire. The first names that occur in the new series are Lucius of Patra (*Patrensis*) and Lucian (q.v.), who flourished in the 2d c. A.D., during the reign of Marcus Antoninus; but as the former simply collected accounts of magical transformations (*metamorphoses*), he is perhaps not to be regarded as a novelist proper at all; while the latter was really a humorist, satirist, and moralist in the guise of a story-teller—in a word, a classic Rabelais and Heine, and as far as possible from being a member of the wonder-loving school of erotics, with whom he has only an accidental connection by the external form of some of his writings. The first of the new series of romance writers, strictly so called, is properly Iamblichus (*not* the Neoplatonic philosopher), whose *Babylonica* is, indeed, no longer extant; but we are able to form a pretty just estimate of it from the epitome of Photius. The next notable name is that of Heliodorus (q.v.), bishop of Trikka, who flourished in the 4th c. A.D. This Christian writer, whose *Loves of Theagenes and Charicleia* is really the oldest extant *erotic* romance, has

far excelled all his predecessors in everything that can render a story interesting or excellent, and his charming fiction obtained a great popularity among such as could read. Some imagine that they see in Heliodorus a resemblance to the minutely descriptive style of novel introduced into England by Richardson, but without adopting this rather extreme notion, it can at least be safely asserted that Achilles Tatius and all the subsequent *erotikoi* deliberately imitated his style and manner, while he was not less certainly used as a model by that once celebrated but dreadfully tedious school of heroic romance which flourished in France during the 17th c., and whose best-remembered representative is mademoiselle de Scudéri. Tasso, Guarini, D'Urfé, and several other modern writers have drawn many particulars—sometimes almost *verbatim*—from the stories in the *Theagenes and Charicleia*. Achilles Tatius (q.v.), probably belonging to the 5th c., ranks next to but at some distance from Heliodorus in point of merit. His romance, entitled *Ta kata Leukippen kai Kleitophonta*, and consisting of eight books, has supplied incidents to more than one Italian and French writer.

The next work that invites our attention in point of time, the *Daphnis and Chloe* of Longus, is of a totally different character. It is a simple and picturesque prose-pastoral, with no poisonings, murders, magic, supernaturalism, and impossible exploits. Over the whole story rest a rural peace and a smile of cheerful sunshine; and, in spite of some singularly polluted passages, it was, for its time, a pure and wholesome fiction. *Daphnis and Chloe* is the only pastoral romance produced by any Byzantine author. Whether or not it exercised any influence on the development of the *modern* pastoral of Italy and France cannot be proved, but it has been noticed that there is no slight resemblance between it and the story of the *Gentle Shepherd*, which we know was suggested to Allan Ramsay by a classical friend, who may have borrowed from the Greek the sketch which he gave to the poet. It has also been very closely imitated by Gessner in his idyl of *Daphnis*.

After Longus comes Chariton (flor. some time between the 6th and 9th centuries), whose romance, in eight books, on the *Loves of Chæreas and Callirrhoë*, is not quite complete, but nearly so. It contains, like the other erotic fictions, plenty of stirring and startling adventures, but on the whole these are less improbable than what we encounter in the writings of his predecessors. Of three Xenophons, also noted among the *erotikoi*, and of uncertain date, the best is Xenophon of Ephesus, whose romance, entitled *Ephesiaca, or the Loves of Anthia and Abrocomas*, is in ten books, and has all the sensational characteristics of the school to which it belongs. It is, however, perhaps worth mentioning that in the romance of Xenophon we meet for the first time with the story of the love-potion, the pretended death, and the mock-entombment of the heroine, which forms the leading incident in Shakespeare's *Romeo and Juliet*, and which, it is thought, reached the great English dramatist at second or third hand, through the Italian novelist Luigi da Porta.

Again a long interval elapses before we meet with another love-fiction of the old pagan sort. During this period, however, a work made its appearance which was essentially a romance, and was composed expressly for the purpose of recommending that form of Christian life which was *the* favorite in early times—the ascetic and recluse form. This was the *Barlaam and Josaphat* (q.v.), the author of which is unknown, but whose popularity, during the middle ages, may be estimated from the fact that it was translated into every language of Christendom from Norway to Spain. In the 12th c. another erotic, Eustathius or Eumathius, who was properly the last of the series, published his *Ismene and Ismenias*, in eleven books. This romance is, in truth, a feeble performance; the expiring flicker of a lamp whose oil is about done. It is puerile in its delineation of character, and full of plagiarisms; yet many of its details have been copied by later occidental writers, such as D'Urfé and Montemayor.

In all the erotic romances the adventures, which in fact constitute the story, have certain common characteristics. The hero and heroine are generally carried off by robbers or pirates; or they flee from home, and are accidentally separated. They resolve to seek each other throughout the world, and in the course of their loving quest they visit the remotest regions, encounter the most frightful perils, make hairbreadth escapes from tragic ends, meet again in most unexpected and miraculous ways, and generally close their career in happiness and splendid prosperity—often turning out to be the offspring of far greater people than they fancied. Copious use is made of poisons, love-potions, improbable tricks, magic instruments, etc.; and one can easily see that the stories were meant to tickle and stimulate a languid, corrupt, sensual, and credulous people, such as the Greeks of the lower empire undoubtedly were.

Before touching on the mediæval romance of western Europe we may in a few words notice such specimens of classical fiction as exist, or are known to have existed in Latin. We have already stated that the Milesian tales were translated into that tongue by Sisenna, who derived his knowledge of them from the Sybarites, a Greek colony of lower Italy. The taste for similar stories increased during the empire, but the writers in general cannot have displayed much genius in their compositions if we may judge from the contemptuous language used by the emperor Severus against Clodius Albinus, whose fictions he designates *ludicra literaria*, and *anilia* (old wives' tales). But higher praise must be assigned to the work commonly attributed to Petronius Arbiter (q.v.), who flourished in the time of Nero, and whose *Satyricon*—incomplete—is a comic novel or romance, and

(although the dirtiest work even in pagan literature) is executed with skill, vigor, and at times, with beauty. In the 2d c. A.D., Appuleius (q.v.), wrote his *Ass* (called from its excellence the *Golden Ass*), which relates the adventures of a young man who had the misfortune to be accidentally metamorphosed into that animal while sojourning in Thessaly: retaining, however, his human consciousness. The miseries which he suffers at the hands of robbers, eunuchs, magistrates, and other persons into whose hands he falls, until the period when he is enabled to resume his former figure, are portrayed with a wit, humor, and fancy, hardly inferior to Lucian. The work is also believed to have had, like the writings of his Greek contemporary, a moral and satirical aim. It was immensely popular in the middle ages; has supplied Boccaccio with some of his stories, and the author of *Gil Blas* with the picturesque incidents of the robbers' cave in the early part of *his* romance, and contains in the episode of *Cupid and Psyche* one of the loveliest allegories of classical antiquity.

2. *Romantic fiction in western Europe.*—The first thing to be clearly understood in connection with this branch of literature is, that it is *not* a continuation of the Græco-Byzantine or classical fiction, though, curiously enough, it began to spring up in the west just as the other was dying out in the east. It is a completely new growth, the product of new historical circumstances, which were but very slightly affected by Byzantine influences of any kind; and it transports us into a world of ideas, sentiments, beliefs, and actions, as different from what we find in the *Erotikoi* as could well be imagined. In the latter, the principal characters are mere lovers *forced* into adventures by the ministers of fate; in the former, they are real heroes, of the old Homeric type, and *seek* dangers greedily and joyously. When we read the *Erotikoi* we are reminded in many ways that we are in the midst of a corrupt and decaying civilization; when we turn to the romances of chivalry in spite of certain superficial and barbarous vices—such as the prevalence of bastardy, and the indifference displayed to bloodshed—we feel that we are in the presence of a youthful, healthy, vigorous, and growing social life. That these romances, generally from beginning to end, consist of a series of extraordinary and utterly impossible exploits, in which the magic, the mystery, and the enchantments of the *Arabian Nights* are rivaled or outshone, is unquestionable; but this proves no more than that the races of western Europe, who slowly, during the dark ages, rose, by the help of the church, out of barbarism into feudalism—the first step toward the civilization of the modern world—were boundlessly ignorant, credulous, and wonder-loving. Their prodigious vigor and vehemence of character, having no proper intellectual *pabulum*, was forced to supply its craving for a knowledge which was beyond its immediate attainment, by the exaggerations of a fancy that was without law or limit. We need not go so far as to assert that, in the mediæval romance, everything is of native or "Gothic" origin; the fact is very much the reverse. This extreme theory, propounded by Mallet, and supported by bishop Percy, and other writers, is totally inadequate to account for all that is contained in these romances. Not less inadequate is another theory, first suggested by Salmasius, and afterward elaborated by Warton, that the mediæval romance is mainly of Saracenic origin, and was probably introduced by the Moorish conquerors into Spain, and thence propagated into France and Britain; while a third theory, which has also found supporters, viz., that it was derived from the classical mythology of ancient Greece, is the most inadequate of all. The true explanation of the matter appears to be that mediæval romance had its root and foundation in chivalry (q.v.)—a genuine product of western Europe—and although the machinery, so to speak, the exploits and the marvels, may have often been derived from the foreign sources we have mentioned, yet the spirit, scenery, sentiment, and life of the legends thoroughly reflect the characteristics of the earlier ages of feudalism. The notions of dragons, giants, magic rings, enchanted castles, are probably of Saracenic origin, and may have been introduced into Europe by the horde of pilgrims who visited the east in the time of the crusades; such incidents as the detaining of a knight from his quest by the enchantments of a sorceress may have been a tradition of the *Odyssey* of Homer; but the gallantry, the courtesy, the romantic valor, the tournaments, the noble friendships of brother-knights—all that distinguishes the romances of chivalry from Runic legends, or the *Arabian Nights*, cannot be traced to any other source than the new-born chivalry of Europe.

The mediæval romances are divisible into three great series—1. Those relating to Arthur and the knights of the round-table. 2. Those relating to Charlemagne and his paladins. 3. Those relating to Amadis de Gaul and his descendants.

The Arthurian series is, in its essence, of Welsh and Armoric origin. Its genesis is as follows: First came the legendary chronicles composed in Wales or Brittany, such as the *De Excidio Britanniæ* of Gildas (q.v.); the chronicle of Nennius, belonging to the 9th c.; the Armoric collections of Walter Calenius or Gualtier, archdeacon of Oxford; and the famous *Chronicon sive Historia Britonum* of Geoffrey of Monmouth (q.v.)—from these, and from the multitude of floating unrecorded traditions, sprung the *metrical*, which in turn gave birth to, and were ultimately superseded by, the *prose* romances. It is with the latter alone that we have here to do. They, like the metrical romances, were composed by Anglo-Norman authors (whose names are unknown) during the 13th, 14th, and 15th centuries, who took all the more willingly to the old British legend that in these the "Saxons" were the objects of the authors' hatred and detestation. The principal romances of the Arthurian cycle are those of *Merlin* (q.v.), the enchanter; of *Arthur*

(q.v.); of the Sangreal (see GRAAL); of *Perceval;* of *Lancelot du Lac;* of the princes of Lyonnesse, *Meliadus* and his son *Tristan;* and of *Isaie le Triste*, the son of Tristan. They relate the marvelous adventures, exploits, loves, and gallantries of the knights of the round-table, and are probably in substance the oldest of the mediæval prose romances. The scenes are generally laid in Wales, Cornwall, Brittany, Ireland, or Scotland; only in one or two of the series are we taken as far as Egypt or India; and though Arthur is slain by "Saracens" who supported his nephew, Mordred, and a general eastern coloring is present in the cycle, yet it is "Saxons" who are his principal foes.

The series of Charlemagne and his paladins is of purely French origin, and originated in a somewhat similar fashion to the Arthurian cycle; that is to say, there was first a legendary chronicle (in verse, however), entitled *Historia de Vita Caroli Magni et Rolandi*, erroneously attributed to Turpin or Tilpin, archbishop of Rheims, and contemporary of Charlemagne, but probably executed in the 11th or 12th centuries; then came a series of metrical romances, strictly so called, which were gradually supplanted by their prose counterparts, the authors of which last, however, appear to have diverged more from the metrical originals, and to have been more free and fanciful than their predecessors of the Arthurian cycle. The principal are *Huon of Bordeaux* (the incidents of which are followed by Wieland in his *Oberon*), *Guerin de Monglave*, *Gaylen Rhetoré* (in which Charlemagne and his paladins proceed *incognito* to the Holy Land), *Miles and Ames*, *Jourdain de Blaves*, *Doolin de Mayence*, *Ogier le Danois*, and *Maugis the Enchanter*. In these romances we are, in some respects, on totally different ground from that on which we find ourselves in the Arthurian series. We are transferred to the east—to Africa, Palestine, Arabia, Bagdad, Constantinople, India, Persia, the Caspian sea, etc. We are introduced to the courts of Saracen "princes," "sultans," and "emirs;" and see Mohammedan maidens of peerless beauty falling in love with Christian knights, and for their sakes abandoning, or even betraying father, mother, brethren, and kinsmen. Fairies, who figure but slightly in the Arthurian romances, play a frequent and an important part in these; demons, dervishes, apes, talismans, palaces with cupolas and gilded roofs, splendid jewels, diamonds, etc.—everything, in fact, shows the influence exercised on the imagination of western Europe by the glowing scenery, the brilliant life, and the gorgeously fanciful superstitions of oriental lands.

The series relating to Amadis de Gaul and his descendants is sufficiently characterized under the head of Amadis (q.v.). We may only observe, as a proof of the comparative lateness of their composition, that the "Saracens" of the French romances here give place to "Turks;" and as the eyes of Europe were turned toward the tottering Greek empire, many of the scenes of warfare are laid at Constantinople.

Besides the three distinct series of romance above-mentioned, a fourth, perhaps, deserves mention, in which the heroes of antiquity are grotesquely tricked out in the costume of mediæval knights. The exact date of their composition cannot be ascertained; but they were probably later in general than any of the other three series; and, at any rate, were for the most part not published till the end of the 15th and the beginning of the 16th centuries. The principal are the romance of *Jason and Medea*, of *Hercules*, of *Œdipus*, and of *Alexander*. They are all written in French, and the first two profess to be the work of a Raoul le Febre. An attempt is made to adhere, in the general outline of the stories, to the ancient myths, but most marvelous embellishments are added, such as only the middle ages could have conceived; while the transformations that the classical personages undergo are exceedingly ludicrous. Jove becomes a "king;" Mercury his "squire;" the fates "duennas;" Cerberus and the sphinx, "giants;" etc.

Before leaving this division of our subject we would observe that, though the romances of chivalry may appear infinitely tedious and absurd to a modern reader, they were immensely relished and admired during the ages in which they were produced; were widely disseminated, in different forms, throughout all Christendom, and were highly popular with later poets. The influence which they exercised on Pulci, Boiardo, Tasso, Spenser, etc., shows the strong hold that they must have had on the imagination of Europe; but, with the decline of chivalry, the spread of the more rational and artistic fictions of the Italian novelists, the revival of letters, and the general advancement in civilization of Christendom, the taste for the romances of chivalry also declined, until finally Cervantes laughed them out of literature, and well-nigh out of memory, in the beginning of the 17th century.

3. *Development and Influence of Fiction in Italy.*—The Italians originated no romances of the kind described above. This resulted from various causes, the principal of which perhaps are: 1st, that they were really not a Gothic, but at least a semi-classic people; 2d, that they were more polished than the northern nations; and 3d, that instead of feudal chivalric institutions, the most characteristic *political* features of Italy, during the middle ages, were mercantile and lettered republics. There was what may be roughly called a *middle class*—of merchants—in Italy, when England and France and Spain contained really little more than nobles and serfs; and these were really the best instructed and the most enlightened portion of the community. Hence it is but natural that we should find a style of fiction mirroring to some extent this more civilized and sober form of social life. That the classical romances had some influence on the development of Italian fiction is probable; several of the tales recorded in the love-letters of Aristinetus, and in the *Golden Ass* of Appuleius, are quite like what we read in Boccaccio and others. The

fables of Pilpai or Bidpai (q.v.), translated into Latin as early as the 13th c., were also not without a certain effect; but it is to the Arabico-Indian book of the seven counselors (better known as *The Tales of the Seven Wise Masters*), still more to the stories of Petrus Alphonsus (whose work is entitled *De Clericale Disciplina*), and the *Gesta Romanorum* (q.v.), a grotesque jumble of classical stories, Arabian apologues, and monkish legends, in the disguise of romantic fiction; but most of all perhaps to the *Contes* and *Fabliaux* (q.v.) of the French poets, that we must look for the first sources of those almost innumerable *novelletti* which mark the earlier literary history of Italy.

The earliest Italian work of this sort is the *Cento Novelle Antiche*, commonly called *Il Novellino*. It is a compilation by different hands—all unknown—of stories floating about, or taken with modifications from the sources above-mentioned, with one or two of the more graceful episodes in the romances of chivalry, and was executed towards the close of the 13th century. It was followed in 1358 by the *Decameron* of Boccaccio (q.v.)—the finest, in point of humor, sentiment, and style, of the whole set, but not more original in the matter of story than *Il Novellino*. Its influence on early European literature was prodigious. Chaucer and Shakespeare in England have been in particular greatly indebted to it for incidents and plots; while in France—from whose Trouvères he had himself derived so much—Boccaccio had a number of distinguished imitators. In his own country his influence was so overwhelming that for some centuries Italian novelists could do nothing more than attempt to copy him. The principal of these imitators are Franco Sacchetti (1335–1410), Ser Giovanni (who began to write his novelletti in 1378, from which Molière got the plot of his *École des Femmes*, and Shakespeare probably part of his story of the *Merchant of Venice*—though the story of the bond is far older, and is of Persian origin—Chaucer is also indebted to this Italian); Massuccio di Salerno (flor. about 1470), more original than most of the post-Boccaccian novelists; Sabadino delli Arienti (flor. about 1483); Agnolo Firenzuolo; Luigi da Porta; Molza, and Giovanni Brevio (flor. at the close of the 15th and in the first half of the 16th c.); Girolamo Parabosco (flor. 1550); Marco Cademoste da Lodi (1544); and Giovanni Giraldi Cinthio (died 1573), noted particularly for his extravagant employment of sanguinary incidents, and the introduction of scenes of incredible atrocity and accumulated horrors. The seventh of his third decade of stories contains the story of Othello, the Moor of Venice; the plot of *Measure for Measure* was also derived indirectly from him. Cinthio was, in fact, the greatest favorite of all the Italian novelists with the Elizabethan dramatists. Besides these, we may further mention Antonio Francesco Grazzini (died 1583); Straparolo (wrote 1554 *et seq.*) from whom Molière, and also the French writers of fairy tales, derived numerous hints; while the ludicrous incident embodied in the Scottish song of *The barrin' o' our door* forms one of the stories of this writer; Bandello (died 1555), the most widely known and read (out of Italy) of all the Italian novelists next to Boccaccio, and in whom we find the original of Massinger's play of *The Picture*, and of Shakespeare's *Twelfth Night;* Granucci (published 1574); Malespini (published 1609); and Campeggi (early part of 17th c.). The best French imitations of these Italian tales are the *Cent Nouvelles Nouvelles* (printed 1456, and translated into English under the title of the *Hundreth Mery Tayles*, 1557). They are full of life, gayety, and imagination, and are written in a most naïve and agreeable manner; and the *Heptameron* of Margaret, queen of Navarre, from which Shirley, the English dramatist, has taken the plots of two of his comedies.

A few words may also be devoted here in passing to a very different class of fiction—the *Spiritual Romance*. It originated, without doubt, in the bosom of the church, and from the desire to edify, by stories of religious knight-errantry, a rude and ignorant community, incapable of understanding or relishing abstract doctrines. The first of the series is *Barlaam and Josaphat*, already alluded to; but by far the greatest work of the kind produced during the middle ages is the *Legenda Aurea*, or Golden Legend (q.v.), itself believed to be drawn from different and now partly forgotten sources. Besides these may be mentioned a species of spiritual tale—the *Contes Dévots*, prevalent in France during the 12th and 13th c., and which were written by monks, probably with the view of counteracting the witty and licentious stories of the Trouvères; but curiously enough, in these pious fictions, the lives of monks and nuns are represented as far more immoral than in those of the secular satirists. The things, too, which the virgin Mary is represented as doing are most astounding, and throw a strange but valuable light upon the religious notions of the age. In one story she conceals the shame of a favorite nun; in another, she performs the part of a procuress; in a third, she officiates as midwife to an abbess who had been frail and imprudent; and in general, she performs the most degrading offices for the most worthless characters.

Romance of the 16th and 17th Centuries.—During the middle ages, the universal sway of the church and the institutions of feudalism gave a certain character of uniformity to the modes of life, and thereby to the social literature of western Europe; but after the epoch of the reformation, and even earlier, this uniformity disappears, and we find in every direction a tendency to the opposite extreme of individualism. This tendency manifests itself especially in the fiction of the period, which, vastly increasing in quantity and varying in quality, becomes difficult to classify. We shall, however, endeavor to group the products of modern prose-fiction works under what appears to us a convenient chronological heading.

During the 16th and 17th centuries, four different kinds of romance or novel were cultivated—1. *The Comic Romance;* 2. *The Political Romance*; 3. *The Pastoral-Romance;* 4. *The Heroic Romance.*

Comic Romance substantially begins in modern times with Rabelais (q.v.), styled by sir William Temple the *father of ridicule.* Others, indeed, had preceded him in the same path, but they had acquired no celebrity. In him we see unmistakably one form of the modern spirit—its daring freedom of speculation, criticism, and satire, also that lack of reverence exhibited by those who, at the period of the reformation, clearly discerned the abuses of the church, but had not faith in the possibility or efficacy of reforms. Thus Rabelais, in his inimitable burlesque romance, scoffs (with the tone of a skeptic, however) at the vices of the clergy, the crooked ways of politicians, the jargon of philosophers, and the absurdities of the *Contes Dévots,* and of the mediæval tales generally. The next remarkable romance of a comic nature is the *Vita di Bertoldo* of Julio Cesare Croce (flor. at the close of the 16th c.), a work recounting the humorous and successful exploits of a clever but ugly peasant, and regarding which we are told that for two centuries it was as popular in Italy as *Robinson Crusoe* or the *Pilgrim's Progress* in England. The substance of the story can be traced back to an oriental source. A few years later appeared *Don Quixote* (see CERVANTES), in which "war to the knife" was proclaimed against the romances of chivalry, and in which, perhaps, we see more distinctly than in any other fiction of the period the new *turn* that the mind of western Europe had taken. Almost contemporaneous with *Don Quixote* was another Spanish romance—Matteo Aleman's *Life of Guzman Alfarache,* successively beggar, swindler, pander, student, and galley-slave. In this work, as in others of the same sort, we find several indications of the influence of the Italian novelists. It has been supposed that *Guzman Alfarache* suggested to Le Sage the idea of *Gil Blas,* and there *is* some resemblance between the two; but, at any rate, it gave birth to a host of Spanish romances with beggars and scamps for heroes, of which the best is the *Lazarillo de Tormes,* by Diego de Mendoza (1586). In the following century France produced, among others, Scarron's *Roman Comique,* and Furetiere's *Roman Bourgeois.* England and Germany have nothing to show in this department.

Political Romance was manifestly suggested partly by the great politico-ecclesiastical changes that took place in Europe in the first half of the 16th c., and partly by the immense increase in the knowledge of the manners and customs of remote nations, occasioned by geographical discoveries and mercantile adventure. The earliest of the series is the *Utopia* of sir Thomas More; next comes the *Argenis* of Barclay, published in 1621; and to the same class belong a variety of French romances produced about the close of the 17th and the beginning of the 18th c., of which by far the most famous is the *Télémaque* of Fénelon.

Pastoral Romance.—All through the Middle Ages, the fame of Virgil kept up a certain interest in compositions devoted to the delineation of rustic or shepherd life. We even find in the poems of the troubadours several specimens of the erotic pastoral; and the *Ameto* of Boccaccio furnishes us with a prose illustration of the same. But it was after the revival of letters that this branch of fiction, so essentially classical, was most assiduously cultivated by men of scholarly genius; and though their works have not retained the popularity they originally enjoyed, they are still interesting and valuable from an historical point of view, and abound in descriptive passages of great beauty and sweetness. The pastoral life which they portray, however, never existed either in Greece or elsewhere. Their shepherds and shepherdesses are as unreal and unhistorical beings as the knights of mediæval romance. The first important work of the kind is the *Arcadia* of Sannazzaro, written in Italian, about the end of the 15th century. It was followed by the *Diana* of Montemayor, written in Spanish, about the middle of the 16th c., several of the episodes of which are borrowed from the Italian novelists; while Shakespeare has in turn directly taken from it the plot of the *Two Gentlemen of Verona,* copying occasionally the very language, as well as some of the most amusing incidents in his *Midsummer Night's Dream.* The *Diana* was imitated in French by Honore d'Urfé, whose *Astrée* (1610–25) was for a long while held in the highest esteem, and is really, in spite of its tediousness, a work of great learning and considerable merit. Twenty years before the appearance of *Astrée,* sir Philip Sidney wrote and published his *Arcadia,* as tiresome, and in substance as unreal, as any production of the same school, but in stateliness and melody of language, in luxury of fancy, in nobility and purity of sentiment, far exceeding them all.

Heroic Romance owed its origin partly to the immediate antecedent pastoral romance, partly to an increased acquaintance with classic history, produced by the translation of such books as *Plutarch's Lives,* and partly to the interest excited in the Moors of Granada by a splendid romance in Spanish (professing, however, to be a *history*) entitled *The Dissensions of the Zegris and the Abencerrages,* and was printed at Alcala in 1604, and which soon became extremely popular, especially in France. It was in the latter country alone that the *Romans de Longue Haleine* (Long-winded Romances), as they have been happily nicknamed, were cultivated. The first of this heavy series was the *Polexandre* of Gomberville, published in 1632, in which the influence of the early Greek romances is visible. His successor, Calprenede, the best of a bad lot, wrote *Cleopatra, Cassandra,* and *Pharamond.* But the most prolific, and consequently the most intolera-

ble of the school, is Mme. de Scudéri, whose principal romances are *Ibrahim, ou l'Illustre Bassa; Clelie; Histoire Romaine; Artamenes, ou le Grand Cyrus;* and *Almahide.* The pompous dignity, the hyper-polite address, the dreadful dullness, and the hollow ceremonialism of these ridiculous performances, admirably (if unintentionally) mirror the features of French court-life during the time of the *Grand Monarque.* The heroic romances did not long retain their meretricious reputation. Molière, and still more, Boileau, in his satire *Les Héros de Roman, Dialogue,* ridiculed them to death, and in consequence, Mme. de Scudéri had no successor.

Novels and Romances of the 18th Century.—The two European nations that most brilliantly distinguished themselves in the department of fiction during this century were England and France, and to these we shall chiefly confine our attention.

1. *English Prose Fiction.*—During the age of Elizabeth and her immediate successors, the imaginative genius of England, from various causes, had taken an almost exclusively poetical direction, and with the exception of Sidney's pastoral of *Arcadia,* and Bunyan's *Pilgrim's Progress,* we meet with nothing in the shape of a novel or a romance for a hundred years. The 17th c. has nothing to show till it approaches its close. This is doubtless owing, in part at least, to the intensity of the great political struggle that agitated and rent England during the first half of that century, and gave an austere theological bias to society. The Puritans, in their day of triumph, would not tolerate either comic or heroic romances. They set their faces "like flint" against all imaginative fiction, which they considered as little better than lying; and even to this day that class of people commonly described as "the religious portion of the community," in some sense the representatives of the Puritans, betray the legitimacy of their spiritual descent by their aversion to all sorts of secular tales. After the restoration, however, an extraordinary change came over the English nation, or at least over the upper and wealthier classes. These rioted in the excess of a coarse and licentious reaction against the rigorous piety and fanaticism of the commonwealth. This turbid viciousness by and by calmed down, but it left a certain taint of sensualism and materialism in the habits and life of the people, which, in the opinion of some competent critics, marks them to this day. It is certain that at the beginning of the 18th c. England was entering on the most prosaic, unimaginative, and unheroical period of her history. Its characteristics are faithfully reflected in most of her novels, which, as pictures of the gross dull life, the paltry thoughts, the low sentiments, the modish manners, and the loose morality that prevailed, possess a great historical value apart altogether from their literary merits. The first name that occurs is that of the notorious *Aphra Behn* (q.v.), the greater number of whose novels, of which *Oronoko* is the best known, appeared towards the close of the reign of Charles II., but are included here in the literature of the 18th c., as they belong to it by the nature of their contents, and not to the 17th c. types of fiction. She was imitated by Mrs. Heywood (born 1696, died 1758), of whose *Love in Excess, The British Recluse,* and *The Injured Husband,* it has been remarked that "the male characters are in the highest degree licentious, and the females as impassioned as the Saracen princesses in the Spanish romances of chivalry." A later work, however, *The History of Miss Betsy Thoughtless,* is of a higher stamp, and is supposed to have suggested the plan of Miss Burney's *Evelina.* But the first novelist of great genius belonging to the new era is Daniel De Foe (q.v.), the father of modern English prose fiction, in whose writings—*The Adventures of Captain Singleton, The Fortunes of Moll Flanders, The History of Colonel Jack,* etc.—the coarse, homely, unpoetical, but vigorous *realism* of the time is strikingly apparent. Perhaps the Spanish ragamuffin romances may have furnished him with some hints. *Robinson Crusoe* is the finest and the most famous of all that class of fiction which was extensively cultivated both in France and England during the earlier part of the 18th c., and which received, in the former country, the name of *Voyages Imaginaires.* To the same class (outwardly at least) belong Swift's *Gulliver's Travels,* though at bottom this is a satirical romance, like the works of Rabelais, and the *Gaudentio di Lucca,* a sort of politico-geographical fiction, generally attributed to Bishop Berkeley. After De Foe comes Richardson (q.v.), very unlike any of the novelists of his age—to appearance! His muse is a most decorous prude, and never utters anything rude, or vulgar, or licentious; but though she was inspired with the best intentions, her notions of how virtue should be rewarded indicate the coarseness of the time, hardly less than the debaucheries and seductions of Fielding and Smollett. The principal novels of Richardson are, *Pamela; Sir Charles Grandison;* and *Clarissa Harlowe.* Fielding (q.v.) thought Richardson untrue to nature, and wrote his first novel of *Joseph Andrews* as a burlesque on the style of his predecessor. Like his subsequent performances, *Tom Jones* and *Amelia,* it represents society as Fielding's sharper eyes saw it, on the whole, gross, vulgar, and impure. Smollett (q.v.), with a different style of genius, continues to paint in the same spirit. His chief works are, *Roderick Random; Peregrine Pickle; The Adventures of Ferdinand Count Fathom;* and *Humphry Clinker.* Sterne (q.v.), belonging to the same period, exhibits a genius so whimsical, peculiar, and original, that it is almost impossible to class him with any of his contemporaries. His *Tristram Shandy* is a work *sui generis,* but nowhere is the coarse impurity and indelicacy of the age more conspicuous. Four years later appeared Goldsmith's *Vicar of Wakefield,* in which a change for the better, in a moral point of view, is first noticeable. With the exception of Richard

son, all the novelists above mentioned are usually, and we may add correctly, described as *humorists*. Other qualities they have besides, but this is the most common and predominant. When this school was passing away about 1760–70, another was on the eve of being born. The publication of Percy's *Reliques* had reawakened an interest in the age of chivalry and romance. Readers had become tired of the long prevalence of prosaic fiction, in spite of the splendid genius devoted to its illustration. It had done its work, and could create no more. The first of the modern romantic school was Horace Walpole, whose *Castle of Otranto* appeared in 1769. It was followed by Clara Reeve, the authoress of the *Old English Baron*, a romance that every school-boy, we hope, remembers with the deepest gratitude; but the greatest genius in this line was undoubtedly Mrs. Radcliffe (q.v.), whose *Mysteries of Udolpho* and other works, though now almost forgotten, were once greedily devoured and abundantly imitated. The ablest of her successors were Matthew Gregory Lewis, author of *The Monk* (1796), and Maturin, author of *Montorio* (1803). In all the romances of this school, the incidents are of the most startling, terrible, and often supernatural character, and the scenery is in keeping with the incidents. Fierce barons, mysterious bandits, persecuted maidens, gloomy castles, secret passages, deep forests, murders, ghosts, haunted chambers, etc.; everything that could charm, by way of contrast, and pleasantly horrify the languid, matter-of-fact, skeptical 18th c., is to be found in their exaggerated pages.

A few novelists remain to be mentioned who are incapable of particular classification. These are Dr. John Moore (q.v.), author of *Zeluco*, etc., Godwin (q.v.), author of *Caleb Williams*, *St. Leon*, etc., in whom the free-thinking and revolutionary spirit that seized many minds after 1789 is conspicuous; Mrs. Inchbald (*Nature and Art*, *A Simple Story*, etc.); Charlotte Smith (*Old Manor House*, etc.); Miss Austen (*Pride and Prejudice*, *Emma*, *Persuasion*); and Maria Edgeworth, whose sketches of Irish character first suggested to Walter Scott—the idea of attempting for Scotland a series of like illustrations.

2. *French prose fiction in the 18th century.*—It is not easy—perhaps not possible—to trace the causes that led to the cultivation of the different kinds of fiction which flourished in France during this century, and particularly during the first half of it. The natural love of change—of novelty; the accidental influences of foreign literature; the disposition, so peculiarly French, to satirize prevalent follies and vices; the wish, on the other hand, to amuse the leisure moments of a luxurious, superstitious, and profligate society: all these and many other causes unquestionably assisted in determining its diverse development. Four kinds have been distinguished: 1. *Pseudo-historical Romance*, the literature in which department, although copious enough, neither deserves nor requires special notice. 2. *Romance in which the incidents, though natural, are purely imaginary.* 3. *Satirico-moral Romance.* 4. *Fairy Tales*, to which may be associated the imitations of *Oriental Tales*, and the *Voyages Imaginaires*.

2. *Romance in which the incidents, though natural, are purely imaginary.*—This class more nearly corresponds with the modern conception of the novel than any of its predecessors, and probably had its prototype in *La Princesse de Clèves* and *Zaïde*, by the comtesse de Lafayette, who flourished in the latter half of the 17 c.; but the first great name that adorns it is that of Marivaux (1688—1763), whose *Vie de Mariamne* and *Paysan Parvenu* were long in high favor. They have this in common with the contemporary English fiction, that everything in them is produced by ordinary means, and the interest of the reader is sought to be awakened by the vivid and powerful portraiture of natural feelings, while the incidents, if often highly romantic, are always sufficiently probable to insure the credence of the imagination. Next to Marivaux comes the Abbé Prevot, (1693–1763), who first "carried the terrors of tragedy into the novel." He was a most voluminous writer, but the work by which he is now chiefly remembered is *Manon L'Escaut*, recounting the adventures of a kept-mistress and swindler, the purpose of which appears to be similar to that of *La Dame aux Camelias* of Dumas *fils*—viz., to show how noble, true-hearted, and self-sacrificing a prostitute may be! Other writers belonging more or less strictly to the same division are Madame Riccoboni (flor. 1750) and Rousseau (q.v.) in whose *Heloise* we begin to see the dawn of that fierce natural impure passion, and that extravagant scorn of conventional life, that culminated in the sanguinary paroxysms of the revolution.

3. *Humorous and satirical romance.*—By far the most celebrated specimens of this kind of fiction produced in France during the 18th c. are the *Gil Blas*, the *Diable Boiteux* and *Le Bachelier de Salamanque* of Le Sage, q.v. (1668—1746), all of which were suggested by the prolific comic romancists of Spain, Juan de Luna, Quevedo, Cervantes, Espinel, from some of whom he has borrowed, with hardly any variation, whole scenes and stories, as well as from more ancient sources. The best parts, however, are his own, and the spirit of the work is thoroughly French in the gay and lightsome vivacity of its humor. It is with some hesitation that we place the younger Crebillon (q.v.) in the same category, for the licentiousness of his *Egarements du Cœur et de l'Esprit*, and other novels, is far more apparent than their satire or humor. Bastide and Diderot (q.v.) hold an equally doubtful position as satirists or humorists; but Voltaire (q.v.) may fairly claim to rank among the former, in virtue of his *Candide*, *Zadig*, *L'Ingénu*, *La Princesse de Babylone*, etc., most of which contain covert attacks on superstition and despotism, under the forms in which Voltaire best knew them. Voltaire, however, had not a rich

imagination, and, in consequence, has been obliged to help himself liberally in the matter of incident from older writers.

4. *Fairy tales, etc.*—A very careful inquiry might probably succeed in tracing back this kind of literature to the early intercourse of Christian and Moorish nations, but the first work in which we find definite examples of fairy tales is the *Nights* of the Italian novelist Straparola, translated into French in 1585. In this collection are found at least the outlines of some of the best-known stories of the sort, such as *Le Chat Botté* (Puss in Boots), *Prince Marcassin, Blanchebelle*, and *Fortunatus*. The immediate forerunner and prototype, however, of the French fairy tales was the *Pentamerone* of Signor Basile, written in the Neapolitan *patois*, and published in 1672. This work attracted and stimulated the fancy of M. Charles Perrault (q.v.), whose *Histoires ou Contes du Temps passé* appeared in 1697, and is incomparably the most naïve and charming of all the collections of fairy tales. The titles of some of his *contes* will recall many a literary feast of our childhood—*La Barbe Bleue* (Bluebeard), *La Belle au Bois Dormant* (The Sleeping Beauty, to which, by the by, Tennyson has given a poetic immortality), *Le Chat Botté* (Puss in Boots), *Riquet à la Houppe* (Riquet with the Tuft), and *Le Petit Chaperon Rouge* (Little Red Riding Hood). The principal successors of Perrault were the comtesse d'Aunoy (see Aunoy), Madame Murat, and Mademosielle de la Force; but their stories are much more extravagant and forced than those of the illustrious academician. The same censure, however, is not applicable to *Les Contes Marines* (1740), by Madame Villeneuve, among which occurs the tale entitled *La Belle et la Bête* (Beauty and the Beast), perhaps the most beautiful creation in the whole circle of this fantastic form of fiction.

Meanwhile, the translation of the *Arabian Nights' Entertainments* (q.v.) by Galland, 1704–17, and of numerous other Arabic and Persian works, the great encouragement extended to the literature of the East in the 17th and 18th centuries, the publication of the *Bibliothèque Orientale* of D'Herbelot, etc., created a taste for the brilliant exaggerations of oriental fiction, and a variety of works were soon in the field, swarming with necromancers, dervishes, caliphs, bashaws, viziers, cadis, eunuchs, slaves. The most notable of these are—*Les Mille et un Quart d'Heure, Contes Tartares; Les Contes Chinois, ou les Aventures Merveilleuses du Mandarin Fum-hoam;* and *Les Sultanes de Guzaratte, Contes Mongols*, of M. Gueulette.—Of the class of fictions known as *Voyages Imaginaires*, the principal are the *Histoire Comique des Estats et Empires de la Lune*, and the *Estats et Empires du Soleil* of Cyrano Bergerac, which materially influenced the genius of Swift, who has, in fact, borrowed not a little from the first of these in his *Gulliver's Travels*, and which were themselves partly suggested by the Spanish romance of Dominico Gonzales, entitled *The Man in the Moon*. Such novels as the *Paul et Virginie* of Bernardin St. Pierre, which appeared towards the end of the 18th c., do not come under any of the four heads, but may most conveniently be mentioned here.

Prose fiction of Germany during the 18th and 19th centuries.—The limits of our space will not permit us to do more than superficially indicate the development of this branch of literature in Germany, which, however, is the less to be regretted, as, during the greater part of the 18th c., it did not attain much distinction. Toward the close of the century, however, writers became more numerous, and as the literary activity of many of them continued on till the first or second quarter of the 19th c., it will be most convenient and natural to treat both centuries together, as they, properly speaking, form only one era in the literary history of that nation.

The first eminent German novelist of this period was Wieland (q.v.), whose Greek romances, *Agathon, Aristippus, Socrates*, etc., are of that didactic and skeptical character which was beginning to mark the reflective genius of the continent, and which has since produced such immense changes in all departments of thought. Wieland was followed by a crowd of writers, in whose productions is more or less distinctly apparent the influence of the English novelists, particularly of Richardson and Fielding, who had been translated and carefully studied in Germany, where, however, the "novel of manners," whether serious or comic, dealt more largely in the representation of "family life." The principal names are August la Fontaine, Wetzel, Müller (whose *Siegfried von Lindenberg* is still remembered and read), Schulz, and Hippel. Almost contemporary with these quiet and somewhat prosaic novelists, there flourished for a brief period (1780—1800) a school of an entirely opposite character, whose works, fiercely and outrageously romantic, had their poetic counterpart in Schiller's *Robbers*. They resemble, in their style of handling the feudal ages, the English romances of Mrs. Radcliffe and others, which probably suggested them. The chief writers of this "turbulent school of fiction," as it has been called, are Cramer, Spiers, Schlenkert, and Veit Weber.

Alone, and far above all others in redundancy and originality of fancy, humor, and pathos, towers Jean Paul Richter (q.v.), who is incapable of classification, and to whom, therefore, his countrymen have affixed the epithet of *Der Einzige* (The Unique). Apart from all schools—in this respect, but in this only, like Richter—stands Johann Wolfgang Goethe (q.v.), whose novels, as well as his poems, are poetico-philosophic efforts to represent, perhaps to solve, the great facts and problems of human life and destiny.

The reaction from the materialism and irreligious levity of French thought, first showed itself in Germany toward the close of the 18th c., in a certain earnest love and study of the old, simple, superstitious, and poetical beliefs of the middle ages. Hence

originated the exquisite class of fictions called *Volksmährchen* (popular legends or tales), in which the Germans have never been equaled. The most illustrious cultivator of this species of fiction is Ludwig Tieck (q.v.), for Musäus (q.v.), though gifted with admirable powers of narration, is marked by a skeptical humor and irony, not altogether compatible with an imaginative conception of his subject. Other distinguished names are those of De la Motté Fouqué (q.v.), Chamisso (q.v.), Heinrich Steffens, Achim von Arnim (q.v.), Clemens Brentano (q.v.), Zschokke, and Hoffman (q.v.). More recent novelists of note are Auerbach, Freytag, and Paul Heyse. The tales of Fritz Reuter, written in the *Platt* or Low German, are original and delightful

German fiction, though it has developed greatly in the present century, has not fully attained the merit that characterizes the work of French, English, and American writers. The most prominent names in the recent development of the German novel are those of Johanna Schopenhauer, E. Marlitt, von Hillern, Spielhagen, Ida von Hahn-Hahn, Gottschall, Georg Ebers, Gottfried Keller (a native Swiss), Meding, Franzos, Paul Heyse, Fanny Lewald, and A. Kirschner, better known by her pseudonym of "Ossip Schubin." Julius Stinde (q.v.) has won cordial recognition in England and America by the inimitable truth and drollery of his *Familie Buchholz*, with its faithful portraiture of the daily life of the German *bourgeoisie* and its reproduction of the "Berliner Dialekt." Fritz Reuter and Klaas Groth have given to Low German a literary dignity which it never had before, by making it the vehicle of their delightful sketches.

The principal defect of German novels is their lack of vivacity and movement, as well as their somewhat tedious digressions and excess of sentiment. For detailed information regarding recent German novels and novel-writers, the reader is referred to W. Scherer's *Geschichte der Deutschen Litteratur* (1883) of which an English translation appeared from the Clarendon Press in 1886; and MacCallum's *Studies in High German and Low German Literature* (1889).

Novels and Romances of the 19th Century.—These have been produced in such overwhelming quantity that volumes would be required merely to classify and characterize them. The vast and rapid increase in the material facilities of intercourse among European nations which has taken place during the last 40 years has, among other results, tended to diffuse through each country the literary products of all the others especially those of an entertaining kind; and these have in turn more or less stimulated the imagination of native genius, so that at present there is hardly a people in Europe, not even excluding Turkey, which has not contributed something to the enormous stock of fiction belonging to the 19th century. It would be altogether out of the question to attempt, in a compendious work like the present, a notice, however brief, of the principal novels and romances of every European nation; we can only refer to the historical surveys of literature to be found under such heads as Bohemian (also Dutch, Hungarian, Polish, Scandinavian, Turkish, etc.) Language and Literature, and to individual biographies of eminent continental novelists. Even in regard to England, France, and America, we can do little more than catalogue a few prominent names.

1. *English Fiction.*—Almost the first novelist that we encounter in the 19th c., sir Walter Scott (q.v.), is probably the greatest that England, or even the world, has ever seen. Here, however, we have less to do with his personal rank in literature than with the kind of fiction that he cultivated. In a qualified sense, he may be regarded as a continuation of the romantic school, but it must be observed that he is free from all their monstrosities, spasms, tricks, and horrible machinery. Possessed at once of far greater antiquarian learning, imaginative genius, sound sense, and instinctive taste than any of his "romantic" predecessors, he knew precisely what to shun and what to choose; and though his feudal age, as depicted in *Ivanhoe*, *The Fair Maid of Perth*, etc., is a considerably idealized portrait of the rugged facts, it *is* a portrait, and not like Horace Walpole's and Mrs. Radcliffe's performances, a furious caricature. The political reaction that took place in Britain, after the sanguinary excesses of the French revolution, assuming the form of a new and passionate attachment to venerable and time-honored traditions, showed itself in literature too, and sir Walter Scott was its grandest representative. He strove to delineate the past as it seemed in the eyes of men who were dubious of the present and afraid of the future—noble, stately, glittering, and gay, with the pulse of life ever beating to heroic measures. The overpowering genius of Scott necessarily but unhappily (for the comfort of readers) led to "endless imitation," but the only one of his followers that held for a time a tolerably decent position in literature is G. P. R. James (q.v.). Galt (q.v.) and Wilson (q.v.), the former with vulgar but racy humor, the latter with a highly sentimental and overdone pathos, portrayed aspects of Scottish life which the author of *Waverley* has passed over. Other novelists, such as Lockhart (q.v.), Miss Ferrier (q.v.), and Mrs. Johnstone, do not call for special notice; neither does Hope (q.v.), though his *Memoirs of Anastasius* is a most brilliant and powerful book; nor Moore (q.v.), though his *Epicurean* has all the sparkling and superficial splendors of his verse. After Scott, the next novelist who distinctly marks a new stage in the development of fiction is sir Edward Bulwer Lytton (q.v.), in whose earlier works at least we find something like a reflection of the cold, sneering, selfish, and sensual spirit that marked the upper classes during the period of the regency; but the versatile genius of this author, and the different fields in which he has won renown, would make it quite unfair to define him as a merely "fashionable" novelist, though his first and least meritorious

distinctions were acquired in that capacity, and students of *Sartor Resartus* are apt to so remember him. Of fashionable novelists, strictly so called, the best-known are Mrs. Gore (q.v.) and Theodore Hook (q.v.). This class was succeeded by another infinitely worse than itself—the *Newgate novelists*, as they have been well termed, who sought for their heroes among highwaymen, thieves, desperadoes, and murderers, like Jack Sheppard, Blueskin, Dick Turpin, Claude Duval, etc., and, flagitiously indifferent alike to fact and morality, labored with pernicious success to invest the lives of these scoundrels with a halo of romantic interest and dignity. The chief of this school, "by merit raised to that bad eminence," is William Harrison Ainsworth (q.v.). During the last 30 years novels have been multiplied to a degree which is almost alarming, and literally incalculable. The greatest names are unquestionably those of Dickens (q.v.), Thackeray (q.v.), and Miss Evans (q.v.); but besides these might be mentioned a host of others, who have attained either celebrity or popularity, or both. Every mode of life, and every kind of opinion, social, artistic, scientific, philosophical, and religious, has sought to recommend itself by adopting this fascinating garb. We have the nautical novels of Marryat (q.v.), redolent, like Dibdin's songs, of the briny deep; the political novels of Disraeli (q.v.); the sporting and military novels of Lever (q.v.); the brilliant "muscular Christian" novels of Kingsley (q.v.); the "governess-novels," as they have been aptly denominated, of Miss Brontë (q.v.); the "school" novels of Hughes and Farrar and "sensational" novels of Wilkie Collins, Miss Braddon, and others; the musical novels of Elizabeth Sheppard; the "Church of England" novels of Miss Yonge; the hunting and regimental stories of Whyte-Melville; the strange East Indian tales of Rudyard Kipling; the strong work of Mrs. Oliphant, Mrs. Gaskell, and Mrs. Mulock-Craik; Meredith's powerful stories; Ouida's erotic rhapsodies; the vivid word-painting of Rider Haggard; the exquisite fancies of George Macdonald and Joseph Henry Shorthouse; the unconventional pen-portraits of Thomas Hardy; the effective exposures of social abuses of Charles Reade and Walter Besant, and, strongly typical of the literature of the last half of the century, the agnostic pleading of Mrs. Humphrey Ward. The extraordinary increase of this potent and therefore perilous branch of literature cannot fail to excite much curious reflection in thoughtful minds.

2. *French Fiction during the 19th Century.*—A few words are all that we can devote to this part of our subject, though it is far from uninteresting either in a literary or a moral point of view. The effect of the revolution of 1789 on literature was not immediately beneficial, but the reverse, though it planted the germs of a multitude of new thoughts and aspirations in the mind of Christendom, which have since yielded, both in France and elsewhere, a prolific harvest of wheat and—tares. The iron despotism of Napoleon crushed nearly all literary expression whatever. His hatred of "idealogues" is well known, but the novel was that species of idealogic composition that came least into collision with the principles of imperialism. Even *it*, however, could hardly be said to flourish; and the only tolerably gifted writer of fiction who figures during the first empire is Le Brun, and he was reduced to the necessity of caricaturing the *bourgeoisie*, to which Napoleon had no particular objection, as they were by no means his warmest admirers. Chateaubriand (q.v.) and Mme. de Staël-Holstein (q.v.) are insignificant in this department, and Charles Nodier, though voluminous, was not an original novelist. After the return of the Bourbons, and especially after the revolution of 1830, France began to display a wonderful literary activity, and in particular its long-repressed faculty of imagination burst into a sudden blossom of poetry and fiction. Even Napoleon, now that he was dead, received a peculiar homage from the class to whom he had never shown favor or regard, of which the songs of Béranger and *Les Misérables* of Victor Hugo afford us specimens. Unhappily for the purity of its literature, the *régime* of the restoration, which followed the deliverance of France from a military despotism, was itself a base, corrupt, and profligate thing. The Bourbons came back only to re-enact the follies of their ancestors in the previous century, and the nation soon came to despise, detest, and disbelieve them and the church which supported them. Hence a certain reckless levity and hollow mocking laughter, as of heartless skepticism, pervading those fictions which profess to delineate the realities of current life. Moreover, the sparkling wit, the sunny humor, the pathos, often exquisitely tender and refined, the delicate or deep delineation of character, the occasional fine flush of sentimental enthusiasm, and the poetic witchery of a religious mysticism, cannot blind us to the fact that the substance of most of the recent French fictions is incurably immoral. Paul de Kock (q.v.), Balzac (q.v.), Dumas (q.v.), father and son, Sue (q.v.), Maupassant (q.v.), Daudet, Zola, though wholly dissimilar in the quality of their genius, are in this respect too wofully alike. Victor Hugo (q.v.) and Lamartine (q.v.) are indeed morally far above the rest of their contemporaries, but they are perhaps the only great exceptions that can be mentioned. The "second empire" did not improve the tone of the French novel, any more than it improved the tone of French society; but if it be true that when things have reached their worst they begin to mend, the country that has produced both *Nana* and *Bel Ami* is, perhaps, as regards the literature of fiction, in a hopeful condition. The Erckmann-Chatrian tales, graphic delineations of provincial life, are honorably distinguished by the absence of all indecency. Verne's tales of impossible semi-scientific voyages to the moon and elsewhere are unique.

French fiction of late has been powerfully influenced by the example of Flaubert

and of Balzac; and has, besides, pushed psychological analysis further than at any time in the past. The result has been a prevailing tone of hopelessness, of cynicism, that to the Anglo-Saxon mind is at once repellent and unreal, springing from a too morbid self-consciousness. An excellent type of this latter-day school is M. Paul Bourget (q.v.), of whom it may be well to quote the verdict of a recent critic, as expressing what is equally true of an entire school of writers:

"Like Flaubert, he discerns too clearly to be greatly pleased with what he sees. The pessimism of the two men was, however, arrived at by somewhat different routes. Setting aside any origins of a purely physical nature, it arose with Flaubert mainly from the inconsistency of his external surroundings with his inward ideals, and denoted simply that his objective world and his subjective world were at strife. M. Bourget's dissatisfaction flows from the unpleasing result of his analysis of the inward feelings themselves. He probes them and penetrates them throughout their complex ramifications and windings, until he reaches some ultimate fact or some irreducible instinct, from which he draws the moral of an unbending necessity. And here he finds the aspirings of his imagination and the decrees of destiny at daggers drawn." See Saintsbury, *Essays on French Novelists* (1891).

The prose fiction of Spain and Italy during the 19th c. scarcely requires notice, as the former country has not produced a single work that has forced its way into the general European market, while the latter can boast of only one that has attained that dignity, the *Promessi Sposi* of Manzoni (q.v.).

American Fiction.—The first half of the nineteenth century produced few novelists of American stock, and fewer still who were not trammeled by adherence to English literary models and traditions. Within that period, however, were produced Charles Brockden Brown's *Edgar Huntly*, Cooper's best romances, treating of the forest and prairie, Hawthorne's *Twice Told Tales*, *Mosses from an Old Manse*, and *Scarlet Letter*, John Pendleton Kennedy's novels, dealing with life in the Old Dominion, Poe's weird tales, Sylvester Judd's *Margaret*, and Miss Catharine Sedgwick's stories of New England. The second half opened auspiciously with Hawthorne's *The House of The Seven Gables*, and in 1852 Mrs. Stowe's *Uncle Tom's Cabin*, a bold grappling with a practically forbidden subject, showed that abundant material of both tragic and comic character existed among us. This author's subsequent novels of New England life did much to encourage the use of home subjects. The rapid growth of our country, its marvelous scenery and resources, its differing races, sudden social changes, and especially those wrought by the civil war, have all contributed to stimulate the nationalism of our writers, and to open new fields to the romancer. In spite of strong influences and fashions, it is difficult to classify our authors strictly within the bounds of the realistic or romantic schools. Some have preferred to draw their inspiration chiefly from foreign sources, and may be designated as cosmopolitan rather than American, as Henry James, Arthur S. Hardy, F. Marion Crawford, William Waldorf Astor, Blanche Willis Howard, and Mrs. Amelia E. Barr. Grouping American novelists within geographical limits, without regard to "schools," there may be mentioned as holding high rank, for delineation of New England life and character, Oliver Wendell Holmes, Thomas Bailey Aldrich, Jane G. Austin, John T. Trowbridge, Louisa M. Alcott, Mrs. A. D. T. Whitney, and those skillful writers of short stories: Mrs. Rose Terry Cooke, Mrs. Annie Trumbull Slosson, Miss Sarah Orne Jewett and Miss Mary E. Wilkins. In the middle states we have Bayard Taylor, Edwin L. Bynner, Ellen Olney Kirk, S. Weir Mitchell, Harold Frederic, Marion Harland, and to be mentioned for realistic satires on New York society, Edgar Fawcett. The history and traditions of Canada and the Northwest have been brilliantly used by Mrs. Mary Hartwell Catherwood and Constance Fenimore Woolson, and the modern life of the interior and far west, by Edward Eggleston, Captain Charles King, E. W. Howe, Bret Harte, and Mary Hallock Foote. The South, since the civil war, has given some notable names to American literature in this special department; among them, George W. Cable, Joel Chandler Harris, Thomas Nelson Page, Richard Malcom Johnston, and Mary Noailles Murfree. On the list of those whose aim has been or is the solving of social and religious problems are William Dean Howells, Edward Bellamy, Albion Tourgée, Helen Hunt Jackson, Elizabeth Phelps Ward, and Margaret Deland. Harriet Prescott Spofford and Frank Stockton occupy a peculiar place; and more difficult of classification are General Lewis Wallace, Edward P. Roe, and Julian Hawthorne. Perhaps the most brilliant triumphs in American fiction have been won by writers of short stories.

For the history of prose fiction the reader is referred to the following standard works; Warren, *A History of the Novel* (N. Y., 1895); Chassang, *Histoire du Roman* (1862); Masson, *British Novelists* (1859); Senior, *Essays on Fiction* (1864); Tuckerman, *History of Prose Fiction* (1882); Bower, *Descriptive Catalogue of Historical Novels* (1882); *Lanier, The English Novel* (1883); Ten Brink, *Causerien over Moderne Romans* (1885); Dunlop, *History of Prose Fiction* (new ed., 1888); *Vogüé, Le Roman Russe* (1886); Breton, *Le Roman au Dix-Septième Siècle* (1890); Saintsbury, *French Novelists* (1891). Also the article REALISM AND NATURALISM.

NOVEMBER (Lat. *novem*, nine) was among the Romans the 9th month of the year, at the time when the year consisted of 10 months; and then contained 30 days. It subsequently was made to contain only 29, but Julius Cæsar gave it 31; and in the reign of Augustus the number was restored to 30, which number it has since retained. November was one of the most important months in connection with the religious ritual of the Romans, and continues in the same position, though for other reasons, in the Roman Catholic ritual. It was known among the Saxons as *Blot-monath*, "blood-month," on

account of the general slaughter of cattle at this time, for winter provision (known for a long time afterwards as *Martinmas beef*) and for sacrifice. This custom was not confined to the Saxons, but prevailed in northern Germany, and even as far south as Spain.

NOVGOROD′, a government of Great Russia, extends immediately s.e. of the government of St. Petersburg. Area, 47,236 sq. m.; pop. '92 1,279,910. The surface is gently undulating, with the Valdai plateau in the south, which rises to between 800 and 1000 ft., and may be said to form the water-shed between the Baltic, Caspian, and White seas. The government contains many lakes and rivers; of the former, the lakes Ilmen and Bieloe are the largest; and of the latter, the Wolchof, Syas, Sheksna, and Mologa are the most important. The rivers are connected by canals, which are of great service to trade. The soil, especially in the n.e., is not fertile, and the climate is severe; agriculture and cattle-rearing are carried on only to a limited extent. Forests and pasture-lands are numerous and extensive, manufactures are few, but fisheries, in the lakes, considerable. Quarries of the best stone for paving occur on the river Tosna, and near Stara-Russa there are mineral and saline springs.

NOVGOROD, an important t. of European Russia, capital of the government of the same name, is situated on the Volkhof, near where it issues from lake Ilmen, 122 m. s.s.e. of St. Petersburg. It is the cradle of Russian history. In 862 the Norman prince Rurik, of the tribe of Variago-Ross (whence the name *Russia*), was invited hither by the neighboring tribes, and from him begins the history of the country, and the line of its sovereigns. A monument, commemorative of this event, was erected here, with great pomp, in Sept. 1862. In the 9th c. Oleg, the successor of Rurik, transported the capital to Kief; but bestowed many privileges and liberties upon Novgorod, and from that time it began to prosper. The greatness of Novgorod provoked the jealousy of the princes of Moscow, and in 1478 the Czar Ivan the Great nearly destroyed the town, bereft it of its liberties, and exiled the most influential citizens. During the time of its prosperity, the town was called Novgorod the Great; and had 400,000 inhabitants, and extended its sway to the White sea and the river Petchora. Its government was a sort of republic, the prince being less a sovereign than the chief commander of the troops. Its greatness was due to its vast foreign trade alone, and when Archangel was opened for English trading vessels, but especially after the foundation of St. Petersburg, its trade fell away, and the town rapidly declined. Of the existing ancient buildings, the most remaakable are the church of St. Sophia, founded in the 11th c., possessing a fine old library, as well as some remarkable paintings and tombs; and the Kreml, in the steeple of which hung the famous bell used to summon the citizens for the deliberation of state affairs. Pop. '93, 24,786.

NOVGOROD SSJEWERSK, or NOVGOROD-SYEVERSK, a t. of Russia, in the province of Tchernigov, 113 m. e.n.e. from Tchernigov, on the right bank of the Desna, a branch of the Dnieper. It is the capital of a district, and is a place of considerable trade and activity. Pop. '89, 8005.

NOVGRAD′-VOLYNSKI′, a t. of European Russia, in the government of Volhynia, 64 m. w.n.w. from Jitomir. It is the capital of a circle, and is situated on the banks of the Slutch, a feeder of the Pripet, and so of the Dnieper. Pop. 14,650.

NO′VI, a t. of northern Italy, in the province of Genoa, is a station on the railway from Turin to Genoa, and is 33 m. n.n.w. of the latter city. It presents few attractions, with the exception of a number of picturesque old houses. It carries on a considerable transit trade; and manufactures silk thread. Pop. 11,445.

NO′VIBAZAR′, also JENIBAZAR, a t. of Bosnia, European Turkey, situated on the river Rashka, an affluent of the Morava, 130 m. s.e. of Bosna-Serai. In the *Sanjak* or district of Novibazar (area, 2840 sq. m.; pop. about 150,000), according to the treaty of Berlin, Austria maintains a military force.

NOVICE. See NOVITIATE.

NOVIKOFF, NIKOLAI IVANOVITCH, 1744–1818; b. Russia; entered the government service at the age of 18, but soon retired to devote himself to literature. One of his first publications was *The Painter*, containing satirical sketches of manners somewhat after the fashion of the *Spectator*. This was followed by his *Specimen of a Lexicon of Russian Authors*. These works won him the favor of the Empress Catharine II., and he removed to Moscow, where he founded a typographical society, for the purpose of printing cheap books. He organized the first circulating library in Russia, but was obliged to leave Moscow, as a supposed adherent of the French philosophers. He published 1773–75 a collection of historical materials, called *The Old Russian Library*.

NOVITIATE, the time of probation, as well as preparatory training, which in all religious orders precedes the solemn Profession. Under the head of MONACHISM will be found the general principles by which the training for the "religious" life is regulated. It will be enough to say here, that the novitiate in all orders must continue (Conc. Trid. Sess. xxv c. 85, *De Regul. and Mon.*) at least one year. In most orders it is

of two, and in several of three. Any attempt to solemnize the profession before the expiration of the noviate, without a dispensation, is invalid. During the novitiate, the novices are immediately subject to a superior, called master (or mistress) of novices. They are not permitted to engage in systematic study, their whole time being devoted to prayer, and to ascetic and liturgical training. During the novitiate, the novice continues free to withdraw, nor is he or she admitted to profession at the close of the novitiate, except after proof given of fitness, and of proper dispositions for the particular institute aspired to.

NOVOARKHANGHELSK′ (New Archangel). See SITKA.

NOVOCHERKASK. See NOVO TCHERKASK.

NOVO GEORG′IEVSKI, a fortress in Russian Poland, at the junction of the Bug and Vistula rivers, 19 m. n.w. of Warsaw. It was founded in 1809 by Napoleon, who gave the name of Modlin, which was changed to the present name by the Russians, when they gained possession of it after the fall of Warsaw in 1831. It had also been in the hands of the Russians, 1813–30, when the Polish revolutionists seized it. It is a strongly fortified post, with an arsenal and citadel and accommodations for from 30,000 to 40,000 troops.

NOVOGRUDOK, t. in Russian government of Minsk, with several churches, a mosque, and a pop. '91, of 12,000. N. was formerly an important place, the ruins of the fortress built here between 1392 and 1430 by Prince Witowt being still visible. This prince likewise settled here the captured Tartars whose descendants still inhabit the town. In 1448 King Casimir IV. of Poland established a parliament, and from 1581 to 1775 the biennial court of justice was held here.

NOVOMOSKOVSK′, an important market-t. of s. Russia, in the government of Ekaterinoslav, and 19 m. n.n.e. of the town of that name, on the Samara, an affluent of the Dnieper. Extensive fairs, chiefly for the sale of cattle and horses, are held here annually. The "remounting" officers attend these fairs for the purpose of supplying their regiments with horses. Tanning and tallow-melting are carried on. Pop. '89, 19,106.

NOVO TCHERKASK′, a t. of s. Russia, capital of the territory of the Cossacks of the Don, on the Aksaï, a tributary of the Don, at a distance of 12 m. from its right bank, and about 70 m. e.n.e. of Taganrog, and 20 m. by rail n.e. of Rostov. The central administration of the territory was transferred hither from Tcherkask in 1805 by count Platoff, commander-in-chief of the Cossacks, and, in spite of its distance from the Don, the city became a trading center of importance. About 19 m. n. of the town by rail are enormous deposits of anthracite coal. In 1855 a statue was erected in memory of count Platoff, who achieved an illustrious name by his military exploits from 1770 till 1816, and especially during the French invasion in 1812. Pop. '91, 38,476; '97, 52,005, who carry on trade and manufactures, agriculture, cattle-breeding, fishing, and wine-growing.

NO′VUM ORGANUM, or The New Instrument, lord Bacon's treatise sketching the inductive method of studying nature, which before his time had been pursued only occasionally and blindly—a method whose introduction divides philosophy into the old and the new. I. Bacon in the first part of his work surveys the imperfections of human knowledge. 1. He notes the vagueness and uncertainty of all speculation, and the want of connection between the sciences and the arts, due to "the perverseness and insufficiency of the methods pursued." "If men had consulted experience and observation, they would have had facts, and not opinions, to reason about." The method then in vogue he describes as "ill-suited to discovery, but wonderfully accommodated to debate." 2. He enumerates the causes of error, naming them in the figurative language so commonly employed by him—*idols*, things to which the mind had long been accustomed to bow down; of these he shows four classes: (1.) Idols of the *tribe* or of the race: causes of error found in human nature in general; such as man's propensity to find in nature a greater degree of order and regularity than actually exists Thus, as soon as men perceived that the orbits of the planets were returning curves, they assumed them to be perfect circles, and the motion in them to be uniform; and to these false suppositions the ancient astronomers labored to reconcile the facts which they observed. (2.) Idols of the *den:* causes of error springing from individual character, as if each person had his own cavern or den, into which light imperfectly enters; some minds being best fitted to mark differences, others resemblances, etc. (3.) Idols of the *forum:* causes of error arising out of public and social intercourse, and especially out of its implement—language. Men believe that their thoughts govern words; while often their words govern their thoughts, and few abstract terms convey precise and well-defined ideas. (4). Idols of the *theater:* causes of error arising from the systems or doctrines of particular schools, which are like imaginary worlds brought upon the stage, yet influencing the mind as if they were real. 3. Bacon, pointing out the circumstances which had favored these perverse methods, (1) notes three periods of pursuit of science—the Grecian, Roman, and European—after the revival of letters: the first, short; the second, disturbed in its earlier part by politics and war, and, after the rise of Christianity, by religious interests and theological pursuits; the third, overshadowed by royal and hierarchical power enslaving the mind. In his opinion no part of knowledge could make much progress if its start was not made from facts in nature. (2.) He shows that the end and object of knowledge had been misunderstood; that some had pursued the knowledge of words rather than of

things; some, of objects imaginary and unattainable, promising to prolong life indefinitely, to extinguish disease, and to rule the spiritual world by magical charms. "All this is the mere boasting of ignorance; for, when the knowledge of nature shall be rightly pursued, it will lead to discoveries that will as far excel the pretended powers of magic, as the real exploits of Cæsar and Alexander exceed the fabulous adventures of Arthur of Britain or Amadis of Gaul." (3.) Reverence for antiquity and the authority of great names had greatly retarded the progress of knowledge: the "older times" were really the young and inexperienced times; the latest age is the oldest; having gathered the most of facts and experiences. (4.) Knowledge has been greatly hindered by the fact that in general men have inquired only into the causes of rare and great phenomena, without troubling themselves about the explanation of such as are common, and make a part of the general course of nature; while the laws always in action are those which it is most important to understand. It was an error of the same sort which had led men to delight in mere contemplation and to regard manual experiment as beneath the dignity of science.

II. The second book of the *Novum Organum* treats of the induction essential to the right interpretation of nature. 1. A history full and accurate of the phenomena concerned must be prepared—a "natural history." 2. There must be a comparison of the various facts to find out the cause of a phenomenon—its "form or essence;" also, to discover the invisible processes and the invisible structure of the bodies concerned. 3. The facts being in hand, consideration is then to be had of them as to what things are by these facts excluded from the number of possible causes. After many such exclusions have left but a few principles common to every case, one of these is to be assumed as the cause, and the trial is to be made by synthetical reasoning whether it will account for the phenomenon. This process by exclusion—through successive negatives to the final affirmative—Bacon regarded as essential to success. 4. This method of induction he declared to be applicable to all investigations where experience is the guide, whether in the physical or moral world.

NOWANAGAR, or Nowanuggur, a seaport of India, in the peninsula of Kattywar, Guzerat, at the mouth of the Nagna, a small river on the s. shore of the gulf of Cutch, 160 m. w.s.w. from Ahmedabad, and in n. lat. 22° 27′, e. long. 70° 11′. It is the principal place of the district of Hallar, the greater part of which is held as a *jaghire* by the chief of Nowanagar, who bears the title of the jam of Nowanagar, and is tributary to Great Britain. Pop. 39,668.

NOWELL, Increase, 1590–1655; b. England; having been chosen an assistant of the proposed colony of Massachusetts bay, upon the formation of the company he came to this country with Winthrop in 1630, and became an elder in the Rev. John Wilson's church. He was commissioner of military affairs during the first Pequot war in 1634, and secretary of the colony, 1636–49.

NOWLIN, a co. in w. central South Dakota; unorganized; 1220 sq.m.; white pop. '90, 149.

NOX, in mythology, daughter of Chaos and mother, by her brother Erebus, of Æther (the air) and Hemera (day). She was also the mother of the Fates, of Death, Dreams, Nemesis, Fraud, the Hesperides, etc. The victims sacrificed to her were a black sheep and a cock. The poets called her mother of all things, and Homer represents Zeus as standing in fear of her. There was a famous statue of her by Rhoecus in the temple of Diana at Ephesus, and her attributes seem to have been blended with those of the moon goddess. She is represented as riding in a chariot with the constellations going before her, and wearing a starry veil, or with two children in her arms, one black representing death, one white representing sleep, or as riding in a chariot drawn by bats and owls, and dressed in mourning, with a crown of poppies on her head.

NOXUBEE, a co. in e. central Mississippi, bordering on Alabama; intersected by the Tombigbee and its branch the Noxubee rivers, and by the Mobile and Ohio railroad; about 668 sq.m.; pop. '90, 27,338. Co. seat, Macon.

NOYADES (i.e., "drownings," from Fr., *noyer*, to drown), the execution of political offenders in great numbers at once by drowning them, one of the atrocities of the French revolution, practised at Nantes by Carrier, the deputy of the convention. See Carrier. This mode of execution was also called, in cruel sport, *vertical deportation.*

NOYES, Edward Follansbee, b. Haverhill, Mass., 1832; graduated at Dartmouth coll., 1857; removed to Cincinnati, O., and was admitted to the bar. He fought in the union army during the civil war, and rose from the rank of major to that of brig.-gen. After the war he became city solicitor of Cincinnati; was elected probate judge of Hamilton co., 1866, and gov. of Ohio on the repub. ticket, 1871. He was minister to France, 1877–81; became judge of the superior court of Cincinnati, 1889. He died in 1890.

NOYES, Eli, d.d., 1814–54, b. Me. He was self-educated, and began to preach in 1834; he embarked with his wife, Sept. 22, 1835, for Calcutta, and settled at Orissa, where he had great success in mission work. In 1841 he returned with impaired health, and for several years was pastor of a Free-will Baptist church in Boston. He edited for 10 years the *Morning Star*, the Free-will Baptist organ. He published *Lectures on the Truths of the Bible; A Hebrew Grammar and Reader.*

NOYES, George Rapall, d.d., 1798–1868; b. Mass; graduated at Harvard college in 1818, and afterwards at the Harvard divinity school. In 1827 he was settled over a Unitarian church in Brookfield, Mass., from which he removed to a church in Petersham. During this time he pursued the study of the biblical text in the original languages, and was recognized as one of the first Hebrew scholars in America. In 1840 he was appointed Hancock professor of the oriental languages in Harvard college, and Dexter lecturer on biblical literature. He published in 1827 *An Amended Version of the Book of Job; A New Translation of the Hebrew Prophets,* 1833–37; *A New Translation of the Prophets, Ecclesiastes, and the Canticles,* 1846; *Theological Essays,* 1856; and a *Translation of the New Testament,* issued by the American Unitarian association in 1869.

NOYES, John Humphrey, b. Vt., 1811; graduated at Dartmouth college; studied theology at Andover and New Haven; was licensed to preach in 1833. In 1834, announcing himself a Perfectionist, his license to preach was recalled, and he began to propagate his new views in various periodicals. Noyes published several volumes, the most important of which are *The Berean; The Second Coming of Christ; Salvation from Sin; Bible Communism; Male Continence and Scientific Propagation; History of American Socialisms.* In 1838 he founded a community of Perfectionists (q.v.) at Putney, Vt.; removed in 1847 to Lenox, Madison co., N. Y., and established the Oneida Community (q.v.). He afterwards established another branch at Wallingford, Conn. The Perfectionists uphold the community of labor and its fruits, and maintain the full equality of the sexes in social and business life. He d. 1886.

NOYES, William Curtis, ll.d., 1805–64; b. Schodack, N. Y.; began the practice of law in 1827 in Oneida co., where he quickly took high rank. He removed to New York in 1838, and immediately took a place among eminent lawyers, and was at one time engaged to codify the laws of the state. In politics he was an antislavery whig. And on the organization of the republican party became a member of it; but was drawn into the futile and temporizing peace convention of 1861. He was elected president of the New England society the day before his death, which took place in New York, Dec. 25, 1864. He bequeathed a valuable law library to Hamilton college.

NOYON, a t. of France in the department of Oise, 78 m. n.n.e. of Paris by the Northern railway. It has a fine cathedral of the 12th and 13th centuries, in the Romanesque style of architecture; an episcopal palace, and important sugar, sheet iron, and chemical manufactures. Pop. '91, 5,812. Noyon was a residence of Charlemagne, and the place where Hugo Capet was crowned king in 987. It is noted as the birthplace of John Calvin.

NUBAR PASHA, b. abt. 1825; of an Armenian family long settled in Egypt. He entered into public life, and rapidly gained a European reputation for ability and probity. He was foreign minister, minister of justice, and ambassador; represented the Khédive at the congress of Berlin, 1878; and was the originator of the mixed courts for the adjudication of causes between Europeans and Egyptians. He was minister of foreign affairs in 1867–76, and premier in 1878–9, 1884–88, and 1894–5, resigning because of old age after a public service of 53 years.

NU'BIA, the modern appellation of a country subject to the khedive of Egypt, extending from Philae to the Sennaar, lat. 18° s., bounded on the e. by the Arabian gulf, n. by Egypt, s. by Abyssinia, and on the w. by the desert. It appears to have been anciently known as Ethiopia. The ancients gave the name of Ethiopia to the w. bank of the Nile from Meroë to the bend of the river. The name seems to have been derived from the Egyptian and Coptic *noub,* or gold, a name still retained in *Wady Nouba,* which extends from the frontier of Dongola, n. of the *Wady Seboua,* above Derri. The tract between Seboua and Assouan is called the Wady Kenous. Diocletian removed hither a Libyan tribe, called Nobatæ, to the district above Syene, to oppose the Blemmyes, who inhabited the western desert, now held by the Ababde and Bisharein Arabs. The dominion of the Pharaohs, when most extended, reached to the isle of Argo, the last place where the monuments of the Egyptians have been found. Under these monarchs it was called Cush, and was governed by a royal scribe, entitled prince of Cush or Ethiopia, till the twentieth dynasty, when it appears to have been recovered by a series of native rulers, who ultimately conquered Egypt; and although driven back, finally extended their rule from Meroë to Syene, the most southern city held by the Egyptian monarchs, the Ptolemies, and the Romans. These Ethiopians adopted the civilization of the Egyptians, and the names of some of their monarchs have been preserved. The subsequent fortunes of this country will be seen under Ethiopia. The modern inhabitants consist principally of Arabs, who invaded the country after the rise of Mohammed, the principal tribes being the Djowabere and El Gharbye, who inhabit from Assouan to the Wady Halfa; the Kenous, Djaafere, and others, a branch of the Koreish, who occupied the land from Esne to Assouan. By the aid of Bosnian soldiers the Djowabere were driven into Dongola in the reign of Selim; and their descendants still flourish at Ibrim, Assouan and Sai. Lower down inhabit a race called the Berbers or Barabras; s. of Cossier are the Ababde. From Dongola and Sennaar, a negro state, the people are called Noubas, a hardy race, differing from the pure blacks; but the country throughout is inhabited by mixed races of Arabian and Nigritic blood. Another tribe, the Sheygya, e. of Dongola—a fine black race, addicted to horsemanship and war—are still more interesting. The Ababde Arabs are renowned as guides and camel drivers; the Bisharein are supposed by some to be the ancient Blemmyes, a tribe living on flesh and milk, but without the oriental jealousy of the Arabs; the Takas, supposed

to be the ancient Bojahs, dwell in the mountains. Three principal languages are spoken by these various tribes—the Nuba by the Berbers, who entered from the s.w.; the Kungara, a Nigritic dialect, by the negroes of Dafur; and the Bisharie, said to exhibit Aryan affinities. The inhabitants, estimated at about 1,000,000, although less in stature than the Egyptians, are a fine muscular race; the women are pleasing, but not beautiful; and the climate is remarkably healthy. In their political government they were governed by their own chiefs, *maks* or *malechs*, till they were subdued by Ismael Pasha, in 1820, to the sway of Egypt, and the civil government is now administered by the Turks. The country is arid, in many places only cultivable at the sides of the Nile, and consists of granite and sandstone. The soil raises durra, cotton, and date palms. It is traversed by the *Bahr-el-Azrek*, or Blue Nile, and the *Bahr-el-Abiad*, or White Nile. The products are numerous, comprising maize, dates, tamarinds, gums, aloes, civet, musk, wax, myrrh, frankincense, senna, black wool, hides both of the elephant and rhinoceros, and their ivory; ostrich feathers, ebony, gold dust, saltpeter, salt, tobacco, coffee, cotton—which are carried by way of commerce to Egypt. The taxes are rated by the number of water wheels for the irrigation of the land. There being no native currency, the coins of Egypt and Europe, especially the Spanish dollar, are received, but glass beads, coral, cloth, *tobs* or shirts, and cloth (*samoor*) also pass as money. In Kordofan value is reckoned by cows. The most primitive modes of measurement are in use, maize being sold by the handful (*selga*), 18 of which go to a *moud;* and cloth being measured from the elbow to the fingers. Polygamy is general, and a wife at Kenous is purchased of her parents for 30 piastres; amongst the Arabs for 6 camels, 3 of which are returned to the bridegroom. Some of the tribes are jealous of their women, who are celebrated by travelers on account of their virtue. In their costume they use turbans, linen, and woolen garments, and are armed with lance and shield, the latter made of the hide of the hippopotamus. No looms exist, but they plait neatly. Their chief musical instrument is a guitar of five strings with sounding-board of a gazelle's hide. They are generally averse to commerce, eat little animal food, and are Mohammedans. Their houses are low huts of mud or stone. The chief attraction of this country to travelers is the numerous temples and other ancient remains of the Egyptians, extending from Philae to the island of Argo. These consist of the temple of Isis, in the isle of Philae, founded by Nectanebo, I., and continued by the Ptolemies; the temple of Deboud, built in honor of Amen Ra, by Ataramen, and continued by the Romans; Tafa or Taphis, the modern Kalabshe, built by Rameses II.; the rock temple of Beit e Welly, recording the conquests of the same monarch; Wady Halfa, built by Osertesen I.; the rock temple of Ibsamboul, built by Rameses II.; Gebel Addeh, built by Horus of the eighteenth dynasty; Ibrim, built by Amenophes II.; Amada, founded by Thothmes III.; Ghersheh, Seboua, and Derri, built by Rameses II.; Dakkeh, the ancient Pselcis, built by Ergamenes; and the colossus of the isle of Argo; the pyramids of Meroë and Tanquassi.—Burckhardt, *Travels;* Champollion le Jeune, *Lettres Ecrites*, p. 107, and foll.; Lepsius, *Reise*, p. 107, and foll.

NUBLE, a small inland department of Chile on the w. slope of the Andes, bounded by the Andes and the provinces of Linares, Concepcion and Biobio; 3556 sq. m.; pop. '94, 165,529. It is one of the most fertile and prolific parts of Chili. Its climate is suited to grain, fruits, vines, and to grazing and the rearing of horses. It is also rich in gold, sulphur, coal and other minerals. Capital, Chillan.

NU'CHA or **NUKHA**, a town of Transcaucasia, Russia; 60 m. n.e. of Elisabethpol, annexed by Russia in 1819, and the only town of the former khanate of Nucha or Sheki, in the n.w. of Shirwan. It is 120 m. e.s.e. from Tiflis, and stands at the southern base of Caucasus in the valley of the Kish-Tshai, an affluent of the Alasan, which itself is a branch of the Kur. Pop. 25,900. The town is surrounded by mulberry groves and fruit gardens, extending to a distance of several miles. It has long been famous for the rearing of silk-worms, silk spinning, and the manufacture of silken goods.

NUCKOLLS, a co. in s. Nebraska, adjoining Kansas, drained by the Little Blue and Republican rivers; 576 sq.m.; pop. '90, 11,417, chiefly of American birth. The surface is mostly prairie, with little timber. It produces good crops of grass, and is suitable for agriculture or grazing. Co. seat, Nelson.

NUCLEOBRANCHIA'TA, or HETEROPODA, an order of gasteropods having the sexes distinct; the locomotive organ fin-like, single, and ventral; the gills packed in small compass along with the heart. They are all marine, and usually swim with the back downwards and the fin-shaped foot upwards. They adhere to sea-weeds by a small sucker placed on the fin. Some of them, as *Atlanta*, have a shell large enough to protect the body; some, as *Carinaria*, have a small shell covering the gills and heart only; and some, as *Firola*, have no shell at all.

NU'CLEUS. See CELLS.

NUDIBRANCHIA'TA (naked-gilled), an order of gasteropods, hermaphrodite, destitute of shell, and having the gills exposed on the surface of the body. The gills are differently situated in different genera. The genus *Doris* (q.v.) is an example of this order.

NUE'CES, a river of Texas, rises in Edwards co., and after a south-easterly course of 300 m., flows into Corpus Christi bay, on the Gulf of Mexico, draining an area estimated at 16,000 sq. m.

NUE'CES, a co. in s. Texas, on the Gulf of Mexico, s. of the Nueces river, drained by the Santa Gertrudis river and others; 2430 sq. m.; pop. '90, 8093, chiefly of American birth, includ. colored. The surface is mostly level, and the soil a rich loam. Co. seat, Corpus Christi.

NUEVA SPARTA. See MARGARITA.

NUEVO LEON, a Mexican state, s. of the Rio Grande; between 24° and 27° 30′ n. lat., and 99° and 100° 40′ w. long.; 23,592 sq. m.; pop. (est. 1893), 294,000. It is a prosperous agricultural region and contains important mines. The surface is irregular and mountainous, and in the s. is made up of table-lands. The chief rivers are the Del Tigre and other branches of the Rio Grande. Capital, Monterey.

NUISANCE. The term nuisance is derived from the French word *nuire*, to do hurt or to annoy, and is applied in English law indiscriminately to infringements upon the enjoyment of proprietary and personal rights. The principal classes of nuisances are those which arise from the negligent use and management of real property; and from keeping ferocious animals. Thus a man may become responsible for a N. by fixing a spout or any projection which causes, or has a tendency to cause, an unnatural quantity of rainwater to descend on his neighbor's house and land; by erecting and working a noisy smith's forge, or noisy workshops, or an offensively odorous tallow-furnace, smelting-house, dye-house, etc., or burning lime or bricks, or erecting a glass-house or brew-house so near to a dwelling-house that the smoke and smell thereof enter the latter and render it unfit for habitation. So the pollution of springs and running streams may constitute a N., for which the riparian proprietors may recover damages. It is an old principle of law that if a person collect together a crowd of people to the annoyance of his neighbors, that is a nuisance for which he is answerable. So the negligent overloading of the floors of warehouses and buildings causing injury to goods of tenants below the floor so injured, and the neglect of an owner to keep his houses perpendicular, are examples of nuisance. So whoever keeps an animal accustomed to attack or bite mankind, with knowledge of its dangerous propensities, is, *prima facie*, liable to an action for damages at the suit of any person attacked or injured by the animal, without proof of any negligence or default in the securing or taking care of it. Not only is the perpetrator of a N. liable in damages to the persons injured thereby, but he is also punishable for a misdemeanor. But for this latter purpose the N. must be not confined to individuals, but must have within its range the community or vicinage as a class. It is not necessary that the N. be one positively deleterious to health. It is enough if it offend the senses or disturb the comfort of the community, or shock the public morality.

NULLIFICATION, in general, might be employed to indicate any act of absolute invalidation or making void, but is almost exclusively applied to the doctrine first set forth by John C. Calhoun in a paper known as the *South Carolina Exposition*, which was presented by him in 1828 to the legislature of that state, and by them ordered printed. This doctrine asserted the right of any state to declare the unconstitutionality of any United States law, though it should have been passed in the proper manner, have received the assent of the president, and even have been tested as to its constitutionality before the U.S. supreme court. And it was further claimed that any attempt to enforce such law in a state which had refused to acknowledge its force was such an unconstitutional violation of the sovereign rights of that state as would justify her in at once leaving the union. The immediate cause of this remarkable assertion of power was the existing system of tariff laws, which, it was claimed, bore with great unfairness on the non-manufacturing and raw-material-producing southern states. The argument was in great measure based on language used by Jefferson in drawing up the Kentucky and Virginia resolutions of 1798–99 in regard to the sedition and alien laws. Here it was asserted that the general government was not "the final or exclusive judge of the extent of the powers delegated to itself, but that, as in all other cases of compact among powers having no common judge, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress." These resolutions further express the conviction that other states "returning to their natural rights in cases not made federal, will concur in declaring such laws void and of no force, and will each take measures of its own in providing that neither these acts nor any others of the general government not plainly and intentionally authorized by the constitution, shall be exercised within their respective territories." Senator Hayne of South Carolina was the first to advocate openly the destructive doctrine based on these expressions of Jefferson, and his speech on the subject in the senate called forth Webster's famous oration of Jan. 26, 1830. The theory rapidly gained ground among the extreme believers in state sovereignty, and toward the close of 1832 the governor of South Carolina, acting on the advice of Calhoun, summoned a convention to meet at Charleston. This convention reported for the action of the legislature an ordnance, declaring that the existing tariff law was "null and void, and no law," authorizing the citizens of the state to refuse payment of any taxes under that law after Feb. 1, 1833, and denying the right of the U. S. supreme court to pass upon the validity of the ordinance itself. This bold declaration of inde-

pendence from the authority of the general government was accompanied by the threat that if any steps were taken to enforce the collection of duties, the state would be justified in retiring from the union, and not a vote was cast against it in the convention. When congress met in 1832, Hayne was governor of South Carolina. Calhoun entered the senate, and the state legislature was on the point of enacting laws to carry out the nullification ordinance. The danger was averted partly by the adoption of the so-called Clay's compromise, a modification of the tariff law, but chiefly by the firm and wise action of Andrew Jackson, then serving his second term as president. His orders to the revenue officers of Charleston showed his intention to carry out the laws and maintain the authority of the general government; it was well known that he was not a man to be trifled with or intimidated, and his special message to congress on the subject is one of the ablest state-papers produced in the country's history. The authorship of the proclamation is generally attributed to Edward Livingston, the secretary of state. Jackson's position as a southern democrat and as a military hero also had much weight. Calhoun made an able and ingenious speech in the senate, Feb., 1833, sustaining his view of nullification, but the movement had lost its force, and though there was for some years a party of nullifiers under Calhoun's leadership, that form of the doctrine of state sovereignty was no longer a factor in politics, though undoubtedly the forerunner and logical parent of the doctrine of the right of secession.

NU'MA POMPIL'IUS, in the mythic history of Rome, was the successor of Romulus, the founder of the city. He was a native of Cures in the Sabine country, and was universally reverenced for his wisdom and piety. Unanimously elected king by the Roman people, he soon justified by his conduct the wisdom of their choice. After dividing the lands which Romulus had conquered, he proceeded, with the assistance of the sacred nymph Egeria, to draw up religious institutions for his subjects, and thus stands out in the primitive legend as the author of the Roman ceremonial law. His reign lasted for 39 years, and was a golden age of peace and happiness. The only feature in the myth of Numa Pompilius which we can regard as probably historical, is that which indicates the infusion of a Sabine religious element into Roman history at some remote period.

NUMANTIA, the chief t. of the Celtiberian people called Arevaci in ancient Spain, was situated on the Douro (Durius), in the neighborhood of the present Soria in old Castile. The site is probably marked by the present Puente de Guarray. Numantia is celebrated for the heroic resistance which it made to the Romans, from 153 B.C., when its citizens first met a Roman army in battle, to 134 B.C., when it was taken and destroyed by Scipio the younger, after a siege of 15 months, in the course of which famine and the sword had left alive very few of its 8000 brave defenders. The besieging force under Scipio amounted to 60,000 men.

NUMBERS, THEORY OF, the most subtle and intricate, and at the same time one of the most extensive, branches of mathematical analysis. It treats primarily of the forms of numbers, and of the properties at once deducible from these forms; but its principal field is the theory of equations, in as far as equations are soluble in whole numbers or rational fractions, and more particularly that branch known as indeterminate equations. Closely allied to this branch are those problems which are usually grouped under the diophantine analysis (q.v.), a class of problems alike interesting and difficult; and of which the following are examples: 1. *Find the numbers the sum of whose squares shall be a square number;* a condition satisfied by 5 and 12, 8 and 15, 9 and 40, etc. 2. *Find three square numbers in arithmetical progression;* Answer, 1, 25, and 49; 4, 100, 196, etc.

Forms of numbers are certain algebraic formulas, which, by assigning to the letters successive numerical values from 0 upwards, are capable of producing all numbers without exception, e.g., by giving to m the successive values 0, 1, 2, 3, etc., in any of the following groups of formulas: $2m$, $2m + 1$; $3m$, $3m + 1$, $3m + 2$; $4m$, $4m + 1$, $4m + 2$, $4m + 3$, we can produce the natural series of numbers. These formulas are based on the self-evident principle, that the remainder after division is less than the divisor, and that, consequently, every number can be represented in the form of the product of two factors + a number less than the smaller factor.

By means of these formulas, many properties of numbers can be demonstrated without difficulty. To give a few examples. (1.) *The product of two consecutive numbers is divisible by* 2: Let $2m$ be one number, then the other is either $2m + 1$ or $2m - 1$, and the product $2m(2m \pm 1)$ contains 2 as a factor, and is thus divisible by 2. (2.) *The product of three consecutive numbers is divisible by* 6: Let $3m$ be one of the numbers (as in every triad of consecutive numbers one must be a multiple of 3), then the others are either $3m - 2$, $3m - 1$; $3m - 1$, $3m + 1$; or $3m + 1$, $3m + 2$. In the first and third cases, the proposition is manifest, as $(3m - 2)(3m - 1)$, and $(3m + 1)(3m + 2)$, are each divisible by 2, and therefore their product into $3m$ is divisible by 6 (= 1.2.3). In the second case the product is $3m(3m - 1)(3m + 1)$, or $3m(9m^2 - 1)$, where 3 is a factor, and it is necessary to show that $m(9m^2 - 1)$ is divisible by 2; if m be even, the thing is proved; but if odd, then m^2 is odd, $9m^2$ is odd, and $9m^2 - 1$ is even; hence, in this case also the proposition is true. It can similarly be proved that the product of four consecutive numbers is divisible by 24 (= 1.2.3.4), of five consecutive numbers by 120 (= 1.2.3.4.5), and so on generally. These propositions form the basis for proof of many properties of numbers, such as that the difference of the squares of any two odd numbers is

divisible by 8. The difference between a number and its cube is the product of three consecutive numbers, and is consequently (see above) always divisible by 6. Any prime number which, when divided by 4, leaves a remainder unity, is the sum of two square numbers: thus, $41 = 25 + 16 = 5^2 + 4^2$, $233 = 169 + 64 = 13^2 + 8^2$, etc.

Besides these, there are a great many interesting properties of numbers which defy classification; such as, that the sum of the odd numbers beginning with unity is a square number (the square of the number of terms added), i.e., $1 + 3 + 5 = 9 = 3^2$, $1 + 3 + 5 + 7 + 9 = 25 = 5^2$, etc.; and, the sum of the cubes of the natural numbers is the square of the sum of the numbers, i.e., $1^3 + 2^3 + 3^3 = 1 + 8 + 27 = 36 = (1 + 2 + 3)^2$, $1^3 + 2^3 + 3^3 \times 4^3 = 100 = (1 + 2 + 3 + 4)^2$, etc.

We shall close this article with a few general remarks on numbers themselves. Numbers are divided into *prime* and *composite*—prime numbers being those which contain no factor greater than unity; composite numbers those which are the product of two (not reckoning unity) or more factors. The number of primes is unlimited, and so consequently are the others. The product of any number of consecutive numbers is even, as also are the squares of all even numbers; while the product of two odd numbers, or the squares of odd numbers, are odd. Every composite number can be put under the form of a product of powers of numbers; thus, $144 = 2^4 \times 3^2$, or, generally, $n = a^p.b^q.c^r$, where a, b, and c are prime numbers, and the number of the divisors of such a composite number is equal to the product $(p + 1)(q + 1)(r + 1)$, unity and the number itself being included. In the case of 144, the number of divisors would be $(4 + 1)(2 + 1)$, or 5×3, or 15, which we find by trial to be the case. *Perfect numbers* are those which are equal to the sum of their divisors (the number itself being of course excepted); thus, $6 = 1 + 2 + 3$, $28 = 1 + 2 + 4 + 7 + 14$, and 496, are perfect numbers. *Amicable numbers* are pairs of numbers, either one of the pair being equal to the sum of the divisors of the other; thus, 220 (= 1+ 2 + 4 + 5 + 10 + 11 + 20 + 22 + 44 + 55 + 110 = 284), and 284 (= 1 + 2 + 4 + 71 + 142 = 220), are amicable numbers. For other series of numbers see FIGURATE NUMBERS.

The most ancient writer on the theory of numbers was Diophantus, who flourished in the 3d c., and the subject received no further development till the time of Vieta and Fermat (the latter being the author of several celebrated theorems, a discussion of which, however, is quite unsuited to this work), who greatly extended it. Euler next added his quota, and was followed by Lagrange, Legendre, and Gauss, who in turn successfully applied themselves to the study of numbers, and brought the theory to its present state. Cauchy, Libri, and Gill (in America) have also devoted themselves to it with success. The chief authorities down to the present century are Barlow's *Theory of Numbers* (1811); Legendre's *Essai sur la Théorie des Nombres* (3d ed., Paris, 1830); and Gauss's *Disquisitiones Arithmeticæ* (Brunswick, 1801; Fr. translation, 1807); and for the latest discoveries, the transactions of the various learned societies may be consulted.

NUMBERS, BOOK OF (LXX. *Arithmoi;* Heb. *Bamidbar*), the fourth book of the Pentateuch, consists of 36 chapters, embracing the history of the march of the Israelites through the desert, together with the special laws given during this period as complementary to the Sinaitic legislation. Beginning with the census of the people (whence the name of the book), and the assigning of the special places to each tribe with reference to the sanctuary, the whole people is classified, and the tribe of Levi specially singled out. Ordinances on the purity to be maintained in the camp, the functions of the priests, and a description of the passover, follow. The second portion of the book describes the journey from Sinai to the borders of Canaan, the miraculous sustenance of the people, their dissatisfaction and consequent rejection, together with various special laws respecting sacrifices, etc., and the episode of Korah. The third part embraces the first ten months of the fortieth year of the wandering—an epoch hurried over with remarkable swiftness by the historian. In quick succession, the renewed strife of the people with their leaders, the message to the king of Moab, the death of Aaron, the defeat of the king of Arad, the punishment of the people by serpents, the march from Hor to Pisga, and the victorious battle against the kings of Sihon and Og, are recounted, and the extraordinary episode of Balaam follows. The further wiles employed by the alarmed Moabites and Midianites to avert the threatening invasion, and their result, together with the second census, are narrated. Moses is warned of his death, and the vital question of his succession is settled. Further laws and ordinances respecting sacrifices and vows, the conquest of the Midianites, and the partition of the country east of the Jordan among certain tribes, a recapitulation of the encampments in the desert, a detailed specification of the manner in which the promised land should be divided after its conquest, and the final ordinance of the marriages of heiresses among their own tribe only, so as to preserve the integrity of landed property, make up the remainder of the book.

The book of Numbers is, like the rest of the Pentateuch, supposed by the greater part of modern critics to consist of several documents written by *Elohists* and *Jehovists* respectively. See GENESIS, PENTATEUCH.

NU'MERALS, the general name given to figures or symbols by means of which num-

bers are expressed (for Roman and Greek numerals, see NOTATION); the distinctive name of *Arabic numerals* being given to the nine figures or digits and the zero that are now in almost universal use among civilized nations for this purpose. Both the origin of these figures and the period at which they became known in Europe have been made subjects of laborious investigation; and it seems to be now proved beyond a doubt that they are of Indian, not Arabic, origin, and were invented by the Brahmans some time B.C. But the more important inquiry as to the time of their introduction into Europe has hitherto baffled all research. The simple and convenient theory that they were introduced into Spain by the conquering Arabs, and from that country, then a great seat of learning, a knowledge of them was disseminated throughout Europe, is contradicted by the fact that the eastern Arabs themselves had no knowledge of them previous to the time of the caliph Al-Mamun (813–33), while a knowledge of them existed in Europe from a considerably earlier date. The most probable theory is that they were brought from India, probably by the Neo-Pythagoreans, and introduced into Italy, whence they became known to a few of the learned men of eastern Europe. We have, however, every reason to suppose that the figures then known were totally different in form from those now used. These latter, called *gobar* by the Arabs, may have been brought to Bagdad during the reign of Al-Mansor (760), or his immediate successors, and certainly not later than the time of Al-Mamun. During the latter reign we know the present system of arithmetic was introduced into Persia from India, and most probably a knowledge of the gobar figures at the same time. Thence the system of arithmetic was brought to north-western Africa and Spain, and doubtless the figures along with it, about the end of the 10th or beginning of the 11th c., and from Spain a knowledge of both was speedily communicated to the rest of Europe, the gobar figures superseding those forms of eastern figures which had previously been employed. The knowledge of the figures, however, spread, as was natural, much more rapidly than the notation and arithmetic of which they were the foundation, and we consequently find in writings and inscriptions of the middle ages the gobar figures partly substituted for, and mixed up with, the Roman numerals; as, for instance, XXX2, for 32; X4, for 14, etc.; and occasionally such expressions as 302, 303, for 32 and 33. The earliest work on modern arithmetic was published in Germany in 1390; it explained the decimal notation and exemplified the elementary rules. The Arabic numerals were not generally introduced into England till the commencement of the 17th c., and it was long after that time before the decimal arithmetic became general. The only valuable essays on the introduction of our present numerals are the works of Woepeke, in the *Encyclopædia Metropolitana*, London, 1845, vol. i., p. 412; in the *Journal Asiatique*, 6th series, vol. i., 1863, pp. 27, 234, 442; and his monograph, *Sur l'Introduction de l'Arithmetique Indien en Occident*, Rome, 1859. His knowledge of Sanskrit, Arabic, and the higher mathematics, may be seen in his reconstruction of that passage where the education of the infant Buddha is exemplified by a kind of competition-wallah, on the basis of the logical figure of the "heap." But we are only just beginning to get reliable dates in Indian archæology, and the edition of Prinsep by Thomas, 1863, the archæological part of the surveys of India, the labors of German scholars in the line of Shemitic influence on early Indian alphabets, all point to conclusions at variance with those of the scholars of the last generation. There are three sets of figures in use among what may be called the mathematical nations, the Sanskrit (this name is used because it does not identify them with any particular alphabet), the Neskhi (as used with the present Arabic alphabet), and the European. None are now as they were in the year 1000 A.D., and none is an immediate borrowing from another. All seem to have been once used without notational place, that is, without the zero, Arab-Greek τζιφρα, Sansk. suneja, both meaning *void*. The earliest Sanskrit figures appear to be of A.D. 674. Bactrian numerals are used till B.C. 116, they are Shemitic, and without notation. The Pali numerals which accompany the series of inscriptions from the 3d c. B.C. to the 5th c. A.D., are partly tallies, partly alphabetic, partly Shemitic, and are also without notation. The Sanskrit figures must be traced back through a Devanagari 10th c. type, through a still older Kashmir shape, to identifiable initials of their Pali (?) names in characters which are not quite identical with either Pali, Allahabad, or Sindh-multani. The resemblance of 1, 2, 3 to our own figures vanishes as we go back, and the only shadow of likeness is an accidental form of the old 7. Evidently, there remains at that point not the slightest resemblance to any modern Devanagari letters, nor are the letters those usually proposed, as the six is spelled with chh, and seven with t. The other two types are, as to a few of their figures, bound together by a common origin, though dissimilar in shape and derivation. It may be well to remind the reader that Alexandria, with the party-colored nationalities who traded there, serves as a great receptacle, not only of all the mysticism but of all the knowledge of the antique east. What a jumble of perverted intelligence remained long after any practical instruction had vanished may be easily seen by studying any of the patristic compilations, or any of the early Arabic encyclopædists. The Arabs of n. Egypt and Barbary, Mughrabin, had always certain heretical traditions, a different arrangement of the supplementary letters of the alphabet, and certain differences in the figures, which distinguished them from their fellows of the east. Their civilization seems earlier and more practical. The oldest figures known (except Chinese current marks) are the Egyptian, and they go

I. II. III. IIII., which in Demotic are changed to one long stroke, with the others reduced each to a short scrabble on its upper left side. The Hieratic changes the tallies to a series of vertical scrabbles, and from these come the Demotic signs for months, 1, 2, 3, almost identical with our figures. These furnish the radical distinction between Arabic and Gobar figures. The Arabic, at least the Neskhi, takes the first four Demotic figures, and, necessarily reversing them in its writing from right to left, adds to them others, of which only 9 bears a chance resemblance to an European figure. The Gobar takes the three Demotic month figures, adds the Demotic common 4, and the rest are identical with the old Mughrab, with the apices of Boethius, and with our modern figures. Variant types are old Arabic 4 like a Greek sigma, Σ, and 5 like our 8 with a tail; the Gobar and the Boethian signs have another 2, like a Saxon t; the 14th c. European 4 is like a Greek lambda, Λ. The apices, occurring in an old manuscript of Boethius, but unfortunately not to be fixed in date, have every appearance of being Gnostic. The signs are strangely deformed, and their names, affixed, are from 4 to 9, Syrian, but 1 and 2 are Indo-German, and 3 unreadable. As the Gobar seem older than the Neskhi, and as their first four figures are undoubtedly Egyptian, it may be that the rest, our figures of to-day, are also debased Demotic. They would be either alphabetical—but of the sequence of the Demotic alphabet we are not entirely certain—or initial—but, if so, of Coptic numbers, or of Arabic numbers spelled in Coptic? It seems impossible to tell, and no guessing, or discovery of chance relation in appearance, is of the slightest value. A series of deductions would attribute the other Neskhi figures to either a Syriac alphabet becoming Kufic, or perhaps to some arrangement of Perso-Bactrian signs with which we are not yet acquainted. The manuscript of Washiyi will show with how many signs an inquisitive Arab of his time might be familiar, while without real knowledge of a single alphabet, even, beside his own. See a dissertation *Sur les Chiffres Indiens*, by M. Woepke, in the Asiatic journal; also, Taylor's *The Alphabet* (1883). See NOTATION.

NUMERATION, the reading off of numbers that are expressed by figures. As shown in notation (q.v.), the first figure on the right hand expresses units; the next, tens; the third, hundreds; and following the same nomenclature with the next three figures, we have the fourth expressing units of thousands; the fifth, tens of thousands; the sixth, hundreds of thousands. The seventh figure, in like manner, expresses units of millions; the eighth, tens of millions; and the ninth, hundreds of millions. When this method is consistently followed out, as is the case with French and other continental arithmeticians, the fourth period, or group of three figures, is denominated billions, the first figure of it (the tenth from the extreme right) being units of billions; the next, tens of billions; etc. Read in this way, the figures 56,084,763,204,504 express fifty-six trillions, eighty-four billions, seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and-four units. In Britain there is a slight variation in the mode, the only effect of which is to render it a little more complicated; thus, after units of millions, come tens and hundreds of millions, but then instead of billions we have, according to the current usage, thousands of millions; after this, tens of thousands of millions and hundreds of thousands of millions, and then billions, which occupy the 13th figure from the right, and are reckoned in the same way as millions, so that the next unit or *trillions* does not come in till the 19th figure. The above number, according to the British mode, would be read fifty-six billions, eighty-four-thousand-seven-hundred-and-sixty-three millions, two-hundred-and-four thousands, five-hundred-and four units. The first method is perfectly symmetrical, keeping throughout to divisions of three figures; the second only keeps to this division up to hundreds of millions, when it changes it for a division into parcels of six figures, which are named from units up to hundreds of thousands of units. The latter mode is, however, gradually falling into disuse.

NUMIDA. See GUINEA FOWL.

NUMID'IA (Gr. *Nomadia*, the land of Nomads), the name given by the Romans to a part of the n. coast of Africa, corresponding to some extent with the modern Algeria. It was bounded on the w. by the river Mulucha (now *Moluya*), which separated it from Mauritania; on the e. by the river Tusca (now *Wadi-el-Berber*), which separated it from the territory of Carthage, the *Africa Propria* of the Romans; on the s. it reached to the chains of mt. Atlas and the Lacus Tritonis, which separated it from the land of the Gaetulians and interior Libya. The chief rivers were the Rubricatus and the Ampsaga. The inhabitants of Numidia, as of Mauritania, belonged to the race from which the modern Berber are descended. They were a warlike race, and excelled as horsemen; but, like most barbarians, were faithless and unscrupulous. Of their tribes, the *Massyli* in the e., and the *Massæsyli* in the w., were the most powerful. In the grand struggle between the Carthaginians and the Romans, they at first fought on the side of the former, but subsequently the king of the eastern Numidians, Massinissa, joined the Romans, and rendered them effectual service in the war with Hannibal. Favored by the conquerors he united all Numidia under his sway. Of his successors in this kingdom Jugurtha and Juba are the most famous. After the victory of Cæsar over Juba I., in the African war, Numidia became a Roman province (46 B.C.); but Augustus afterwards gave the western part—from the river Ampsaga, now Wadi-el-Kibbir—with Mauritania, to Juba II., and the name Numidia became limited to the eastern part; and when Mauritania became a Roman province, the western part was called Mauritania Cæsariensis.

Among the Roman *coloniæ* were Hippo Regius, near the mouth of the river Rubricatus; Cirta (the residence of the Numidian kings), afterwards called Constantina, a name still preserved in Constantine; Sicca, and Rusicada. For the modern history of Numidia see ALGERIA.

NUMISMATICS (Lat. *nummus* and *numisma*, money; Gr. *nomisma*, from *nomos*, law, a medium of exchange established by law), the science which treats of coins and medals. A coin is a piece of metal of a fixed weight stamped by authority of government, and employed as a circulating medium. A medal is a piece struck to commemorate an event. The study of numismatics has an important bearing on history. Coins have been the means of ascertaining the names of forgotten countries and cities, their position, their chronology, the succession of their kings, their usages—civil, military, and religious—and the style of their art. On their respective coins we can look on undoubtedly accurate representations of Mithridates, Julius Cæsar, Augustus, Nero, Caracalla, and read their character and features.

The metals which have generally been used for coinage are gold, silver, and copper. In each class is comprised the alloy occasionally substituted for it, as electrum (an alloy of gold and silver) for gold, billon for silver, bronze for copper, and potin (an alloy softer than billon) for silver and copper. The side of a coin which bears the most important device or inscription is called the *obverse*, the other side the *reverse*. The words or letters on a coin are called its inscription; an inscription surrounding the border is called the *legend*. When the lower part of the reverse is distinctly separated from the main device, it is called the *exergue* (Gr. *ex ergou*, without the work), and often bears a secondary inscription, with the date or place of mintage. The field is the space on the surface of the coin unoccupied by the principal device or inscription.

The use of coined money cannot be traced further back than the 9th c. B.C. Money, however, as a medium of exchange, existed much earlier, and when of metal it passed by weight, no piece being adjusted to any precise weight, and all money being weighed when exchanged. Early metallic money was in the form of bars, spikes, and rings; the ring money could be opened, closed, and linked in a chain for convenience of carriage.

The Lydians are supposed to have been the first people who used coined money, about 700 or 800 years before the Christian era; and their example was soon after followed by the different states of Greece, the earliest Greek coins being those of Ægina. In its early stages the process of coining consisted in placing a lump of metal of a fixed weight, and approaching to a globular form, over a die, on which was engraved the religious or national symbol to be impressed. A wedge or punch placed at the back of the metal was held steadily with one hand, and struck by a hammer with the other, till the metal was sufficiently fixed in the die to receive a good impression. The impression was a guarantee of the weight of the piece. From the nature of the process, the earliest coins had a lumpish appearance, and on their reverse was a rough, irregular, hollow square, corresponding to a similar square on the punch, devised for the purpose of keeping the coin steady when struck by the coining hammer. The original coins of Asia Minor were of gold, those of Greece of silver. The earliest coins bear emblems of a sacred character, often embodying some legend regarding the foundation of the state, as the *phoca* or seal on the coins of the Phocians, which alludes to the shoal of seals said to have followed the fleet during the emigration of the people. A very early double stater of Miletus, in Ionia, of which the type is the lion's head, was derived from Persia and Assyria, and associated with the worship of Cybele, a symbol which is continued in the later coinage of Miletus. Types of this kind were succeeded by portraits of protecting deities. The earliest coins of Athens have the owl, as type of the goddess Athene; at a later period, the head of the goddess herself takes its place, the owl afterwards re-appearing on the reverse. The punch-mark, at first a rudely-roughed square, soon assumed the more sightly form of deep, wedge-like indents, which in later specimens become more regular, till they form themselves into tolerably symmetrical square. In the next stage, the indents become shallower, and consist of four squares forming one large one. The surrounding of the punch-mark with a band bearing a name, and the introduction of a head in the center, gradually led to the perfect reverse. There is a remarkable series of so-called "encased" coins struck in Magna Græcia, of which the reverse is an exact repetition in concave of the relief of the obverse. These coins are thin, flat, sharp in relief, and beautifully executed.

The leading coin of Greece and the Greek colonies was the stater, so called because founded on a standard of weight generally received before the introduction of coined money. There were double staters, and half, third, and quarter staters, and the stater was equivalent in value to six of the silver pieces called drachmæ. The obolus was one-sixth of the drachma, at first struck in silver, in later times in copper.

The inscriptions on the earliest Greek coins consist of a single letter, the initial of the city where they were struck. The remaining letters, or a portion of them, were afterwards added, the name, when in full, being in the genitive case. Monograms sometimes occur in addition to the name, or part name, of the place. The first coin bearing the name of a king is the tetradrachm (or piece of four drachmæ) of Alexander I., of Macedon.

Among the early coins of Asia, one of the most celebrated is the stater Daricus or Daric, named from Darius Hystaspes. It had for symbol an archer kneeling on one

knee, and seems to have been coined for the Greek colonies of Asia by their Persian conquerors. In the reign of Philip of Macedon the coinage of Greece had attained its full development, having a perfect reverse. One of the earliest specimens of the complete coin is a beautiful medal struck at Syracuse, with the head of Proserpine accompanied by dolphins, and for reverse a victor in the Olympic games in a chariot receiving a wreath from victory—a type which is also found on the reverse of the staters of Philip of Macedon, known as Philips, and largely imitated by other states. Coins of Alexander the great are abundant, many having been struck after his conquests in the Greek towns of Asia. A rose distinguishes those struck at Rhodes, a bee those struck at Ephesus, etc.; these are all types generally accompanying the figure of Zeus on the reverse; on the obverse is the head of Hercules, which has sometimes been supposed to be that of Alexander himself. It would rather seem, however, that the conqueror's immediate successors were the first who placed their portrait on the coins, and that under a shallow pretence of deification, Lysimachus as a descendant of Bacchus, and Seleucus of Apollo, clothed in the attributes of these deities. Two most beautiful and important series of Greek coins are those of the Seleucidæ, in Asia, of silver, and of the Lagidæ or Ptolemies, in Egypt, of gold.

In Palestine there is an interesting series of coins founded on the religious history of the Jewish nation, and assigned to Simon Maccabæus. They are shekels and half-shekels, equivalent to two attic drachmæ and one drachma respectively. The shekels bear on the obverse the pot of manna, with the inscription "Schekel Israel" (the Shekel of Israel); on the reverse is Aaron's rod with three flowers, and the legend "Ierouschalim kedoschah" (Jerusalem the holy). The inscriptions are in the Samaritan character. The successors of Simon assumed the title of king, and placed their portraits on the coins, with inscriptions in Greek as well as in Hebrew.

Roman coins belong to three different series, known as the republican, the family, and the imperial.

The so-called republican, the earliest coinage, began at an early period of Roman history, and subsisted till about 80 B.C. Its standard metal was copper, or rather *æs* or bronze, an alloy of copper. The standard unit was the pound weight divided into twelve ounces. The *æs*, *as*, or pound of bronze, is said to have received a state impress as early as the reign of Servius Tullius, 578 B.C. This gigantic piece was oblong like a brick, and stamped with the representation of an ox or sheep, whence the word *pecunia*, from *pecus*, cattle. The full pound of the as was gradually reduced, always retaining the twelve (nominally) uncial subdivisions, till its actual weight came to be no more than a quarter of an ounce. About the time when the as had diminished to nine ounces, the square form was exchanged for the circular. This large copper coin, called the "as grave," was not struck with the punch, but cast, and exhibited on the obverse the Janus bifrons; and on the reverse, the prow of a ship, with the numeral I. Of the fractions of the as, the sextans, or the sixth part, generally bears the head of Mercury, and the uncia, or ounce piece, that of Minerva; these pieces being further distinguished by dots or knobs, one for each ounce. There were circular pieces as high as the decussis, or piece of twelve asses, presenting a head of Roma (or Minerva), but none are known to have been coined till the weight of the as had diminished to four ounces. The Roman uncial coinage extended to the other states of Italy, where a variety of types were introduced, including mythological heads and animals. In the reign of Augustus, the as was virtually superseded by the sestertius, called by numismatists the first bronze, about the size of our penny, which was at first of the value of two and a half, afterwards four asses. The sestertius derived its value from the silver denarius, of which it was the fourth. The half of the sestertius was the dupondius (known as the second bronze), and the half of the dupondius was called the assarium, an old name of the as. The assarium is known to numismatists as the third bronze.

Silver was first coined at Rome about 281 B.C., the standard being founded on the Greek drachma, then equivalent in value to ten asses; the new coin was therefore called a denarius, or piece of ten asses. The earliest silver coined at Rome has on the obverse the head of Roma (differing from Minerva by having wings attached to the helmet); on the reverse is a quadriga or biga, or the Dioscuri. Among various other types which occur in the silver of the Italian towns subject to Rome are the horse's head, and galloping horse, both very beautiful. During the social war, the revolted states coined money independently of Rome, and used various devices to distinguish it as Italian and not Roman money.

The earliest gold coins seem to have been issued about 90 B.C., and consisted of the scrupulum, equivalent to 20 sestertii, and the double and treble scrupulum. These pieces bear the head of mars on the obverse, and on the reverse an eagle standing on a thunderbolt, with the inscription "Roma" on the exergue. The large early republican coins were cast, not struck.

The family coins begin about 170 B.C., and about 80 B.C. they entirely supersede the coins first described. Those families who successively held offices connected with the public mint acquired the right first to inscribe their names on the money, afterwards to introduce symbols of events in their own family history. These types gradually superseded the natural ones; the portrait of an ancestor followed; and then the portrait of a living citizen, Julius Cæsar.

Under the empire, the copper sestertius, which had displaced the as, continued the nonetary standard. A magnificent series exists of the first bronzes of the emperors from Augustus to Gallienus. While it was the privilege of the emperors to coin gold and silver, copper could only be coined *ex senatus consulto*, which from the time of Augustus was expressed on the coins by the letters S.C., or EX S.C. The obverse of the imperial coins bears the portraits of the successive emperors, sometimes of the empress or other members of the imperial family; and the reverse represents some event, military or social, of the emperor's reign, sometimes allegorized. The emperor's name and title are inscribed on the obverse, and sometimes partly continued on the reverse; the inscription on the reverse generally relates to the subject delineated; and towards the close of the 3d. c., the exergue of the reverse is occupied by the name of the town where the coin is struck. The coins of Augustus and those of Livia, Antonia, and Agrippina the Elder have much artistic merit. The workmanship of Nero's sestertii is very beautiful. The coins of Vespasian and Titus commemorate the conquest of Judea. The colosseum appears on a sestertius of Vespasian. The coins of Trajan are noted for their architectural types. Hadrian's coins commemorate his journeys. The coins and medals of Antonine, Marcus Aurelius, and the two Faustinæ are well executed; as are also those of Commodus, of whom a remarkable medallion relates to the conquest of Britain. There is a rapid falling off in design after the time of Commodus, and base silver comes extensively into use in the reign of Caracalla. Gallienus introduced the practice of coining money of copper washed with silver.

The colonial and provincial money of this period was very inferior to that coined in Rome. In the coins of the provinces which had been formed out of the Greek empire, the obverse bears the emperor's head and the reverse generally the chief temple of the gods in the city of coinage; the inscriptions are in Greek. In the imperial coins of Alexandria appear such characteristic devices as the heads of Jupiter Ammon, Isis, and Canopus, the sphinx, the serpent, the lotus, and the wheat-ear. Colonial coins were at first distinguished by a team of oxen, afterwards by banners, the number of which indicated the number of legions from which the colony had been drawn.

After the time of Gallienus, the colonial money and the Greek imperial money, except that of Alexandria, ceased, and much of the Roman coinage was executed in the provinces, the name of the town of issue appearing on the exergue. Diocletian introduced a new piece of money, called the follis, which became the chief coin of the lower empire. The first bronze has disappeared after Gallienus, and the second disappears after Diocletian, the third bronze diminishing to $\frac{1}{20}$ of an ounce. With the establishment of Christianity under Constantine, a few Christian types are introduced. The third bronze of that emperor has the Labarum (q.v.), with the monogram IHS. Large medallions, called *contorniati*, encircled with a deep groove, belong to this period, and seem to have been prizes for distribution at the public games. Pagan types recur on the coins of Julian; and after his time the third bronze disappears.

The money of the Byzantine empire forms a link between the subject of ancient and that of modern coins. The portrait of the emperor on the obverse is, after the 10th c., supported by some protecting saint. The reverse has at first such types as Victory with a cross, afterwards a representation of the Saviour or the Virgin; in some instances, the Virgin supporting the walls of Constantinople. Latin is gradually superseded by Greek in the inscriptions, and wholly disappears by the time of Alexius I. The chief gold piece was the solidus or nomisma, which was long famed in commerce for its purity, and circulated largely in the west as well as the east of Europe.

Of the coins of the Middle Ages, the most important is the silver denier or penny, derived from the Latin denarius. Its half was the obole, first of silver, afterwards of billon. Coins of this description were issued in the German empire, France, England, and the Scandinavian states, and in many cases by ecclesiastical princes and feudal lords as well as sovereigns. The obverse of the regal coin of the early middle ages is generally the bust of the sovereign, and the reverse a Greek cross, accompanied by the royal name or title, and the place of mintage or the moneyer (see MINT). The arms of the country were introduced in the 12th c., in conjunction with the cross, and afterwards superseded it. In the 13th and 14th centuries, coins began to be issued by free imperial cities or corporations of towns; and there prevailed extensively throughout Germany and other parts of Europe a thin piece called a bracteate, in relief on one side, and hollow on the other, often not bearing a single letter, and rarely a full inscription. Down to the 14th c., the relief of the mediæval coins is very inconsiderable, the pieces thin, and the art poor.

Britain received the Roman money on its subjugation. Constantine seems to have had a mint in London, and the Roman currency continued to circulate for a time after the departure of the conquerors. The first independent coinage, however, shows hardly a trace of the influence of Rome; it consists of two small coins, called the skeatta and styca, the former of silver, the latter of copper. Both seem to belong solely to the Saxon kingdom of Northumbria; they are without inscriptions; a bird, a rude profile, and several unintelligible symbols appear on them, and their art is of the most debased kind. In the other kingdoms of the heptarchy silver pennies were coined, first intended to be $\frac{1}{240}$ of a pound weight; on the disappearance of skeattæ and stycæ, they form, with the occasional addition of half-pennies, the sole currency of England down to the

reign of Edward III. The pennies of the heptarchy bear the name of the king or of the moneyer; a cross sometimes appears after the introduction of Christianity, and in later times a rude head of the king or queen. The pennies of the Saxon and Danish sole monarchs of England have a somewhat similar character. Alfred's earlier coins have a grotesque-looking portrait, and on the reverse a monogram of London; in his later coins the head disappears, and a cross and circle take its place. A cross variously ornamented with three pellets in each angle continues to be the usual reverse of the Saxon, Norman, and Plantagenet coins. The coins of Edward III. are a great artistic advance on those that preceded them. The silver coinage of that king consisted not only of pennies, half-pennies, and farthings, but also of groats and half-groats. The obverse of the groat bears a conventional crowned head within a flowered circle of nine arches, the words "Dei Gratia" and the title "Rex Franciæ" appearing for the first time in the legend. The reverse has the motto "Posui Deum adjutorem meum," which continued on the coinage till the time of Edward V. But the great numismatic feature of Edward III.'s reign is the issue of gold nobles, worth six shillings and eightpence. The obverse of those beautiful coins represent the king in a ship, a sword in his right hand, in his left a shield with the quartered arms of France and England. The reverse is a rich cross flory within a circle of eight arches, and a lion under a crown in each angle of the cross, the legend being "Ihesus autem transiens per medium illorum ibat." Half and quarter nobles were also coined. The noble having increased in value, a coin called an angel, of the former value of a noble, was issued by Henry VI. and Edward IV. The obverse represented St. Michael transfixing a dragon, the reverse a ship, with a cross for the mast.

As we approach the period of the Reformation, the coinage gradually becomes more ornate. The nobles coined by Edward IV., after the value of that coin had been fixed at 10 shillings, were called rials (a name derived from a French coin), and the double rial or sovereign was first coined by Henry VII. The obverse has the king on his throne with scepter and orb, and on the reverse, in the center of a heraldic full-blown rose, is a shield with the arms of France and England. The testoon, or shilling, valued at twelve pence, also first appeared in this reign, with the royal profile crowned on the obverse, and the royal arms quartered by the cross on the reverse. A great debasement of the coinage took place in the reign of Henry VIII. The reverse of the farthings of that monarch bears a portcullis, that of the shillings a rose surmounted by a crown, and of the sovereigns, the royal arms supported by a lion and dragon. A noble was coined with St. George and the dragon on the obverse, and on the reverse a ship with three crosses for masts, and a rose on the center mast. On the coins of Henry VIII. the title "Hiberniæ Rex" first appeared, former kings having only styled themselves "Dominus Hiberniæ," Ireland not being accounted a kingdom. Under Edward VI. the silver coins called crowns and half-crowns appear, having for device the king crowned on horseback in the armor of the period. They derived their name from coins circulating on the continent, which had for device a crown. The royal arms in an oval shield without the cross are introduced as the reverse of the shilling. From this period there is a very obvious decline in the artistic feeling of the English coins. On some of the shillings of Mary, her bust and that of Philip face each other, the insignia of Spain and England impaled occupying the reverse; afterwards the king's head occupies one side of the coin, and the queen's the other. Half sovereigns, or rials, and angels were coined of the old type of Edward IV. The great event in the coinage of Elizabeth's reign was the temporary introduction of the mill and screw, instead of the hammer and punch, producing coins of a more regular and workmanlike appearance. The profile bust of James I., crowned and in armor, appears on his shillings and smaller pieces; on his crowns and half-crowns he is represented on horseback; on the reverse are the quartered arms of the three kingdoms (the harp of Ireland appearing for the first time on the coinage), with the motto "Que Deus conjunxit nemo separet." Copper farthings, with crown, scepter, and sword on the obverse, and a harp on the reverse, were coined for England as well as Ireland, the first copper money issued in England since the styca. Private tokens of copper, issued by tradesmen and others, had, however, been in circulation before, and came again into use to a large extent at a later period. Charles I. coined ten and twenty shilling pieces of silver, the former a very noble coin, with a representation of the king on horseback. A crown, struck at Oxford, bears on the obverse the king on horseback, with a representation of the town, and on the reverse the heads of the Oxford declaration. The guinea, first coined in this reign, was so called from the metal being procured from the coast of Guinea; its original value was but twenty shillings.

The coins of the Commonwealth exhibit a shield with the cross of St. George surrounded by a palm and olive branch, and have for legend "the Commonwealth of England." On the reverse are two shields accollée, with the cross of St. George and the harp of Ireland, and the motto "God with us." Coins far superior in character were executed by Cromwell, with his laureated bust and title as protector, and on the reverse a crowned shield quartering the cross of St. George, of St. Andrew and the harp, with the protector's paternal arms in surtout; but few of these were issued. In the early coins of Charles II., that monarch is crowned, and in the dress of the time; in his later money he is in conventionalized Roman drapery, with the head turned to the left, and from that time it has been the practice to turn every king's head the reverse way from

that of his predecessor. The four shields on the reverse are disposed in the form of a cross (an arrangement which continued till the reign of George II.), and on the edge of the crowns and half-crowns is the legend "Decus et tutamen." Charles II. issued a copper coinage of half-pennies and farthings; on the former appears the device of Britannia, taken from the Roman coins relating to Britain. Pennies were not coined till George III.'s reign. The coins of William and Mary have the profiles of the king and queen one over the other, and the shields of the three kingdoms in the form of a cross on the reverse, with Nassau in the center. The coinage of William alone, after the death of Mary, is of somewhat improved design, sir Isaac Newton being then master of the mint. Little change in the general design of the coin occurs in the reigns of Anne and George I. On the accession of the house of Hanover, the Hanoverian arms are placed in the fourth shield, and George IV. substituted a quartered shield with Nassau en surtout for the four shields on the reverse of his gold coins. During the greater part of George III.'s reign the coinage was utterly neglected, and the silver pieces in circulation were worn perfectly smooth. When coins were at last issued, the Roman conventionalism of the previous reigns gave way to a now fashionable Greek conventionalism. The quartered shield supplanted the four shields, and on the reverse of the crown appeared a Grecianized St. George and the dragon. George IV.'s bust is taken from Chantrey's statue; the rose, thistle, and shamrock, united under a crown, appear on the reverse of his shilling. Silver groats were issued in the reign of William IV. The ensigns of Hanover disappeared at the beginning of the present reign; the reverse of the shilling is even poorer than that of George IV., the words "One shilling" occupy the field, surrounded by an oak branch and a laurel branch; silver pieces of three pence have been introduced. But the principal monetary event is the issue of the silver florin, in value equivalent to two shillings, looked on as a step towards the institution of a decimal coinage. It represents the head of the queen crowned, with the legend in old English character, and for reverse the four shields are once more placed in the form of a cross.

No native Scottish coinage existed earlier than the 11th century. Coins are extant of Somerled, prince of the Isles of that century, and of Alexander I. of the century following. The silver pennies of William the lion, and Alexander II. and III., are like contemporary English money, but ruder, and bear the names of the moneyers and place of mintage, generally Edinburgh, Perth, or Berwick. The profiles on the coins of John Baliol, Robert Bruce, and David II. are attempts at portraiture. A remarkable gold piece, first coined by Robert II., is the St. Andrew, with the arms of Scotland on the obverse, and St. Andrew on his cross on the reverse. In the four succeeding reigns the weight of the silver coins rapidly decreased, and coins of billon, or base metal, were issued, nominally pennies, but three and a half of which eventually passed for a silver penny. The evil increased, and baser and baser alloy was used. Groats of billon, known as placks and half-placks, were coined by James III. James IV.'s coins have a characteristic portrait, and a good deal of artistic feeling. James III. and IV. issued well executed gold pieces, called unicorns and riders, the type of the one being the unicorn, of the other the king on horseback. A still more beautiful coin was the gold bonnet piece of James V., so called from the cap in the king's portrait. Of Mary there are a great variety of interesting pieces. The portrait is sometimes crowned, sometimes uncrowned; and on the coin issued soon after Francis's death, has a widow's cap and high-frilled dress. The types in James VI.'s reign are also very various. On his accession to the English throne, the relative value of English and Scottish coins was declared to be as 12 to 1. The coins afterwards issued from the Scottish mint differed from the English, chiefly in having Scotland in the first quarter in the royal shield. The last Scottish gold coinage consisted of pistoles and half-pistoles of Darien gold, about the size of a guinea and half-guinea, struck by William III.; the pistole distinguished by a rising sun under the bust of the king.

The coinage of Ireland is scanty and uninteresting compared with that of Scotland. The coins of English monarchs struck in Dublin resemble much those current in England. Henry VIII. first placed a harp on the Irish coins.

In France, the earliest coins are those of the Merovingian kings, rude imitations of the late Roman and early Byzantine money, and mostly of gold. Under the Carlovingian dynasty, deniers and oboles are the prevailing coinage, remarkably rude in fabric without portrait, and bearing the name of the king and place of mintage. Some coins of Charlemagne, struck at Rome, are of better workmanship. They contain one letter of "Roma" at each extremity of the cross, with the legend "Carolus IP." The coinage improved under the Capetian kings; the fleur-de-lis appears in addition to the cross. In the 13th c. gold pieces were issued, and in the time of Philip VI. both the design and the execution of the coins are beautiful. The coins of Louis XII. are the first that bear the royal portrait. The modern coinage may be said to begin under Henry II., whose portrait is good. The seignorial coins of France in the middle ages are of considerable importance, and the medals of Louis XIV. and Napoleon I. are much more interesting than the modern coins.

The mediæval coinage of Italy is of great interest. The money of the Lombard kings of Italy and dukes of Benevento, is little inferior to that of the Greek emperors. There is a beautiful series of gold and silver pieces belonging to Venice, bearing the names of

the doges, and having generally for type the doge receiving the gonfalon, or standard of St. Mark. The gold florins of Florence, with the lily for device, are no less celebrated, and were imitated by other states. Florence had also a remarkable series of medals, with admirable portraits of persons of note. The coins of the popes, from Hadrian I. down to the 14th c., bear the name of the pope and emperor of the west; those of later date are beautiful in execution, and have seated portraits of the pontiffs, with the cross-keys and miter for reverse. A remarkable series of medals commemorates the chief events of each reign, one of which, struck after the massacre of St. Bartholomew, has for type an angel slaying the Huguenots, and the inscription "Ugonottorum strages." The coins of the Norman princes of Naples struck in Sicily, have the legends partly or wholly in Arabic. Malta has a series, with the arms and effigies of the grand-masters.

The mediæval money of Germany comprises coins of the emperors, the electors, the smaller princes, the religious houses, and the towns. The imperial series is extensive and very interesting, though, till near the close of the middle ages, it is rather backward in its art. About the reformation period, however, there are vigorous portraits both on its current coins and on the medals, and those double-dollars which are virtually medals. The coins of the dukes of Saxony, with their portraits are equally remarkable. The coins of the archbishops of Cologne, Mainz, and Treves form a very interesting series, the first more especially, with a representation of the cathedral.

The coins of the Low Countries resemble those of France and Germany. The Dutch medals are of interest, more especially those struck in commemoration of events in the war with Spain.

The coins of the Swiss cantons and towns during the early period of Swiss independence bore the heraldic shield of each, drawn with vigorous grotesqueness. There are also pieces struck by ecclesiastical lords, and by different families who had a right of coinage.

The coins of Spain begin with those of the Gothic princes, which are chiefly of gold, and on the model of the trientes and semisses of the lower empire. Some of the early pieces have a rude head of the monarch on one side, and of the emperor on the other. Afterwards, the obverse bears the profile of the monarch, and the reverse a cross of some description, with the name of the place of mintage, and the word "Pius" for legend. In later times, there are two interesting series of coins belonging to the kingdom of Aragon and to the kingdom of Castile and Leon.

The coinages of Norway and Sweden at first resembled the British, and afterwards the German type. From the 10th to the 14th c., bracteates were issued by the ecclesiastics. The coinage of Hungary begins in the 11th c., and has the portraits of the monarchs. The Russian coinage is Byzantine in character, and rude in its art. The earliest pieces are the silver darga of the 14th c., of an oblong shape, with representations of the prince on horseback, and various legendary subjects. Peter the Great introduced the usual European type. There is an important series of bronze coins of the crusaders, beginning with Tancred, and coming down to the end of the 15th c., including money of the kings of Cyprus and Jerusalem, and other princes established in the east.

In India, the succession of the kings of Bactria, the remotest of the dynasties founded on the ruins of Alexander's empire, has only become known through their recently discovered coins. There are early rude Hindu coins of the Gupta line, with figures of the Brahmanic divinities of a type still in use.

Of the coins of the Mohammedan princes, the oldest gold pieces are the bilingual coins of cities of Syria and Palestine, of the middle of the 7th c. (A.H. 78, barbarous imitations of the latest Byzantine money of Alexandria. Most of the Mohammedan coins are covered exclusively by inscriptions expressive of the elementary principles of the Mohammedan faith. For some centuries, no sovereign except the caliph was allowed to inscribe his name on the coin. Large gold coins of great purity were issued by the Moslem kings of Granada in Spain.

The high prices given for ancient coins have led to numerous forgeries from the 15th c. downward. Against such imitations, collectors require to be on their guard.

The history of American numismatics is, of course, a comparatively short one, but not devoid of interest. The first coinage on American soil is believed to have been that of the Virginia Company in the Bermudas in 1612. The coin then struck was of brass, with the figure of a wild hog on the obverse, accompanied by the legend, "Sommer Island," the early name of the Bermudas (q.v.). The reverse showed a ship firing a cannon. Of the colonies, Massachusetts was the first to coin money. An act of the general court established a mint at Boston in 1652, and the first coins there struck were silver pieces of the respective value of one shilling, sixpence, and threepence. These bore no marks other than the Roman numeral indicating their value. In the same year a new die was made, and a second series, with the inscription "Massachusetts" on the obverse, with the figure of a tree, and on the reverse the words "New England" and the date. In 1662 a twopenny piece was added. This coinage is now known as the "pine-tree" coinage. These dies were used steadily for thirty-five years.

Under William and Mary, coins for use in Massachusetts and the Carolinas were prepared in England, showing on the reverse respectively, "God Preserve New England," and "God Preserve Carolina and the Lords Proprietors," accompanied by the date; and on the obverse the figure of an elephant. Shillings, sixpences, and fourpenny pieces

of silver were also struck in England for the colony of Maryland, showing the bust of Lord Baltimore; and a copper halfpenny. At the time when William Wood, made famous through the attacks upon him by Dean Swift (q.v.), received from George I. the right of coining in Ireland, a similar privilege was accorded him in the American colonies; but the people rejected his money, which was of Bath metal or pinchbeck. All through the colonial period not only English gold and silver circulated freely, but by reason of the American trade with the West Indies, Spanish dollars (*reales*) and minor silver coins.

During the revolutionary period, coins were struck by both Congress and the separate state governments (1778–1787). A mint was authorized at the town of Rupert, Vt., to coin copper cents. Connecticut established a mint at New Haven in the same year (1785); New Jersey authorized two mints, one near Morristown, and the other at Elizabeth (1786); and Massachusetts created a mint at Dedham (1786). All these mints confined themselves to the production of copper coins—chiefly cents and half cents. The New Haven mint coined also a large number of copper cents for the Continental Congress in 1787. These show on one side 13 linked circles, and a small circle in the middle surrounded by the words "United States," and containing the legend, "We Are One." The other side bore the figure of a sun-dial, the word *Fugio*, the date, and the legend, "Mind Your Business."

After the adoption of the present constitution, which forbids to the states the right to coin money, the decimal system of coinage was adopted (1792), of which the history is concisely given in the article UNITED STATES. The first gold coins were the eagle, the half eagle, and the quarter eagle. In 1849 the double eagle and the gold dollar were first coined, and in 1873 the three-dollar gold-piece. The silver dollar of 1792 weighed 416 grs. In 1837 this weight was reduced to 412½ grs. In 1873 a "trade dollar" of 420 grs. of silver was coined, though not a legal tender. The old silver dollar had the seated figure of Liberty on one side and the eagle on the other. In 1884 a new die was adopted, bearing, instead of the seated figure, a head.

The earliest copper coins of the United States were a cent and a half cent, the former containing 264 grs., and the latter 132 grs. In 1857 these clumsy coins were discontinued, and a cent containing 88 per cent. of copper and 12 per cent. of nickel, and weighing 72 grains, was substituted. In 1864 a bronze cent was substituted, containing 95 per cent. of copper and 5 per cent. of tin and zinc, and weighing 48 grs. In this year the two-cent piece was first coined, weighing 96 grs., and in 1865 a three-cent piece of copper and nickel. In 1866 appeared the five-cent piece of copper and nickel. The so-called "eagle cent," bearing the figure of an eagle in flight, was coined from 1856–1858. Large numbers of "tokens" and medals appeared during the civil war (1861–65), most of them being of copper and of no intrinsic interest. They generally bear some patriotic motto, with an appropriate device, such as a soldier and a sailor clasping hands; a flag; a liberty cap, etc. Of a different nature, and more interesting, are the small gold pieces struck by private individuals in California in the days of the early gold discoveries, and intended to supply the lack of coined money. They passed current as twenty-five cent pieces, and are the smallest gold coins ever used in this country. There are two varieties, one round, and one octagonal in shape.

The latest issue from the U. S. Mint is the series of small silver coins of January, 1892. These are half dollars, quarters, and dimes. The half dollars and quarters have on the face a head of Liberty, with the motto "In God We Trust," thirteen stars, and the date. On the back appears the seal of the United States, with the motto, "E Pluribus Unum." The dime now has for the face the same head as the half dollar and quarter dollar, except that in place of the stars there is the inscription, "United States of America." The motto, "In God We Trust," is now omitted from the dime. The reverse of the dime is the same as before.

Among the best works on numismatics are Eckhel, *Doctrina Numorum Veterum* (Vienna, 1792–98); Hennin, *Manuel de Numismatique Ancienne* (Paris, 1830); Grasset, *Handbuch der alten Numismatik* (Leipsic, 1852–53); Leake, *Numismata Hellenica* (London, 1854); Ruding's *Annals of the Coinage of Great Britain* (London, 1840); Patrick's *Records of the Coinage of Scotland* (1877); Leblanc, *Traité Historique des Monnaies de France* (Paris, 1690); Cappe, *Die Münzen der Deutschen Kaiser* (1850); Marsden, *Numismata Orientalia Illustrata* (London, 1823–25); Boutkovski, *Dictionnaire Numismatique* (Leip., 1877); Stevenson, *Dictionary of Roman Coins* (1889); Loubat, *Medallic History of the United States;* McSherry, *National Medals of the United States;* Prime, *Coins, Medals, and Seals.*

NUMITOR. See ROMULUS.

NUM'MULITE LIMESTONE, an important member of the Middle Eocene period, consisting of a limestone composed of nummulites held together by a matrix formed of the comminuted particles of their shells, and of smaller foraminifera. It forms immense masses of the strata which are raised up on the sides of the Alps and Himalayas, and may be traced as a broad band often 1800 m. in breadth, and frequently of enormous thickness, from the Atlantic shores of Europe and Africa, through western Asia, to northern India and China. It is known also to cover vast areas in North America.

NUMMULITES, or NUMMULINA (Gr. money-fossil), a genus of fossil foraminefera, the shells of which form immense masses of rock of Eocene age. See NUMMULITE LIMESTONE. Upwards of 50 species have been described. They are circular bodies of a lenticular shape, varying in magnitude from the merest point to the size of a crown-piece. The shell is composed of a series of small chambers arranged in a concentric manner. The growth of the shell does not take place only around the circumference, but each whorl invests all the preceding whorls, so as to form a new layer over the entire surface of the disk, thus adding to the thickness as well as the breadth, and giving the fossil its lenticular form. A thin intervening space separates each layer from the one which it covers, and this space at the margin swells out to form the chamber. All the internal cavities, however, seem to have been occupied with the living sarcode, and an intimate connection was maintained between them by means of innumerable parallel tubuli, which everywhere pass from one surface to another, and which permitted the passage of the sarcode as freely as do the minute pores or foramina of the living foraminifera. See illus., TERTIARY PERIOD, vol. XIV. fig. 12.

The name is given to them from their resemblance to coins. In Egypt, where the whole of the Mokkadam mountains, from the stone of which the pyramids were built, is formed of them, they are called by the natives "Pharaoh's Pence."

NUN, a member of a religious order of women. The etymology of this name is a subject of some controversy, but there seems every reason to believe that it is from a Coptic or Egyptian root, which signifies "virgin." It is found in use as a Latin word as early as the time of St. Jerome (*Ep. to Eustachius*, p. 22, c. 6). The general characteristics of the religious orders will be found under the head MONACHISM (q.v.), and under those of the several orders. It is only necessary here to specify a few particulars peculiar to the religious orders of females. Of these the most striking perhaps is the strictness in the regularly authorized orders of nuns of the "cloister," or inclosure, which no extern is ever permitted to enter, and beyond which the nuns are never permitted to pass, without express leave of the bishop. The superiors of convents of nuns are called by the names abbess, prioress, and, in general, mother superior. They are, ordinarily speaking, elected by chapters of their own body, with the approval of the bishop, unless the convent be one of the class called exempt houses, which are immediately subject to the authority of the Holy See. The ceremony of the solemn blessing or inauguration of the abbess is reserved to the bishop, or to a priest delegated by the bishop. The authority of the abbess over her nuns is very comprehensive, but a precise line is drawn between her powers and those of the priestly office, from which she is strictly debarred. The name of nun is given in general to the sisters of all religious congregations of females who live in retirement and are bound by rule; but it is primitively and properly applicable only to sisters of the religious orders strictly so called. See MONACHISM.

NUNC DIMITTIS, the name given to the canticle of Simeon (Luke ii., 29–32), which forms part of the compline office of the Roman breviary, and is retained in the evening service of the Anglican church when it follows the second lesson. On the great festivals in Lent, the music of this canticle is especially grand and imposing.

NUNCIO (Ital. *nunzio*, Lat. *nuncius*, a messenger), the name given to the superior grade of the ambassadors sent by the pope to foreign courts, who are all called by the general name of LEGATE (q. v.). A nuncio is an ambassador to the court of an emperor or king. The ambassador to a republic, or to the court of a minor sovereign, is called INTERNUNCIO.

NUNEATON, a small market-t. of England, in the county of Warwick, and 18 m. n. e. of the town of that name. It contains a small parish church in Gothic, and its free grammar school was founded by Edward VI. in 1553. Worsted and cotton goods are manufactured. Pop. 11,600.

NUÑEZ, ALVAR (CABEZA DE VACA), 1490–1560; b. Spain, second in command to Pamfilo de Narvaez in the unfortunate expedition to Florida in 1528. After the latter was lost while attempting to make his way to Mexico, Nuñez, with a few other survivors of the expedition, succeeded in landing on the continent at some point w. of the Mississippi river, and went n. w. to a country supposed to have been what is now New Mexico. The party had endured great hardship on the journey, but were well cared for by friendly Indians, among whom they passed eight months. They then went on towards the s. w., and after terrible suffering, only Nuñez and three companions survived to arrive at the Spanish colonies on the Pacific. This was in 1536, eight years after the shipwreck of Narvaez. Nuñez went back to Spain, but in 1540 started for La Plata, of which he had been appointed governor. His vessel was wrecked, and he landed in Paraguay, which he at once began to explore, passing down the La Plata through the country of the Guaranís, to Asuncion, which he made his headquarters. He conquered several Indian tribes, but was at one time defeated, and soon afterward on the accusations of Domingo de Irala, his second in command, he was sent to Spain for trial, found guilty, and banished to Africa. Recalled by the king at the end of eight years, he was made judge of the supreme court of Seville, and continued in that office till his death. *The Shipwrecks of Alvar Nuñez*, with the *Commentaries of Alvar Nuñez*, written by his secretary, Fernandez, appeared at Valladolid in 1544. His story

is found in an abridged form in Hakluyt's *Voyages*, and an English translation of the whole was published by Buckingham Smith at Washington in 1852.

NUÑEZ DE ARCE, Gaspar, the so-called "Tennyson of Spain," is a dramatist and lyric poet, born at Valladolid, Aug. 4, 1834. He studied at Toledo, where he received the degree of doctor of philosophy. Among his comedies may be mentioned *Como se Empeñe un Marido*; *Ni tanto ni tan poco*; *Discursos leidos ante la Real Academia Española*. Other dramas are *El Haz de Leña*; *Las Mujeres del Evangelio*, etc., besides numerous lyric poems, which have gained for him his pseudonym. He was elected to the cortes in 1865, and to the Spanish academy in 1876; became minister of colonial affairs in 1882, and subsequently minister of commerce and agriculture; and was accorded a national ovation in 1894.

NURAGHE, the name of certain structures, of conical shape, in the island of Sardinia, rising 30 or 40 ft. above the ground, with two or three stories of domed chambers connected by a spiral staircase. Some are raised on basements of masonry or platforms of earth. They are made of granite limestone, basalt, porphyry, sandstone, and schist. Their entrances are small and low, and when they have chambers of two stories, the upper chamber is reached by the spiral staircase, which has loopholes to admit the light. The tops are supposed to have had a terrace. Although 3,000 of them exist, none are perfect. Their masonry is irregular, but not polygonal, and resembles the style of work called Asiatic. Like the round towers of Ireland, and other uninscribed monuments, their object and antiquity are enveloped in much doubt. They have been supposed to be the work of the Pelasgi, the Phenicians, or Carthaginians, and to have been ancient sepulchres, *Tholi* or *Daedalia*, constructed in heroic times. Skeletons, and other funeral paraphernalia, have been found in them. They have many points of resemblance to the "Burghs" or "Duns" on the northern shores of Scotland, of which the Burgh of Mousa, in Shetland, is perhaps the best example.—De la Marmora, *Voyage en Sardaigne*, tom. ii.; Petit Radel, *Nuraghes* (Paris, 1826–28); Micali, *Ant. Pop. Ital.* ii. pp. 43; Dennis, *Cities and Cem. of Etruria*, ii, pp. 161.

NUREDDIN'. See Noureddin-Mahmoud.

NUREMBERG, or Nürnberg (*Norimberga*, *Norica*), a fortified city of the Bavarian province of middle Franconia, situated in 49° 28′ n. lat., and 11° 5′ e. long. Pop '90, 142,404; '95, 162,380. Nuremberg is one of the most remarkable and interesting cities of Germany, on account of the numerous remains of medieval architecture which it presents in its picturesque streets, with their gabled houses, stone balconies, and quaint carvings. Its double lines of fortified walls, separated from each other by public walks and gardens, and guarded by large round towers, together with the numerous bridges which span the Pegnitz, on whose banks the city is built, give it distinctive features of its own. Among the most remarkable of its numerous public buildings are the old palace or castle, commanding, from its high position, a glorious view of the surrounding country, and interesting for its antiquity, and for its gallery of paintings, rich in gems of early German art; the town-hall, which ranks amongst the noblest of its kind in Germany, and is adorned with works of Albert Dürer, and Gabriel Weyher; the noble Gothic fountain opposite the cathedral by Schonhofer, with its numerous groups of figures, beautifully restored in modern times; and many other fountains deserving notice. Of the numerous churches of Nuremberg, the following are the most remarkable: St. Lawrence, built between 1274–1477, with its beautiful painted glass windows, its noble towers and doorway, and the celebrated stone pyx, completed in 1500, by Adam Kraft, after five years' assiduous labor; and the exquisite wood carvings of Veit Stoss; St. Sebald's, with its numerous fine glass-paintings and frescoes by Peter Visscher and other German masters; the cathedral, or Our Lady's, built in 1631, similarly enriched. Nuremberg is well provided with educational establishments, and, besides two gymnasia and polytechnic and industrial institutions, has good schools of art, normal and other training colleges, a public library of 80,000 vols., galleries of art collections, museums, etc.; while the numerous institutions of benevolence are liberally endowed and well maintained. Although the glory of the foreign commerce of Nuremberg may be said to have been long extinct, its home trade, which is still of considerable importance, includes the specialties of metal, wood, and bone carvings, and children's toys and dolls, which find a ready sale in every part of Europe, and are largely exported to America and the east. In addition to its own industrial commerce, it is the seat of a large transfer and exchange business, which owes much of its importance to the facilities of intercommunication afforded by the network of railway lines with which the city is connected, and by the Ludwig canal, which joins the Danube with the Main and Rhine. See Architecture (illus.); Bavaria.

Nuremberg was raised to the rank of a free imperial city by the Emperor Henry V., in 1219, previous to which time, Henry IV. had ennobled 38 of the principal burgher families, who forthwith arrogated to themselves supreme power over the Nuremberg territory. In the 13th c., we find it under the title of a burg-graviate in the hands of the Hohenzollern family, who, in 1417, ceded for a sum of money all their territorial and manorial rights to the magistracy of the city. This measure put a stop to the feuds which had hitherto raged between the burg-grafs and the municipality, and for a time

Nuremberg continued to grow rich with the fruits of the great internal trade which it had long maintained between the traders of the east and the other European marts of commerce. The discovery of the passage by the cape of Good Hope, by opening new channels of communication between Asia and Europe, deprived Nuremberg of its ancient monopoly. The thirty years' war completed the decay of the city, which suffered severely from both parties in turn. The ancient reputation of Nuremberg as a wealthy and loyal city of Germany secured to it, however, special consideration; and in 1803 when the imperial commissioners reorganized some of the dismembered parts of the old empire, it was allowed to retain its independence, with a territory of 483 sq.m., containing 40,000 inhabitants, and drawing a revenue of 800,000 guldens; but in consequence of the disputes in which the free city became involved with the king of Prussia, who had some hereditary claim on the ancient burg-graviate, Nuremberg, alarmed at the prospect of still greater embarrassments, entered into the Rhenish confederation, and as the result of this alliance, was transferred, in 1806, with the surrender of its entire domain and all rights of sovereignty, to the king of Bavaria.

NUREMBERG, DIETS OF, 1522–23, important church councils of the reformation. After the invasion of Hungary by Soliman the Turk the emperor Charles V. convened a diet at Nuremberg, Mar. 22, 1522, to concert measures against the Turks, and settle internal religious difficulties. The emperor wrote to pope Adrian VI., urging him to confirm the decisions of the diet, and to use his money to destroy the heresy of Luther. Pope Adrian sent his chamberlain with a brief to the elector of Saxony, requesting him in the next diet "to protect and maintain the dignity and majesty of the apostolic see, and with it the peace of christendom," as his ancestors had done. Frederick replied that while he chiefly sought the glory of God and the peace of the empire, Luther and his followers must be met with reason, not force. The pope then represented to Francis Chieregati, his legate at Nuremberg, that Luther and his adherents were not only heretics, but dangerous to the state, and therefore must be suppressed. In another brief to the elector he charged him with being the friend of heretics. He also forbid his protecting Luther under penalty of ecclesiastical and civil punishment. At the diet which convened Dec. 13, 1522, Hans von Plaunitz, a friend of Luther, represented Frederick. Chieregati, the pope's legate, presented a papal brief to the diet demanding that the Lutheran preachers should be arrested and sent to Rome to be judged. This the diet refused, and made a vigorous reply to the brief. Appearing again in 1523 before the diet the legate demanded the enforcement of the decrees of the diet of Worms against Luther's heresy, declaring at the same time that the bad state of the church was due to the laxity of discipline in the clergy, and also to the bad example of some of the popes. The pope also confessed freely the need of reformation in the church, and promised to do all in his power for its improvement. Both parties were displeased with these statements of the legate; the papal, because the pope confessed the evil condition of the church, and censured his predecessors; the reformers, ridiculing the promise of the pope to introduce reforms. A committee was appointed by the state to prepare a reply to the legate; and this favored the Protestant principles, declaring that the abuses of the Roman court, the immorality of the clergy, the violation of the concordats, etc., had been fully shown by Luther, making in all 81 different counts. The reply also demanded that a free council should be held at some city of Germany, engaging that Luther and his adherents should not make disturbance by preaching or writing. The legate, in reply, insisted on the execution of the terms of the edict of the diet of Worms. Philip von Feilitzsch, the envoy of the elector of Saxony, protested against the agreement that Luther and his followers should publish nothing until the meeting of the council. Luther also wrote to the elector Frederick, claiming the same freedom to defend himself that the opposite party had to attack him; that the stipulation not to publish until the settlement of the difficulties could not apply to the publishing of the Bible or the preaching of the gospel, as the word of God could not be bound. The acts of the diet disappointed the pope; the emperor disregarded his appeals, because of his interference in the affairs of France, and Adrian died of grief.

The condition of things in Germany and the change in the papal see led to another diet at Nuremberg, Nov. 11, 1523. Cardinal Lorenzo Campeggio was the legate of the new pope, Clement VII. The diet was opened Jan. 14, 1524. The majority showed itself opposed to the pope. They discussed the necessity of furnishing assistance to the king of Hungary, of contributing to the war against the Turks, and of removing the seat of government from Nuremberg to Esslingen. This displeased the emperor as well as the pope, and Hanart, in behalf of the emperor, and Campeggio for the pope, demanded the dissolution of the diet. Campeggio showed the danger to the empire in any departure from the ancient faith; the states referred him to the grievances complained of in a former diet. The legate replied that the pope had received no official communication of those grievances, and insisted on the carrying out of the edict of Worms. Frederick's representative declared that he had received no official communication of the edict of Worms; that the late diet had not forbidden evangelical preaching, and that its decisions could not be set aside without discussion. The diet dissolved April 18. The seat of government was removed to Esslingen, aid was granted to the king of Hungary and for the war against the Turks. The states decided also, that the pope should, with the assent of the emperor, cause a free council to be held in Germany as soon as possible, and that,

in the meantime, another diet at Spires should specify the grievances of the princes against the pope, and decide on the manner of holding the aforementioned council; until then the princes should carefully watch all new doctrines and books, but see also that the gospel should be freely and peacefully preached and explained, as generally received by the church. The emperor was prevented by complications with France from much impeding the reformation. The pope's legate sought to organize a Roman Catholic league in opposition to the evangelical princes and states, and even attempted to gain over Melanchthon. The reformation rapidly gained ground. In 1542 and 1543 two other diets were held, but they were not very important. Political difficulties and dissatisfaction because the promised reforms had not been carried out, led to another diet, which was held Jan. 31, 1543, in which the Roman Catholics opposed all reform, and the other party acted with vigor. King Ferdinand urged the prosecution of the war against the Turks with increased energy, of protecting Hungary and the neighboring regions, and of granting aid against the French, who had invaded the Netherlands. The evangelical princes and states presented to the king and to the imperial commissioners a list of their grievances. They complained of the peace of Nuremberg having been broken by the imperial chamber of justice, and of the promised reforms not having been carried out. They required also religious liberty. All the questions gave rise to numerous debates, which related mostly to the political affairs of the empire. The proposed council, which was to be held at Trent, the evangelical party refused to accept, and, as no sure guarantees of peace were given them, they declined to take any further part in the proceedings of the diet. The resolutions of the diet were therefore passed without the participation of the reform party.

NUREMBERG, Peace of, was a temporary compromise afforded in religious matters by a treaty between the Protestant princes and Charles V. of Germany, signed in July, 1532. Charles agreed to allow all Protestants entire liberty of conscience, and in return the princes agreed to join him in repelling invasions of the Turks, etc. See, also, Schmalkald, League of, and Reformation.

NURSE, a colloquial name given to several species of sharks. In New England it is used of the *somniosus microcephalus;* in Florida to the *ginglymostoma cirratum;* and in the Pacific to the *cestracion philippi.*

NURSE, Military. See Red Cross Societies.

NURSERY, a garden or portion of a garden devoted to the raising of young plants, to be afterward planted elsewhere. The ripening of garden-seeds for sale is generally also an important part of the trade of the public nurseryman. Many culinary vegetables are very commonly raised from seed in public nurseries, and sold as young plants; the trouble of raising them in small gardens being found too great, although, when there is no public nursery at hand, even the cottage gardener may be compelled to undertake this trouble for himself, in order to procure a supply of young kale, cabbage, cauliflower, etc., in fresh and healthful condition. Many flowering plants, as geranium, stock, sweet-william, etc., are also raised and sold by nurserymen. Another great use of the nursery is the rearing of fruit-trees. In the nursery the stocks are raised from seed, the grafting is performed, and the training of the young tree, whether for standard, espalier, or wall tree, is begun. As, with regard to fruit-trees, the selection of grafts is of the utmost importance, the reputation of the nurseryman is particularly to be considered by the purchaser; nor is there any trade in which this is more generally necessary, months, or sometimes years elapsing before the quality of the goods purchased can be experimentally ascertained.

NURSES, Training of. The demand for skilled and well-educated nurses in our large cities and towns has led to the establishment of training schools where men and women may be taught the scientific management of invalids. In these schools thorough instruction is given as to surgical emergencies, besides lessons in bandaging, and in the preparation of food for the sick. In addition to clinical teaching, there are elementary courses in hygiene, anatomy, and physiology. At the end of the course, which generally lasts for two years, diplomas are given certifying that the holders are experienced and competent nurses. In New York the employment bureau of the Young Women's Christian Association furnishes trained nurses on application. There are schools connected with the Bellevue Hospital (charges, $10 per month, first year, $16, second year), the Charity Hospital (charges, $10 per month, first year, $15, second year), and the New York Hospital. The Philadelphia school, in connection with the College of Physicians and Surgeons, is doing excellent service. There are good schools at Boston, Albany, New Haven, and other cities. The Connecticut soc. for the training of nurses has issued a serviceable manual on the science of nursing, and there is a growing literature on this important subject. The *Medical Register* publishes lists of the skilled nurses in New York, with their addresses. The schools are careful in the selection of their pupils, and require recommendations as to character as well as a fair education in the rudimentary branches. There were, 1883, 23 training schools for nurses in the U. S., with 97 instructors, 475 pupils, and 779 graduates. These numbers are now much increased.

NUSAIRIEH, Nossairians or Ansonians. See Ansaries.

NUT, in popular language, is the name given to all those fruits which have the seed inclosed in a bony, woody, or leathery pericarp, not opening when ripe. Amongst the

best known and most valuable nuts are the hazel-nut, Brazil nut, walnut, chestnut, and cocoa-nut, all of which are edible. Other nuts are used in medicine, and for purposes connected with the arts. Some of the edible nuts abound in a bland oil, which is used for various purposes.—In botany the term nut (*nux*) is used to designate a one-celled fruit, with a hardened pericarp, containing, when mature, only one seed. The *achenium* (q.v.) was by the older botanists generally included in this term. Some of the fruits to which it is popularly applied scarcely receive it as their popular designation. The hazel-nut is an excellent example of the true nut of botanists.—The name nut, without distinctive prefix, is popularly given in Britain to the hazel-nut, but in many parts of Europe to the walnut.

Many nuts have a considerable commercial value, from their being favorite articles of food; these are the hazel-nut and its varieties, the black Spanish, the Barcelona, the Smyrna, the Jerusalem filbert, and the common filbert; the walnut, chestnut, hickory, and pecan; the souari, the cocoa or coker nuts, and the Brazil or Para nut.

Nuts imported into the United States are subject to the payment of a duty, except those received from the Hawaiian Islands, which are admitted free, under the treaty of reciprocity. In 1890 this country imported from other countries nuts to the value of $1,613,654, of which fully half were almonds.

NUTATION is a slight oscillatory movement of the earth's axis, which disturbs the otherwise circular path described by the pole of the earth round that of the ecliptic, known as the "precession of the equinoxes." It is produced by the same causes, viz., the attraction of the sun, moon, and planets (the attraction of the last mentioned being so small as to be quite imperceptible) upon the bulging zone about the earth's equator, though in this case it is the moon alone that is the effective agent. It also, for reasons which need not be given here, depends, for the most part, not upon the position of the moon in her orbit, but of the moon's node. If there was no precession of the equinoxes, nutation would appear as a small elliptical motion of the earth's axis, performed in the same time as the moon's nodes take to complete a revolution, the axes of the ellipse being respectively 18″.5 and 13″.7, the longer axis being directed towards the pole of the ecliptic. But this motion, when combined with the more rapid one of precession causes the pole of the earth's axis to describe a wavy line round the pole of the ecliptic.

The effect of nutation, when referred to the equator and ecliptic, is to produce a periodical change in the obliquity of the ecliptic, and in the velocity of retrogradation of the equinoctial points. It thus gives rise to the distinction of "apparent" from "mean" right ascension and declination, the former involving, and the latter being freed from the fluctuations arising from nutation. This motion is common to all the planets.

NUT-CRACKER, *Nucifraga* or *Caryocatactes*, a genus of birds of the family *corvidæ*, with a straight conical bill, both mandibles terminating in an obtuse point, and tail nearly square at the end. The form and characters are nearly similar to those of crows, but the habits are rather those of jays, and in some respects indicate an approach to woodpeckers. One species (*N. caryocatactes* or *C. nucifraga*) is occasionally seen in Britain, and is not uncommon in many parts of Europe and of Asia, particularly in mountainous regions covered with pines. It is about the size of a jackdaw, but has a longer tail. The plumage is light brown, speckled with white, except on the wings, rump, and tail, which are nearly black. The nut-cracker frequents the tops of high pines, and is a shy bird.

NUTGALL. See GALLS.

NUT-HATCH, *Sitta*, a genus of birds of the family *certhiadæ*, having a straight conical or prismatic bill, short legs, the hind-toe very strong. They run up and down trees with great agility, moving with equal ease in either direction, and without hopping, so that the motion is rather like that of a mouse than of a bird. They feed on insects, in pursuit of which they examine the crevices, and remove the scales of the bark; also on seeds, as those of pines, and the kernels of nuts, to obtain which they fasten the nut firmly in some crevice of bark or other such situation, and peck at it until the shell is broken, so placing themselves that they sway not merely the head, but the whole body, to give force to the stroke. The English name is said to have been originally *nut-hack*. One species, the EUROPEAN NUT-HATCH (*S. Europæa*), is common in most parts of Europe, and is found in most of the wooded districts of England. Its whole length is about six inches. If taken young, it is easily tamed, and becomes very familiar and amusing; but an old bird caught and put into a cage, is apt to kill itself by violently pecking to force a way out. It soon destroys the wood of a cage.—Other species are found in the east and in North America, where the genus is particularly abundant. Birds nearly allied are found in Australia.

NUTMEG. This well-known and favorite spice is the kernel—mostly consisting of the albumen—of the fruit of several species of *myristica*. This genus belongs to a natural order of exogens called *myristicaceæ*, which contains about forty species, all tropical trees or shrubs, natives of Asia, Madagascar, and America. They generally have red juice, or a juice which becomes red on exposure to air. The order is allied to *lauraceæ*. The leaves are alternate and without stipules. The flowers are unisexual, the perianth generally trifid, the filaments united into a column. The fruit is succulent, yet opens

like a capsule by two valves. The seed is nut-like, covered with a laciniated fleshy aril, and has an albumen penetrated by its membranous covering. The species of this order are generally more or less aromatic in all their parts; their juice is styptic and somewhat acrid; the albumen and aril contain both a fixed and an essential oil, and those of some species are used as spices. The genus *myristica* has the anthers united in a cylindrical column, and the cotyledons folded. The species which furnishes the greater part of the nutmegs of commerce is *M. fragrans* or *moschata;* but the long nutmeg (*M. fatua*), from the Banda isles, is now not uncommon in our markets. The common nutmeg-tree is about 25 ft. in height, with oblong leaves, and axillary few-flowered racemes; the fruit is of the size and appearance of a roundish pear, golden yellow in color when ripe. The fleshy part of the fruit is rather hard, and is of a peculiar consistence, resembling candied fruit; it is often preserved and eaten as a sweetmeat. Within is the nut, enveloped in the curious yellowish-red aril, the *Mace* (q.v.), under which is a thin shining brown shell, slightly grooved by the pressure of the mace, and within is the kernel or nutmeg. Up to 1796, the Dutch being the possessors of the Banda isles, jealousy prevented the nutmeg from being carried in a living state to any other place; but during the conquest and retention of the islands by the British, care was taken to spread the culture of this valuable spice, and plants were sent to Penang, India, and other places, where they are now successfully cultivated; indeed, they have now become established in the West India Islands, and both Jamaica and Trinidad produce excellent nutmegs. Brazil is also found favorable to their culture. The nutmeg is very liable to the attack of a beetle, which is very destructive, and it is a common practice to give them a coating of lime before shipping them to Europe, in order to protect them from its ravages. The Dutch or Batavian nutmegs are nearly always limed, but those from Penang are not, and are consequently of a greater value. The nutmeg yields, by expression, a peculiar yellow fat, called oil of mace, because, from its color and flavor, it was generally supposed to be derived from mace; and by distillation is obtained an almost colorless essential oil, which has very fully the flavor of the nutmeg. Her own settlements now furnish Great Britain with the greater portion of this spice, but some lots of Batavian also come into the market. In 1890 the United States imported nutmegs to the value of $534,340.

Nutmegs are chiefly used as a spice; but medicinally they are stimulant and carminative. They possess narcotic properties, and in large doses produce stupefaction and delirium, so that they ought not to be used where affections of the brain exist or are apprehended.

Other species of *myristica* besides those already named yield nutmegs sometimes used, but of very inferior quality.—The fruits of several species of *lauraceæ* also resemble nutmegs in their aromatic and other properties; as the cotyledons of *Nectandra Puchury*, the Pichurim beans of commerce, and the fruit of *acrodiclidium camara*, a tree of Guiana, the camara or ackawai nutmeg. The clove nutmegs of Madagascar are the fruit of *agathophyllum aromaticum*, and the Brazilian nutmegs of *Cryptocarya moschata*. All these belong to the order *lauraceæ*. The Calabash nutmeg is the fruit of *monodora myristica*, of the natural order *anonaceæ*.

NUTMEG STATE. This is a popular name for the State of Connecticut. Its inhabitants, having acquired a wide reputation for shrewdness, were facetiously said to have manufactured and sold wooden nutmegs as an article of commerce. See STATES, POPULAR NAMES OF.

NUTRIA, the Spanish name for the otter, is the common designation in the fur trade for the fur of the South American animal called the coypu (q.v.). The animal, which in size comes between the beaver and the muskrat, is particularly abundant along the La Plata. The fur is much like that of the beaver, and although the outer hair is coarse and long, the under fur is soft and dense, beautifully marked in the upper parts with yellow shades, and lighter and more uniform in the under parts. The skins range in value from twelve to twenty-five cents, but many of those obtained are unsound; hence, both in this country and in England they are chiefly used in the manufacture of hats. The name nutria may have been given to this fur by mistake, or originally with intention to deceive. Another name for it is Racoonda.

NUTRITION. The blood which is carried by the capillaries to the several tissues of the body is the source from whence all the organs derive the materials of their growth and development; and it is found that there is direct proportion between the vascularity of any part and the activity of the nutrient operations which take place in it. Thus, in nervous tissue and muscle, in mucous membrane and in skin, a rapid decay and renovation of tissue are constantly going on, and these are parts in which the capillaries are the most abundant; while in cartilage and bone, tendon and ligament, the disintegration of tissue is comparatively slow, and the capillaries are much less abundant. Each elementary cell or particle of a tissue seems to have a sort of gland-like power not only of attracting materials from the blood, but of causing them to assume its structure, and participate in its properties. Thus, from the same common source, nerves form nervous tissue, muscles muscular substance, and even morbid growths, such as cancer, have an assimilating power.

Before entering further into the subject of nutrition, it is necessary to understand how it differs from the allied processes of development and growth. All these processes are

the results of the plastic or assimilative force by which living bodies are able to form themselves from dissimilar materials (as when an animal subsists on vegetables, or when a plant grows by appropriating the elements of water, carbonic acid, and ammonia); but they are the results of this force acting under different conditions.

Development is the process by which each tissue or organ of a living body is first formed, or by which one, being already incompletely formed, is so changed in shape and composition as to be fitted for a function of a higher kind, or finally is advanced to the state in which it exists in the most perfect condition of the species.

Growth, which commonly concurs with development, and continues after it, is properly mere increase of a part by the insertion or superaddition of materials similar to those of which it already consists. In growth, properly so called, no change of form or composition occurs; parts only increase in weight, and usually in size; and if they acquire more power, it is only more power of the same kind as that which they before enjoyed.

Nutrition, on the other hand, is the process by which the various parts are maintained in the same general conditions of form, size, and composition, which they have already by development and growth attained. It is by this process that an adult person in health maintains for a considerable number of years the same general outline of features, and nearly the same size and weight, although during all this time the several tissues of his body are undergoing perpetual decay and renovation. In many parts this removal and renewal of the particles is evident. In the glands—the kidneys (q.v.), for example—the cells of which they are mainly composed are being constantly cast off; yet each gland maintains its form and proper composition, because for every cell that is thrown off a new one is produced. In the epidermis of the skin, a similar process is perpetually going on before our eyes. In the muscles a similar change may be readily traced, for, within certain limits, an increased amount of exercise is directly followed by an increased excretion of the ordinary products of the decomposition of the nitrogenous tissues—viz. urea, carbonic acid, and water. Again, after prolonged mental exertion, there is often a very marked increase in the amount of alkaline phosphates in the urine, which seems to show that in these cases there is an excessive oxidation of the phosphorus of the brain; and yet, in consequence of the activity of the reparative process, neither the muscles nor the brain diminish in size.

It may be regarded as an established fact in physiology that every particle of the body is formed for a certain period of existence in the ordinary conditions of active life, at the end of which period, if not previously destroyed by excessive exercise, it is absorbed or dies, and is cast off. (The hair and deciduous or milk teeth afford good illustrations of this law.) The less a part is exercised the longer its component particles appear to live. Thus Mr. Paget found that if the general development of the tadpole be retarded by keeping it in a cold, dark place, and if hereby the functions of the blood corpuscles be slowly and imperfectly discharged, the animal will retain its embryonic state for several weeks longer than usual, and the development of the second set of corpuscles will be proportionally postponed, while the individual life of the corpuscles of the first set will be, by the same time, prolonged.

For the due performance of the function of nutrition certain conditions are necessary, of which the most important are—1, a right state and composition of the blood, from which the materials of nutrition are derived; 2, a regular and not far distant supply of such blood; 3, a certain influence of the nervous system; and 4, a natural state of the part to be nourished.

1. There must be a certain adaptation peculiar to each individual between the blood and the tissues. Such an adaptation is determined in its first formation, and is maintained in the concurrent development and increase of both blood and tissues. This maintenance of the sameness of the blood is well illustrated by the action of vaccine matter. By the insertion of the most minute portion of the virus into the system, the blood undergoes an alteration which, although it must be inconceivably slight, is maintained for several years; for even very long after a successful vaccination, a second insertion of the virus may have no effect, because the new blood formed after the vaccination continues to be made similar to the blood as altered by the vaccine matter. So, in all probability, are maintained the morbid states of the blood which exist in syphilis and many other chronic diseases; the blood once inoculated, retaining for years the taint which it once received. The power of assimilation which the blood exercises in these cases is exactly comparable with that of maintenance by nutrition in the tissues; and evidence of the adaptation between the blood and the tissues, and of the delicacy of the adjustment by which it is maintained, is afforded by the phenomena of symmetrical diseases (especially of the skin and bones), in which, in consequence of some morbid condition of the blood, a change of structure affects in an exactly similar way the precisely corresponding parts on the two sides of the body, and no other parts of even the same tissue. These phenomena (of which numerous examples are given in two papers by Dr. W. Budd and Mr. Paget in the 25th vol. of the *Medico-chirurgical Transactions*) can only be explained on the assumption—1st, of the complete and peculiar identity in composition in corresponding parts of opposite sides of the body; and 2dly, of so precise and complete an adaptation between the blood and the several parts of each tissue, that a morbid material being present in the blood, may destroy its fitness for the nutrition of one or

two portions of a tissue, without affecting its fitness for the maintenance of the other portions of the same tissue. If, then, the blood can be fit for the maintenance of one part, and unfit for the maintenance of another part of the same tissue (as the skin or bone), how precise must be that adaptation of the blood to the whole body, by which in health it is always capable of maintaining all the different parts of the numerous organs and tissues in a state of integrity.

2. The necessity of an adequate supply of appropriate blood in or near the part to be nourished, is shown in the frequent examples of atrophy of parts to which too little blood is sent, of mortification when the supply of blood is entirely cut off, and of defective nutrition when the blood is stagnant in a part. The blood-vessels themselves take no share in the process, except as the carriers of the nutritive matter; and provided they come so near that the latter may pass by imbibition, it is comparatively unimportant whether they ramify within the substance of the tissue, or (as in the case of the non-vascular tissues, such as the epidermis, cornea, etc.) are distributed only over its surface or border.

3. Numerous cases of various kinds might be readily adduced to prove that a certain influence of the nervous system is essential to healthy nutrition. Injuries of the spinal cord are not unfrequently followed by mortification of portions of the paralyzed parts; and both experiments and clinical cases show that the repair of injuries takes place less completely in parts paralyzed by lesion of the spinal cord than in ordinary cases. Division of the trunk of the trifacial nerve has been followed by incomplete nutrition of the corresponding side of the face, and ulceration of the cornea is a frequent consequence of the operation.

4. The fourth condition is so obvious as to require no special illustration.

For furthur information on this most important department of physiology, the reader is referred to Mr. Paget's *Surgical Pathology*, or to his original lectures on nutrition, hypertrophy, and atrophy (published in vol. 39 of *The Medical Gazette*) or to the chapter on "Nutrition and Growth," in Kirke's *Handbook of Physiology*, which contains an excellent abstract of Mr. Paget's views, and to which we are indebted for the greater part of this article. The subject of nutrition is exhaustless. It comprehends all vital phenomena, for none of the functions of life are performed without involving replacement by living matter, and therefore nutrition. The subject of hygiene in all its aspects is connected with it, whether in eating, drinking, exercise, sleeping, or breathing. A change in each of these processes involves a corresponding change in the elaboration and appropriation of new material, and the disassimilation, or elimination of old, or its reconversion. This includes the functions of digestion (q.v.), chylification, sanguification, circulation (q.v.), respiration (q.v.), assimilation, secretion (q.v.), metabolic change, and excretion. Nutrition, to be healthy, requires the respiration of pure air, the proper mastication of wholesome food, and its reception into the stomach. Not only must the food be wholesome, but a proper quantity, and no more, must be taken, and that at proper intervals. After its reception into the stomach a certain amount of attention to the requirements of the act of digestion is necessary for its normal performance. Too violent exercise immediately after, or the swallowing of too much fluid, particularly of cold water, will interfere with digestion and render it more or less imperfect. The system must be free from poisonous or malarious influences, and the mind unoccupied with distressing thoughts. As soon as digestion has progressed to some extent, and absorption of digested material has taken place, and consequently assimilation commenced, a certain amount of motion among the organs and tissues of the various parts of the body should be going on, so that the fluids which carry the nutritive materials may be sent on in their channels and thrown and drawn into the tissues they are destined to supply. This motion is principally produced by the exercises given by the ordinary duties of life, but those duties are so variously distributed among different persons that some get a great deal too much exercise, and others do not get near enough. In neither of these classes, therefore, can nutrition be perfectly normal. It is true that the tissues of the body are endowed with abundant, it may be said naturally superabundant, vitality, or restorative power, by which abnormal tendencies are overcome, except when they are too great. Then a certain degree of unhealthy nutrition will follow, and this is the general rule. There are few persons, especially in large cities whose inhabitants are so unfortunate as to be unable to secure sanitary policing of their neighborhoods, whose solids and fluids are not more or less impregnated with malarial poisons. The processes of nutrition in them require much more assistance than in those who live in more cleanly towns. Often some of the organs get into a condition far below the natural standard, and are composed of more or less degenerated tissue. This does not have the normal assimilative power and cannot derive from the blood, which itself is necessarily more or less abnormal, constituents for healthy regeneration. Under such circumstances various means require to be resorted to to assist the weakened tissues and forces. Medicines are often given, sometimes with a view of antagonizing certain of the malarial symptoms, of stimulating the nervous system to action, and of promoting excretion; often quinine is administered with benefit, it sometimes being the only available remedy unless the person removes to where the air is pure. But it is a sound axiom in medicine that recovery from disease is "regeneration

of tissue." The real remedy for most cases of faulty nutrition, and which are included in the various forms of disease, is diet, and, when it can be had, exercise. But in many cases of sickness voluntary exercise is out of the question, and rest, as nearly absolute as possible, is demanded. In nearly all cases, however, of chronic disease, exercise, both voluntary and passive, is the only rational treatment having as its end complete recovery, or in other words, return to healthy nutrition. And all the exercise required in most cases of debility is not secured by mere movements of the limbs. The motion which is imparted by friction of various kinds, and by kneading the body so thoroughly that internal parts have their surfaces moved over each other, and alternations of pressure exerted so that the contents of the different vessels are propelled in their natural directions, is of very great advantage, and supplies a natural stimulus to the nerves, which regulate to a certain extent the nutritive forces.

It must be apparent that as the blood is the great carrier of nutritive material to all parts of the body, it is of the highest importance that it should be in a perfectly healthy condition, and this implies that all the secreting and excreting glands shall take from it all that it has borne away of effete matter from parts through which it has passed, and further elaborate all that is retained. But that these organs shall be able to do this, the blood itself must furnish them with the proper materials. There is therefore an intimate interdependence between the blood and every organ, and also between each organ and every other. The blood must have its normal quantity of fibrine (q.v.), of hemoglobine (q.v.), of iron, and of alkaline salts. If these are deficient, or any one of them, they must be supplied either in the food or in the form of medicine. Of great importance to nutrition are the lymphatic glands and the lymphatic system of vessels. See LYMPH and LYMPHATICS. The liver (q.v.), the most important gland in all the body, if poisoned by malaria, or otherwise, can neither perform its biliary nor its glycogenic functions, nor can the cholesterine, which has been brought to it as a product of nerve disassimilation, be properly separated from the blood or combined with the bile. The ductless glands exercise important offices in the elaboration of the blood. It has not been precisely determined what they do, or all that they do, but the spleen (q.v.) probably acts a part in renovating blood corpuscles, and is a sort of store-house of nutritive material. One of the quite constant effects of a miasm upon the human system is enlargement of the spleen. Thus we see an example in this single organ of the disturbing influences of malarial poison upon nutrition. The evolution of vital force is generally spoken of as the great purpose of nutrition, but perhaps it would be more comprehensive to say that the great purpose is the reparation of the organism and the keeping it in a normal condition that it may be the instrument for the transmission of force. See DIET; FOOD AND DRINK; SANITARY SCIENCE.

NUTTALL, THOMAS, 1786–1859, b. England; apprenticed to a printer, but went to the United States and devoted himself to the study of natural history. He made a scientific exploration of the great lakes and the n. tributaries of the Mississippi. In 1810 he went up the Missouri to the Mandan villages, and in 1819 he traveled through the country drained by the Arkansas river. He published an account of his journey in 1821, under the title of *A Journal of Travels into the Arkansas Territory.* He also explored the Pacific coast, upon the natural history of which he published a number of papers. In 1822 he became professor of natural history and curator of the botanic garden at Harvard college. His most important books are *A Manual of the Ornithology of the United States and Canada,* 1834, and *The North American Sylva,* 1842–49. He left his professorship in 1834, and finally settled in England, where an estate had been given him on condition of his living on it.

NUX VOMICA is the pharmacopœial name of the seed of *strychnos nux vomica,* or *poison nut.* The following are the characters of these seeds, which are imported from the East Indies: "Nearly circular and flat, about an inch in diameter, umbilicated and slightly convex on one side, externally of an ash-gray color, thickly covered with short satiny hairs, internally translucent, tough, and horny, taste intensely bitter, inodorous."—*The British Pharmacopœia,* p. 99.

For the genuine characters, see the article STRYCHNOS. The nux vomica tree is a native Coromandel, Ceylon, and other parts of the East Indies. It is a tree of moderate size, with roundish-oblong, stalked, smooth leaves, and terminal corymbs. The fruit is a globular berry, about as large as a small orange, one-celled, with a brittle shell, and several seeds lodged in a white gelatinous pulp. The bark is known as *false angostura bark,* having been confounded with angostura bark, in consequence of a commercial fraud, about the beginning of the present c.; but its properties are very different, as it is very poisonous.

The seeds contain (in addition to inert matters, such as gum, starch, woody fiber, etc.) three alkaloids closely related to each other, which act as powerful poisons on the animal frame, and speedily occasion violent tetanic convulsions and death. These alkaloids or bases are named *strychnia, brucia,* and *igasuria,* and exist in the seeds in combination with lactic and strychnic (or igasuric) acid. For a good method of obtaining pure strychnia, which is by far the most important of the three bases, the reader is referred to p. 328 of *The British Pharmacopœia.*

Strychnia, $C_{21}H_{22}N_2O_2$, occurs "in right square octahedrons or prisms, colorless and

inodorous, scarcely soluble in water, but easily soluble in boiling rectified spirit, in ether, and in chloroform. Pure sulphuric acid forms with it a colorless solution, which, on the addition of bichromate of potash, acquires an intensely violet hue, speedily passing through red to yellow."—*Op. cit.* In nitric acid, it ought, if pure, to form a colorless solution; if the solution is reddish, it is a sign that brucia is also present. Strychnia combines with numerous acids, and forms well-marked salts, which are amenable to the same tests as the base itself.

Brucia, $C_{23}H_{26}N_2O_4 \cdot 4H_2O$, is insoluble in ether, but more soluble in water and in strong alcohol than strychnia; and it is the most abundant of the three alkaloids in nux vomica. It acts on the animal economy similarly to but much less actively than strychnia, from which it may be distinguished not only by its different solubility, but by the red color which is imparted to it by nitric acid, and which changes to a fine violet on the addition of protochloride of tin. Like strychnia, it forms numerous salts.

Igasuria seems closely to resemble brucia in most respects. Little is known regarding *igasuric acid.*

Strychnia, brucia, and igasuria, occur not only in nux vomica, but in the seeds of *strychnos ignatii* (St. Ignatius's beans), and in the seeds and other parts of several plants of the genus *strychnos.* The amount of strychnia present in these substances varies from 0.5 to 1.5 per cent.

Nux vomica, according to the experiments of Marcet, acts on vegetables as a poison. His experiments were, however, confined to the haricot bean and the lilac. It is poisonous in a greater or lesser degree to most animals, though larger quantities are required to kill herbivorous than carnivorous animals. Thus, a few grains will kill a dog, but some ounces are required to destroy a horse. It is believed, however, that the bird called *buceros rhinoceros* eats the nuts with impunity; and a peculiar kind of *acarus* lives and thrives in the extract of the nuts. Dr. Pereira describes three degrees of the operation of this substance on man. 1. In very small doses, its effects are tonic and diuretic, and often slightly aperient. 2. In larger doses, there is a disordered state of the muscular system; the limbs tremble; a slight rigidity or stiffness is felt when an attempt is made to put the muscles in action; and the patient experiences a difficulty in keeping the erect posture. If the use of the medicine be continued, these effects increase in intensity, and the voluntary muscles are thrown into a convulsed state by very slight causes, as, for example, by inspiring more deeply than usual, or even by turning in bed. It is remarkable that in paralysis the effects are most marked in the paralyzed parts. 3. In poisoning doses, the symptoms are tetanus and asphyxia, followed by death. After swallowing a large dose of strychnia (on which the poisonous effects of nux vomica essentially depend), the following phenomena occurred in a case recorded by Taylor in his *Medical Jurisprudence:* "A young man, aged seventeen, swallowed forty grains of strychnia. The symptoms came on in about a quarter of a hour; lock-jaw and spasmodic contraction of all the muscles speedily set in, the whole body becoming as stiff as a board; the lower extremities were extended and stiff, and the soles of the feet concave. The skin became livid, the eyeballs prominent, and the pupils dilated and insensible; the patient lay for a few minutes without consciousness, and in a state of universal tetanus. A remission occurred, but the symptoms became aggravated, and the patient died asphyxiated from the spasm of the chest in about an hour and a half after taking the poison." It is difficult to say what is the smallest dose that would prove fatal to an adult. Thirty grains of the powdered nuts, given by mistake to a patient, destroyed life. Three grains of the extract have proved fatal; and in a case quoted by Taylor (*op. cit.*), half a grain of sulphate of strychnia caused death in 14 minutes.

The preparations of nux vomica are the powdered nuts, the extracts, the tincture, and strychnia; the alkaloid being usually preferable, in consequence of its more constant strength. In various forms of paralysis, especially where there is no apparent lesion of structure, nux vomica is a most successful remedy; although there are cases in which it is positively injurious. It is also of service in various affections of the stomach, such as dyspepsia, gastrodynia, and pyrosis. The average dose of the powder is two or three grains, gradually increased; that of the tincture, 10 or 15 minims; and that of the extract half a grain, gradually increased to two or three grains The dose of strychnia, when given in cases of paralysis, is at the commencement one-twentieth of a grain three times a day, the dose being gradually increased, till slight muscular twitchings are observed. For gastric disorders, a still smaller dose is usually sufficient, as, for example, one fortieth of a grain.

NYACK, a village in Rockland co., N. Y., on the Hudson river, 28 m. n. of New York, on the Northern railroad of New Jersey ; pop. '90, 4111. It is connected with New York city by steamboat, and with Tarrytown by ferry. It has Rockland college, daily and weekly newspapers, public library, Y. M. C. A., a number of summer hotels, a national bank, and manufactories of steam and sailing yachts, bicycles, paper, shoes, sleighs, carriages, sash and blinds; and ships milk and fruits.

NYAM-NYAM, a tribe of negroes in n. central Africa, s. of the country of Bongos, between 4° and 6° n. lat. and 24° and 29° e. long. Schweinfurth, who visited their country in 1870, describes them as cannibals, living in cone-shaped straw huts, and possessing some skill in the manufacture of iron and earthen wares. The number of their chiefs is large, and their authority almost absolute, but in every village there is a public place for the consideration and decision of public questions. They are thought by Schwein-

furth to have made a conquest of their present territory within a quite recent period. Though cannibals, they are more civilized than the surrounding tribes.

NYAN'ZA, Victoria, a great fresh water lake in central Africa, discovered by capt. Speke in 1858, explored by Speke and Grant in 1862, in about 0° 25′ n. to 3° s. and 31° 45′ to 34° 45′ e. The northern part belongs to the sphere of British influence, the southern part to that of German influence. The most authentic information that we have about the Victoria Nyanza is, however, derived from the exploration and circumnavigation of it by Stanley in 1875. The native name, Nyanza, signifies "the water." Its northern shore runs nearly parallel to the equator, and is about 20 m. to the n. of it. Its greatest length n. to s. is about 180 m., and greatest width e. to w. 208 m. Area 32,167 sq. m. Its greatest depth is 620 ft.; the surface is estimated at from 3,300 to 4240 ft. above sea-level. There are a number of islands near its shores, the chief of which are Ukerewe in the s.e., and Ugingo in the n.e. At its n.e. extremity, lake Victoria Nyanza has its outlet to the Nile by Ripon falls. The countries on the w. shores of the lake enjoy a mild and genial climate, and the rainfall is below that of many parts of Britain, being only 49 inches. The districts around the lake are among the most thickly populated in Africa. The most considerable tributary of the Victoria Nyanza is the Shimiyu (see Nile), which flows into its southern extremity in long. 33° 33′ e., other tributaries are, in the s.e. the Rubana, and in the w. the Kagera and Katonga. The Nile emerges from the n. end of the Victoria Nyanza at Napoleon bay, precipitating itself over the Ripon falls. Northwest from lake Nyanza was thought to lie what Speke called Lúta N'Zigé lake. This lake is now known as the Albert Nyanza (q. v.).

NYAS'SA, or Nyanja (apparently identical with name N'yanza), another lake in the interior of Africa, which Dr. Livingstone discovered in 1861 by ascending the river Shiré (q. v.). The southern end of the Nyassa, or Star Lake, is in lat. 14° 25′ s. and its northern end extends to the parallel of 9° 30′ s. The lake is upwards of 300 m. long, its average breadth being 25, and is 1570 ft. above sea-level. The first representatives of a mission on Nyassa, founded in honor of Dr. Livingstone, carried with them in sections a steamer of steel plates, which was successfully launched on the lake in 1875. None of the rivers flowing into Nyassa are navigable. The lake is in most parts very deep—in many places over 200 fathoms. To the east is a range of mountains 100 miles long, and ranging from 10,000 to 12,000 ft. over the lake. The scenery of Nyassa is described as grand in the extreme, though much of the land surrounding it is low and marshy. The Stevenson road connects the upper end of the lake with the southern end of Lake Tanganyika. If its surface were raised but 100 ft. its waters would fill the upper Shiré and thus flow into Lake Chilwa.

NYÂYA (from the Sanskrit *ni*, into, and *âya*, going, a derivative from *i*, to go; hence, literally, "entering," and, figuratively, "investigating analytically") is the name of the second of the three great systems of ancient Hindu philosophy; and it is apparently so called because it treats analytically, as it were, of the objects of human knowledge, both material and spiritual, distributed by it under different heads or topics; unlike, therefore, the *vedânta* (q.v.) and *sânkhya* (q.v.), which follow a synthetic method of reasoning, the former of these systems being chiefly concerned in spiritual and divine matters, and the latter in subjects relating to the material world and man. The Nyâya consists, like the two other great systems of Hindu philosophy (see Mîmânsâ and Sânkhya), of two divisions. The former is called Nyâya (proper), and will be exclusively considered in this article; the other is known under the name of Vais'eshika (q.v.). With the other systems or philosophy, it concurs in promising beatitude—that is, final deliverance of the soul from re-birth or transmigration—to those who acquire truth, which, in the case of the Nyâya, means a thorough knowledge of the principles taught by this particular system.

The topics treated of by the Nyâya are briefly the following: 1. The *pramân'a*, or instruments of right notion. They are: *a.* Knowledge which has arisen from the contact of a sense with its object; *b.* Inference of three sorts (*à priori*, *à posteriori* and from analogy); *c.* Comparison; and *d.* Knowledge, verbally communicated, which may be knowledge of "that whereof the matter is seen," and knowledge of "that whereof the matter is unseen" (revelation). 2. The objects or matters about which the inquiry is concerned (*prameya*). They are: *a.* The *Soul* (*âtman*). It is the site of knowledge or sentiment, different for each individual coexistent person, infinite, eternal etc. Souls are therefore numerous, but the supreme soul is one; it is demonstrated as the creator of all things. *b. Body* (*s'arîra*). It is the site of action, of the organs of sensation, and of the sentiments of pain or pleasure. It is composed of parts, a framed substance, not inchoative, and not consisting of the three elements, earth, water, and fire, as some say, nor of four or all the five elements (viz. air and ether in addition to the former), as others maintain, but merely earthy. *c. Organs of sensation* (*indriya*); from the elements, earth, water, light, air, and ether, they are smell, taste, sight, touch, and hearing. *d. Their objects* (*artha*). They are the qualities of earth, etc.—viz. odor, savor, color, tangibility, and sound. *e. Understanding* (*buddhi*), or *apprehension* (*upalabdhi*), or

conception (*jnâna*), terms which are used synonymously. It is not eternal, as the Sânkhya maintains, but transitory. *f. The organ of imagination and volition* (*manas*). Its property is the not giving rise simultaneously to more notions than one. *g. Activity* (*pravr'itti*), or that which originates the utterances of the voice, the cognitions of the understanding, and the gestures of the body. It is therefore oral, mental, or corporeal, and the reason of all worldly proceedings. *h. Faults* or *failings* (*dosha*), which cause activity—viz. affection, aversion, and bewilderment. *i. Transmigration* (*pretyabhâva*, literally, the becoming born after having died), or the regeneration of the soul, which commences with one's first birth, and ends only with final emancipation. It does not belong to the body, because the latter is different in successive births, but to the soul, because it is eternal. *k. Fruit* or *retribution* (*phala*), or that which accrues from activity and failings. It is the consciousness of pleasure or of pain. *l. Pain* (*duh'kha*), or that which has the characteristic mark of causing vexation. It is defined as "the occurrence of birth," or the originating of "body," since body is associated with various kinds of distress. Pleasure is not denied to exist, but, according to the Nyâya, it deserves little consideration, since it is ever closely connected with pain. *m. Absolute deliverance* or *emancipation* (*apavarga*). It is annihilation of pain, or absolute cessation of one's troubles once for all.

After (1) "instruments of right notion," and (2) "the objects of inquiry," the Nyâya proceeds to the investigation of the following topics.

3. *Doubt* (*sam's'aya*). It arises from unsteadiness in the recognition or non-recognition of some mark, which, if we were sure of its presence or absence, would determine the subject to be so or so, or not to be so or so; but it may also arise from conflicting testimony. 4. *Motive* (*prayojana*), or that by which a person is moved to action. 5. *A familiar case* (*dr'ish'tânta*), or that in regard to which a man of an ordinary and a man of a superior intellect entertain the same opinion. 6. *Tenet* or *dogma* (*siddhânta*). It is either "a tenet of all schools," i.e., universally acknowledged, or "a tenet peculiar to some school," i.e., partially acknowledged; or "a hypothetical dogma," i.e., one which rests on the supposed truth of another dogma; or "an implied dogma," i.e., one the correctness of which is not expressly proved, but tacitly admitted by the Nyâya. 7. The different members (*avayava*) of a regular argument or *syllogism* (*nyâya*). 8. *Confutation* or reduction to absurdity (*tarka*). It consists in directing a person who does not apprehend the force of the argument as first presented to him, to look at it from an opposite point of view. 9. *Ascertainment* (*nirn'aya*.) It is the determination of a question by hearing both what is to be said for and against it, after having been in doubt. The three next topics relate to the topic of controversy, viz., 10. *Discussion* (*vâda*), which is defined as consisting in the defending by proofs on the part of the one disputant, and the controverting it by objections on the part of the other, without discordance in respect of the principles on which the conclusion is to depend; it is, in short, an honest sort of discussion, such, for instance, as takes place between a preceptor and his pupil, and where the debate is conducted without ambition of victory. 11. *Wrangling* (*jalpa*), consisting in the defense or attack of a proposition by means of tricks, futilities, and such like means; it is therefore a kind of discussion where the disputants are merely desirous of victory, instead of being desirous of truth. 12. *Caviling* (*vitan'd'â*), when a man does not attempt to establish the opposite side of the question, but confines himself to carping disingenuously at the arguments of the other party. 13. *Fallacies*, or semblances of reasons (*hetvâbhâsa*), five sorts of which are distinguished, viz., the erratic, the contradictory, the equally available on both sides, that which, standing itself in the need of proof, does not differ from that which is to be proved, and that which is adduced when the time is not that when it might have availed. 14. *Tricks*, or unfairness in disputation (*chhala*), or the opposing of a proposition by means of assuming a different sense from that which the objector well knows the propounder intended to convey by his terms. It is distinguished as verbal misconstruing of what is ambiguous, as perverting, in a literal sense, what is said in a metaphorical one, and as generalizing what is particular. 15. *Futile objections* (*jâti*), of which twenty-four sorts are enumerated; and, 16. Failure in argument or reason of defeat (*nigraha-sthâna*), of which twenty-two distinctions are specified.

The great prominence given by the Nyâya to the *method*, by means of which truth might be ascertained, has sometimes misled European writers into the belief, that it is merely a system of formal logic, not engaged in metaphysical investigations. But though the foregoing enumeration of the topics treated by it could only touch upon the main points which form the subject-matter of the Nyâya, it will sufficiently show that the Nyâya intended to be a complete system of philosophical investigation; and some questions, such as the nature of intellect, articulated sound, etc., or those of genus, variety, and individual, it has dealt with in a masterly manner, well deserving the notice of western speculation. That the atomistic theory has been devolved from it, will be seen under the article VAIS'ESHIKA. On account of the prominent position, however, which the *method* of discussion holds in this system, and the frequent allusions made by European writers to a Hindu syllogism, it will be expedient to explain how the Nyâya defines the "different members of a syllogism" under its seventh topic. A regular argument consists, according to it, of five members—viz., *a.* the proposition (*pratijnâ*), or the declaration of what is to be established; *b.* the reason (*hetu*), or "the means for the establishing of what is to be established;" *c.* the *example* (*udâharan'a*), i.e. some familiar case illustrating the fact to be established, or, inversely, some familiar case illustrating

the impossibility of the contrary fact; *d.* the application (*upanaya*), or "restatement of that in respect of which something is to be established;" and *e.* the conclusion (*nigamana*), or "the re-stating of the proposition because of the mention of the reason." An instance of such a syllogism would run accordingly thus: *a.* This hill is fiery, *b.* for it smokes, *c.* as a culinary hearth, or (inversely) not as a lake, from which vapor is seen arising, vapor not being smoke, because a lake is invariably devoid of fire; *d.* accordingly, the hill is smoking; *e.* therefore, it is fiery.

The founder of the Nyâya system is reputed under the name of *Gotama*, or, as it also occurs, *Gautama* (which would mean a descendant of Gotama). There is, however, nothing as yet known as to the history of this personage or the time when he lived, though it is probable that the work attributed to him is, in its present shape, later than the work of the great grammarian Pân'ini. It consists of five books or *Adhyâyas*, each divided into two "days," or diurnal lessons, which are again subdivided into sections or topics, each of which contains several aphorisms, or *Sûtras*. See SÛTRA. Like the text-books of other sciences among the Hindus, it has been explained or annotated by a triple set of commentaries, which, in their turn, have become the source of more popular or elementary treatises.—The Sanskrit text of the Sûtras of Gotama, with a commentary by *Vis'wanâtha*, has been edited at Calcutta (1828); and the first four books, and part of the fifth, of the text, with an English version, an English commentary, and extracts from the Sanskrit commentary of Vis'wanâtha, by the late Dr. J. R. Ballantyne (Allahabad, 1850–54). This excellent English version and commentary, and the celebrated Essay on the Nyâya, by H. T. Colebrooke (*Transactions of the Royal Asiatic society*, vol. i. Lond. 1827; and reprinted in the *Miscellaneous Essays*, vol. i. Lond. 1837), are the best guide for the European student who, without a knowledge of Sanskrit, would wish to familiarize himself with the Nyâya system.

NYBORG, a t. in Denmark, 17 m. e.s.e. of the city of Odense on the e. coast of Fünen, an island of the Baltic; pop. '90, 6049. It is fortified, has a strong citadel, and here the Sound dues were paid by passing ships before the exclusive right of Denmark to the entrance of the Baltic was extinguished by purchase. The place contains ruins of the ancient palace of the kings of Denmark, a hospital, infirmary and dockyards. Near the walls occurred, in 1659, the great victory of the Danes over the Swedes.

NYCTAGINA'CEÆ, a natural order of exogenous plants, consisting partly of herbaceous plants, both annual and perennial, and partly of shrubs and trees. Lindley ranks them in his *Chenapodal alliance*. The flowers are either clustered or solitary, and either the cluster or the flower often has an involucre, which is often gayly colored. The perianth is tubular, plaited in bud, colored; the limb entire or toothed, deciduous. The stamens are equal in number to the lobes of the perianth. The ovary is superior, with one ovule, and one style. The fruit is a thin *caryopsis*, inclosed within the enlarged and indurated base of the perianth. There are about 100 known species, natives of warm countries. Some have flowers of considerable beauty, as those of the genus *mirabilis*, known in our gardens as *Marvel of Peru*, one of which, *M. Jalapa*, was at one time erroneously supposed to produce jalap. The roots of many are fleshy, purgative, and emetic. Those of *Boerhaavia paniculata* are used instead of ipecacuanha both in Guiana and in Java.

NYCTALO'PIA AND HEMERALOPIA. Terms employed for affections of the eye, and which have been indiscriminately employed. Mr. Lawrence, an English surgeon, and one of the pioneers in scientific ophthalmology, says: "A great confusion has arisen in the application of these learned terms, each word being nearly as often used to express one affection as the other. Hippocrates used the term hemeralopia to denote night-blindness, and we may as well follow his example." And this is good etymology, for nyctalopia signifies "I see by night," while hemeralopia signifies "I see by day." Still it is not uncommon for nyctalopia to be defined as "night-blindness." "Hemeralopia," says Mr. Lawrence, "is that state of vision in which the patient sees well during the day, but imperfectly as twilight comes on; and when the affection is fully formed he loses his sight entirely at the approach of night, not being able to see a lighted candle brought close to the eye. In the commencement of the affection the person can see by moonlight, or when the room is lighted by a candle, but as it proceeds he can discern nothing after sunset; in the morning vision returns. There is no unnatural appearance in the eye; indeed if a person can see perfectly during the day, the organ can have undergone no important change (structural). There is little increased irritability in the commencement, but as the affection proceeds the pupil becomes rather dilated. The duration of the disease varies from one night to six or twelve months, or even longer. More generally it lasts from two weeks to three or six months, when left to itself. Relapses are frequent so long as persons remain exposed to the exciting cause, which seems to be the exhaustion of the power of the retina by exposure to strong light during the day." The disease is most prevalent in hot climates, and where there is much glare of sunlight, as in the East and West Indies. It is not also infrequent in high latitudes where the snow reflects the sun's rays for a great many hours during the day. Dr. Matthew Guthrie states that peasants in the interior of Russia are subject to it, where it is called *kieritsha slepotæ*, or hen blindness, and occurs during the harvest in June and July. He also says that several hundred Russian soldiers in the war in Finland were attacked by the affection. It has been recorded as occurring epidemically, and an instance is related in the 8th vol. of

the *Dublin Journal* of medical and chemical science of such an epidemic among some Prussian soldiers stationed on the Rhine; but Mr. Lawrence observes that all the cases which he had seen commenced in the East or West Indies and were brought to England. Mackenzie, another high British authority, says that the disease does not appear to be necessarily connected by any constitutional symptoms, and Mr. Bampfield, in the *British Medico-chirurgical Transactions*, states that of more than three hundred cases in his practice in different parts of the globe, but chiefly in the East Indies, all perfectly recovered. The prognosis is, therefore, very favorable. In some instances night-blindness, or hemeralopia, is congenital. Richter relates three cases in a family of nine children. The only abnormal appearance of the eyes was the excessive dilation of the pupils after sundown. When the account was given these children had reached the age of from 20 to 30 years, without any alteration in their sight. One of them had never seen any stars. Dr. Cunier, of Ghent, relates some remarkable cases of hereditary hemeralopia (*Annales de la société de médecine de Gand* 1840). In the official capacity of an army surgeon, in the case of a conscript claiming exemption from night-blindness, Dr. Cunier made an examination in the commune of Vendémain, near Montpellier, and reported upon information and observation that one Jean Nougaret was the first of the family known to be hemeralopic; his children, one daughter, and two sons, were all affected with night-blindness. The second generation included 16 individuals of whom ten were thus affected; in the third generation there were 14 out of 81; in the fourth 23 in 208; in the fifth, not then completed, 24 in 218; in the sixth, including 103 persons, there were 11. But one of the remarkable facts in the case, and worthy of much consideration by those studying the subject of heredity, because varying in this respect from most hereditary laws, is that among all these descendants, numbering more than 600, and of whom nearly one-seventh were affected with night-blindness, there was not a single case in those families where both parents were free from the affection; that is, there was no intermediate transmisssion. *Nyctalopia*, or "night-seeing" (day-blindness) is a state opposite to hemeralopia, and is a disease of a very different nature. Mr. Lawrence states that in opacity of the cornia, in certain forms of cataract, in incipient opacity of the lens, in central opacity of the capsule, in contractions of the pupil from prolapse of the iris, the patient will often see best in a weak light, and find vision very imperfect in a strong light. In scrofulous affections of the eyes (strumous ophthalmia) the intolerance to light amounts to blindness during the day, while in the evening, with a faint light the patient sees quite well. Albinos are frequently nyctalopic, the absence of pigmentum nigrum, rendering the eye extremely sensitive, from its want of absorptive power. Barron Larrey records a remarkable case of day blindness, occurring in an old man, one of the galley slaves at Brest, who had been shut up in a subterranean dungeon 33 years. He had become so affected that he could only see in a shady light. As this condition is generally accompanied with some observable affection of the ocular apparatus its treatment will vary with circumstances.

NYCTERIBIA, an extremely curious genus of insects, ranked in the order *diptera*, although very different from most of that order, and having neither wings nor balancers. Its nearest alliance is with *hippoboscidæ* (see FOREST FLY and SHEEP-LOUSE), which it resembles particularly in parasitic habits, and in the retention of the eggs within the abdomen of the female, until they have not only been hatched, but have passed from the larva into the pupa state. The form, however, is so spider-like, that these insects were at first ranked among the *arachnida*. The few species known are all parasitic on bats, on which they run about with great activity. The head is very small, curiously affixed to the back of the thorax, and when the creature sucks the blood of the bat, upon which it lives, it places itself in a reversed position.

NYCTICEBINÆ, a sub-family of lemuroid monkeys. They are distinguished from the rest of the family by their very short tails. There are two African and two Asiatic genera. The African genera are *perodicticus*, or the potto, and *arctocebus*, or the angwantibo. The Asiatic genera are the slender lemur (*loris*), and the slow lemur (*nycticebus*). In all these four genera the fore-finger of each hand is short, and in the potto it is rudimentary, so that each hand has but three fingers. They are inactive during the day, but at night prowl stealthily among the branches in search of food, which consists principally of insects and small birds. They also eat eggs and fruit. When irritated during their period of repose in the day their motions are very slow, and they utter a cry similar to that of the American sloths. They have a very tenacious grasp, ascribed by some to a peculiar mechanical arrangement of the muscles and tendons by which the mere stretching of the leg causes the toes to flex and produce a tight grasp. Others attribute it to the power of continuing muscular contraction, and this idea seems to be strengthened by the observations of sir Anthony Carlisle, who injected the arterial system of a *nycticebus tardigradus* and found a very peculiar and abundant distribution of blood vessels to the limbs. The axillary artery divided into 23 equal-sized cylinders, surrounding the principal trunk, and passing down the arm, each cylinder was found distributed to an individual muscle in the fore-arm. A similar distribution takes place in the lower or hind limbs. In this species there is also a remarkable peculiarity in the tongue, which is double. Beneath the principle tongue, which somewhat resembles a cat's, there is another tongue, white colored, narrow, and very sharp pointed, which is used with the

upper tongue in catching flies and in eating, but which the animal has the power of retaining in the mouth while the other tongue is in use. Dental formula $i\ \frac{2-2}{2-2}$; $c\ \frac{1-1}{1-1}$; $pm\ \frac{3-3}{3-3}$; $m\ \frac{3-3}{3-3} = 36$. The limbs are nearly equal in size, the ears are short and rounded, the eyes large and staring, and placed close together.

NYE, a co. in Nevada, bounded on the s.w. by California, drained by Amargoza and Reese rivers; 16,908 sq.m.; pop. '90, 1290. Co. seat, Belmont.

NYE, Edgar Wilson (pseudonym, Bill Nye), humorist, was born in Maine, Aug. 25, 1850. His childhood was passed in Wisconsin, where he also studied law, and was admitted to the bar in Wyoming in 1876. Here he was a member of the legislature, post-master, and newspaper correspondent. On account of ill-health he returned to Wisconsin in 1883, and settled in New York in 1886. He was a popular lecturer, newspaper contributor, and also published several humorous books, among them, *Baled Hay; Chestnuts* and *Forty Liars* (all 1887); *Thinks* (1888); and in collaboration with James Whitcomb Riley, *Railroad Guide* (1888) and *Fun, Wit, and Humor* (1889). A play founded on his western life, entitled *The Cadi*, was produced in New York in 1891. See also a series of articles in the *Century* for 1891–92. He died Feb. 22, 1896.

NYE, James Warren, 1814–76; b. Madison co., N. Y., where he was reared on a farm, received a common school education, studied law and commenced practice. While quite young he was elected district attorney and co. judge. In 1848 he was the anti-slavery candidate for congress in the same district, and defeated. Then he removed to Syracuse. In 1860 he was state police commissioner in the city of New York; was appointed governor of Nevada by President Lincoln in 1861; when Nevada became a state he was elected a U. S. senator from it for six years, ending Mar. 3, 1873. As a public speaker he was distinguished for his contagious humor, and in private for his genial disposition. On his retirement from the senate his mind was impaired. He died at White Plains, N. Y., Dec. 25, 1876.

NY'KERK, or Nieuwkerk, on the Veluwe, is a very flourishing and well-built t. near the Zuyder Zee, inthe province of Gelderland, Netherlands, 10 m. s.w. of Harderwyk. It has a good harbor, which is connected with the sea by a wide canal of $1\frac{1}{2}$ m. in length. In the neighborhood are fine rich meadow-pastures and lands suited for all kinds of grain, tobacco, potatoes, etc. Tobacco is extensively grown; many cattle are raised; and a brisk trade carried on both with the surrounding country and Amsterdam, the market to which the cattle, tobacco, dairy, and other agricultural produce, together with much firewood, are sent. Nykerk has a handsome Reformed church, a Roman Catholic chapel, a synagogue, orphan-house, and good schools. There are several manufactures carried on, which also give employment to the people. In Netherlands' church history, Nykerk is famed as the place where a great religious movement began at the middle of last century. The history of the movement, which spread throughout the land, contains all the marks of the later revivals in America, Scotland, and Ireland. See Ypey and Dermout's *Geschiedenis der Nederd. Her. Kerk*, vol. iv.

NY'KÖPING, a seaport of Sweden, pleasantly situated on the Baltic, cap. of the province of Södermanland, 60 m. s.w. of Stockholm. It comprises among its manufacturing products cotton goods, stockings, tobacco, etc., and has good ship-yards, mills, and manufactories for machinery, especially steam-engines for steamboats and locomotives. The port is 13 ft. deep at its entrance, and has 1213 ft. of quayage. The ruined old castle of Nyköping, nearly destroyed by fire in 1665, and which ranked in point of strength next to those of Stockholm and Calmar, has experienced many eventful vicissitudes of fortune. King Valdemar of Sweden, after his dethronement in 1288, was imprisoned here till his death in 1302; but the most tragic incident connected with Nyköping castle was the horrible death within its walls of the dukes Eric and Valdemar, who, after being entrapped by their pusillanimous brother, King Birger, in 1317, were left to perish of hunger in a dungeon, the keys of which the king threw into the sea before he left the castle. The horror of this deed roused the indignation of the people, who seized upon the castle, sacked it, and demolished its keep and donjons. In 1719 the town was taken and dismantled by the Russians; and since then it has ceased to be the scene of any events of historical interest. Pop. '90, 5978.

NYL-GHAU, *Antilope picta*, or *Portax tragocamelus*, a species of antelope, with somewhat ox-like head and body, but with long slender limbs, and of great activity and fleetness. It is one of the largest of antelopes, and is more than four feet high at the shoulder. The horns of the male are about as long as the ears, smooth, black, pointed, slightly curved forwards. The female has no horns. The neck is deep and compressed, not rounded as in most of the antelopes. A slight mane runs along the neck and part of the back, and the breast is adorned with a long hanging tuft of hair. The back is almost elevated into a hump between the shoulders. The Nyl-ghau inhabits the dense forests of India and Persia, where it has long been regarded as one of the noblest kinds of game. It is often taken, like other large animals, by the inclosing of a large space with nets, and by great numbers of people. It is a spirited animal and dangerous to a rash assailant. It is capable of domestication, but is said to manifest an irritable and capricious temper.

NYMPHÆA'CEÆ, a natural order of exogenous plants, growing in lakes, ponds, ditches, and slow rivers, where their fleshy root-stocks are prostrate in the mud at the bottom; and their large, long-stalked, heart-shaped, or peltate leaves float on the surface of the water. Their flowers also either float or are raised on their stalks a little above the water. The flowers are large, and often very beautiful and fragrant. There are usually four sepals, and numerous petals and stamens, often passing gradually into one another. The ovary is many-celled, with radiating stigmas, and very numerous ovules, and is more or less surrounded by a large fleshy disk. The seeds have a farinaceous albumen. More than fifty species are known, mostly natives of warm and temperate regions. The root-stocks of some of them are used as food, and the seeds of many.—See WATER-LILY, LOTUS, VICTORIA, and EURYALE.—Very nearly allied to Nymphæaceæ are *Nelumbiaceæ*. See NELUMBO.

NYMPHS, in classic mythology, female divinities of inferior rank, inhabiting the sea, streams, groves, meadows and pastures, grottoes, fountains, hills, glens, trees, etc. Among the nymphs, different classes were distinguished, particularly the *Oceanides*, daughters of Oceanus (nymphs of the great ocean which flows around the earth), the *Nereids*, daughters of Nereus (nymphs of the inner depths of the sea, or of the inner sea —the Mediterranean), *Potameides* (river nymphs), *Naiads* (nymphs of fountains, lakes, brooks, wells), *Oreades* (mountain nymphs), *Dryads* or *Hamadryads* (forest nymphs, who were believed to die with the trees in which they dwelt). They were the goddesses of fertilizing moisture, and were represented as taking an interest in the nourishment and growth of infants, and as being addicted to the chase (companions of the divine huntress Diana), to female occupations, and to dancing. They are among the most beautiful conceptions of the plastic and reverent (if credulous) fancy of the ancient Greeks, who, in the various phenomena of nature—the rush of sea-waves, the bubble of brooks, the play of sunbeams, the rustle of leaves, and the silence of caves—felt, with a poetic vividness that our modern science will hardly permit us to realize, the presence of unseen joyous powers. See illus., MYTHOLOGY, vol. X.

NYS'SA. See TUPELO.

NYS'TAD, a t. of Finland, on the eastern coast of the gulf of Bothnia, 50 m. s. of Björneborg. Pop. '90, 3908. Here in 1721, a treaty was agreed to, between Russia and Sweden, by virtue of which all the conquests of Peter the Great along the coasts of the gulf of Finland were annexed to Russia.

O

O, THE fifteenth letter in the English and in most western alphabets, is one of the five simple vowel signs of the English language. As the language is at present pronounced, it stands for at least four distinct sounds, heard in the words *note, nōr*, (nŏt), *move, son*. The primary and simple sound of O is that heard long in *nōr*, and short in *nŏt, tŏp*. The sound given to it in such words as *note, go*, is really a diphthong—a long *o* terminating in a slight *u* or *oo* sound (o-u). The corresponding letter in the Hebrew and Phenician alphabet (q.v.) was called Ayn, i.e., "eye;" and accordingly the primitive form of the Phenician letter was a rough picture of an eye, which naturally became a circle with a dot in the center—still to be seen in some ancient inscriptions—and then a simple circle.

O', a prefix in many Irish family names, serves to form a patronymic, like *Mac* in Gaelic names; as O'Brien, a descendant of Brien. By some, it is considered to be derived from *of;* but it is more likely from Ir. *ua*, Gael. *ogha*, a grandson. In the Lowland Scottish the word *oe* is used for grandson, and in some localities for nephew.

OA'HU, one of the Sandwich islands (q.v.).

OAJA'CO, or OAXACA, a Mexican state, bounded s. by the Pacific, e. by Tehuantepec and the gulf of Tehuantepec, w. and n. by Puebla and Vera Cruz; 35,382 sq. m.; pop. in '95, 882,529. La Verda is the only river of consequence. The surface is almost entirely made up of mountains and table-lands and the climate is remarkably fine; the rainfall is large, and the heat less oppressive than in most other states of Mexico. The products of the soil are greatly varied; cochineal and indigo are the chief exports, and wheat, coffee, sugar, tobacco, cotton, cocoa, honey, plantains, and fruit of all kinds are found. Gold and silver mines exist, but are of little importance. Capital, Oaxaca.

OAJA'CO, OAXACA, or GUAXACA, a city of Mexico, capital of a state of the same name, stands on the river Atoyac, 210 m. s.s.e. of Mexico. Founded in 1582, it is well built, with open streets, interspersed with plantations, on which the cochineal insect feeds and had, '94, 27,856 inhabitants. Cigars, cotton, sugar, and chocolate are manufactured.

OAK, *Quercus*, a genus of trees and shrubs of the natural order *cupuliferæ*, having a three-celled ovary, and a round (not angular) nut—which is called an *acorn*—placed in

a scaly truncated cup, the lower part of it invested by the cup. The species are very numerous, natives of temperate and tropical countries. A few species are found in Europe. North America produces many; and many are natives of mountainous regions in the torrid zone; some are found at low elevations in the valleys of the Himalaya, some even at the level of the sea in the Malay peninsula and Indian islands. But in the peninsula of India and in Ceylon none are found; and none in tropical Africa, in Australia, or in South America. The oaks have alternate simple leaves, which are entire in some, but in the greater number variously lobed and sinuated or cut; evergreen in some, but more generally deciduous. Many of them are trees of great size, famous for the strength and durability of their timber, as well as for the majesty of their appearance, and their great longevity. Throughout all parts of Europe, except the extreme n., two species are found, or varieties of one species, the COMMON OAK (*Q. robur*); one (*Q. pedunculata*) having the acorns on longish stalks, the other (*Q. sessiliflora*) having them almost without stalks. Other differences have been pointed out, but they are regarded by some of the most eminent and careful botanists as merely accidental, and not coincident with these; while, as to the length of the fruit-stalks, every intermediate gradation occurs. Both varieties occur in Britain, the first being the most prevalent, as it is generally in the n. of Europe; the second being more abundant in more southern countries. The short-stalked oak is sometimes called DURMAST OAK in England. It has been much disputed which is entitled to be considered the true British oak; and much alarm has occasionally been expressed lest new plantations should be made of the wrong kind; whilst the most contradictory statements have been made as to the comparative value and characters of the timber. The oak succeeds best in loamy soils, and especially in those that are somewhat calcareous. It cannot endure stagnant water. It succeeds well on soils too poor for ash or elm; but depends much on the depth of the soil, its roots penetrating more deeply than those of most other trees. Noble specimens of oak trees, and some of them historically celebrated, exist in almost all parts of Britain; but are much more frequent in England than in Scotland. The former existence of great oak forests is attested by the huge trunks often found in bogs. The oak attains a height of from 50 to 100 or even 150 or 180 ft.; the trunk being 4, 6, or even 8 ft. in diameter. It sometimes grows tall and stately, but often rather exhibits great thickness of bole and magnitude of branches. It reaches its greatest magnitude in periods varying from 120 to 400 years, but lives to the age of 600, or even 1000. The timber is very solid, durable, peculiarly unsusceptible of the influence of moisture, and, therefore, eminently adapted for ship-building. It is also employed in carpentry, mill-work, etc.—The bark abounds in tannin; it also contains a peculiar bitter principle called *quercine*, and is used in medicine, chiefly in gargles, etc., on account of its astringency, sometimes also as a tonic; it is used along with gall-nuts in the manufacture of ink; but most of all for tanning (see BARK), and on this account the oak is often planted as copse-wood (see COPSE) in situations where it cannot be expected to attain to great size as a tree. The timber of copse oak is excellent fire-wood. The oak is particularly fitted for copse-wood, by the readiness with which it springs again from the stools after it has been cut. Acorns are very nourishing food for swine, and in times of scarcity have been often used for human food, as, indeed, they commonly are in some very poor countries, either alone or mixed with meal. The bitterness which makes them disagreeable is said to be in part removed by burying them for a time in the earth. The acorns of some trees are also much less bitter than others, and oaks of the common species occur which produce acorns as sweet as chestnuts. Other varieties of the common oak are assiduously propagated by nurserymen as curious and ornamental, particularly one with pendulous branchlets (the *weeping oak*), and one with branches growing up close to the stem, as in some kinds of poplar. Among the Greeks and Romans the oak was sacred to Zeus or Jupiter; and it has been connected with the religious observances of many nations, as of the ancient Celts and Germans.—The TURKEY OAK or ADRIATIC OAK (*Q. cerris*), now very frequently planted in Britain, is a large and valuable tree, very common in the s.e. of Europe, and in some parts of Asia. The timber is imported in considerable quantity into Britain for ship-building and other purposes. The leaves differ from those of the common oak in their acute lobes, and the cups of the acorns are *mossy*, i.e., have long, loose, acute scales. Similar to this, in both these respects, are the AUSTRIAN OAK (*Q. Austriaca*), abundant near Vienna, and the SPANISH OAK (*Q. Hispanica*).—The CORK OAK or CORK-TREE (*Q. suber*) is noticed in the article CORK; the HOLM OAK or EVERGREEN OAK (*Q. ilex*), another of the species found in the s. of Europe, in the article ILEX. Of the North American oaks, some are very valuable as timber trees. Perhaps the most important is the WHITE OAK or QUEBEC OAK (*Q. alba*), a large tree, the leaves of which have a few rounded lobes. It is found from the gulf of Mexico to Canada; and in some places forms the chief part of the forest. The timber is less compact than that of the British oak; that of young trees is very elastic.—The OVERCUP OAK (*Q. lyrata*), a majestic tree, highly esteemed for its timber, and having its acorns almost covered by their globular cup, grows chiefly in lands liable to inundation in the southern states.—The CHESTNUT-LEAVED WHITE OAK (*Q. prinus*) is also a much-esteemed timber tree of the southern states.—The SWAMP WHITE OAK (*Q. bicolor*), a closely allied species, extends further north.—The LIVE OAK (*Q. virens*), an evergreen species, with entire leathery leaves, is regarded as a tree of the first importance in the United States, from

the excellence of its timber and its value for ship-building, so that efforts have been made by the government to protect it and to promote the planting of its acorns. Yet it is not a very large tree, being seldom more than 45 ft. in height, with a trunk of 2 ft. in diameter. It grows on the coasts of the gulf of Mexico, and as far north as Virginia. It once abounded on the Sea islands, now so celebrated for their cotton.—The RED OAK (*Q. rubra*), a large tree with sinuated and lobed leaves, the lobes toothed and bristle-pointed, yields great part of the *red oak staves* exported from Canada and the n. of the United States to the West Indies; but *red oak staves* are also produced in the middle and southern states by the SCARLET OAK (*Q. coccinea*), a very similar species, by the BLACK OAK or QUERCITRON OAK (*Q. tinctoria*), another species with the lobes of the leaves bristle-pointed, better-known for the dye-stuff which its bark yields (see QUERCITRON), and by the willow oak (*Q. phellos*), a large tree with lanceolate leaves and a willow-like aspect. The timber of all these species is of very inferior quality. These are the American oaks of greatest economical and commercial importance, but there are numerous other species, some of them trees, some mere shrubs, of which some grow on poor soils, and cover them in compact masses; resembling in this a single European species (*Q. viminalis*), a native of the Vosges, 6 to 8 ft. high, with slender, tough branches, which makes excellent hedges.—The BLACK JACK (*Q. nigra*) is an American oak, chiefly notable for the abundance in which it grows on some of the poorest soils. It is a small tree, and its timber of little value. The bark is black.—Some of the Nepaulese oaks are large and valuable trees, as are some of those of China and Japan, of Java, of Mexico, etc. The oaks of Java and the other Indian islands have generally the leaves quite entire.—The bark of most of the species of oak is capable of being used for tanning, and is used in different countries. The cups and acorns of the VALONIA OAK (*Q. ægilops*) are exported from the Morea and other parts of the Levant in great quantities for this purpose, under the name of *valonia*. See LEATHER. The tree resembles the Turkey oak, and has very large hemispherical mossy cups. The cups are said to contain more tannin than any other vegetable substance.—Galls (q.v) or gall-nuts are in great part obtained from the oak, therefore called the GALL-OAK (*Q. infectoria*), a scrubby bush, a native of Asia Minor, with bluntly serrated, ovate-oblong leaves.—The KERMES OAK (*Q. coccifera*), on the leaves of which the kermes (q.v.) insect is found, is a low bush, with evergreen spinous leaves, much resembling a holly, a native of the s.e. of Europe.—Of oaks with sweet and edible acorns, may be mentioned the BALLOTE OAK (*Q. ballota* or *gramuntia*), an evergreen with round spiny-toothed leaves, a native of the n. of Africa, the acorns of which are regularly brought to market in Algeria and in Spain, and are long and cylindrical; the Italian oak (*Q. æsculus*), closely allied to the common oak; and the DWARF CHESTNUT OAK (*Q. chinquapin* or *prinoides*) of North America, a small shrubby species, which has been specially recommended to cultivation on this account. Other North American species, and some of the Himalayan species, also produce edible acorns. From the acorns of some species, oil is made in considerable quantity in different parts of the world, and is used in cookery.—The leaves of the manna oak (*Q. mannifera*)—a native of the mountains of Kurdistan, having oblong, blunt-lobed leaves—secrete in hot weather a kind of manna, a sweet mucilaginous substance, which is made into sweetmeats, and very highly esteemed.

The name oak is sometimes popularly applied to timber trees of very different genera. Thus, AFRICAN OAK is another name of African teak. See TEAK. Some of the species of *casuarina* (q.v.) are called oak in Australia. The STONE OAK (*lithocarpus Javenensis*) of Java, so named from the extreme hardness of its timber, is a tree of the same family with the true oaks. See illus., BOTANY, vol. II., figs. 20, 33; HAZEL, vol. VII., fig. 4.

OAK APPLE. See GALL-FLY; GALLS.

OAK BEAUTY, *Biston prodromaria,* a moth of the family *geometridæ*, a native of England, about an inch and a half or two inches in expanse of wings; the upper wings with two brown curved bands, and margined with black, the lower wings with one brown band. The caterpillar feeds on the oak.

OAKES, URIAN, D.D., 1631–81; b. England. He emigrated to Massachusetts in 1634, graduated at Harvard in 1649, and published at Cambridge a set of astronomical calculations while quite young. He accepted a pastorate at Fitchfield, Eng., which his nonconformist views compelled him to relinquish in 1662, and later he preached to another congregation. On account of his learning and piety, he was chosen pastor of the church in Cambridge, whither he returned, commencing his labors in 1671. He accepted the presidency of Harvard college in 1675, being formally installed five years later; and held this position until his death.

OAK'HAM, the county-town of Rutlandshire, Eng., in the vale of Catmos, 25 m. w.n.w. of Peterborough. It is a station on the Syston and Peterborough branch of the Midland railway. In former times, there was a castle here; it is now in ruins with the exception of the portion used as the county-hall. The church, the interior of which was beautifully restored in 1858, is an edifice in the perpendicular style, and has a fine tower and spire. It has manufactures of boots, shoes and fancy hosiery. Pop. '91, 3,542.

OAKLAND, a co. in s.e. Michigan, drained by the Clinton, and branches of the Huron and Flint rivers; crossed by the Detroit, Grand Haven, and Milwaukee, and several other

railroads; 900 sq. m.; pop. '90, 41,245. The surface in the northern portion is undulating, and numerous small lakes diversify it; in most parts the soil is fertile, and in good cultivation; about a quarter of the county is still covered with forests. Wheat, Indian corn, oats, live stock, and butter, are the chief productions; it contains flour mills, carriage, saddlery, plaster and casting manufactories. Co. seat, Pontiac.

OAKLAND, city and co. seat of Alameda co., Cal.; on San Francisco bay and the California and Nevada and the Southern Pacific railroads; opposite and 7 miles e. of San Francisco. The city takes its name from a grove of majestic evergreen oaks in which it was first built, but beyond which it now extends. It is a favorite residence for the merchants of San Francisco, and has many drives, fine scenery and a healthy climate. It is supplied with water from a stream 5 m. distant, and with gas and electric lights. San Antonio creek, on the s. front, forms a harbor for the city. A pier runs along the water front, a distance of 2 m. into the bay; on it are warehouses, docks, a carriage way, and the rails of the Southern Pacific railroad, which connects with the ferry for San Francisco. The city has California college (Bapt.); St. Vincent's college (R. C.); a normal and special training school; convent of Our Lady of the Sacred Heart; Field seminary; Snell seminary; Pacific theological seminary (Cong.); St. Mary's college; public, public school, and several college libraries; national, state, and savings banks; electric street railroads; manufactories of windmills and carriages; planing, quartz, and flour mills; cordage and jute factories; marble, iron, smelting and metallurgical works; and many daily, weekly, and monthly periodicals. Pop. '90, 48,682.

OAK'UM, a tangled mass of tarred hempen fibers, is made from old rope by untwisting the strands and rubbing the fibers free from each other. Its principal use is in caulking (q.v.) the seams between planks, the space round rivets, bolts, etc., for the purpose of preventing water from penetrating.

OANNES, the name of a Babylonian god, who, in the first year of the foundation of Babylon, is said to have come out of the Persian gulf, or the old Erythræan sea, adjoining Babylon. He is described as having the head and body of a fish, to which were added a human head and feet under the fish's head and at the tail. He lived amongst men during the day-time, without, however, taking any food, and retired at sunset to the sea, from which he had emerged. Oannes had a human voice, and instructed men in the use of letters, and in all the principal arts and sciences of civilization, which he communicated to them. Such is the account of him preserved by Berosus and Apollodorus. Five such monsters are said to have come out of the Persian gulf; one, called Anedotos or Idotion, in the reign of Amenon, the fourth king of Babylon; another in that of the fifth king; and the last, called Odacon (or Ho Dagon), apparently the Phenician Dagon, under the sixth. Many figures of Oannes, resembling that of a Triton, having the upper part of a man, and the lower part of a fish, or as a man covered with a fish's body, have been found in the sculptures of Kouyonjik and Khorsabad, as well as on many cylinders and gems. Oannes is supposed to have symbolized the conquest of Babylonia by a more civilized nation coming in ships to the mouth of the Euphrates; but he is apparently a water-god, resembling in type and character the Phenician Dagon, and the Greek Proteus and Triton.

OAR.

OAR, a wooden instrument by which a person sitting in a boat propels it through the water. The form found in practice to combine greatest power with lightness, is that shown in the figure. From *a* to *b* is the blade of the oar, thin and nearly flat, though occasionally somewhat curved, so as to present a concave surface to the water; from *b* to *d* is round or square, gradually thickening towards *d*, that the part *ce* may nearly balance the part *ac*. At *de* is the handle, which is grasped by one or both hands. The oar rests at *c* on the *row-lock*, and in many cases some device is resorted to to retain the oar from slipping outwards. In the Thames, a leathern stop, called a button, is used; sometimes a pin in the gunwale of the boat passes through the oar (but this weakens the oar, and precludes *feathering*); at other times the oar is fastened to the pin by a leathern thong. The action of an oar in moving a boat is that of a lever, the rower's hand being the power, the water the fulcrum, against which the oar presses, and the row-lock the point at which the opposition caused by the weight of the boat and its cargo is felt. *Feathering* an oar consists in turning it, immediately on leaving the water, so that the flat blade of the oar is horizontal, and in preserving this position until just before the fresh dip, when of course the vertical position must be resumed. Feathering diminishes the resistance offered by air, wind, and small waves; it also adds greatly to the beauty and grace of rowing.

The best oars are of Norway fir, though some are made of ash and beech.

O'ASES, certain cultivated spots in the Libyan desert (called also *Auasis*, *Ouasis*, or *Hoasis*) which produce vegetation, owing to the presence of springs issuing from the

ground. The principal oases are those lying to the w. of Egypt, a few days' journey from the Nile, and known to the ancients by the name of the greater and lesser oases, and that of Ammon. It is supposed that they were known to the Egyptians during the 12th dynasty under the name of *Suten-Khenn*, but no evidence of their occupation by the Egyptians earlier than Darius has been found *in situ*. By some of the ancients they were called the islands of the blessed, or compared to the spots on a panther's skin. Their name is supposed to be the Coptic *Ouahé* (inhabited place). They are first mentioned by Herodotus in his account of the destruction of the army of Cambyses by the storm of sand, or simoom. Equally celebrated is the visit of Alexander the great to the oasis, which he successfully accomplished after the conquest of Egypt, and passed through the desert a nine days' journey before he reached the temple of Ammon, the priests of which declared him the son of that god, and the future conqueror of the entire world. Herodotus describes that of El Wah, or the oasis Magna of the Romans, which contained the oracle of Ammon, and which lies seven days' journey w. of Thebes. It appears to have been anciently frequented by caravans going to the pillars of Hercules. Strabo mentions three oases: the first seven days' journey w. of Abydos; the second, w. of the lake Mœris; the third, near the oracle of Ammon. Pliny mentions two oases; so does Ptolemy, who calls them the lesser and greater. Under the Roman empire, they were used for temporary banishment of criminals of state, and the poet Juvenal was sent there. Olympiodorus, a native of the Thebiad, gives a glowing description of them in the days of Theodosius the younger. Under the Byzantine emperors, the emperors banished there the heads of the Catholic party, at the instigation of the Arians, in the 4th c., and Athanasius himself is supposed to have taken refuge in them. In the 5th c., Nestorius the bishop of Constantinople, was banished there. He was rescued by an excursion of the Blemyes, but expired soon after his arrival at the Nile. The oases were then a place of desolation and horror, occasionally plundered by Bedouins. They fell, 943 A.D., into the power of the Arabs, after having been held by the Egyptian monarchs and their successors till that period; and they are described by Edrisi (1150 A.D.) as uninhabited; by Abulfeda (1240 A.D.) and by Leo Africanus (1513 A.D.), as inhabited and cultivated, and quite independent, having three fortresses. The first modern traveler who visited them is supposed to have been Poncet (1698 A.D.). Subsequently, in 1792, Browne discovered the oasis of Ammon at El Siwah; and it was visited in 1798 by Hornemann, and in 1819 by Cailliaud. It lies in 29° 12′ 20″ n. lat., and 26° 6′ 9″ e. long. Drovetti and Minutoli also visited the same spot.

These oases are now held by Muggrebi Arabs, a powerful race in the desert, capable of raising 30,000 men, who supply camels and guides to travelers. The principal oases are: 1. El Khargeh, or the Oasis Magna, the Greater Oasis of Ptolemy; 2. El Kasr, or Oasis Parva, the Lesser Oasis; 3. Siwah, or the Oasis of Ammon, the most northerly; 4. The Western Oasis, or Dakkel, mentioned by Olympiodorus, and visited by sir Archibald Edmonstone in 1819, and Rohlfs in 1874. Of El Khargeh full particulars have been given by M. Hoskins, who discovered it lying about 125 m. w. of the Nile, having a stream of water rising near the village of Genah, on the north-west of the oasis, and lost in the sand. It is bounded on the e. by Hagel-bel-Badah. North of El Gem lies the metropolis, El Khargeh, which consists of a series of covered streets and open bazaars. The temple lies two hours' journey from it, in a fine situation; the *sekos* has a vestibule of 500 f., with pylons, or gateways, the first of which has a decree in Greek, dated in the reign of Galba (68 A.D.), against forcing persons to farm the revenue, preventing imprisonment for debt, preserving the dowries of women, and limiting the office of strategos for three years. The temple has other decrees preventing the officers of government from smuggling. It has an avenue of sphinxes and three pylons; on the third, Darius is represented offering to Amen Ra, Osiris, and Isis; while Nekht-her-hebi (Nectabes) continued the ornaments of the temple about 414–340 B.C. The sekos is 140 ft. long, and represents Darius offering to Amen Ra, or Khnumis, the ram-head god, and Osiris; while in the accompanying scenes are seen Anta, or Anaitis, Raspu, or Reseph. In the vicinity is a magnificent necropolis of 150 sepulchers, of a late period, with Doric and Corinthian capitals. There are several temples at other spots of the oases. 2. El Kasr, the Oasis Parva, lies four or five days' journey s.e. of Siwah, called the Wah-el-Bahnasa, or Wah-el-Menesheh, contains no monuments older than the Roman, consisting of a triumphal arch, subterraneous and other aqueducts, several hot springs, a necropolis, and Christian church. This oasis was first conquered by the Arabs; and in its vicinity is another oasis called Wady Zerzoora, with others adjoining, of inferior interest. 3. Siwah, or the Oasis of Ammon—one of the first discovered, and repeatedly visited, has, unfortunately, not been seen by any one acquainted with hieroglyphics—lies w. of the Natron lakes. It would appear from Minutoli that the temple was built by Nekht-her-hebi, or Nectabes I., in honor of the god Khnum, Ammon Khnumis or Chnebis, who as the deity of water, presided over the water from which the oasis originated. The oasis is 9 m. long and 2 broad, contains El Garah Gharmy, and Menchyeh, has a population of about 8,000 inhabitants, possesses date and other trees, grows cereals, and has sulphurous springs, a salt lake at Arachieh, and many ruined temples, a necropolis, and other remains. The oracle of Ammon is supposed to have been at a place called Om-Beydah, or the temple of Nekht-her-hebi. From this, it would seem that the oasis did not fall into the power of Egypt till about the 5th c. B.C. The

celebrated Fountain of the Sun is at Siwah Shargieh. It is 30 paces long, 20 broad, six fathoms deep, with bubbles constantly rising to the surface, steaming in the morning, and warmer at night. Close to it are the remains of the sanctuary of Ammon. 4. El Dakkel, or the Western Oasis, lies about 78 m. s.w. of Siout. The principal ruin at Dar-el-Hadjar consists of a small temple, dedicated to Khnumis by the Roman emperors Nero and Titus. At Ain Amoor, between this oasis and the Oasis Magna, is a temple built under the Roman empire.—Herodotus, iii. 26; Strabo, ii. p. 130, xvii. pp. 790, 791, 813; Ptolemy, iv. 5, 37; Minutoli, *Reise zum Tempel des Jupiter Ammon* (Berlin, 1824); Hoskins, *Visit to the Great Oasis* (8vo. Lond. 1837); Champollion, *L'Egypte*, p. 282.

OAT, or **OATS,** *Avēna*, a genus of grasses, containing many species, among which are some valuable for the grain which they produce, and some useful for hay. The Linnæan genus *avena*, less natural than most of the Linnæan genera, has been much broken up. The genus, as now restricted, has the spikelets in loose panicles, the glumes as long as the florets, and containing two or more florets; the paleæ firm, and almost cartilaginous, the outer palea of each floret, or of one or more of the florets, bearing on the back a knee-jointed awn, which is twisted at the base. The awn, however, tends to disappear, and often wholly disappears in cultivation. Those species which are cultivated as corn-plants have comparatively large spikelets and seeds, the spikelets—at least after flowering—pendulous. The native country of the cultivated oats is unknown, although most probably it is central Asia. There is no reference, however, to the oat in the Old Testament; and although it was known to the Greeks, who called it *bromos*, and to the Romans, it is probable that they derived their knowledge of it from the Celts, Germans, and other northern nations. It is a grain better suited to moist than to dry, and to cold than to warm climates, although it does not extend so far north as the coarse kinds of barley. The grain is either used in the form of groats (q.v.) or made into meal. Oat-meal cakes and porridge form great part of the food of the peasantry of Scotland and of some other countries. No grain is so much esteemed for feeding horses. Besides a large quantity of starch—about 65 per cent—and some sugar, gum, and oil, the grain of oats contains almost 20 per cent of nitrogenous principles, or proteïne (q.v.) compounds, of which about 16 or 17 parts are *avenine*, a substance very similar to *caseïne* (q.v.), and two or three parts gluten, the remainder albumen. The husk of oats is also nutritious, and is mixed with other food for horses, oxen, and sheep. From the starchy particles adhering to the husk or *seeds* after the separation of the grain, a light dish, called *sowans* is made in Scotland by means of boiling water, was once very popular, and is very suitable for weak stomachs. The grain is sometimes mixed with barley for distillation. The Russian beverage called *quass* is made from oats. The straw of oats is very useful as fodder, bringing a higher price than any other kind of straw.—The varieties of oats in cultivation are very numerous, and some highly esteemed varieties are of recent and well-known origin. It is doubtful if they really belong to more than one species; but the following are very generally distinguished as species: 1. Common Oat (*A. sativa*), having a very loose panicle, which spreads on all sides, and two or three fertile florets in each spikelet, the paleæ quite smooth, not more than one floret awned; 2. Tartarian Oat (*A. orientalis*), also called Hungarian Oat and Siberian Oat, distinguished chiefly by having the panicle much more contracted, and all turned to one side; 3. Naked Oat (*A. nuda*), differing from the Tartarian oat chiefly in having the paleæ very slightly adherent to the seeds, which, therefore, fall readily out of them, whilst in the other kinds they adhere closely; 4. Chinese Oat (*A. chinensis*), which agrees with the last in the characters of the paleæ and seeds, but is more like the common oat in its panicle, and has more numerous florets, 4–8, in the spikelet; 5. Short Oat (*A. brevis*), which has a close panicle turned to one side, the spikelets containing only one or two florets, each floret awned, the grains short. Almost all the varieties of oat in cultivation belong to the first and second of these species. The naked oat is cultivated in Austria, but is not much esteemed. The Chinese oat, said to have been brought by the Russians from the north of China, is prolific, but the grain is easily shaken out by winds. The short oat is cultivated as a grain-crop on poor soils at high elevations in the mountainous parts of France and Spain, ripening where other kinds do not; it is also cultivated in some parts of Europe as a forage plant. Besides these, there is another kind of oat, the Bristle-pointed Oat (*A. strigosa*), regarded by some botanists as belonging even to a distinct genus, *danthonia*, because the lower palea is much prolonged, and instead of merely being bifid at the point, as in the other oats, is divided into two long teeth, extending into bristles. The panicle is inclined to one side, very little branched; the florets, 2 or 3 in a spikelet, all awned, the grain rather small. This plant is common in corn-fields, is cultivated in many countries, but chiefly on poor soils, and was at one time much cultivated in Scotland, but is now scarcely to be seen as a crop. Not unlike this, but with the panicle spreading equally on all sides, the outer palea merely bifid, and long hairs at the base of the glumes, is the Wild Oat (*A. fatua*), also frequent in corn-fields, and a variety of which is cultivated in some northern countries for meal, but which is more generally regarded by farmers as a weed to be extirpated, springing up so abundantly in some districts as to choke crops of better grain. Its awns have much of the hygrometrical property which gains for *A. sterilis*, a species found in the south of Europe, the name of the Animal Oat, because the seeds

when ripe and fallen on the ground resemble insects, and move about in an extraordinary manner through the twisting and untwisting of the awns. The seed of the WILD OAT has been sometimes used instead of an artificial fly for catching trout. Amongst the species of oat useful not for their grain but for fodder are the DOWNY OAT-GRASS (*A. pubescens*) and YELLOW OAT-GRASS (*A. flavescens*), both referred by some botanists to the genus *trisetum*—the short awn being like a middle tooth in the bifid palea—and both natives of Britain, the former growing on light ground and dry hills, especially where the soil is calcareous, the latter on light meadow lands. Other species are found in Britain, continental Europe, North America, Australia, etc. In some parts of the Sahara are bottoms of ravines richly productive of a species of oat-grass (*A. Forskalii*) much relished by camels.

Oats have been cultivated in America ever since the advent of the first white settlers. They were sown, with other cereals, by Gosnold on the Elizabeth islands, 1602; were introduced into Massachusetts Bay, 1629; and their cultivation has since extended to every state in the Union. A species of wild O. grows quite extensively in California, and yields a good hay, but the grain is worthless. In the northern states O. are cultivated more successfully than in the southern, owing to the attacks of rust in the latter region. The average yield in 1883 in several of the northern states and territories was over 35 bushels to the acre (in Arizona it reached 43 bushels), while in Florida, North and South Carolina, and Georgia it was less than 10 bushels. In 1889 the total production of O. in the U. S. was 751,515,000 bushels; the number of acres occupied by O. (1884), 21,300,917, and the value of the crop, $161,528,470. This crop was the largest ever produced in the country; the average was larger by 3,000,000 than in 1882, and the average price fell to 27.7 cents—a lower figure than had ever before been reported by the Bureau of agriculture, except the average of 24.6 in 1878. The lowest state average in 1884 was 19 cents, in Nebraska; the highest was 60 cents, in Florida. All but a very small fraction of the crop is consumed at home. The largest amount ever exported in a year was 5,452,136 bushels in 1879; in 1884 the amount exported was 1,760,376; in 1883 it was only 461,496. The leading oat-growing state is Illinois, which in 1883 produced 102,780,000 bushels, more than one-sixth of the entire crop of the U. S. It was followed by Iowa with 68,403,600 bushels, and New York with 42,071,400 bushels. The weight of a bushel of American O. varies from 30 to 40 lbs., whilst Scotch O. weigh from 40 to 50. In the Middle and Northern states the almost universal custom is to sow in the spring, as soon as the soil is in a condition for tilling, but in the South fall sowing generally prevails. The seed is sown broadcast, from 2 to 5 bushels being used to the acre. In the most northern latitude it ripens in 90 days, or even less, but in the southern a longer time is required.

OATES, (*alias* AMBROSE,) TITUS, was the son of a ribbon weaver, who, having first become an Anabaptist minister under Cromwell, took orders and a benefice in the English church after the restoration. Titus appears to have been born about 1649 in London. He was a pupil of Merchant Taylor's school, whence he passed to Trinity college, Cambridge, took orders, and received a small living from the duke of Norfolk. This position, however, he forfeited, in consequence of a malicious prosecution, in which he narrowly escaped conviction for perjury; and having been afterwards appointed to the chaplaincy of one of the king's ships, he was expelled form it on a charge still more disgraceful. In this extremity he conformed to the Roman Catholic church, and was admitted as a scholar of the Jesuits' college at Valladolid; but was expelled for misconduct after a trial of a few months. He was again received by the Jesuits, on his earnest protestations of repentance, at St. Omer, where he was no less unsuccessful, and was finally dismissed by them in the early part of 1678. He now, as a mere vagabond adventurer, set himself to live by his wits, in the evil exercise of which he devised, about this time, the atrocious scheme with which his name is identified in history. Just then great excitement and alarm pervaded the Protestant party in England. It was well known that Charles was at heart a Roman Catholic; and his brother, the duke of York, afterwards James II., was an active and avowed zealot on the same side. The growing confidence of the Roman Catholics was unconcealed; and with or without instant reason, the cry so often since heard arose, and was everywhere re-echoed that the "Protestant religion was in danger." In this fevered state of general feeling, Oates saw his opportunity, and dexterously and boldly availed himself of it. He communicated to the authorities the details of a pretended plot, the figment of his own brain, the main elements of which were a rising of the Catholic party, a general massacre of Protestants, the burning of the city of London, the assassination of the king, and the invasion of Ireland by a French army. In certain of its items the fiction was devised with considerable ingenuity to catch the proper belief. By the strangest coincidence, moreover, there just then occurred in aid of it a series of events which seemed conclusively to attest its genuineness. A correspondence, the object of which was the propagation of the Roman Catholic religion, came to light between the secretary of the duke of York and Pere La Chaise, the confessor and confidant of Louis XIV. Danby, the prime minister, it also appeared, had been busy with intrigues in the same quarter. Finally, Godfrey, the zealous magistrate through whom publicity was first given to "the plot," was found mysteriously murdered. After this, could reasonable doubt exist? Was not the English St. Bartholomew already begun? All London went wild with fear and rage; and it seemed at one time likely that a massacre of Roman Catholics would be substituted for the dreaded extermination of the Protestants. The parliament, which might have done

something to allay the excitement, was itself swept headlong away by it. The king alone, whose life was threatened, but who, dissolute and indolent as he was, wanted neither courage nor shrewdness, much to his honor, scornfully insisted that the plot was merely some insane delusion, and tried, so far as he could, to control the excesses which followed. Too probably his interference was of the characteristically easy, *insouciant* kind; in any case, it did not avail. The story of Oates was universally believed and he became the popular hero of the day. A pension of £900 a year was granted him; a suite of apartments in the palace at Whitehall was set apart as sacred to his use; and wherever he went, the Protestant public wildly cheered him as their savior. With the aid of a set of suborned ruffians, only one degree less foul than himself, convictions of his victims were readily obtained, judges and juries vying with each other in their unquestioning reception in evidence of the grossest and most manifest perjuries; and many innocent Roman Catholic gentlemen died the death of traitors at the block. Over the space of two years, the base success of Oates was signalized by a series of judicial murders. Naturally, however, as reason resumed its sway, doubts began to be felt; and on the execution of a venerable and respected nobleman, viscount Stafford, with a strong shock of pity and remorse, public suspicion awoke, and a violent reaction set in. It was only, however, on the accession of James II., in 1685, that retribution overtook the malefactor. Active steps against him were then taken. He was tried before the court of king's bench, convicted of perjury, and sentenced to be pilloried, whipped at the cart's tail, and afterwards imprisoned for life. We might wonder a little at the leniency of the sentence, were it not thus to be explained: it was intended that the severity of the first two items of punishment should render the last one superfluous, and that the wretch should die under the lash of the executioner. But the hide of Oates was beyond calculation tough; and horribly lacerated, yet living, his carcass was conveyed to the prison, from which it was meant never more to issue. Very strangely, however, the next turn of the political wheel brought back the monster to the light of day and to prosperity. When the revolution of 1688 placed William on the throne, the Protestant influence triumphed once more. In the outburst of enthusiasm which ensued, what more natural than that Oates should be glorified as a Protestant martyr? Parliament solemnly declared his trial an illegal one; he was pardoned, and obtained his liberty; and in order to his perfect enjoyment of it, a pension of £300 a year was granted him. He was, however, no more heard of; he passed his 17 remaining years in obscurity, and died in 1705.

OATH (Ang.-Sax. *ath*, Ger. *eid*), in the religious use of the word, may be defined an expressed or implied calling upon the Almighty to witness the truth of an asseveration, or the good faith of a promise; with which is ordinarily conjoined an imprecation of his vengeance, or a renunciation of his favor, in case the asseveration should be false, or the promise should be broken. This practice has prevailed, in some form or other, in almost all the religions of the ancient, as well as of the modern world. It supposes, however, a belief of the existence of a provident Supreme Being, in order to its moral efficacy as a safeguard of truth. Among the Jews, we find instances in Gen. xiv. 22, xxi. 24, xlvii. 31, l. 5, confirmed even by the example of God himself, Numb. xiv. 28, Jer. xliv. 26, Isa. lxii. 8. It was strictly forbidden to the Jews to swear by false gods (Amos viii. 14, Jer. xii. 16). The form of oath was probably variable, either a direct adjuration as "The Lord liveth," or an imprecation, "The Lord do so to me;" but in all cases, the strongest denunciations are held out against the false swearer (Exod. xx. 7, Lev. xix. 12). Oaths were employed, both judicially and extrajudicially, by the ancient Egyptians, Assyrians, Medes, and Persians, as well as by the Greeks, and also by the Romans. The forms were very various—one of the most solemn consisting in the act of placing the hand on the altar of the deity who was invoked as witness. In the judicial proceedings of both the last-named nations, oaths were employed, but not universally; and in examples of their extrajudicial use, the literatures of both abound.

The lawfulness and fitness of the practice, under circumstances of due solemnity, are commonly recognized by Christians. Some communions, of which the most remarkable are the Moravians and the Society of Friends, applying literally the words of Christ (Matt v. 34), regard all oaths as unlawful. But other communions generally restrict this prohibition to ordinary and private discourse, and find in Rom. i. 9, 2 Cor. xi. 21, Gal. i. 20, Phil. i. 8, and 1 Thess. ii. 5, full warrant for the lawfulness of oaths in judicial and other solemn use. From some passages of the fathers, it might seem that they shared the difficulties of the Quakers and Moravians on the subject of the lawfulness of swearing; but these fathers for the most part referred to the oaths required of Christians by the pagans, which generally involved a recognition of particular pagan divinities; and they condemned these pagan oaths, rather as involving or even directly containing a profession of the popular paganism than as unlawful in themselves. The Christians of the later ages may perhaps be said to have multiplied in an opposite degree the occasions of oaths; especially of what were called "purgatorial" oaths, in which a party charged with a crime justified himself by swearing his innocence. These oaths were commonly accompanied by some imprecatory form or ceremonial, and were often expected to be followed by immediate manifestations of the divine vengeance upon the perjurer. The common instrument of attestation on oath was the Bible or some portion of it; but oaths were sometimes sworn on the relics of saints, or other sacred objects; sometimes simply

by raising the hand to heaven, or by laying it upon the breast or the head. In canonical processes, the oath was often administered to the party kneeling. The forms varied very much; the most general being that which the English oath still retains (*Sic me Deus adjuvet*). Divines commonly require, in order to the lawfulness of an oath, three conditions (founded upon Jer. iv. 2), viz., *truth*, *justice*, and *judgment*—that is to say (1), that the asseveration, if the oath be assertive, shall be *true*, and that the promise, if the oath be promissory, shall be made and shall be kept *in good faith;* (2), that the thing promised shall be objectively lawful and good; (3), that the oath shall not be sworn without due discretion and deliberation, and without satisfactory reasons founded on necessity, or at least on grave and manifest utility.

The Mohammedans do not employ oaths in their judicial proceedings; but they regard deliberate perjury, even when extrajudicially committed, as sinful, and deserving of God's vengeance. For this, however, they require that the oath should be an express adjuration of God himself by some one of his well-known holy names; that the jurant should be of full age and intelligence; and that the oath should be sworn deliberately, and with the intention of swearing.

OATH, in point of law, is that kind of solemn declaration which is necessary as a condition to the filling of some office more or less public, or of giving evidence in a court of justice. Nearly all the great public offices of the state in Great Britain can only be filled by persons who are willing to take an oath before acting in such office. The most important office of all—that of king or queen of Great Britain—requires a coronation oath (q.v.). Members of parliament also require to take the oath of fidelity and true allegiance, and promising to maintain the succession, in a full house, before taking their places (29 and 30 Vict. c. 19). Quakers and others may make an affirmation to the same effect. In 1868 and 1871 great changes were made as to oaths. The oath of allegiance and the official oath must now be taken by the great officers of state, such as the first lord of the treasury, chancellor of the exchequer, lord chancellor, secretaries of state, etc., in England. In Scotland the same are taken by the lord keeper of the great seal and privy seal, lord clerk register, lord advocate, and lord justice-clerk; so in Ireland by the lord lieutenant, lord chancellor, and two others. The oath of allegiance and the judicial oath are taken by the superior judges in each kingdom, justices of the peace, and Scotch sheriffs. No others, except under the clerical and parliamentary oaths acts, are to take the oaths of allegiance, supremacy, and abjuration, or any oath substituted for these. All others who used formerly to take oaths now make declarations of fidelity in their office, and in some cases also one of secrecy.

The most important oaths affecting the general public are those which are required to enforce the truth from witnesses in courts of justice. It may be stated that jurymen, where they are called upon to exercise their functions, are also required to take an oath. The oath is read to the juror thus—"You shall well and truly try the issue between the parties, and a true verdict give, according to the evidence, so help you God;" and the juror kisses the New Testament. Witnesses who are called to give evidence must all be first sworn in a similar manner, the words being, "The evidence you shall give shall be the truth, the whole truth, and nothing but the truth, so help you God." Hence the person who is a witness must have sufficient understanding to know the nature and obligations of an oath ; and on this ground, young children are incompetent to be witnesses. Formerly a condition or qualification required in one who took an oath as a witness was, that he had a competent sense of religion, in other words, he must not only have some religious knowledge, but some religious belief. He must, in substance, believe in the existence of a God, and in the moral government of the world ; and though he could not be questioned minutely as to his particular religious opinions, yet, if it appeared that he did not believe in a God and future state, he was not allowed to give his evidence, for it was assumed, that without the religious sanction, his testimony could not be relied upon. So long, however, as a witness appeared to possess competent religious belief, the mere form of the oath was not material. The usual practice in England and Ireland is, for the witness, after hearing the oath repeated by the officer of court, to kiss the four gospels by way of assent; and in Scotland, the witness repeats similar words after the judge, standing and holding up his right hand, "swearing by almighty God, as he shall answer to God at the great day of judgment," but without kissing any book. Jews are sworn on the Pentateuch, keeping on their hats, and their oath ends with the words, "so help you Jehovah." A Mohammedan is sworn on the Koran; a Chinese witness has been sworn by kneeling and breaking a china saucer against the witness-box. Thus the mere form of taking the oath is immaterial; the witness is allowed to take the oath in whatever form he considers most binding upon his own conscience—the essential thing being, however, that the witness acknowledge some binding effect derived from his belief in a God or a future state.

The policy of insisting upon the religious formalities attending the taking of an oath, has been much discussed of late years, and it has been disputed whether atheists, who avow an entire absence of all religious belief, should be entirely rejected as witnesses (as is sometimes the case), and justice be thereby frustrated. The objections of Quakers, Moravians, and Separatists to taking an oath have long been respected as not being fundamentally at variance with a due sense of religious feeling, and hence they have by

statute been allowed to make an affirmation instead of taking the oath. In 1854 another concession was made to those who, not being Quakers, yet refuse to take the oath from sincere conscientious motives, and these are now also allowed to affirm instead of swear. In 1869 a statute was passed, excluding all reference to religious tests. Any person on whose conscience an oath would not be binding, now makes a solemn affirmation. See BRADLAUGH, CHARLES.

When a witness, after being duly sworn, gives false evidence in a court of justice or in a judicial proceeding, and his evidence so falsely given is material, he commits the offense of *perjury;* but it is necessary, in England, not only that two witnesses shall be able to prove the falsity of such evidence, but also that the party should be proceeded against, in the first instance, before a justice of the peace, or by order of a judge, or the attorney-general, it being found that frivolous and unfounded indictments were often preferred against witnesses by disappointed or hostile parties. As a general rule, perjury cannot be committed except in some judicial proceeding, or rather the giving of false evidence cannot be punished except it has been given in some judicial proceeding. The practice formerly existed of persons voluntarily taking oaths in various matters not connected with any judicial proceeding; and creditors often in this manner sought to add to other securities by insisting on a formal oath before a justice of the peace, in some isolated matter of fact. The form of administering the oath to witnesses in courts of justice varies slightly in different states, but the substance is the same as at common law. It is not required that the witness should have any particular religious belief, or even that he should believe in a God and a future state in order that his testimony may be admissible. An atheist must make an affirmation, usually in the words, "You do solemnly and sincerely affirm, etc.;" and the testimony which is given upon such affirmation is subject to the law in relation to perjury, as if given upon oath. If any particular form of oath is more binding upon the conscience of the witness, that mode of administering it will be adopted.

OATHS, MILITARY. The taking of the oath of fidelity to government and obedience to superior officers, was, among ancient armies a very solemn affair. A whole corps took the oath together, sometimes an entire army. In modern times, when so many other checks are used for maintaining discipline, the oath has become little more than a form. In the United Kingdom a recruit enlisting into the army or militia, or a volunteer enrolling himself, swears to be faithful to the sovereign, and obedient to all or any of his superior officers; also to divulge any facts coming to his knowledge which might affect the safety of his sovereign, or the stability of that sovereign's government. The members of a court-martial take an oath to try the cases brought before them justly, according to the evidence, to keep secret the finding until confirmed by the crown, and to keep secret always the opinions given by the members individually. The only other military oath is the common oath of a witness before a court-martial to tell the truth, the whole truth, and nothing but the truth.

OAXA'CA. See OAJACO.

OB, or OBI, the great river of western Siberia, rises in two branches, the Biya and the Katun or Katunga, both of which have their origin in the Altai mountains, within the frontier of the Chinese dominions, about lat. 49° n., and long. 90° east. These branches flowing in a n.w. direction, unite to form the Ob at the town of Biysk in lat. 52° 30′ n., long. 85° east. Pursuing a winding course, with a general n.w. direction, the Ob reaches the meridian of 75° e., when it turns w., and maintains that direction to its confluence with the Irtish, the greatest of its tributaries. It then flows n.w., n., and n.e. to its mouth in the gulf of Ob, which it reaches after a total course of 3,235 miles. The total area of the basin is 1,150,870 sq. m. In its lower course it inundates its banks and widens out to 27 m. At Barnaul the river is free from ice for 198 days. Its chief affluents on the right are the Tom—a swifter stream than the Ob, 400 m. in length, and navigable for the last 280 m. from the beginning of May till July—the Tchulim, and the Ket. The principal affluent on the left is the Irtish, which, rising within the frontier of the Chinese territories, traverses the Altai mountains, and, after a course longer than that of the Ob itself, joins that river 250 m. below Tobolsk. The trade of the Irtish, of which the center is Tobolsk, is important. The principal towns on the banks of the Ob are Narim, Sargut, Berezow, and Obdorsk.—The gulf of Ob is a long inlet of the Arctic ocean, 450 m. in length by about 100 m. in breadth. At present several steamers regularly ply on the great water-system of the Ob between Tyumen, Tomsk, etc., but that system, communicating as it does between Siberia, the Chinese territories, and European Russia, is, without doubt, destined to become a great commercial thoroughfare, for steamers penetrate as far as Biysk in the Altai. Explorations from Dundee through the Kara sea to the gulf of Ob, have amply proved the feasibility of this direct route. This river is very rich in fish. Below its junction with the Irtish it divides itself into several parallel streams; and in the flood season it inundates great tracts of country, and presents the appearance of a waste of waters, its desolate uniformity broken only by the occasional tree-tops that rise above the surface.

OBADIAH, the fourth of the minor prophets, according to the Hebrew and English arrangement, and the shortest book in the Old Testament. Some have conjectured that the author of it was the steward of Ahab's household; but this opin-

ion has nothing to support it except the identity of name. There are several striking resemblances between Obadiah and Jeremiah, Joel and others of the minor prophets; but critics have not succeeded in determining to whom priority of date is to be assigned. The better opinion, however, seems to be that Obadiah preceded Jeremiah, or was contemporary with him. His prophecy is a denunciation of Edom, the inhabitants of which are addressed as deceived by their pride and fancied security, from which they would be utterly cast down; and as denounced for their violence against Israel, their refusal to help him, their joy over his calamities, and their profit from his fall. Their doom is to be in the line of their sin; as they had done to others so it should be done to them. In contrast with their sin and destruction, the deliverance and holiness of Zion would be conspicuous; Jacob and Joseph would be as a fiery flame, and Esau would be consumed as stubble. The inhabitants of the south would possess Idumea, and those of the plain, Philistia; Judah would extend to Samaria, Benjamin to Gilead, and the captives of the ten tribes, to the borders of Sidon; saviors would dwell in Zion, and the kingdom would be the Lord's.

O'BAN, a parliamentary burgh and sea-port, Argyleshire, Scotland, on a bay of the same name, 20 m. (in direct line) n.w. of Inveraray. The bay is protected from every wind by the island of Kerrera on the w., and by the high shores of the main-land, and is overlooked on the n. by the picturesque ruins of Dunolly castle. It is from 12 to 24 fathoms deep, and although the girdle of hills that seems to surround it gives it the appearance of a lake, it is easily accessible. The pier is 250 ft. long and about 30 ft. wide. Oban is the great rendezvous for tourists in the west Highlands. Its importance dates chiefly from the beginning of the present century. The burgh now contains a number of churches, several hotels and inns, schools, banks, etc. Within 3 m. of Oban is Dunstaffnage castle, which is said to have been the seat of the Scottish monarchy previously to its transference to Scone. The stone of destiny, which now supports the coronation chair in Westminster abbey, and was carried thither from Scone by Edward I., was obtained, in the first instance, according to tradition, from Dunstaffnage castle. Pop. of parliamentary burgh—which is one of the Ayr (q. v.) group—was 1,940 in '61; in '91 ,4,946. A railroad from Calander to O. connects it with Glasgow and Edinburgh.

OBBLIGATO, a term in music signifying that the instrumental part so marked is absolutely necessary to the performance of the composition, and cannot be omitted.

OBE, or **OBI** (etymology unknown), the name given to the magical arts or witchcraft practiced by a class of persons among the negroes of the West Indies. The practicer is called an *obeah-man* or *obeah-woman.* It differs in no essential respect from the corresponding superstitions all the world over. See MAGIC, WITCHCRAFT.

OBEDIENCE, in canon law means the duty by which the various gradations in ecclesiastical organization are held subject, in all things consistent with the law of God or of the church, to the several superiors placed immediately above each, respectively, in the hierarchical scale. Thus priests and inferior clergy owe canonical obedience to the bishop, and priests are bound thereto by a solemn promise administered at ordination. The bishop primitively took a similar oath to the metropolitan; but by the modern law, the jurisdiction of the metropolitan is confined to the occasions of his holding a visitation, or presiding in the provincial synod. Bishops, by the present law of the Roman Catholic church, take an oath of obedience to the pope. This obedience, however, is strictly limited by the canons, and is only held to bind in things consistent with the divine and natural law. In ecclesiastical history the word obedience has a special signification, and is applied to the several parties in the church, which, during the great western schism (q.v.), adhered to the rival popes. Thus we read of the "Roman obedience," which included all who recognized the pope chosen at Rome, and the "Avignon obedience," which meant the supporters of the Avignon pope. So, again, historians speak of "the obedience of Gregory XII.," and "the obedience of Benedict XIII.," etc. Applied to the monastic institute, obedience means the voluntary submission which all members of religious orders vow, at the religious profession, to their immediate superiors, of whatever grade in the order, as well as to the superior general, and still more to the rules and constitutions of the order. This forms, in all orders, one of the essential vows. It is, however, expressly confined to lawful things; and although it is held that a superior can command certain things under pain of sin, yet Roman Catholics repudiate the notion that the command of a superior can render lawful, much less good, a thing which is of its own nature, or by the law of God, sinful or bad. The name obedience is sometimes given to the written precept or other formal instrument by which a superior in a religious order communicates to one of his subjects any special precept or instruction—as, for example, to undertake a certain office, to proceed upon a particular mission, to relinquish a certain appointment, etc. The instruction, or the instrument containing it, is called an obedience, because it is held to bind in virtue of religious obedience.

OBEID', EL, a t. in s. Kordofan, e. central Africa, capital of the province; 240 m. s.w. of Sennaar and about 120 m. w. of the Nile, which forms the e. boundary of the state; pop. 16,000. The town consists mainly of straw or reed huts, but there are mosques, a market-place, and a hospital. The place is in the midst of a wild plain, and a strong thorn hedge is necessary to keep off the wild beasts at night. The exports are ivory, gold, silver, hides, ostrich feathers, and gums.

OBEIDULLAH, Sheikh, 1832–83, chief of the Koords, of noble Arab descent; lived in the stronghold of Nehrieh, near the Persian frontier. He ruled over many Turkish and Persian villages in his neighborhood. In 1880 he engaged in a war with Persia on his own account, which he was compelled to abandon at the command of his sovereign, the sultan of Turkey. He again prepared to invade Persia, 1881, but was called to Constantinople where he was confined until he escaped, 1882. The sultan then sent a force against him which captured and pillaged his stronghold, and he was sent to Mosul, where he was imprisoned until shortly before his death.

O'BEIRNE, Thomas Lewis, D.D., 1748–1823; b. Ireland; was educated at St. Omer's, a Roman Catholic college in France; became Protestant, and took orders in the Episcopal church; was chaplain of lord Howe's fleet at the beginning of the American war for independence; in 1776 he preached in St. Paul's, the only Episcopal church in New York city not destroyed by the great fire of that year; in 1782 acted as private secretary to the lord lieut. of Ireland, and received from him in 1783 two valuable livings, in Northumberland and Cumberland; in 1796 he was made bishop of Ossory, and in 1798 was translated to the see of Meath, where he died. He was the author of a *Vindication* of the conduct of admiral and of Gen. Howe, some political tracts, and a poem, *The Crucifixion.*

OB'ELISK, a word derived from the Greek *obelos* and *obeliskos*, signifying a spit, applied to prismatic monuments of stone and other materials, terminating with a pyramidal or pointed top. These monuments, called *tekhen*, were placed upon bases before gateways of the principal temples in Egypt, one on each side of the door. They served in Egyptian art for the same purposes as the stelæ of the Greeks and columns of the Romans, and appear to have been erected to record the honors or triumphs of the monarch. They have four faces, are cut out of one piece, and are broader at the base than at the top, at a short distance from which the sides form the base of a pyramidion in which the obelisk terminates. They were placed upon a cubical base of the same material, which slightly surpassed the breadth of their base. Each side of the obelisk at the base measures $\frac{1}{10}$th of the height of the shaft, from the base line to that where the cap, or pyramidion commences. The cap is also $\frac{1}{10}$ of the same height. Their sides are slightly concave, to increase their apparent height. Their height varies from upwards of 100 ft. to a few inches, the tallest known being that of Karnak, which rises to 105 ft. 7 inches. The sides are generally sculptured with hierogylphs and representations, recording the names and titles of kings, generally in one line of deeply-cut hieroglyphs down each side. The pyramid of obelisks was sometimes decorated with subjects. The mode by which they were made appears to have been to hew them first in the rough out of a solid piece in the quarries, and one unfinished specimen thus prepared still remains in the quarries of Syene. They were transported down the Nile during the inundation, on rafts to the spot where they were intended to be placed, and raised from their horizontal position by inclined planes, aided by machinery. Some obelisks, before their erection, had their pyramid capped with bronze gilded, or gold, the marks of such covering still being evident on their surfaces. Under the Roman empire, they were raised by pulleys and heavy tackle. The difficulty of erecting the fallen ones in the ages of renaissance, as also the mechanical appliances for the lowering from its original site the obelisk of Luxor in 1831, and erecting it in the Place de la Concorde in 1833 by Le Bas, show the difficulties experienced by the ancients. The use of obelisks is as old as the appearance of art itself in Egypt; these grand, simple, and geometric forms being used in the 4th dynasty, and continued till the time of the Romans. Their object is enveloped in great obscurity. At the time of the 18th dynasty, it appears that religious ceremonies and oblations were offered to the obelisks, which were treated as divinities. Their sepulchral use is evinced by their discovery in the tombs of the 4th dynasty, and the vignettes of early papyri. No large obelisk is older than that of Matarieh or Heliopolis, erected by Osortesen I. about 1900 B.C.; and that of Beggig or Crocodilopolis is, in reality, only a stele. Thothmes I. placed two of large size before the granite sanctuary of Karnak, and his daughter Hatasu, two others of above 90 ft. high before the second propylæon. Additional sculptures were made on these obelisks by Sethos I., who restored them. Thothmes III. appears to have erected many obelisks. The oldest is that of the Atmeilan or Hippodrome of Constantinople, erected to record his conquests of Naharania or Mesopotamia. Two others, which formerly stood at Heliopolis, were subsequently re-erected by Rameses II. at Alexandria, and have been popularly known as Cleopatra's Needles. One, which long lay prostrate, was after an adventurous voyage brought to London in 1878, and erected on the Thames embankment, the other, removed to New York 1880. The highest of all obelisks, that of St. John of the Lateran, appears to have been removed from Thebes, and set up by Thothmes IV. A small obelisk of Amenophis II., said to have been found in the Thebaid, apparently from Elephantine, is in the collection of the duke of Northumberland at Sion. Sethos I. commenced the Flaminian obelisk, subsequently completed by Rameses II., and placed at the temple of Heliopolis. It was removed to Rome by Constantius, and found 16 ft. under the surface in the pontificate of Gregory XIII., and erected in that of Sextus V. by the architect Fontana. The other obelisks of Rameses II. are, the one at the Luxor quarter of Thebes, the companion of which was removed to the Place de la Concorde at Paris in 1838; the two obelisks of

San or Tanis; that of the Boboli gardens of Florence, transported from the circus of Flora at Rome; the obelisk of the Rotonda at Rome, erected by Clement XII., 1711 A.D.; and that of the Villa Mattei, which decorated the Ara Cæli of the capitol. A fragment of another obelisk was in the Collegio Romano. No obelisks are known of other monarchs till the 26th dynasty. That of the Monte Citorio at Rome, erected by Psammetichus II. at Heliopolis, was transported by Augustus to the Campus Martius, having been exhumed 1748 A.D., and erected by the architect Antinori in that of Pius VI. Two other obelisks of small size, made of black basalt, dedicated by Nekhtherhebi or Nectanebes II, at Hermopolis, commonly known as the obelisks of Cairo, are in the British museum. Ptolemy Philadelphus is said to have erected in the Arsinoeum at Alexandria a plain obelisk of 80 cubics, cut in the quarries by Nectabis. It was set up by the architect Satyrus. Two obelisks, erected by Ptolemy Euergetes II. and his wife Cleopatra, stood before the temple of Philae, one of which was removed to Corfe castle by Mr. Bankes. The so-called Pamphiliano obelisk at Rome, erected by E. Bernin in 1651, in the Piazza Navona, under the pontificate of Innocent X., was removed from the Circus of Maxentius, having, as their hieroglyphical legends testify, been originally erected by Domitian before the Serapeum at Rome. The last of the Roman obelisks was the Barberini, which was found in 1633 on the site of the Circus of Aurelian, and finally erected in 1822 on the Monte Pincio. It was placed by the emperor Hadrian before the mausoleum or cenotaph either of himself or Antinous, between 132–8 A.D. Barbarous hieroglyphs, found on the Sallustian obelisk, are copied from the Flaminian obelisk. It is supposed to have been transported to Rome, unadorned with hieroglyphs, by Sallustius Crispus, prefect of Numidia, and to have been set up in the gardens of Sallust, in the reign of Vespasian. It was erected by Antinori, 1789, before the Church of Trinita del Monte. It has been seen how, on the renaissance of the arts, the obelisks were restored and applied to the embellishments of modern Rome, either as columns in the centers of piazzas or squares, or else as the ornaments of fountains; one obelisk being set up alone in the center of the piazzas and places of Italy and France, while in antiquity they always stood in pairs before the Pylons. One of the obelisks of Rameses II. at Alexandria, was removed to London in 1879, and another was given by the Khedive of Egypt and brought to this country by the *Dessoug*, Commander H. H. Gorringe. It arrived in New York, July 21, 1880, and was set up in Central park, with appropriate ceremonies, and addresses by William M. Evarts and others, Feb. 22, 1881. The expense of removal and erection was defrayed by William H. Vanderbilt, of New York.

Two small obelisks, and the apex of a third, have been found in Assyria, in shape of truncated prisms, the apices step-shaped. The most interesting is that of the n.w palace of Nimrud, of black marble, is 5 ft. 9 in. high. Each side has five compartments of bas-reliefs, representing the tribute and offerings made to the Shalmanaser. It is covered with a cuneiform inscription, recording the annals of the king's reign, from his first to his 31st year. On it is represented the tribute of Jehu, king of Israel. A second obelisk, of white marble, measures 8 ft. 2 in. high, is covered with bas-reliefs, representing scenes of war and tributes, winding round it like those of a Roman triumphal column. On it is an inscription of Shamas-Pul. The broken apex of a third has a dedication from Ashur-izir-'pul II. An obelisk of Semiramis at Babylon is mentioned by Diodorus, and another of Aricarus was interpreted by Democritus. Under the Roman empire. obelisks were used as gnomons, plaeed in the public spaces, or erected in the *spina* of the *circi*. The first removal of obelisks to Rome took place in the reign of Augustus, who placed one in the circus, said to been originally erected in the reign of Semenpsertеus, 85¼ ft. high; and another of 9 ft. less, in the Campus Martius, and had it adjusted as a gnomon by the mathematician Facundus Novus; a third obelisk was erected in the Circus of Caligula and Nero in the Vatican, and originally dedicated to the sun by Nuncoreus, the son of Sesosis, on the recovery of his sight. Two other small obelisks, which decorated the mausoleum of Augustus, and were erected by Claudius or Vespasian and his sons, have been found. Other obelisks are known to have been removed by Constantius, 354 A.D. P. Victor, in his description of the quarters of ancient Rome, reckons 6 of the largest size and 42 others. The Romans added to them brazen spheres and other decorations. Some were removed to Constantinople by Theodosius the younger, and Valentinian, 390 A.D. The translation of the inscription of one of the Roman obelisks made by a Greek or Egyptian, named Hermapion, has been preserved by Ammianus Marcellinus.—Kircher, *Œdipus Ægyptiacus* (tom. iii. Rom. 1652–54); Zoega, *De Origine et Usu Obeliscorum* (fo. Rom. 1797); Cipriani, *Sui Dodici Obelischi di Roma* (fo. Rom. 1823); L'Hôte, *Notice Historique sur les Obélisques Egyptiens* (8vo, Paris, 1836); Birch, *Notes upon Obelisks in the Museum of Classical Antiquities* (8vo, Lond. 1853, pp. 203–39; Layard, *Nineveh and its Remains*, vol. i. p. 346; Sir H. Rawlinson, *A Commentary on the Cuneiform Inscriptions* (12mo, Lond. 1850). **See illus., Egypt, vol. V., fig. 1.**

OBER-AMMERGAU. See Mysteries and Miracle Plays.

OBERLIN, a village in Lorain co., Ohio, on the Lake Shore and Michigan Southern railroad, 30 m. s.w. of Cleveland; the seat of the well-known Oberlin college. The village has several churches, business college, school of telegraphy, national and state banks, union school-house, conservatory of music, hotel, weekly, monthly, and quarterly

periodicals, electric lights, and college and public libraries. The village has a few manufactories. It has always been noted for its strictness of morals and its high religious tone. Pop. exclusive of students, 4,376.

OBERLIN, JOHANN FRIEDRICH, distinguished for his active benevolence and usefulness, was b. at Strasburg, Aug. 31, 1740; and in 1766 became Protestant pastor of Waldbach, in the Ban de la Roche or Steinthal, a wild mountainous district of Alsace. Here he spent the remainder of his life, combining an affectionate diligence in the ordinary duties of the pastorate, with wise and earnest endeavors to promote the education and general prosperity of the people. The district had suffered terribly in the thirty years' war, and the scanty population which remained was sunk in poverty and ignorance. Oberlin introduced better methods of cultivating the soil, and various branches of manufacture. The population, which was scarcely 500 when he entered on his labors, had increased to 3,000 at the close of the century. Yet, though animated in all his actions by the most pure and disinterested piety, it may be questioned if he did not carry his moral supervision too far when he kept a register of the moral character of his parishioners, and searched with the minuteness though not the motives of an inquisitor, into the most insignificant details of their private life. Oberlin was ably assisted in his reformatory labors by his pious housekeeper, Luise Schepler, who survived her master eleven years. He died June 1, 1826. Notwithstanding the humble sphere in which his days were spent, his fame as a philanthropist has extended over the world, and his example has stimulated and guided many. See *Brief Memorials of Oberlin*, by the Rev. T. Sims, M.A. (Lond., 1830), the *Memoirs of Oberlin* (1852), the biography by Bodemann (1868), and that by Spach (Paris, 1866).

OBERLIN COLLEGE, at Oberlin, Lorain co., Ohio, was founded in 1833 as a Christian institution for the liberal education of both sexes under conditions favorable to persons of limited pecuniary resources. It has four departments, college, theological seminary, academy and conservatory of music. In the college the three courses, classical, philosophical and scientific are upon an entire equality as to the quantity of work required for entrance and graduation. The theological seminary is in close, though not official, relations with the Congregationalists. The *Bibliotheca Sacra*, quarterly, is edited principally by members of its faculty. The academy is the preparatory school, and has a separate organization and faculty. The conservatory is ably equipped, and through its artists' recitals secures the frequent presence of the most distinguished performers. The 16 buildings include a number of handsome stone structures, The catalogue for 1896 shows 82 instructors and 1411 students. The town is on the Lake Shore railway, 34 m. w. of Cleveland, and contains about 4500 inhabitants. There is a public water supply and sewer system.

OBERLIN THEOLOGY, designates the peculiar views generally supposed to have been taught at Oberlin college during the earlier years of its history, by its president, the Rev. Charles G. Finney and his colleagues. Many from without on the one hand looked at the institution through the mists of prejudice and misapprehension; and on the other hand the views actually held and taught within the college were probably improved by increased reflection and growth in the Christian life. 1. The general system of doctrine taught was of a modified Calvinistic type in which the leading thoughts seemed to be that responsibility pertains to the voluntary action of the will, and that every moral agent determines freely for himself, under the pressure of the motives around him, all that is blameworthy or commendable in his character and conduct; that sin is a voluntary failure in duty and holiness a voluntary performance of it; and that a voluntary total moral depravity exists among unregenerate men. The repentance which is a condition of salvation is a forsaking of sin, the obligation to forsake it resting on the sinner, and the power to forsake it being always within his reach. The power to commit sin implies the power to forsake it. The Holy Spirit's work in conversion is a moral work effected by the presentation of motives through the truth; and the consequent work of sanctification is of a similar kind. As God's sovereignty works in harmony with human freedom, one factor in a man's salvation is his own voluntary consent. As sin cannot be imputed where it is not committed, so righteousness cannot be where it is not possessed. Hence the atonement does not include the transfer of human guilt to Christ or of his righteousness to men; but rather so exhibits in the cross of Christ the faithfulness and love of God, in contrast with the sinfulness of man, as to render the forgiveness of the penitent sinner safe and right. 2. The views concerning the nature of virtue taught at Oberlin were at their basis those of President Edwards, making the well-being of the sentient universe the highest ultimate good; and consequently the voluntary regard for this good, which is called benevolence, the vital element in all virtue. 3. The Oberlin doctrine of sanctification is determined by the view taken of moral action as necessarily right or wrong; and therefore of moral character as being necessarily at any one instant, either perfectly holy or perfectly sinful. If this be so, conversion necessarily becomes entire consecration, and obedience and faith are essentially complete. The difficulty with the Christian is that he is weak, inexperienced, and liable to temptation. Sanctification therefore becomes a gradual attainment of experience and strength, through repeated enlightenments by the Holy Spirit, accompanied by patient continuance in well doing. And the baptism of the Holy Spirit is to be sought by prayer with faith in the promise of Christ. The Oberlin theology has of late years lost its distinctness, and has been merged in the general current of Christian doctrine.

O'BERON, the king of the elves or fairies, and the husband of Titania. The name is derived by a change of spelling from *Auberon*, more anciently *Alberon*, and that from the German *Alberich*, i.e., king of the Elves. Oberon is first mentioned as "Roi du royaume de la féerie" in the old French poem of *Huon de Bordeaux, pair de France*, which was afterwards made the basis of a popular prose romance. From the French, Oberon was borrowed by the English poets, Chaucer, Spenser, and others, but he is most familiarly known from his appearance in Shakespeare's *Midsummer Night's Dream*.

OBE'SITY, or CORPULENCE, may be defined to be "an accumulation of fat under the integuments or in the abdomen, or in both situations, to such an amount as to embarrass the several voluntary functions." A certain degree of fatness is not only quite compatible with health, but, as has been shown in the article FATS, ANIMAL, the fatty tissue is of considerable use in the animal body, partly in consequence of its physical, and partly in consequence of its chemical properties; and it is only when the fatness begins to interfere with the discharge of any of the vital powers, that it can be regarded as a morbid condition. Obesity may occur at any period of life, but it is most commonly after the fortieth year that the tendency to an inordinate accumulation of fat begins to show itself. After that time, in the case of men, the pleasures of the table are usually more attractive than in earlier life, and much less muscular exercise is taken; while in women, the cessation of the power of child-bearing induces changes which tend remarkably to the deposition of fat. The extent to which fat may accumulate in the human body is enormous. Daniel Lambert, who died at the age of forty years, weighed 739 lbs.; his exact height is not recorded, but, according to the investigations of the late Dr. Hutchinson (the inventor of the spirometer), the normal weight of a man 6 ft. high should not exceed 178 lbs. Dr. Elliotson has recorded the case of a female child, a year old, who weighed 60 lbs.;

The predisposing causes of obesity are a peculiar habit of body, hereditarily transmitted; inactivity; sedentary occupations, etc.; while the more immediate or exciting causes are a rich diet, including fatty matters, and matters convertible in the body into fats, such as saccharine and starchy foods, and the partaking of such a diet to a greater extent than is necessary for balancing the daily waste of the tissues. "Fat meats, butter, oily vegetable substances, milk, saccharine and farinaceous substances are the most fattening articles of food; whilst malt liquors, particularly rich and sweet ale are, of all beverages, the most conducive in promoting obesity. The fattening effect of figs and grapes, and of the sugar-cane, upon the natives of the countries where these are abundant, is well known. In various countries in Africa and the east, where obesity is much admired in females, warm baths, indolence, and living upon saccharine farinaceous articles, upon dates, the nuts from which palm-oil is obtained, and upon various oily seeds, are the means usually employed to produce this effect."—Copland's *Dictionary of Medicine*, article "Obesity." The knowledge of the means of inducing obesity affords us the best clue to the rational treatment of this affection. It is a popular belief that the administration of acids—vinegar, for example, or one of the mineral acids—will check the deposition of fat; but if the desired effect is produced, it is only at the cost of serious injury to the digestive, and often to the urinary organs. The employment of soap and alkalies, as advocated a century ago by Dr. Flemyng (*A Discourse on the Nature, Causes, and Cure of Corpulency*, 1760), is less objectionable than that of acids, but the prolonged use even of these is usually prejudicial.

A very interesting *Letter on Corpulence*, published in 1863 by Mr. Banting, in which he records the effect of diet in his own case, after all medicinal treatment had failed, is well worthy of the attention of those who are suffering from the affection of which this article treats. The following are the leading points in his case. He was 66 years of age, about 5 ft. 5 in. stature (and therefore, according to Dr. Hutchinson's calculations, ought to have weighed about 142 lbs.), and in Aug., 1862, weighed 202 lbs. "Few men," he observes, "have led a more active life . . . . so that my corpulence and subsequent obesity were not through neglect of necessary bodily activity, nor from excessive eating, drinking, or self-indulgence of any kind, except that I partook of the simple aliments of bread, milk, butter, beer, sugar, and potatoes, more freely than my aged nature required . . . . I could not stoop to tie my shoe, nor attend to the little offices humanity requires without considerable pain and difficulty; I have been compelled to go down stairs slowly backwards, to save the jar of increased weight upon the ankle and knee joints, and been obliged to puff and blow with every slight exertion" (pp. 10 and 14).

By the advice of a medical friend, he adopted the following plan of diet: "For breakfast I take 4 or 5 ounces of beef, mutton, kidneys, broiled fish, bacon, or cold meat of any kind except pork; a large cup of tea (without milk or sugar), a little biscuit, or one ounce of dry toast. For dinner, 5 or 6 ounces of any fish except salmon, any meat except pork, any vegetable except potato, one ounce of dry toast, fruit out of a pudding, any kind of poultry or game, and 2 or 3 glasses of good claret, sherry, or Madeira; champagne, port, and beer forbidden. For tea, 2 or 3 ounces of fruit, a rusk or two, and a cup of tea without milk or sugar. For supper, 3 or 4 ounces of meat or fish, similar to dinner, with a glass or two of claret (p. 18). I breakfast between 8 and 9 o'clock, dine between 1 and 2; take my slight tea meal between 5 and 6; and sup at 9" (p. 40). Under this treatment he lost in little more than a year (between Aug. 26, 1862, and Sept. 12, 1863) 46 lbs. of his bodily weight, while his girth round the waist was reduced 12¼ inches. He reported himself as restored to health, as able to walk up and down stairs

like other men; to stoop with ease and freedom; and safely to leave off knee-bandages, which he had necessarily worn for 20 years past. Mr. Banting died in 1878.

OBI, or OBEAH. See OBE.

OBI'ON, a co. in n.w. Tennessee, bordering on Kentucky; 540 sq.m.; pop. '90, 27,273. Co. seat, Union City.

O'BIT (Lat. *obitus*, a "going down," "death") literally means the decease of an individual. But as a certain ecclesiastical service was fixed to be celebrated on the day of death (*in die obitus*), the name came to be applied to the service itself. Obit therefore signifies, in old church language, the service performed for the departed. It consisted, in the Roman church, of those portions of the *officium defunctorum* which are called matins and lauds, followed by a mass for the dead, chanted or occasionally read.

OBITER DICTUM, a Latin expression meaning, literally, "said by the way" and used in law to denote an expression of opinion by the court in deciding a case which does not bear upon any point directly involved in the case. Such an opinion does not have the force of a precedent, and as it is given without hearing argument is not as likely to be as well considered and precise as opinions on questions direct and not collateral. On the other hand the train of reasoning which leads to a given conclusion can often appear only by examining the side issues and using analogous principles.

OBJECT, in the language of metaphysics, is that of which any thinking being or *subject* can become cognizant. This subject itself, however, is capable of transmutation into an object, for one may think about his thinking faculty. To constitute a metaphysical object, actual existence is not necessary; it is enough that it is conceived by the subject. Nevertheless, it is customary to employ the term objective as synonymous with real, so that a thing is said to be "objectively" considered when regarded in itself, and according to its nature and properties, and to be "subjectively" considered, when it is presented in its relation to us, or as it shapes itself in our apprehension. Skepticism denies the possibility of objective knowledge; i.e., it denies that we can ever become certain that our cognition of an object corresponds with the actual nature of that object. The verbal antithesis of objective and subjective representation is also largely employed in the fine arts, but even here, though the terms may be convenient, the difference expressed by them is only one of degree, and not of kind. When a poem or a novel, for example, obtrudes the peculiar genius of the author at the expense of a clear and distinct representation of the incident and character appropriate to itself, we say it is a subjective work; when, on the contrary, the personality of the author retires into the background, or disappears altogether, we call it objective. The poems of Shelley and Byron; the novels of Jean Paul Richter, Bulwer Lytton, and Victor Hugo; and the paintings of the Preraphaelites belong essentially to the former class; the dramas of Shakespeare, the novels of Scott, and the poems of Goethe to the latter.

OBJECT-GLASS, the glass in a telescope (q.v.) or microscope (q.v.), which is placed at the end of the tube nearest the object, and first receives the rays of light reflected.

OBJECT TEACHING. A method of instruction in which objects are employed to call into systematic exercise the observing faculties of young pupils. Pestalozzi (1746–1827) was the first to introduce object teaching as a special feature of elementary education, although Comenius, Locke, Rousseau, and others based their systems on the same principle—that is, they recognized the necessity of training the mind to grasp ideas from objects by actual perception, before attempting to teach verbal expression of those ideas. In his *Wie Gertrud ihre Kinder lehrt* (1806) Pestalozzi says "the culture of the outer and inner senses is the absolute foundation of all knowledge—the first and highest principle of instruction." Object teaching became universal in Germany by the commencement of this century largely owing to the efforts of pedagogical writers like Harnisch, Grassmann, and Völter, who freely discussed Pestalozzi's theories and sought to improve them in practice. There are five important purposes to which object lessons may be applied: (1) preparation for serious learning; (2) sharpening of the senses and guidance to the right use of same; (3) exercise in language; (4) acquisition of knowledge; (5) moral training. Although now conceded to have its obvious limitations, object teaching, more or less modified, still holds its own in the educational systems of almost all civilized nations. According to the scheme of the London school board (in 1889), objects are classified in four groups—viz., (*a*) Domestic group: door, chair, table, etc.; (*b*) Animal group: child, itself, cat, dog, etc.; (*c*) Plant group: flowers, etc., in season; (*d*) Mineral group. See *Cyclopedia of Education*, by Kiddle and Schem (1877), and Sonnenschein's *Cyclopedia of Education* (London, 1889).

OBLATES (Lat. *oblatus*, *oblata*, "offered up"), the name of a class of religious bodies in the Roman Catholic church, which differ from the religious orders strictly so called, in not being bound by the solemn vows of the religious profession. The institute of oblates was one of the many reforms introduced in the diocese of Milan by St. Charles Borromeo, toward the close of the 16th century. The members consisted of secular priests who lived in community, and were merely bound by a promise to the bishop to devote themselves to any service which he should consider desirable for the interest of religion. St. Charles made use of their services chiefly in the wild and inaccessible Alpine districts of his diocese. This institute still exists, and has been recently introduced into England. Still more modern are the "oblates of the blessed Virgin Mary," a body of French origin, which arose in the present century, and has been very widely

extended ; and whose chief object is to assist the parochial clergy, by holding missions for the religious instruction of the people in any district to which they may be invited. This body also has been established in England and in Ireland. Other similar institutes might be enumerated, but the constitution of all is nearly the same. There is also a female institute of oblates, which was established in Rome, about 1440, by St. Francisca of Rome, and which consists of ladies associated for charitable and religious objects, and living in community, but bound only by promise, and not by vow.

OBLATION (Lat., *oblatio*, "an offering"). This term signifies in Canon law an offering to God, of whatever kind, upon His altar. The *Greater* and *Lesser Oblations* are included in the Eucharistic Office of the Roman Catholic Church. The *Lesser Oblation* in the early church was the offertory service, or the offering of bread and wine by the faithful for use in the sacramental service, or for the support of the priests. The actual custom of making offerings began to fall into disuse about the year 1000 A.D., but the service and name are still retained and constitute the *Lesser Oblation*. The *Greater Oblation* is the service attending the offering of the bread and wine to God by the priest for the purpose of consecration.

OBLIGATION OF CONTRACTS, the legal bond which demands that the contracting parties shall carry out their agreement, and including the right to enforce the contract by legal procedure. This extension of the word obligation to include the legal effect and remedy is important, and upon the subject the United States supreme court has said that "the laws which exist at the time and place of making the contract and where it is to be performed enter into and form a part of it. This embraces alike those which affect its validity, construction, discharge, and enforcement." In the United States constitution, art. I. sec. 10, is found this provision: "No state shall pass . . . any bill of attainder, *ex post facto* law, or any law impairing the obligation of contracts." The questions at once arise: What are the obligations of a contract; to what contracts does the prohibition apply, and what laws are of such a nature as to violate that prohibition? The first question is answered in the definition given above, and it should be added that the legal bond is derived from those laws only which were in existence at the time of the contract and thus supposed to be in the contemplation of the parties. As to the second, all contracts are embraced within the meaning of the law, if they respect rights or claims which could be brought before a court of law or equity, whether they are expressed or implied, executed or executory. Conveyances, statutory grants, and private charters issued by a state undoubtedly come within the prohibition. Against this the states have protested, but in the great Dartmouth college case the supreme court decided that a private charter is a contract between the state and the corporation, and cannot be repealed or impaired by subsequent legislation, and that such collateral stipulations as exemption from taxation are of the essence of the contract. This decision has been many times reaffirmed but is still doubted by many eminent lawyers on the ground that a state cannot sell by contract its sovereign functions. Municipal corporations have no such immunity as to their charters, as they are political in their nature. The contract of marriage has been held not to be of such a nature as to create obligations in the sense used in the constitution, but on the other hand it has been said that a law creating new grounds for the divorce of parties married before its passage would impair the obligation of the marriage contract and would therefore be unconstitutional. As to remedies for violation of contract obligations, it is not considered that the state impairs the obligation by changing the nature and extent of the relief offered, or by varying the time and mode in which these remedies may be pursued, or by barring all relief after a prescribed time. The case would be different were all remedies to be abolished. The right of the state to pass regulations for preserving public order, health, and morality is not to be restrained by a forced interpretation of the clause of the constitution under discussion. The right of a state legislature to forever exempt from taxation any property, and thus to bind its successors and, as it were, compromise the sovereignty of the state, is not yet fully settled; but the prevailing doctrine seems to be that such exemption may be made for good or valuable consideration, as all property rights are subject to the state powers of taxation and eminent domain. Congress has been given the power of passing general bankrupt laws, but this power is not exclusive; such laws, however, passed in aid of debtors, as stay laws, exemption laws, or statutes of limitation, conflict with the prohibition of impairment of obligations when they are so framed as to act retrospectively. Licenses, public offices, and permission by statute to do certain acts, as to sue the state, are not in their nature contracts; no consideration exists, and the grant may be repealed without impairing any contract obligation. Thus it has repeatedly been held that license to establish a lottery or to carry on a dangerous manufacture may at any time be revoked. It will be noticed that the constitution does not extend the prohibition of impairment to congress as well as to the states, and however opposed to common honesty and public policy such an act would be, there is little doubt that congress has the legal power to pass such laws.

OBLIGATO, the same as OBBLIGATO (q.v.).

O'BOE (French, *Hautbois;* English, *Hautboy*), the oldest and most important wood wind-instrument. It is of great antiquity, and is traced in the sculpture of Egypt and Greece. Early specimens from Arabia, China, and India are in the South Kensington and other museums. In ancient history it was known as the schalmei, chalumean, and shawm. The mechanism of the modern oboe differs from that in use fifty years ago, many devices having been taken from Boehm, and additions made by Apollon Marie-

Rose Barret, a noted oboe-player of France. His modifications were the introduction of a plate for the left-hand thumb, the double automatic octave keys, and a system of fingering to lessen the mechanical difficulties. The oboe is the most elaborate and difficult of reed instruments. It is of wood, and made in separate pieces: a top, bottom, bell-joints, a short metal tube, on which the reed —two blades of thin cane—is attached. It has a conical bore, terminating in a bell, and is furnished with a complete set of keys and orifices. The oboe stands in the key of C, and is written for the treble clef. Its harmonic tones are consecutive, and similar to those of a stopped organ-pipe. The compass is of two octaves and a fifth below the treble clef; the oboe is one of the most important members of the orchestra, and its weird, romantic, melancholy quality is most effective, resembling that of the Cor Anglais, or English horn. Beethoven, Haydn, and Mozart give it prominence in their orchestral writings. The principal solo compositions for the oboe are: Handel's six concertos; Mozart's quintet for oboe and strings; Beethoven's trio for two oboes and English horn; Hummel's variations, with orchestra; and Kalliwoda's concertino in F, with orchestra. B-flat oboes are used in military bands, but require transposition of the written parts. The oboe d'Amore, in use in the 18th century, became obsolete, but has been reconstructed by M. Mahillon, of Brussels, at the order of M. Gevaert, in order to perform correctly the works of Bach. The oboe di cacciæ (hunting-oboe), which is found in the scores of Bach, Haydn, and others, has now gone out of use, and is often confounded by modern writers with the Cor Anglais.

OBOK (sometimes spelled OBOCK), a French colony on the east coast of Africa on Tajurra bay in the gulf of Aden. The chief town, Obok, on the north shore of Tajurra bay is a military, marine and coaling station and has a population of 800. Obok was bought by the French government in 1862, but not occupied until 1883. The harbor is small but safe and easy of access. A submarine cable to Jibuti has been projected. There is trade with Shoa and other countries in the interior. See Poydenot, *Obock, station de ravitaillement pour la marine française* (Paris, 1893).

OB'OLUS (Gr., *obolos* or *obelos*, a spit), the smallest of the four common Greek coins and weights, was originally, as is generally supposed, a small piece of iron or copper, similar in form to the head of a spit, or spear head, whence its name. In this form it was used as a coin, and a handful of "oboli" was equivalent to a drachma (q.v.). It was subsequently coined of silver, and in the ordinary round form, but still retained its original name; its value, both as a coin and a weight, was now fixed as the $\frac{1}{6}$ part of a drachma, so that in the Attic system it was equivalent to 2 cts., and $15\frac{2}{5}$ Troy grains respectively; while the Æginetan obolus was worth 5 cts. as a coin, and $25\frac{3}{5}$ Troy grains as a weight.

OB'OLUS, in natural history. See INVERTEBRATE ANIMALS, sub-kingdom mollusca, division A; class III., family 10.

OBOOKI'AH, HENRY, was born in the island of Hawaii, about 1792, and in 1809 was brought to New Haven, Conn., by a sea-captain. A desire for education was stimulated by the sight of the college and its students, and his wish to become a missionary to his people gained him many friends, by whose aid he studied at Andover, Mass., and at Torringford, Litchfield, and Cornwall, Conn. At the last-named place a foreign mission school was established, and here Obookiah was placed to complete his education, but died in Feb., 1818. The interest awakened by his case led to the sending of missionaries to Hawaii.

O'BRIEN, a co. in n.w. Iowa, drained by Little Sioux river and Willow creek; on the Chicago, Milwaukee, and St. Paul, and the Illinois Central railroads; 576 sq. m.; pop. '90, 13,069. Co. seat, Primghar.

O'BRIEN, FITZ-JAMES, 1828–62; b. Ireland; emigrated to America in 1850, and in April, 1861, joined the New York 7th regiment. In the following January he was placed on the staff of Gen. F. W. Lander, was wounded in a skirmish, Feb. 16, 1862, and died from the effects of a surgical operation. He was a contributor in prose and verse to the *Atlantic Monthly*. He was happy in his choice of themes, especially for his poetical work, and he gave them noble treatment, vigorous but refined. He was a brave soldier. He is called the ablest of those of the New York Bohemians, from 1850 to 1862, who are now dead. He was a member of that literary coterie to which Charles G. Halpine, E. C. Stedman, Walt Whitman, and T. B. Aldrich belonged, and in a publication of the present year entitled *Life, Poems, and Stories of Fitz-James O'Brien*, edited by William Winter, who knew him well, are included his stories, most distinguished for imaginative ability and literary art, *The Diamond Lens* and the *Golden Ingot*.

O'BRIEN, JEREMIAH, 1740–1818; b. Ireland; came to this country and settled in Maine; in 1775, with only a few assistants, struck the first hostile blow in the American waters, capturing the Margaretta, a British armed vessel, for which act he was appointed capt. of privateers. Soon afterwards he captured other English vessels, and was commissioned capt. in the state navy, but finally was made prisoner, and confined in the prison-ship Jersey for six months, then sent to England and placed in Mill Prison, but a year later escaped, and returned to Maine. He held the office of collector at Machias, at which place he died.

O'BRIEN, WILLIAM SMITH, b. in 1803, was the second son of the late sir Edward O'Brien, bart. of Dromoland, in the county of Clare, Ireland, and uncle of the present

lord Inchiquin; that ancient barony having recently passed to the Dromoland O'Briens on the failure of the elder branch. William S. O'Brien was educated at Harrow School, whence he passed to Trinity college, Cambridge. He entered parliament for the borough of Ennis in 1828, and was a warm supporter of Catholic emancipation. In 1835 he was returned on advanced liberal principles for the county of Limerick, and for several years strongly advocated the claims of Ireland to a strictly equal justice with England, in legislative as well as executive measures. Professing his inability to effect this in the united legislature, and having embroiled himself with the speaker by refusing to serve on committees (for which refusal he was committed to prison in the house by the speaker's order), he withdrew from attendance in parliament in 1841, and joined actively with Daniel O'Connell (q.v.) in the agitation for a repeal of the legislative union between England and Ireland. In the progress of that agitation, a division having arisen on the question of *moral* as against *physical force* between O'Connell and the party known as "young Ireland," O'Brien sided with the latter; and when the political crisis of 1848 eventuated in a recourse to arms, he took part in an attempt at rebellion in the s. of Ireland, which in a few days came to an almost ludicrous conclusion. He was in consequence arrested, and, having been convicted, was sentenced to death. The sentence, however, was commuted to transportation for life; and after the restoration of tranquillity in the public mind in Ireland, he, in common with the other political exiles, was permitted to return to his native country. From that date (1856) he spent much of his time in foreign travel; and although he wrote more than once in terms of strong disapproval of the existing state of things, he invariably abstained from all active share in the political proceedings of any party. He died June, 1864.

O'BRIEN, William, was born in Ireland in 1852, and educated at Queen's College, Cork. In 1883 he was elected to the House of Commons from Mallow, from South Tyrone in 1885, and from North-East Cork in 1886. He has always been a leading member of the Home Rule (q.v.) party, and represented the Irish National League at the convention held in Chicago in 1886. He has been four times imprisoned under the so-called Coercion Act, and once suspended from the House for breach of the rules. In 1890, while set free on bail during a pending trial, he forfeited his bail and escaped to the United States to keep an engagement there to deliver addresses. He played a prominent part in the negotiations between the Parnellite and the McCarthy factions in 1891. He has edited *United Ireland*, and while in prison wrote *When We Were Boys*. He is a vigorous and incisive speaker, and has much influence in the councils of the Irish party. See Parnell; Plan of Campaign.

OBSCENE PRINTS, BOOKS, or **PICTURES.** By the United States revised statutes, sec. 2491, all persons are prohibited from importing into the United States from any foreign country any obscene book, pamphlet, paper, writing, advertisement, circular, print, picture, drawing, or other representation, figure, or image, on or of paper or other material, or any instrument or drug for any immoral purpose. No invoice or package containing such articles shall be admitted at the custom house. Any judge of any U. S. district or circuit court, before whom complaint in writing is made upon knowledge or belief, and if upon belief, setting forth the grounds of such belief, supported by complainants' oath, may issue a warrant to any marshal or deputy marshal to search for and seize such immoral articles, and to make return so that they may be condemned and destroyed. The proceedings, as in other cases of municipal seizure, are subject to appeal or writ of error. It was held in *The U. S.* vs. *One case of Stereoscopic Slides*, Sprague, 407, that where an invoice contains any immoral articles, the whole is forfeited. By sec. 3,878, obscene publications, etc., are excluded from the mails. By sec. 3,893 any person who shall knowingly deposit in or take out from the mails such things for the purpose of circulation or distribution, shall be guilty of a misdemeanor, and for each offense be fined not less than $100 or more than $5,000, or imprisoned not less than one year or more than 10 years, or both at the discretion of the court. The prohibition of these statutes is against every article or thing intended or adapted to any obscene, indecent, or immoral use. By sec. 5,389, every person in the district of Columbia, or any of the territories, or elsewhere within the United States jurisdiction, who sells, lends or gives away, or in any manner exhibits or publishes or offers to publish any obscene publication etc., shall be punished with hard labor in the penitentiary for not less than 6 months, or more than 5 years for each offense, or shall be fined not less than $100 or more than $2,000 with costs. By sec. 1785, any officer, agent, or employee of the United States who violates laws against obscene literature etc., is guilty of misdemeanor, and for each offense, shall be fined not less than $100, nor more than $5,000, or shall be imprisoned at hard labor for not less than one year, nor more than 10 years or both. See Vice, Societies for the Suppression of

OBSCURANTISTS, the name given, originally in derision, to a party who are supposed to look with dislike and apprehension on the progress of knowledge, and to regard its general diffusion among men, taken as they are ordinarily found, as prejudicial to their religious welfare, and possibly injurious to their material interests. Of those who avow such a doctrine, and have written to explain and defend it, it is only just to say that they profess earnestly to desire the progress of all true knowledge as a thing good in itself; but they regard the attempt to diffuse it among men, indiscriminately, as perilous,

and often hurtful, by producing presumption and discontent. They profess but to reduce to practice the motto—

A little learning is a dangerous thing.

It cannot be doubted, however, that there are fanatics of ignorance as well as fanatics of science.

OBSEQUIES. See FUNERAL RITES.

OBSERVANTISTS, or OBSERVANT FRANCISCANS. Under the head FRANCISCANS (q.v.) has been detailed the earlier history of the controversies in that order on the interpretation of the original rule and practice established by St. Francis for the brethren, and of the separate organization of the two parties at the time of Leo X. The advocates of the primitive rigor were called *Observantes*, or *Strictioris Observantiæ*, but both bodies were still reputed subject, although each free to practice its own rule in its own separate houses, to the general administrator of the order, who, as the rigorists were by far the more numerous, was a member of that school. By degrees, a second reform arose among a party in the order, whose zeal the rigor of the observantists was insufficient to satisfy, and Clement VII. permitted two Spanish friars, Stephen Molena and Martin Guzman, to carry out in Spain these views in a distinct branch of the order, who take the name of *reformati*, or reformed. This body has in later times been incorporated with the observantists under one head. Before the French revolution, they are said to have numbered above 70,000, distributed over more than 3,000 convents. Since that time, their number has, of course, been much diminished; but they still are a very numerous and widespread body, as well in Europe as in the new world, and in the missionary districts of the east. In Ireland and England, and for a considerable time in Scotland, they maintained themselves throughout all the rigor of the penal times. Several communities are still found in the two first-named kingdoms.

OBSERVATION AND EXPERIMENT are the leading features of modern science, as contrasted with the philosphy of the ancients. They are indispensable as the bases of all human knowledge, and no true philosophy has ever made progress without them, either consciously or unconsciously exercised. Thus, by Socrates, Plato, and Aristotle, no less than by Archimedes and the ancient astronomers, observation and experiment are extensively though not prominently or always obviously employed; and it was by losing this clue to the spirit of their master's teaching, that the later disciples in these schools of philosophy missed the path of real progress in the advancement of knowledge. It was in the latter half of the 16th c. that the minds of philosophers were first *consciously* awakened to the importance of observation and experiment, as opposed to authority and abstract reasoning. This result was first occasioned by the discoveries and controversies of Galileo in Florence; and to the same end were contributed the simultaneous offorts of a number of philosophers whose minds were turned in the same direction—Tycho Brahe in Holland, Kepler in Germany, William Gilbert in England, who were shortly afterwards followed by a crowd of kindred spirits. The powerful mind of Francis Bacon lent itself to describe the newly awakened spirit of scientific investigation, and though he ignored or affected to despise the results achieved by the great philosophers just mentioned, he learned from them enough to lay the foundation of a philosophy of inductive science, which, if we look at the course of scientific progress since his day, seems to have been almost prophetic. The difference between observation and experiment may be said to consist in this, that by observation we note and record the phenomena of nature as they are presented to us in her ordinary course; whereas by experiment we note phenomena presented under circumstances artificially arranged for the purpose. Experiment is thus the more powerful engine for discovery, since one judiciously conducted experiment may provide the data which could only result from a long course of observations.

OBSERVATORY, an institution supplied with instruments for the regular observation of natural phenomena, whether astronomical, meteorological, or magnetical. In some observatories all three classes of observation are carried on, but in most cases special attention is paid to astronomy alone, and only such meteorological observations are taken as are required for the calculation of the effect of atmospheric refraction on the position of a heavenly body; there are, however, a few observatories which are devoted solely to meteorologieal or magnetical observations. Confining our attention to astronomical observatories, it will be convenient to divide them into two classes—public and private observatories—the former being devoted to those observations which from their nature require to be continued on the same system for long periods of time, whilst the latter are usually founded for some special object, which may be attained with a comparatively small expenditure of time and labor.

The most important work which is carried out in public observatories is the determination of the movements of the sun, moon, and planets among the stars; and as a corollary to this, the relative positions of the stars to which the other heavenly bodies are referred. In early times the Greek astronomers fixed these positions by means of armillary spheres and astrolabes, having concentric graduated circles, on which the latitudes and longitudes could be read off, when a pair of sights was pointed to the heavenly body. Ptolemy made use of a quadrant, with which he measured zenith distances on the meridian; and many centuries after, Tycho Brahé converted this form of instrument

into an altazimuth by mounting it on a vertical axis in connection with a horizontal or azimuth circle. With this instrument Tycho Brahé made a long series of observations of the altitudes and azimuths of the heavenly bodies at the observatory which the king of Denmark erected for him, and he also measured with great assiduity their angular distances from each other by means of a sextant, a method of observation which Flamsteed afterward employed with a much improved form of the instrument, and which is now extensively used with the reflecting sextant, for finding the longitude at sea. It was not till the middle of the last c., that the improvement of the clock by Graham enabled astronomers to rely on it for the determination of right ascensions by the times of passage across the meridian, instead of by measuring them with a graduated circle. The quadrant was then fixed in the meridian, and being attached to a massive wall, its dimensions were increased, and greater accuracy thereby secured in the determination of meridian zenith distances. Two such instruments pointing respectively n. and s. were erected at the royal observatory, Greenwich, and used by Bradley and his successors from 1750 till they were displaced by the mural circle (see CIRCLE, MURAL), an instrument vastly superior in principle, since the troublesome errors of centering of the quadrant were got rid of by combining the readings of opposite parts of a graduated circle, whilst the effect of division errors was much reduced by taking the mean of the readings at 6 or 8 equidistant points of the circle. At the same time, the accuracy of the readings was greatly increased by the invention of the micrometer-microscope, which made it possible to measure spaces to $\frac{1}{100000}$ of an inch. Neither the quadrant nor the mural circle, however, could be relied upon for accurate motion in the plane of the meridian, but Römer remedied this defect by inventing a separate instrument, the transit (q.v), which enabled astronomers to observe the times of meridian passage or transit with great accuracy, and thus to determine the differences of right ascension of the heavenly bodies by means of the apparent diurnal movement. With the transit and quadrant Bradley commenced that series of observations of the positions of the sun, moon, and planets, and of stars for reference, which have been continued ever since at Greenwich, and on which, in combination with less extensive series at Paris and Königsberg, all our tables of the motions of the heavenly bodies are founded. In modern observatories, the transit and mural circle are combined into one instrument, the transit-circle, a change which has been rendered possible chiefly by the improvement in graduated circles since the invention of Troughton's dividing engine, the unwieldy size of the old quadrants and mural circles necessitating an attachment to a massive wall. Although Reichenbach made transit-circles at the beginning of this c. for several foreign observatories, including that of Dorpat, the lightness of their structure and their want of stability prevented their being introduced generally, and the mural circle held its place in the principal observatories till sir George Airy designed the Greenwich transit-circle in 1851, an instrument of a most massive character, which has served as model for nearly all that have been constructed in recent years. The main features of the modern transit-circle are: (1) that it is not reversible, its collimation error being determined by means of two collimators, or reversed telescopes pointing at each other and at the transit telescope, n. and s. respectively; (2) that a spirit-level is not used, the level error being found by means of the reflection of the wires from the horizontal surface of mercury. These two negative characteristics, while admitting of great massiveness in construction (the Greenwich instrument weighs more than a ton), have removed three troublesome sources of error—inequality in the pivots, lateral flexure of the telescope in the process of reversion, and the effect of currents of heated air on a spirit-level. An important auxilliary to the transit-circle is the chronograph, an American invention, which, in various forms, is now found in all well-equipped observatories, the principle in all cases being the same—viz., the registration on a revolving cylinder of paper of the times of transit across the system of spider-lines of the transit-circle, as well as of the seconds of the sidereal clock, by means of electric currents, which pass through electro-magnets, when the circuit is closed either by the observer or the clock, thus causing a momentary attraction of a piece of soft iron, and producing a corresponding mark on the paper either with a pen or a steel point. This system, while improving somewhat the accuracy of the individual observations, admits of a large number being made at intervals of two or three seconds, and leaves the observer free to make several observations of zenith distance during the passage of a star across the field of view. Allusion has been made to the importance of the sidereal clock in modern astronomy. Considerable improvements have been made in its construction since Graham's time, the original gridiron pendulum having been replaced successively by the mercurial and the zinc and steel, and the dead-beat escapement by Dennison's gravity and Airy's detached escapement. Recently an apparatus depending on the attraction of a movable magnet connected with a float in a siphon barometer has been applied by sir George Airy to the sidereal clock at Greenwich, to correct for the effect of variations in the atmospheric pressure on the motion of the pendulum. This clock is placed in a basement which is kept at a nearly uniform temperature, an important condition, which has contributed to make its peformance very far superior to that of any other clock hitherto constructed, and fully equal to the requirements of the methods of observation now in use. With instruments such as have just been described, regular observations of the sun, moon, and planets, and of fundamental stars, are made at Greenwich, Paris, Washington and Oxford, supplemented at the first-named observatory by extra-meridian observations of the moon with a massive altazimuth, which can be employed when the moon is too near

new moon to be seen on the meridian in full daylight, and which is in fact used to secure an observation on every night when the moon is visible.

The observations of stars at these four observatories are directed to the most accurate determination of the places of a limited number, and the deduction of their proper motions by comparison with the results obtained by Bradley, Piazzi (with an altazimuth by Ramsden at Palermo), and Groombridge; but at other observatories differential or zone observations of large numbers of stars have been made, with the object of making a complete and tolerably accurate survey of the heavens, the rhomb or ring micrometer being used for this purpose. Among those who have devoted themselves to this work may be mentioned Lacaille at the cape of Good Hope, Lalande at Paris, Bessel at Königsberg, and Argelander at Bonn. These zone-observations are now being repeated with the transit-circle at a number of observatories, associated together for the purpose of getting far more accurate places than was possible with the equatorial. A large number of observatories, chiefly in Germany and America, are devoted to a very different class of observations—viz., differential observations with the equatorial (q.v.) of comets and small planets as referred to comparison-stars, and the search for such objects; whilst at other observatories, among which that of Pulkowa may be mentioned, the measurement of double stars with the micrometer is laid down as the chief object. Of late years two new subjects have been introduced in the routine of observatory work—photography and spectroscopy. The former was carried on for many years at Kew observatory under Mr. de la Rue's auspices, and at his private observatory at Cranford, and the work is now being continued at Greenwich: the latter has been taken up at a number of Italian observatories, and particularly at Rome by P. Secchi, and it now forms part of the regular system at Greenwich; whilst the observatories at Paris, Berlin, and Vienna are equipped for these physical observations, and in America and Australia they are vigorously carried on at several observatories—Melbourne, in particular, being provided with a four-feet equatorial reflector for this purpose, as well as for the examination of nebulæ. The most important work of an observatory, however, consists, not in making observations, which are easily multiplied, but in reducing and publishing them—a task of far greater labor, and requiring far higher qualifications. However various may be the observations, the method of eliminating their errors is the same in all cases, and similar mathematical considerations apply to their reduction, whether they be meridian observations, micrometer measures, measures of photographs, or spectroscopic observations; and it is when such treatment is required in any inquiry that it should be undertaken at a public observatory, where this rigorous method will be applied. See illus., Telescopes and Observatories, vol. XIV.

The work of private observatories hardly admits of being specified, though its general character has already been indicated; it may suffice to mention the observations of double stars and nebulæ by the two Herschels, Groombridge's catalogue of circumpolar stars, Smyth's double-star measures, Carrington's Redhill catalogue and solar observations, the nebular observations of Lord Rosse and Mr. Lassell, De la Rue's long series of photographs, and the spectroscopic observations of Huggin's and Lockyer.

OBSIDIAN, a mineral accurately described by Pliny under the name which it still bears. It is a true kind of native glass, composed of silica (from 70 to 80 per cent), alumina, lime, soda, potash, and oxide of iron. It is hard and brittle, with remarkably vitreous luster, and perfectly conchoidal fracture, the edges of the fractures very sharp and cutting like glass. It varies from semi-transparency to translucency only on the edges. It is often black, or very dark gray; sometimes green, red, brown, striped, or spotted; and sometimes *chatoyant* or *avanturine*. It occurs in volcanic situations, and often in close connection with pumice, in roundish compact pieces, in grains, and in fibers. It is capable of being polished, but is apt to break in the process. It is made into boxes, buttons, ear-drops, and other ornamental articles; and before the uses of the metals were well known, it was employed in different parts of the world for making arrow and spear heads, knives, etc. It is found in Iceland, the Lipari isles, Vesuvius, Sardinia, Hungary, Spain, Teneriffe, Mexico, South America, Siberia, the United States, etc. Black obsidian was used by the ancients for making mirrors, and for this purpose was brought to Rome from Ethiopia. It was used for the same purpose in Peru and Mexico. Mirrors of black obsidian are indeed still employed by artists. Chatoyant or avanturine obsidian is very beautiful when cut and polished, and ornaments made of it are sold at a comparatively high price.

OBSTETRICS. See Midwife.

OBVERSE, or Face, the side of a coin or medal which contains the principal device or inscription, the other side being in contradistinction called the reverse. See Numismatics.

O'CALLAGHAN, Edmund Bailey, ll.d., b. Ireland in 1797. After studying two years at Paris he went in 1823 to Quebec; commenced the practice of medicine in 1827; became in 1836 a prominent member of the provincial parliament; in 1834–37 was editor of the *Vindicator*, the national organ at Montreal. In 1837 he removed to New York. O'C. published several works, among which the following are the most important: *History of New Netherlands; Jesuit Relations; Documentary History of New York*, 4 vols.; *Documents relating to the Colonial History of New York*, 11 vols.; *Remonstrance of New Netherland; Commissary Wilson's Orderly Book; Orderly Book of General John Burgoyne; Journals of the Legislative Councils of New York; Voyage of George Clark to America*, with introduction and notes; *Voyages of the slavers St. John and Arms; Journal of the Voyage*

of the sloop Mary from Quebec; and many translations of manuscripts from foreign languages. He d. 1880.

OCARINA, a musical instrument originally invented by an Italian boy, and improved by French musicians. It was first a molded piece of clay a few inches long, with holes for keys, a mouth piece, and hollowed within. Different sizes are now made for the different parts in music; and a piston at the end is used to temper the note. A row of keys in the improved instrument takes the place of the original holes. The O. is an instrument of much sweetness, and is now used in concert halls.

OCCAM, WILLIAM OF, surnamed *Doctor Singularis et Invincibilis,* a famous schoolman, was born in England, at the village of Ockham, in the county of Surrey, about the year 1270. We do not possess any precise or satisfactory knowledge of his early life. He is said to have been educated at Merton college, Oxford, and to have held several benefices in his native country, but soon after resigned them on entering the Franciscan order. Early in the 14th c. it is supposed he proceeded to Paris, where he attended the lectures of Duns Scotus, of whose philosophy he was afterwards the most formidable opponent. Here he soon became prominent by the boldness of his ecclesiastical views. Philippe, *le Bel,* king of France, having forbidden Pope Boniface VIII. to levy contributions in his dominions, the latter, by way of retaliation, excommunicated him. Occam rushed to the defense of the monarch, and in his *Disputatio inter Clericum et Militem, super Potestate Prælatis Ecclesiæ atque Principibus Terrarum Commissa,* denies that the popes have any authority in temporal affairs, and boldly declares that all who favored such a doctrine ought to be expelled from the church as heretics. Meanwhile, from being a listener, he had become a lecturer in philosophy. The system which he advocated—for he was not properly its originator—is known by the name of *nominalism* (q.v.), but it had never before received so rigorously logical and rational a treatment: hence his epithet of *Invincibilis.* The work in which his views are set forth is entitled *Expositio Aurea, et admodum utilis super totam Artem Veterem.* It contains a series of commentaries upon the *Isagoge* of Porphyry, and on the *Categories* and *Interpretation* of Aristotle, with a special treatise headed *Tractatus Communitatum Porphyrii,* and a theological opusculum on predestination. It is intended as a demolition of the moderns—i.e., the scholastics—and shows that in their method they have completely departed from the principles and methods of the great Stagyrite, for whom, like every sound and solid thinker, he shows the deepest respect and admiration. About 1320 or 1321 he again plunged into ecclesiastical controversy. A certain Narbonese priest, having affirmed that Jesus Christ and his apostles held everything in common, and that every ecclesiastical possession is a modern abuse, was pounced upon by the inquisitors, and defended by a certain Berenger Talon, a Franciscan monk of Perpignan. But Berenger's defense of apostolical poverty was naturally enough very disagreeable to the pope, John XXII., who therefore condemned it. Berenger was, however, vigorously supported by his order, and among others by Michael de Cesena, the general-superior, Bonagratia of Bergamo, and William of Occam, who attacked the pope with great vehemence and trenchant logic. Shortly after they were arrested as favorers of heresy, and imprisoned in Avignon. But while their trial was proceeding, Michael de Cesena and Occam, knowing what little mercy or justice they had to expect from their accusers and judges, made their escape to the Mediterranean, and were received at a little distance off shore on board a galley of Ludwig, king of Bavaria, the patron of the Franciscan antipope, Peter of Corbaras, and one of the most powerful sovereigns in Europe. The remainder of Occam's life was spent at Munich, where, safe from the machinations of his enemies, he continued to assail at once the errors of papistry in religion, and of realism in philosophy. He died April 7, 1347. It is impossible to praise Occam too highly. He was the first logician, and the most rational philosopher among the whole body of schoolmen. We are often reminded by his clear and vigorous common sense and wholesome incredulity that he was the countryman of Locke and Hobbes, and that he came of a people ever noted for the solidity of their understanding. Besides the works already mentioned, Occam's principal writings are: *Dialogus in tres Partes distinctus, quarum prima de Hæreticis, secunda de Erroribus Joannis XXII., tertia de Potestate Papæ, Conciliorum et Imperatoris; Opus Nonaginta Dierum contra Errores Joannis XXII.; Compendium Errorum Joannis Papæ XXII.; Decisiones Octo Quæstionum de Potestate summi Pontificis; Super Quatuor Libros Sententiarum Subtilissimæ Quæstiones earumque Decisiones* (based on Peter the Lombard's famous *Sententiæ,* and containing nearly the entire theology of Occam. These *Decisiones* were long almost as renowned as the *Sententiæ* which gave them birth); *Antiloquium Theologicum; Summa Logices ad Adamum Major Summa Logices.*—See Luke Wadding's *Scriptores Ordinis Minorum* (1650); Cousin's *Histoire de la Philosophie* (2d ed. 1840); and B. Hauréau's *De la Philosophie Scholastique* (1848).

OCCASIONALISM, or the doctrine of OCCASIONAL CAUSES (see CAUSE), is the name given to the philosophical system devised by Descartes and his school, for the purpose of explaining the action of mind upon matter, or, to speak more correctly, the combined, or at least the synchronous action of both. It is a palpable fact that certain actions or modifications of the body are accompanied by corresponding acts of mind, and *vice versâ.* This fact, although it presents no difficulty to the popular conception, according to which each is supposed to act directly upon the other—body upon mind, and mind upon body—has long furnished to philosophers a subject of much speculation. But on the other hand, it is difficult to conceive the possibility of any *direct* mutual interaction of sub-

stances so dissimilar, or rather so disparate. And more than one system has been devised for the explanation of the problem, as to the relations which subsist between the mind and the body, in reference to those operations, which are clearly attributable to them both. According to Descartes and the Occasionalists, the action of the mind is not, and cannot be *the cause* of the corresponding action of the body. But they hold that whenever any action of the mind takes place, God directly produces, in connection with it, and by reason of it, a corresponding action of the body; and in like manner conversely, they explain the coincident or synchronous actions of the body and the mind. It was in opposition to this view that Leibnitz, believing the Cartesian system to be open to nearly equal difficulties with that of the direct action, devised his system of *Pre-established Harmony*. See LEIBNITZ. His real objection to the Occasionalist hypothesis is, that it supposed a perpetual action of God upon creatures, and, in fact, is but a modification of the system of "direct assistance."

OCCLEVE, OR HOCCLEVE, THOMAS, was an English poet of whom very little is known, except that he is supposed to have been born in Hocclough (hence his name), Northumberland, about 1368, and to have been a clerk of the Exchequer. His principal work is a tedious version, the *De Regimine Principum* of Ægidius Romanus, consisting of over five thousand lines written in Chaucer's seven-line stanza. In the prologue, which comprises about one-third of the whole work, the author gives a sketch of his own life. The most interesting portion is that in which he alludes to his own grief at the death of Chaucer, whom he calls the "floure of eloquence." The poem was edited by T. Wright (1860). His *Minor Poems* and his *Complaint* have been edited by Dr. Furnivall for the Early English Text Society. There are also many other poems ascribed to Occleve still unpublished. The exact date of his death is unknown, though he is known to have been living in 1448, as some of his poems bear that date.

OCCULTATIONS (Lat. *occultatio*, a concealment) are neither more nor less than "eclipses;" but the latter term is confined by usage to the obscuration of the sun by the moon, and of the moon by the earth's shadow, while the former is restricted to the eclipses of stars or planets by the moon. Occultations are phenomena of frequent occurrence; they are confined to a belt of the heavens about 10° 17½′ wide, situated parallel to, and on both sides of the equinoxial, and extending to equal distances n. and s. of it, being the belt within which the moon's orbit lies. These phenomena serve as data for the measurement of the moon's parallax; and they are also occasionally employed in the calculation of longitudes. See ECLIPSES.

OCCULTISM. An occultist is "one who studies the whole range of psychological, physiological, cosmical, physical, and spiritual phenomena;" hence O. seems to embrace the whole cycle of human knowledge, but prefers those subjects which, for want of explanation, are not yet transferred from the realm of the imagination to reason. It is a favorite word in the publications of the Theosophical soc., founded, 1875, by Col. Henry S. Olcott and Mme. H. P. Blavatsky. Olcott had been a quartermaster in the U. S. army during the civil war, was afterward in the Internal revenue service, and a man-about-town in New York; his conversion to his new theories was in 1874. There are various small publications by the soc., including a journal; *Isis Unveiled*, by Blavatsky, 2 vols., N. Y., 1877, etc. Shortly after this publication these two went to India, embracing the tenets of Buddhism, and beginning what may be called a countermission in the e. of India and Ceylon; see a *Buddhist Catechism*, H. S. Olcott, London, 1881, and for an account of journeys and healings, the *Pall Mall Gazette*, in the early spring of 1884. The object of the founders of the society is "to experiment practically in the occult powers of nature, to disseminate among Christians information about the oriental religious philosophies, and spread among the 'poor benighted heathen' such evidences as to the practical results of Christianity as will at least give both sides of the story to the communities among which missionaries are at work."

The book of Mme. Blavatsky, exponent of occultism, has little to do with anything but the imagination. The wonders here enumerated are considered by scientists as magical, due to jugglery, trained manual and mental dexterity, or neurosis; see the works of the late Dr. Beard on hypnotism, muscle-reading, etc.

OCCUM, or **OCCOM,** SAMSON, 1723–92; an American Indian born in Conn., educated for the ministry at Lebanon; from 1749–59 taught and preached among the Indians at Montauk, L. I.; was ordained by the Suffolk presbytery in 1759; went in 1766 to England with Rev. Mr. Whitaker to solicit funds for his school, which was soon transferred to Hanover, N. H., and became Dartmouth College. Occum engaged in missionary labors in different places, and in 1786 removed with a number of Mohegan and other Indians to Brotherton, near Utica, N. Y.

OCCUPANCY, in law, the taking possession of an unappropriated corporeal thing, with the intention of becoming its owner. This mode of acquiring property came to the common from the Roman law, which considered occupancy a mode of acquiring property belonging to no one, but subject to appropiation by the first comer. Instances are uninhabited lands, which belong to the discoverer. The finder of unclaimed lost goods

has a title to them by occupancy, and so has the captor of beasts of a wild nature, so long as he keeps possession of them, but there can be no complete property in them till they are domesticated; and if they make their escape, with no intention of coming back, *animus revertendi*, the ownership of the original owner ceases, and their next captor acquires a title in them by occupancy. But if they be once domesticated the title by occupation becomes indefeasible. The owner of property by accession acquires his title by occupancy, and so does the owner of goods obtained by confusion; it being held, that where a person with fraudulent intent mixes his property indistinguishably with that of another, the latter is not compelled to distinguish his property from that of the former, but is entitled to the ownership of the whole, and he acquires such ownership by occupancy. Blackstone refers the title to literary property to the same head of occupancy, and here also belongs the title to trade marks, ownership of which is acquired by a person using them to indicate his ownership of certain articles, or certain business. Another instance of title to personal property obtained by occupancy, occurs in the case of property acquired from an enemy in time of war. By the law of nations, property captured from an enemy vests in the government or sovereign of the state of which the captor is a subject; but the captors are generally allowed a part or the whole of the property captured. A good title to property captured on land is acquired by occupancy without the intervention of a court; but in the case of prizes acquired at sea, judgment must be rendered by a prize court of competent jurisdiction. The English method of distributing *booty*, i.e., property captured on land, is by grant from trustees appointed by the crown, and whose acts of distribution are subject to its assent. Instances of the acquisition of a title to land by occupancy are more rare. Land left bare by the sea or a lake, or deposited by a river, is acquired by occupancy. Another instance, at the common law, was where an estate was limited to one person during the life of another person, and the former died; there was then no person to whom the estate could pass. The executor could not take it, for it was not personal property; nor the heir, because it was not a fee; nor the original grantor, because he could not take back his own grant. Any person, therefore, could come in and take possession; and the person so acquiring possession was known as the "general occupant." The common law rule has been changed in many of the states, and in some the residue of the estate goes to the executor as personal property. Where the limitation was to one person and his heirs, during the life of another, and the former person dies, the residue goes to his heirs, not as heirs, because the estate is not one of inheritance, but as "special occupants" named in the grant. The general theory of title by occupation has long been of little importance. While this country was a colony of Great Britain, the ownership of land was held to be vested in the crown, and individual titles to land were derived from the crown. Since the separation of the colonies from Great Britain, titles are derived from the grant of the United States or the individual states. The *occupatio*, or occupation, of the Roman law, was the same thing as occupancy.

OCEAN, a term which, like Sea, in its general acceptation, denotes the body of salt water that separates continent from continent, and is the receptacle for the waters of rivers. The surface of the ocean is about three-fifths of the whole surface of the earth. Although no portion of it is completely detached from the rest, the intervening continents and islands mark it off into divisions, which geographers have distinguished by special names: the *Atlantic ocean* (q.v.), between America and Europe and Africa; the *Pacific ocean* (q.v.), between America and Asia; the *Indian ocean* (q.v.), lying s. of Asia, and limited on the e. and w. by Australasia and South Africa; the *Arctic ocean* (q.v.), surrounding the north pole; and the *Antarctic ocean* (q.v.), surrounding the south pole. The general features and characteristics of the ocean will be described under Sea.

OCEAN, a co. in s.e. New Jersey, bounded on the e. by the Atlantic ocean, watered by Cedar creek and Toms river, traversed by the Central of New Jersey, the Tuckerton and the Pennsylvania railroads; area, 578 sq. m.; pop. '90, 15,974. Co. seat, Toms River.

OCEAN, a tp. in Monmouth co., N. J.; including Long Branch and Seabright towns. Pop. '90, 10,209.

OCEA'NA, a co. in w. Michigan, bounded on the w. by lake Michigan; drained by White river; on the Chicago and West Michigan railroad; 540 sq.m.; pop. '90, 15,698. Co. seat, Hart.

OCEANA. See Harrington, James.

OCEAN'IA, the name given to the fifth division of the globe, comprising all the islands which intervene between the south-eastern shores of the continent of Asia and the western shores of the American continent. It naturally divides itself into three great sections—Malay Archipelago (q.v.), Australasia (q.v.), or Melanesia and Polynesia (q.v.).

OCEAN'ICA. See Oceania.

OCEAN RACING. See Steam Navigation.

OCE'ANUS, in mythology, the eldest of the Titans, son of Ouranos and Gê, father, by his sister Tethys, of the 3000 Oceanides, or ocean nymphs. He was the god of the ocean-stream which surrounded the plain of earth. His palace, according to Homer, was in the west. Æschylus represents him as living in a cave under ocean.

OCEL'LUS, LUCA'NUS, b. Lucania, Italy, 5th c. B.C.; a pupil of Pythagoras. He wrote a number of philosophical treatises, of which only one, *on the nature of the universe*, has been preserved. In this he maintains the eternity of the human race, and of the universe. Diogenes Laërtius cites a letter from Archytas to Plato, mentioning four treatises of Ocellus which the former had sent to Plato; the answer of Plato acknowledges the receipt of the books, of which he expresses a high opinion. The subjects of the four works were on *law*, *piety*, the nature of the *universe*, and *kingly rule*. The extant treatise is written in the Ionic dialect, while Doric was the dialect prevailing in Lucania. The genuineness of the work has been questioned on this ground. The weight of opinion seems to be in favor of the supposition of Rudolphi, that the work was originally written in Doric, but that the Ionic forms were introduced by successive copyists and grammarians. The fragments of the same treatise found in Stobæus, are written in Doric. There is an English translation by Thomas Taylor (1837).

OCELOT, the name of several species of *felidæ*, natives of the tropical parts of South America, allied to the leopard by flexibility of body, length of tail, and other characters, but of much smaller size. They are usually included in the genus *leopardus* by those who divide the felidæ into a number of genera. They are inhabitants of forests, and very expert in climbing trees. Their prey consists in great part of birds. They are beautifully marked and colored. The best-known species, or COMMON ocelot (*felis pardalis*), a native of the warm parts of America, from Mexico to Brazil, is from 2 ft. 9 in. to 4 ft. long, exclusive of the tail, which is from 11 to 15 ins., and nearly of uniform thickness. The ears are thin, short, and pointed. The muzzle is rather elongated. The colors vary considerably, but the ground tint is always a rich red or tawny color, blending finely with the dark brown on the margins of the open spots, of which there are chains along the sides; the head, neck, and legs being also variously spotted or barred with dark brown or black. The ocelot is easily tamed and is very gentle and playful, but excessively mischievious. It may be fed on porridge and milk, or other such food, and is said to be then more gentle than if permitted to indulge in carnivorous appetites. Very similar to the common ocelot are several other American species, as the LINKED OCELOT (*felis catenata*), the LONG-TAILED OCELOT (*felis macrourus*), the CHATI (*felis mitis*), etc. The similarity extends to habits and disposition as well as form.

O'CHERS, the name usually applied to clays colored with the oxides of iron in various proportions, giving to the clay a lighter or deeper color. Strictly speaking the term belongs only to a combination of peroxide of iron with water. From many mines large quantities of water charged with ferruginous mud are being continually pumped up, and from this water the colored mud or ocher settles In this way large quantities are procured from the tin mines of Cornwall, and the lead and copper mines of north Wales and the isle of Man. Ochers occur also ready formed, in beds several feet thick, in the various geological formations, and are occasionally worked, as at Shotover hill, Oxford, in Holland, and many other places in Europe and America. Very remarkable beds are worked in Canada. The ochers so obtained are either calcined for use or not, according to the tint wanted. The operation adds much to the depth of color, by increasing the degree of oxidation of the contained iron. The most remarkable varieties of ocher are the Siena earth (terra di Siena) from Italy; the so-called red chalk, with which sheep are marked; Dutch ocher; Armenian bole, or Lemnian earth; Italian rouge, and Bitry ocher. They vary in color from an Isabelline yellow, through almost every shade of brown, up to a tolerably good red. The finest kinds are used by painters, the coarsest by carpenters for marking out their work, by farmers for marking cattle, etc.

O'CHIL HILLS, a hilly range in Scotland, occupying parts of the counties of Perth, Clackmannan, Stirling, Kinross, and Fife, and extending from the vicinity of Stirling n.e. to the Firth of Tay. The range is 24 m. in length and about 12 m. in breadth. The highest summit is Bencleugh (2,352 ft.), near the s.w. extremity.

OCHILTREE, a co. in n.w. Texas; formed 1876; organized 1889; crossed by North fork of Canadian river; 900 sq. m.; pop. '90, 198. Co. seat, Ochiltree.

OCHNA'CEÆ, a natural order of exogenous plants, containing not quite 100 known species, natives of tropical and subtropical countries. Some of them are trees, most of them under-shrubs; all are remarkable for their smoothness in all parts. Bitter and tonic qualities prevail in this order, and some species are medicinally used in their native countries. The seeds of *Gomphia jabotapita* yield an oil, which is used in salads in the West Indies and South America.

O'CHRO. See HIBISCUS.

OCKLEY, SIMON, 1678–1720; b. England: entered Queen's college, Cambridge, in 1693, and received the degree of B.D. In 1705 he was presented to the vicarage of Swavesey He became learned in the oriental languages. From Arabic manuscripts in the Bodleian library, at Oxford, he compiled a work containing much serviceable information concerning the early conquests of the Arabs, entitled *The History of the Saracens*, beginning with the times immediately subsequent to the death of Mohammed, and concluding in the year 705, which is much esteemed as a book of reference for the student in oriental languages. Gibbon, the historian, while writing his *Decline and Fall*, consulted it with advantage, and characterized the author as "an original in every sense who had opened

his eyes," and "a learned and spirited interpreter of Arabian authorities." Disraeli says: "He was, perhaps, the first who exhibited to us other heroes than those of Rome and Greece, sages as contemplative, and a people more magnificent even than the iron masters of the world." The scholars of his time received the book with marked approbation, esteeming it "the most authentic account of the Arabian prophet yet given to the world," and in 1847 it was regarded as "the standard history of this eventful period." In 1711 he was made professor of Arabic in the university of Cambridge, and in his inaugural address he pathetically referred to his poverty. The 1st vol. of his history was published in 1708, the 2d and last in 1718, and was dated at Cambridge castle, where he was imprisoned for debt. From these circumstances the conclusion is drawn that his literary work brought him little profit, but it is also a matter of history that he had an expensive family. In Chalmers's *Biographical Dictionary* there is an interesting account of his life, by Dr. Heathcote, and about the preparation of his principal work, his own words express the difficulties encountered, when he says: "Had I not been forced to snatch everything that I have, as it were, out of fire, our Saracen history should have been ushered into the world in a different manner." A third edition with additions by Dr. Long appeared in 1757 in 2 vols., and a fourth edition revised, improved, and enlarged, in 1847. Among his most important works, in addition to sermons on *The Christian Priesthood*, and the *Necessity of Instructing Children in the Scriptures*, there were published in 1706, *Introductio ad Linguis Orientalis in qua iis Discendis via munitur et Earum usus Ostenditur;* in 1707, *The History of the present Jews Throughout the World*, translated from the Italian of Leo of Modena, a Venetian rabbi; in 1708, *The Improvement of Human Reason Exhibited in the Life of Hai Ebn Yokdhan*, from the Arabic. In 1716 he published a new translation from the Arabic version of the second *Apocryphal Book of Esdras*. His writings are distinguished for their almost perfect accuracy as well as their erudition.

OCMUL'GEE, a river in Georgia, which rises in the northern center of the state by three branches, and after a course of 200 m. s.s.e., joins the Oconee, to form the Altamaha. It is navigable to Macon, 130 m. above its mouth.

OCO'NEE, a river of Georgia, rises in the n.e. part of the state, and flows southerly 250 m. where it unites with the Ocmulgee to form the Altamaha; it is navigable to Milledgeville, 100 miles.

OCO'NEE, a co. in n.e. central Georgia, bounded by the Oconee river on the e., and the Appalachee on the w.; pop. '90, 7713, chiefly of American birth, includ. colored. The soil is fertile and the surface hilly; corn and cotton are the chief products. The county was formed about 1870 from the s. part of Clarke county. Area, 168 sq. m. Co. seat, Watkinsville.

OCO'NEE, a co. in extreme n.w. South Carolina, bounded n.w. by the Chattooga, s.w. by the Tugaloo, and e. by the Keowee rivers; intersected by the Blue Ridge railroad; 620 sq. m.; pop. '90, 18,687, chiefly of American birth, includ. colored. The surface is broken and hilly, covered in most part by pine forests; cotton, Indian corn, and pork are the staples. Gold is found in small quantities. Co. seat, Walhalla.

O'CONNELL, DANIEL, eldest son of Mr. Morgan O'Connell of Darrynane, near Cahirciveen, in the co. of Kerry, Ireland, was born Aug. 9, 1775. His family was ancient, but straightened in circumstances. O'Connell received his first education from a hedge-schoolmaster, and, after a further training under a Catholic priest in the co. of Cork, was sent in 1790 to the English college at St. Omer. His school reputation was very high; but he was driven home prematurely by the outbreak of the revolution, and in 1794 entered as a law-student at Lincoln's Inn. In 1798 he was called to the bar; and it was the boast of his later career as an advocate of the repeal of the Union with England, that his first public speech was delivered at a meeting in Dublin, convened for the purpose of protesting against that projected measure. He devoted himself assiduously, however, to the practice of his profession, in which he rose steadily. By degrees, the Roman Catholic party having begun to rally from the prostration into which they had been thrown through the rebellion of 1798 and its consequences, O'Connell was drawn into public political life. In all the meetings of his co-religionists for the prosecution of their claims, he took a part, and his unquestioned ability soon made him a leader. He was an active member of all the successive associations which, under the various names of "Catholic board," "Catholic committee," "Catholic association," etc., were organized for the purpose of procuring the repeal of the civil disabilities of the Catholic body. Of the Catholic association he was himself the originator; and although his supremacy in its councils was occasionally challenged by some aspiring associates, he continued all but supreme down to its final dissolution. By means of this association, and the "Catholic rent" which it was enabled to raise, he created so formidable an organization throughout Ireland that it gradually became apparent that the desired measure of relief could not longer be safely withheld; and the crisis was precipitated by the bold expedient adopted by O'Connell, of procuring himself to be elected member of parliament for Clare in 1828, notwithstanding his well-known legal incapacity to serve in parliament, in consequence of his being obliged to refuse the prescribed oaths of abjuration and supremacy, which then formed the ground of the exclusion of Roman Catholics from the legislature. This decisive step towards the settlement of the question, although it failed

to procure for O'Connell admission to parliament, led to discussions within the House, and to agitations outside, so formidable, that in the beginning of the year 1829, the duke of Wellington and sir Robert Peel found it expedient to give way: and, deserting their former party, they introduced and carried through, in the spring of that year, the well-known measure of Catholic emancipation. O'Connell was at once re-elected, and took his seat for Clare, and from that date until his death continued to sit in parliament. He was elected for his native county in 1830, for the city of Dublin in 1836, for the town of Kilkenny in 1836 (having been unseated for Dublin on petition), for Dublin again in 1837, and for the co. of Cork in 1841. During all these years, having entirely relinquished his practice for the purpose of devoting himself to public affairs, he received, by means of an organized annual subsidy, a large yearly income from the voluntary contributions of the people, by whom he was idolized as their "liberator;" and who joined with him in all the successive agitations against the act of Union, against the Protestant church establishment, and in favor of reform, in which he engaged. In the progress of more than one of these political agitations, his associations were oppressed by the government; and the agitation for a repeal of the Union, recommenced in 1841 and carried on by "monster meetings" throughout Ireland, at which O'Connell himself was the chief speaker, assumed proportions so formidable, that he, in common with several others, was indicted for a seditious conspiracy, and after a long and memorable trial, was convicted, and sentenced to a year's imprisonment, with a fine of £2,000. This judgment was reversed by the House of Lords; and O'Connell, on his discharge, resumed his career; but his health had suffered from confinement, and still more from dissensions and opposition in the councils of his party; and as, on the return of the whigs to power in 1846, he consented to support their government, the malcontents of the repeal association openly separated from him, and a bitter feud between "young" and "old" Ireland ensued. In this quarrel, O'Connell steadfastly maintained his favorite precept of "moral force," and was supported by the great body of the Catholic bishops and clergy; but his health gave way in the struggle. He was ordered to try a milder climate: and on his journey to Rome in the spring of 1847, he was suddenly seized with paralysis, and died at Genoa on May 15 of that year. His eminence as a public speaker, and especially as a master of popular eloquence, is universally admitted. Into the controversies as to his public and political character, it is not our place to enter here. His speeches unfortunately were for the most part extempore, and exist but in the reports (uncorrected by himself) taken at the time. He published but a single volume, *A Memoir of Ireland, Native and Saxon*, and a few pamphlets, the most important of which, as illustrating his personal history and character, is *A Letter to the Earl of Shrewsbury.*—See *Life and Times of Daniel O'Connell*, by his son, John O'Connell; also *Recollections of Daniel O'Connell*, by John O'Neill Daniel; Fagan's *Life of Daniel O'Oonnell;* and *The Liberator*, by L. F. Cusack (1872) and McCarthy's *History of Our Own Times* (1879–80).

O'CONNELL, EUGENE, D.D., b. county Meath, Ireland, 1818; studied at Maynooth, where he was ordained a Rom. Cath. priest, 1842; went to the U. S., 1851. He performed missionary labors, and was prof. of the sem. of St. Thomas, Cal.; was made bishop of Flaviopolis and vicar apostolic of Marysville, 1861; was transferred to the see of Grass Valley, Cal., and Nev., 1868; and was relieved of this charge at his request, 1884, and appointed titular bishop of Joppa.

O'CONNOR, THOMAS POWER, M.P. (1848 —), was born at Athlone, in the county of Roscommon, Ireland. He was educated at the College of the Immaculate Conception, Athlone, and at Queen's College, where he graduated B.A. and M.A. He commenced life as a journalist, and after being connected for three years with the Dublin press, he came to London. His first engagement was with the *Daily Telegraph*, and he was afterward employed on several other London journals. In 1876 Mr. O'Conner published the first volume of a biography of the late Lord Beaconsfield under the title of *Benjamin Disraeli, Earl of Beaconsfield*, but afterward changed his plan and brought out a complete life of the then Premier in a single volume entitled *Lord Beaconsfield, a Biography*. This work was well received as a literary production, but as it took an unfavorable view of the Conservative leader, its politics could hardly meet with universal approval. At the general election of 1880 he was elected member of parliament from Galway, and soon became one of the most active and prominent members of the party led by Mr. Parnell. He was one of the executive body of the Land League, both in England and Ireland. In October, 1881, he made a tour through the United States which extended over seven months, and lectured on the Irish cause to large gatherings in nearly all the large cities, raising large sums of money. In 1883 he was elected president of the Irish national league of Great Britain. In 1885 he defeated Mr. Woodward, the Liberal candidate for the Scotland division of Liverpool by a large majority, and in 1886 he defeated Mr. Earle, a Unionist Liberal. He has edited a *Cabinet of Irish Literature*, and has written a large number of tales, essays, and magazine articles. In 1885 he published his principal work, *The Parnell Movement;* and in 1891 a life of Parnell.

O'CONNOR, ARTHUR, 1763–1852; b. Ireland; called to the bar in 1788. Soon afterwards he entered the Irish parliament, where he advocated Roman Catholic emancipation; his course in this regard caused his uncle, lord Longueville, to disinherit him. Becoming one of the five directors of the "united Irishmen," he was tried for high treason, but

acquitted. He left Ireland for France (1803), where he rose to be lieut.-gen., and afterwards gen. of division. He wrote *Letters to the Earl of Carlisle* (1795); *Letters to Earl Camden* (1798); *The Present State of Great Britain* (1804), and other works. He married a daughter of Condorcet.

O'CONNOR, FEARGUS EDWARD, 1796–1855; b. in co. Meath, Ireland. In 1832 he was elected member of parliament for Cork, and when re-elected, in 1835, lost his seat on account of his disqualifications. He then became a prominent member of the so-called "chartist" party, and carried on the agitation for the extension of the ballot and other privileges to the lower classes. He was again returned to parliament in 1857 from Nottingham. Disheartened by the small success of his efforts he became insane in 1852.

O'CONNOR, JAMES, D.D., b. Ireland, 1823. He emigrated to America, 1838, and was educated at Philadelphia, and at the coll. of the Propaganda, Rome, where he was ordained, 1845. He returned to America, and labored in Pittsburg and Philadelphia, in charge of theol. seminaries. He was consecrated titular bp. of Dibona and vicar apostolic of Nebraska, 1876, and took up his residence in Omaha, where he established Creighton college and several schools. In 1885 the vicariate was erected into a regular see, with seat at Omaha. He d. in 1890.

O'CONNOR, RODERICK (RORY), king of Ireland, 1116–98; b. Connaught; son of Turlogh O'Connor, king of Connaught, whom he succeeded in 1156. After a protracted contest with the O'Briens and O'Neals, he took the title of king of Ireland in 1166. He drove Dermot, king of Leinster, out of his kingdom in 1168, but afterwards reseated him on the throne. He worsted Strongbow and the English in a number of battles, but finally entered into a convention with them. In 1175 he had an interview with Henry II. of England, to whom he did homage, and whom he recognized as lord paramount of Ireland. Roderick kept the crown of Connaught till 1186, when, on account of a revolt of his sons, he entered a monastery, where he passed the rest of his life.

O'CONNOR, WILLIAM DOUGLAS, b. Mass., 1833; a journalist who commenced life as an art student in Boston, in 1853 became one of the editors of the *Commonwealth*, a newspaper published in that city. In 1854 he entered into an editorial connection with the *Saturday Evening Post* of Philadelphia, retaining it six years. He was twelve years corresponding clerk of the light-house board at Washington, and in 1873 became chief clerk, in 1884 librarian of the treasury dept., of which the light-house board is a branch. He became in 1878 assistant general superintendent of the Life Saving Service. He contributed a number of essays, stories, and poems to the popular magazines; and in 1860, published *Harrington*, a romance; and in 1866, *The Good Grey Poet*, a pamphlet in favor of Walt Whitman; and in 1867, *The Ghost*. His story of *The Carpenter*, which appeared in one of the periodicals, attracted much attention and critical comment. He d. 1889.

O'CONOR, CHARLES, LL.D.; b. New York city, 1804. His father came to the U. S. from Ireland, and was a man of good family and liberal education. As he lost a considerable fortune shortly after his arrival here, he was unable to give his son a university education. At the age of 20, O'Conor was admitted to the bar of New York state. By his industry and high intellectual ability he soon gained high rank in the profession. Among the cases in which he has been concerned are many of national interest, such as that of the slave Jack, 1835. Other of his best known cases are the Lispenard, Parish, and Jumel will litigations, and the Forrest divorce suit. In politics, Mr. O'Conor was a democrat, but he rarely accepted office. He was district attorney under President Pierce for a little over a year, was also member of several state conventions, and in 1872 was nominated for the presidency by the "labor reform" party, and by a convention of democrats dissatisfied by the nomination of Horace Greeley. He received in all but 29,489 votes, which were merely complimentary, as he had declined both nominations. He had always taken interest in the city government and local reform, and was one of the prosecuting counsel in the "ring" cases, as they were called, brought against the municipal officers of New York in 1873. He d. 1884.

OCONTO, a co. in n.e. Wisconsin, bounded on the n.e. by Michigan and the Menomonee river, and on the s.e. by Green bay; watered by the Peshtigo and Oconto rivers, on the Chicago and Northwestern railroad; 1127 sq. m.; pop. '90, 15,009. Co. seat, Oconto.

OCONTO, city and co. seat of Oconto co., Wis.; on Green bay at the mouth of the Oconto river and on the Chicago and Northwestern and the Chicago, Milwaukee, and St. Paul railroads; 30 miles n.e. of Green Bay. It has large lumber interests, and contains flour and planing mills, foundries, wagon factories, national bank, public park, and weekly newspapers. Pop. '90, 5219.

OCTAGON, a plane closed figure of 8 sides. When the sides are equal, and also the angles, the figure is called a "regular octagon;" in this case, each angle is 135°, or equal to three half right angles. If the alternate corners of a regular octagon be joined, a square is constructed; and as the angle contained between the sides of the square and of the octagon is one-fourth of a right angle, the octagon may easily be constructed from the square as a basis.

OCTAHE'DRON (Gr. *okto*, eight, *hedra*, base) is a solid figure bounded by 8 triangles, and having 12 edges and 6 angles. A *regular* octahedron has its 8 triangular faces all equilateral, and may, for convenience, be defined as a figure composed of two equal and similar square pyramids with equilateral triangles for their sides placed base to base. This solid is symmetrical round any angle, and is one of Plato's 5 regular solids. The octahedron appears in nature as one of the forms of crystals of sulphur.

OCTAVE (Lat. *octavus*, eighth), the interval between any musical note and its most perfect concord, which is double its pitch, and occupies the position of the eighth note from it on the diatonic scale. The name octave is often given to the eighth note itself as well as to the interval. There is between a note and its octave a far closer relation than between any other two notes; they go together almost as one musical sound. In combination, they are hardly distinguishable from one another, and their harmonics agree invariably, a coincidence which occurs in the case of no other interval.

OCTA'VIA, the sister of the Roman emperor Augustus, and wife of Mark Antony. She was distinguished for her beauty, her noble disposition, and womanly virtues. Her first husband was C. Marcellus, to whom she was married 50 B.C. He died 41 B.C., shortly after which she consented to marry Antony, to make secure the reconciliation between him and her brother. The event was hailed with joy by all classes. In a few years Antony became tired of his gentle and virtuous spouse, and forsook her for Cleopatra. When the Parthian war broke out, Octavia wanted to accompany her husband, and actually went as far as Corcyra, whence Antony sent her home, that she might not interrupt his guilty intercourse with the Egyptian queen. In 35 B.C., Octavia made an effort to rescue him from a degradation that was indifferent even to the honor of the Roman arms, and sailed from Italy with re-enforcements; but a message reached her at Athens ordering her to return home. She proudly obeyed, but, with a magnanimity that reminds us of the Roman character in earlier and better days, she forwarded the supports to her husband. Her brother, Octavian, was indignant at the treatment she received, and would have had her quit her husband's house, and come and live with him: but she refused. In 32 B.C. war, long inevitable, broke out between Antony and Octavia; and the former crowned his insults by sending Octavia a bill of divorcement. But no injury was too great to be forgiven by this "patient Grizel" of the ancient world; and after her husband's death, she brought up with maternal care not only her own children, but also Cleopatra's bastards. Her death took place 11 B.C.

OCTOBER (Lat. *octo*, eight) was the eighth month of the so-called "year of Romulus," but became the tenth when (according to tradition) Numa changed the commencement of the year to the first of January, though it retained its original name. It has since maintained its position as the tenth month of the year, and has 31 days. October preserved its ancient name notwithstanding the attempts made by the Roman senate, and the emperors Commodus and Domitian, who substituted for a time the terms Faustinus, Invictus, Domitianus. Many Roman and Greek festivals fell to be celebrated in this month, the most remarkable of which was the sacrifice at Rome of a horse (which was called *October*) to the god Mars. The other festivals were chiefly bacchanalian. Among the Saxons it was styled *Wyn moneth* or the wine month.

OCTO'PODA (Gr. eight-footed), a section of dibranchiate cephalopods (see CEPHALOPODA), having the body in general very short, the head very distinct; eight arms, not very unequal, furnished with simple suckers; with or without a shelly covering. To this section belong argonauts, poulpes, etc.

OCTO'PUS. See POULPE.

OCTOROON. A name given to the offspring of a quadroon and a white person, and who is, therefore, one-eighth negro.

OCTOSTYLE, the name given in classic architecture to a portico composed of eight columns in front.

OCTROI (Lat. *auctoritas*, authority), a term which originally meant an ordinance authorized by the sovereign, and thence came to be restrictively applied to a toll or tax in kind levied from a very early period in France, and other countries of northern Europe, on articles of food which passed the barrier or entrance of a town. The right to levy this toll was often delegated to subjects, and, in order to increase its amount, a device was resorted to of raising the weight of the pound in which the octroi was taken. The large pound, an ounce heavier than that in ordinary use, was called the *livre d'octroi*, whence the expression *pound troy*. The octroi came eventually to be levied in money, and was abolished in France at the revolution. In 1798 it was re-established, under the pretext that it was required for purposes of charity, and called the *octroi de bienfaisance*, and it has been reorganized in 1816, 1842, and 1852. Of the octroi duty which is at present levied at the gates of the French towns, one-tenth goes to the national treasury, and the rest to local expenses. The octroi officers are entitled to search all carriages and individuals entering the gates of a town.

OD (from the same root as Odin, and supposed to mean all-pervading), the name given by baron Reichenbach (q.v.) to a peculiar physical force which he thought he had discovered. This force, according to him, pervades all nature, and manifests itself as a flickering flame or luminous appearance at poles of magnets, at the poles of crystals, and wherever chemical action is going on. This would account for the luminous figures said to be sometimes seen over recent graves. The odd force has positive and negative poles, like magnetism. The human body is od-positive on the left side, and od-negative on the right. Certain persons, called "sensitives," can see the odic radiation like a luminous vapor in the dark, and can feel it by the touch like a breath. As the meeting of like odic poles causes a disagreeable sensation, while the pairing of unlike

poles causes a pleasant sensation, we have thus a sufficient cause for those likings and antipathies hitherto held unaccountable. Some sensitive persons cannot sleep on their left side (in the northern hemisphere), because the north pole of the earth, which is od-negative, affects unpleasantly the od-negative left side. All motion generates od; why, then, may not a stream running underground affect a sensitive water-finder, so that the divining-rod in his or her hand shall move without, it may be, any conscious effort of will? All the phenomena of mesmerism are ascribed to the workings of this od-force. Reichenbach does not pretend to have had the evidence of his own senses for any of those manifestations of his assumed od-force; the whole theory rests on the revelations made to him by "sensitives." It may be added, that few, if any, really scientific men have any belief in the existence of such a force.

O'DAL or **UDAL RIGHT** (Celtic *od*, property), a tenure of land which was absolute, and not dependent on a superior, and prevailed throughout northern Europe before the rise of feudalism. It was founded on the tie of blood which connected freeman with freeman, and not on the tie of service. It was the policy of the sovereign authority everywhere to make it advantageous for the freemen to exchange the odal tie for the tie of service—a change which paved the way for the feudal system. The odalers of Orkney were allowed to retain or resume their ancient privileges, on paying a large contribution to the erection of St. Magnus's cathedral at Kirkwall; and the odal tenure prevails to this day to a large extent in the Orkney and Shetland islands, the right to land being completed without writing by undisturbed possession proved by witnesses before an inquest.

ODALISQUE is the name of a female slave, or concubine, retained in the harem of the Turkish Sultan. The Turkish form of the word is *ôdalik*, from *odah*, which signifies "chamber."

ODD-FELLOWS, the name assumed by one of the most extensive self-governed provident associations in the world. The institution arose in Manchester, England, in 1812, although isolated "lodges" had existed in various parts of the country for some time previously. These latter were generally secret fraternities, humble imitations of Freemasonry—adopting a similar system of initiatory rites, phraseology, and organization—instituted for social and convivial purposes, and only occasionally extending charitable assistance to members. On its institution in Manchester, the main purpose of odd-fellowship was declared by its laws to be, "to render assistance to every brother who may apply through sickness, distress, or otherwise, if he be well attached to the queen and government, and faithful to the order;" and this continues to be the basis of all its operations. It still, however, retains some of the characteristics of freemasonry, in possessing pass-words and peculiar "grips," whereby members can recognize one another. The headquarters of the society are at Manchester, where the grand-master and board of directors meet quarterly to hear appeals, and transact the general business of the order.

ODD-FELLOWS, INDEPENDENT ORDER OF. The order was introduced into the United States in 1806. Some persons who had been members of English lodges established a lodge at Baltimore in 1819; and this lodge soon received a charter from the Manchester unity. The lodges already established in New York, Philadelphia, and Boston accepted charters from the Maryland grand lodge. The American lodges have long ceased to hold friendly relations with the Manchester unity. The U. S. grand lodge has established grand lodges in all the states and in most of the territories. About 20 periodicals, devoted to the order, are published in this country. American odd-fellowship seeks "to visit the sick, relieve the distressed, bury the dead, and educate the orphan." There were, in 1890, 610,508 members of the organization in the United States, and the annual disbursements for relief of families, burials, education, etc., were over $2,387,288; grand lodges, 54; subordinate, 8,002. To become a member of a lodge one must be a white male, at least 21 years of age, and must believe in a supreme being.

ODE (Gr. a song) originally meant any lyrical piece adapted to be sung. In the modern use of the word, odes are distinguished from songs by not being necessarily in a form to be sung, and by embodying loftier conceptions and more intense and passionate emotions. The language of the ode is therefore abrupt, concise, and energetic; and the highest art of the poet is called into requisition in adapting the meters and cadences to the varying thoughts and emotions. Hence the changes of meter and versification that occur in many odes. The rapt state of inspiration that gives birth to the ode, leads the poet to conceive all nature as animated and conscious, and instead of speaking *about* persons and objects, to address them as present. See *Gosse's English Odes* (1881).

Among the highest examples of the ode are the *Song of Moses* and several of the psalms. Dryden's *Alexander's Feast* is reckoned one of the first odes in the English language. We may mention, as additional specimens, Gray's *Bard*, Collin's *Ode to the Passions*, Burns's *Scots wha ha'e*, Coleridge's *Ode to the Departing Year* and *Dejection*, Shelley's *Ode to the Skylark*, and Wordsworth's *Ode on the Recollections of Immortality in Childhood*.

ODENHEIMER, WILLIAM HENRY, D.D., 1817–79; b. Philadelphia; educated at the university of Pennsylvania. He took orders in the Protestant Episcopal church, became

rector of St. Peter's church, Philadelphia, in 1840, and was elected bishop of New Jersey in 1859. He published *The Origin of the Prayer-Book* (1841), an essay on *Canon Law*, (1847), *Jerusalem and Vicinity* (1855), and other works.

O'DENKIRCHEN, a t. of Rhenish Prussia, 15 m. w.s.w. from Düsseldorf, near the right bank of the Niers. It has manufactures of velvets, silks, leather, etc., and like many of the other manufacturing towns in the same district, has recently much increased in size and population. Pop. '95, 12,832.

O'DENSE, anciently known as Odin's-Ey or Odin's Oe (i. e., Odin's island), the chief town of the Danish island of Fünen, and the oldest city of the kingdom, is situated in the amt or district of the same name, in 55° 25′ n. lat., and 10° 20′ e. long. Pop. '90, 30,268. Odense, which is the seat of the governor of the island and the see of a bishop, has a gymnasium, churches, and is an active, thriving provincial town. A bishopric was founded here in 988, prior to which time Odense bore the reputation of being the first city established by Odin and his followers. The cathedral, founded in 1086 by St. Knud, whose remains were deposited here, is a fine specimen of the early simple Gothic style. At Odense a diet was held in 1527, in which the reformed or Lutheran doctrines were declared to be the established creed of Denmark, and equality of rights was granted to Protestants; while another diet held there in 1539 promulgated the laws regulating the affairs of the reformed church. The new harbor has 1040 ft. of quayage and a depth alongside of 16 ft. Odense is the birthplace of Hans Christian Andersen.

O'DENWALD. See HESSE-DARMSTADT.

ODE'ON, a musical theater among the ancient Greeks, built on the same plan as the theater, but smaller, and covered with a roof. The first was at Sparta, about the middle of the 7th c. B.C. It was called the Skias, and was designed by Theodorus, an architect of Samos. Athens had an old one near the Ilissus, but Pericles erected a better one. It stood near the base of the acropolis, on the s.e. side, and its form was said to be imitated from that of Xerxes' tent. It was burned at the siege of Athens by Sulla, and soon after re-erected by Ariobarzanes, king of Cappadocia. There were two other odeons in Athens, one of which, built by Herodes Atticus, had a capacity of 8,000. Each principal Greek city had its odeon ; and it was introduced into Rome by Domitian.

O'DER (Lat. *Viadrus*, Slavon. *Vjodr*), one of the principal rivers of Germany, rises in the Leselberg on the table-land of Moravia, more than 1000 ft. above the level of the sea, and enters Prussian Silesia at Odersberg, after a course of some 30 miles. After traversing Brandenburg in a n.w. direction, it crosses Pomerania, and empties itself into the Stettiner Haff, from whence it passes into the Baltic by the triple arms of the Dievenow, Peene, and Swine, which inclose the islands of Wollin and Usedom. The Oder has a course of more than 500 m., and a river-basin of 50,000 sq.miles. The rapid flow of this river, induced by its very considerable fall, is accelerated by the affluence of several important mountain-streams, and thus contributes, together with the silting at the embouchures of these streams, to render the navigation difficult; great expense and labor being, moreover, necessary to keep the embankments in order, and prevent the overflowing of the river. The Oder has numerous secondary streams, the most important of which are the Oppa, Neisse, Ohlau, Klodnitz, Bartsch, Warte, and the Ihna; and is connected with the Havel and thence with the Elbe by the Finow canal, and with the Spree by the Friedrich-Wilhelms canal. The chief trading port of the Oder is Swinemunde, which constitutes an important center for the transfer of colonial and other foreign goods to northern Germany and Poland. At Ratibor, 17 m. below Oderberg, the river becomes navigable, and is upwards of 100 ft. in breadth; at Oppeln, in Prussian Silesia, it has a breadth of 238 feet. As a boundary river, it is of considerable importance in a military point of view, and is well defended by the fortresses of Kosel, Grossglogau, Küstrin, and Stettin.

ODERZO, a t. in the Italian province of Treviso, 14 m. n. e. of the town of Treviso; pop. (comm.), 6,668. It contains a church of the 14th century, a technical school, and tannery, and carries on a considerable trade. In ancient times the place was called *Opitergium*. It was formerly much larger than at present, but still has some business activity. Its chief interest is from its numerous palaces, pictures, and antiquities. The villa *Colfrancui* contains many inscriptions, bas-reliefs, and bronze, iron, ivory, and gold objects of art, found near by.

ODESSA, an important seaport and commercial city of s. Russia, in the government of Kherson, stands on an acclivity sloping to the shore, on the n. w. coast of the Black sea, 32 m. n.e. of the mouth of the Dniester, and 933 m. by rail from Moscow. Lat. 46° 22′ n., long. 30° 44′ e. The three fine harbors are formed by large moles defended by strong works, and the roadstead is capable of containing 1000 vessels. The bay is deep enough, even close in shore to admit the approach of the largest men-of-war, and is frozen only in the severest winters, and then only for a short time. The promenade along the face of the cliff descending to the shore by a broad stone stair, is the favorite walk of the inhabitants. Here also stands the monument of the duc de Richelieu, to whom in great part the town is indebted for its prosperity. In the pedestal of the monument is preserved the ball by which he was shot during the bombardment of the town by the allied

fleet in 1854. The university of Odessa, founded in 1864, had, in 1891, 441 students; and the public library possessed over 30,000 volumes. The city contains many fine edifices, as the cathedral of St. Nicholas, the admiralty, the custom-house, etc. Owing to the intensity of the heat in summer (rising occasionally to 120°), and the dryness of the soil, vegetation in the vicinity of Odessa is very poor. In the neighborhood are quarries of soft stone, which is used for building purposes in Odessa and in the surrounding towns. One of the great deficiencies of Odessa used to be its want of good water; but works for securing an ample supply from the Dniester were completed in 1873. Gas was first used in Odessa in 1861. A railway, opened in 1872, has added enormously to the commercial success and importance of Odessa, as it connects it, and of course Kherson, with the governments n. and e. of it in Russia. Odessa is not merely the port of export for the two basins of the Dniester and Dnieper, but likewise for much merchandise brought from South Russia and Caucasia, besides which it is visited yearly by about 1,500 foreign ships and 2,500 coasting vessels. In '94 the total exports were valued at about $99,760,416, and the imports at $39,600,000. The rapid strides Odessa has made in commerce within the last few years will be seen when these latter sums are compared with the corresponding ones of 1858 and 1869; the former year showing the sum of $3,350,000, and the latter exhibiting a fall down to $2,325,000. The pop. of Odessa in 1897 was 404,651.

In ancient times, Odessa (Gr. *Odessus*) was inhabited by a Greek colony, and later by Tartar tribes. In the beginning of the 15th c., the Turks constructed a fortress here, which was taken by the Russians in 1789. In 1793 a Russian fortress was built here, and became the nucleus of a town and port, which one year after received the name of Odessa. The duc de Richelieu, a French emigrant in the Russian service, was appointed governor here in 1803, and during the 11 years of his wise administration the town prospered rapidly. Since 1823 the city has formed part of the general governorship of s. Russia; is the seat of its administration, and is the residence of the gov. gen. and of an archbishop. The advantageous commercial position of the city, and the privileges granted to it by government, but chiefly the privileges of a free port between 1817 and 1858, have developed this city from a mere Turkish fortress into the chief commercial town of the Russian empire after St. Petersburg and Riga. On the outbreak of the Crimean war, April, 1854, the British steamer *Furious* went to Odessa for the purpose of bringing away the British consul. While under a flag of truce, she was fired upon by the batteries of the city. On the failure of a written message from the admirals in command of the fleet to obtain explanations, 12 war-steamers invested Odessa, April 22, and in a few hours destroyed the fortifications, and took a number of Russian vessels. Odessa, with its suburbs Peressyp and Nowaja, Selobodka, etc., now forms a separate captaincy.

ODGER, GEORGE, 1820–77; b. Eng. When very young he was apprenticed to a shoemaker; afterward settled in London, where he became prominent as a labor reformer. He was a member of the society of Cordwainers, and was also one of the most prominent members of the Reform League.

ODIC FORCE. See OD.

O'DIN, the chief god of northern mythology. According to the sagas, Odin and his brothers, Vile and Ve, the sons of *Boer*, or the first-born, slew Ymir or Chaos, and from his body created the world, converting his flesh into dry land; his blood, which at first occasioned a flood, into the sea; his bones into mountains; his skull into the vault of heaven; and his brows into the spot known as *Midgaard*, the middle part of the earth, intended for the habitation of the sons of men. Odin, as the highest of the gods, the *Alfader*, rules heaven and earth, and is omniscient. As ruler of heaven, his seat is Valaskjalf, from whence his two black ravens, Huginn (Thought) and Muninn (Memory), fly daily forth to gather tidings of all that is being done throughout the world. As god of war, he holds his court in Valhalla, whither come all brave warriors after death to revel in the tumultuous joys in which they took most pleasure while on earth. His greatest treasures are his eight-footed steed Sleipner, his spear Gungner, and his ring Draupner. As the concentration and source of all greatness, excellence, and activity, Odin bears numerous different names. By drinking from Mimir's fountain he became the wisest of gods and men, but he purchased the distinction at the cost of one eye. He is the greatest of sorcerers, and imparts a knowledge of his wondrous arts to his favorites. Frigga is his queen, and the mother of Baldur, the Scandinavian Apollo; but he has other wives and favorites, and a numerous progeny of sons and daughters. Although the worship of Odin extended over all the Scandinavian lands, it found its most zealous followers in Denmark, where he still rides abroad as the wild huntsman, rushing over land and water in the storm-beaten skies of winter.

The historical interpretation of this myth, as given by Snorre Sturleson, the compiler of the *Heimskringla*, or chronicles of the kings of Norway prior to the introduction of Christianity, and followed in recent times by the historian Suhm, is that Odin was a chief of the Œsir, a Scythian tribe, who, fleeing before the ruthless aggressions of the Romans, passed through Germany to Scandinavia, where, by their noble appearance, superior prowess, and higher intelligence, they easily vanquished the inferior races of those lands, and persuaded them that they were of godlike origin. According to one tradition, Odin conquered the country of the Saxons on his way; and leaving one of his

sons to rule there, and introduce a new religion, in which he, as the chief god Wuotan, received divine honors, advanced on his victorious course, and making himself master of Denmark, placed another son, Skjold, to reign over the land, from whom descended the royal dynasty of the Skjoldingar. He next entered Sweden, where the king, Gylfi, accepted his new religion, and with the whole nation worshipped him as a divinity, and received his son Yugni as their supreme lord and high-priest, from whom descended the royal race of the Yuglingars, who long reigned in Sweden. In like manner he founded, through his son Sœming, a new dynasty in Norway; and besides these, many sovereign families of northern Germany, including our own Saxon princes, traced their descent to Odin. As it has been found impossible to refer to one individual all the mythical and historical elements which group themselves around the name of Odin., Wodin, or Wuotan, it has been suggested by Suhm and other historians, that there may have been two or three ancient northern heroes of the name; but notwithstanding the conjectures which have been advanced since the very dawn of the historical period in the n. in regard to the origin and native country of the assumed Odin, or even the time at which he lived, all that relates to him is shrouded in complete obscurity. It is much more probable, however, that the myth of Odin originated in nature-worship. See SCANDINAVIAN MYTHOLOGY.

ODLING, WILLIAM, b. England, 1829; studied medicine in Guy's Hospital, and at the university of London. In 1863 he became professor of chemistry at St. Bartholomew's Hospital. In 1861 he published a *Manual of Chemistry*, and in 1866 *Lectures on Animal Chemistry*. In 1868 he succeeded Faraday as Fullerian professor at the Royal Institution, and in 1872 became professor of chemistry at Oxford.

ODO, SAINT, 879–943, second abbot of Clugny, son of Abbon, a powerful lord at the court of William the Strong, duke of Aquitaine, solemnly consecrated by his father to the church even before his birth. His education, commenced in the convent of St. Martin of Tours under the guidance of Saint Odalric, was completed at Paris. He returned to St. Martin, but, thinking that its rule was not strict enough, left it and entered the Cistercian convent at Baume, in Burgundy. After the death of Bernon, Odo was chosen to succeed him as abbot of Clugny and of Bourgdeols. Under his energetic administration the order rapidly increased in reputation and wealth. The fame of the school of Clugny was diffused far and wide. The aid of Odo was sought in reforming converts in various quarters. The popes sent for him to settle disputes between princes and kings, intrusted him with the most important diplomatic negotiations. On his return from a journey to Rome he died in the convent of St. Julian at Tours. He was profoundly conscious of the corruption in the church among the clergy, monks, and laity; and while full of zeal for the renovation of the Christian life, did not regard asceticism as Christian perfection, though he sought to correct the secularized life of the clergy by a severe monastic discipline. In the midst of prevailing corruption his pious zeal and pure life gave him great influence and authority. He was a diligent writer, and composed many anthems and hymns.

ODOA'CER (also ODOVACER, ODOBAGAR, ODOVACHAR, OTACHAR, etc., and, according to St. Martin, the same as OTTOCHAR, a name frequent in Germany during the middle ages), the ruler of Italy from the year 476 to 493, was the son of Edecon, a secretary of Attila, and one of his ambassadors to the court of Constantinople. This Edecon was also capt. of the Scyrri, who formed the bodyguard of the king of the Huns. After the death of Attila he remained faithful to the family of his master, but perished about 463 in an unequal struggle with the Ostrogoths. He left two sons, Onulf and Odoacer, the former of whom went to seek his fortune in the east; while Odoacer, after leading for some time the life of a bandit chief among the Noric Alps, determined to proceed to Italy, whither barbarian adventurers were flocking from all Europe. According to a monkish legend, a pious hermit, St. Severinus, whom he went to visit before his departure, prophesied his future greatness. Odoacer entered the military service of the western Roman empire, and rapidly rose to eminence. He took part in the revolution by which Orestes (476) drove the emperor Julius Nepos from the throne, and conferred on his son Romulus the title of Augustus, which the people scoffingly changed into Augustulus. He soon perceived the weakness of the new ruler, and resolved to profit by it. He had little difficulty in persuading the barbarian soldiery, who had effected the revolution, that Italy belonged to them, and in their name demanded of Orestes the third part of the land as the reward of their help. This Orestes refused; and Odoacer, at the head of his Herulians, Rugians, Turcilingians, and Scyrii, marched against Pavia, which Orestes had garrisoned, stormed the city, and put his opponent to death (476). Romulus abdicated, and withdrew into obscurity. What became of him is not known. Thus perished the Roman empire. Odoacer showed himself to be a wise, moderate, and politic ruler, quite unlike our general notion of a barbarian. In order not to offend the Byzantine emperor Zeno, he took the title of king only, and caused the senate to despatch to Constantinople a flattering letter, in which it declared one emperor to be enough for both east and west; renounced its right of appointing the emperors, expressed its confidence in the civil and military talents of Odoacer, and begged Zeno to confer upon him the administration of Italy. After some hesitation the Byzantine emperor yielded to the entreaties of the senate, and Odoacer received the title of *Patricius*. He

fixed his residence at Ravenna. According to his promise he divided among his companions the third part of the land of Italy—a measure far less unjust than at first sight may seem, for the peninsula was then almost depopulated, and many domains were lying waste and ownerless. This barbarian ruler did everything in his power to lift Italy out of the deplorable condition into which she had sunk, and to breathe fresh life into her municipal institutions—those venerable relics of nobler days! He even re-established the consulate, which was held by eleven of the most illustrious senators in succession, maintained peace throughout the peninsula, overawed the Gauls and Germans, and reconquered Dalmatia and Noricum. In religion, though an Arian himself, he acted with a kingly impartiality that more orthodox monarchs have rarely exhibited. Gibbon remarks, with his usual pointed sarcasm, that the *silence* of the Catholics attests the toleration which they enjoyed. The valor, wisdom, and success of Odoacer appear to have excited the jealousy and alarm of Zeno, who encouraged Theodoric, king of the Ostrogoths, a still greater warrior and sovereign than Odoacer himself, to undertake an expedition against Italy. The first battle was fought on the banks of the Isontius (mod. *Isonzo*), Aug. 28, 489. Odoacer was beaten, and retreated. During his retreat he hazarded another battle at Verona, and was again beaten. He now hastened to Rome to rouse the inhabitants, but the gates of the city were closed against him. Returning northwards to his capital, Ravenna, he reassembled the wrecks of his army, and in 490 once more marched against the Ostrogoths, whose advance guard he defeated and pursued to the walls of Pavia. Another great battle now took place on the banks of the Adda, when Odoacer was vanquished for the third time. He now shut himself up in Ravenna, where Theodoric besieged him for three years. Odoacer then capitulated, on condition that the kingdom of Italy should be shared between him and Theodoric. This agreement was solemnly sworn to by both parties, Feb. 27, 493; but on March 5 Odoacer was assassinated at a feast, either by Theodoric himself or by his command.

ODOM'ETER (Gr. *odos*, a road, *mĕtrŏn*, a measure), also called *perambulator*, or *surveying-wheel*, is an instrument attached to a carriage or other vehicle, for the purpose of registering the distance it has traveled. Such machines have been in use from an early period, and one is described by Vitruvius in that part of his work, *De Architectura*, which is devoted to machines. The instrument, as commonly employed, consists of a train of wheel-work, which communicates motion from the axle of the carriage wheel to an index which moves round the circumference of a dial fixed in one side of the carriage over the axle. The wheel-work is arranged so as to produce a great diminution of the velocity impressed by the axle of the vehicle, and the dial is so graduated that the index can show the number of miles, furlongs, yards, etc., traversed. The instrument is also constructed to work independently, being in this case provided with wheels and an axle of its own; when this is done the wheel is made of such a size that its circumference is an aliquot part of a mile, an arrangement which greatly simplifies the calculation of the distance traversed. The complete odometer can then be drawn along by a man on foot, or attached behind a carriage. See PEDOMETER.

O'DONNELL, LEOPOLD, Duke of Tetuan, Marshal of Spain, b. in 1809, was descended from an ancient Irish family. He entered the Spanish army when young, and bravely espoused the cause of the infant queen Isabella against her uncle, Don Carlos. When the Carlists were overthrown, he was created count of Lucena, made gen. of brigade, and chief of the staff to Espartero. He took the side of the queen-mother in 1840, emigrated with her to France at the time when her cause seemed desperate, and took up his residence at Orleans, where he planned many of the political risings and disturbances which took place under the rule of Espartero. He headed in person a revolt of the Navarrese against the minister, but on its failure returned to France. In 1843 his intrigues against Espartero (q.v.) were successful, and he was rewarded by the governor-generalship of Cuba, where he amassed a large fortune by favoring the iniquitous trade in slaves. When he returned to Spain (1845) he intrigued against Bravo Murillo and Narvaez; and when the latter was succeeded by Sartorius, O'Donnell, proscribed by the government, headed a military insurrection. Defeated and driven into Andalusia in 1854, he issued a liberal manifesto. The profligacy of the court and the despotism of the government favored the appeal; and when Espartero gave in his adhesion, the Spaniards rose *en masse* and replaced the ex-regent at the helm. Espartero reversed the confiscation against O'Donnell, and made him a marshal and minister of war. O'Donnell again plotted against his old benefactor, and in July, 1856, supplanted him by a *coup d'état*. Blood was shed in the streets of Madrid, but O'Donnell remained president of the council. He was in three months' time succeeded by Narvaez; but in 1858 he returned to power again, and in 1859, while still holding the position of prime minister, he assumed the command of the army sent to Morocco. The campaign continued for many months, without leading either to reverses or glory. The Moors displayed an entire absence of military qualities; and O'Donnell, though successful in obscure skirmishes, occupied three months in the march from Ceuta to Tetuan. A battle took place, Feb. 4, 1860; O'Donnell gained a complete victory, took the Moorish camp, and the city of Tetuan surrendered to the Spaniards. The emperor of Morocco submitted to a loss of territory, and O'Donnell was raised to the first rank of the Spanish nobles as duke of Tetuan. He remained prime minister till 1866, when his cabinet was

upset by Narvaez. He then received leave of absence—that is to say, was exiled and spent the most of his time in Paris. He died at Bayonne in 1867. The O'Donnell ministry improved the finances, army, and administration of Spain.

ODONTASPID'IDÆ, a family of sharks nearly related to the mackerel shark, but having shape more like that of ordinary sharks. Head depressed; eyes have no nictitant membrane; nostrils simple and far from the mouth, which is wide and inferior; teeth nail like, with basal cusps in both jaws. Dorsal fins two, the first in front of the ventrals. Tail has no pits at the root, and no lateral keels. The family is a small one, one species, *O. ferox*, inhabiting the Mediterranean; and there is an American Atlantic species, known as *sand shark*, which is also said to be found at the cape of Good Hope, and at Tasmania and Australia.

ODONTOL'OGY. See TEETH.

ODONTOR'NITHES, a sub-class of birds whose fossils have been found by Marsh in the cretaceous formation of Kansas. They include two orders, odontolcæ, and odontormæ. The order odontolcæ was founded by Marsh for the reception of the extraordinary *hesperornis regalis*. The fossil of this gigantic bird indicates that in many points of structure it resembled the loons of the present day. It measured between 5 and 6 ft. from the bill to the toes, and it stood nearly as high. Its jaws were furnished with numerous conical, recurved teeth, sunk deep in a continuous groove. The front of the under jaw was not furnished with teeth, and was probably encased in a horny beak. The breast-bone had no central ridge or keel, and the wings were too small for a bird of flight. The tail consisted of about 12 vertebræ, of which the last three or four were amalgamated to form a flat, terminal mass. The tail was probably capable of a considerable up and down movement, enabling it to act as a paddle. The cervical and dorsal vertebræ were of the ordinary bird type. The legs were powerful and the feet adapted for rapid paddling. It was undoubtedly a swimming and diving bird, larger than any of the present day, and probably lived upon fishes. *Lestornis crassipes*, also of the cretaceous, is nearly related to *hesperornis;* and *enaliornis* of the cretaceous of Great Britain is probably allied to the same genus, but the formation of its jaws is unknown. The next order, odontolcæ, was founded by Marsh for the reception of two remarkable birds which he has named *ichthyornis dispar* and *apatornis celer*. *Ichthyornis dispar* may be taken as the type of the order. Its teeth were contained in distinct sockets instead of grooves as in *hesperornis*. They were small, compressed, and pointed, and all of them which have been preserved are of similiar form. The lower jaw contained about twenty on each side, all more or less inclined backward. Those in the upper jaw resembled those in the lower. The skull was of moderate size, and the eyes placed well forward. The jaws were long and slender, and apparently not encased in a horny sheath. The articular faces of the vertebræ were biconcave, as in fishes. The wings were large in proportion to the legs, and the humerus had an extended radial crest. The metacarpal bones were united as in ordinary birds. Whether the tail was elongated cannot at present be determined, but the last vertebra of the sacrum was very large. The fossil found by Prof. Marsh was that of an adult, and about the size of a pigeon. The species was carnivorous, and probably aquatic. *Apatornis* resembled *ichthyornis*, but was rather more slender.

ŒCOLAMPADIUS, JOANNES—a name Latinized, according to the fashion of the age, from the German JOHANN HUSSGEN—one of the most eminent of the coadjutors of Zwingli in the Swiss Reformation, b. in 1482 at Weinsberg, in Swabia. His father destined him for the profession of the law, and he studied for it in Heidelberg and Bologna; but yielding to his own strong inclination, he relinquished this study for that of theology, which he prosecuted at Heidelberg. He then became tutor to the sons of the elector Palatine, and subsequently preacher in Weinsberg. This office he resigned in order to study the Greek language under Reuchlin at Stuttgart. He also learned Hebrew from a Spanish physician, Matthew Adrian. Being appointed preacher at Basel, he formed the acquaintance of Erasmus, who highly appreciated his classical attainments, and employed his assistance in his edition of the New Testament. In 1516, Œcolampadius left Basel for Augsburg, where also he filled the office of preacher, and where he entered into a convent. But Luther's publications exercised so great an influence on him that he left the convent, and became chaplain to Franz von Sickingen, after whose death he returned to Basel in 1522, and in the capacity of preacher and professor of theology, commenced his career as a reformer. He held disputations with supporters of the church of Rome, in Baden in 1526, and in Bern in 1528. In the controversy concerning the Lord's supper, he gradually adopted more and more the views of Zwingli, and at last maintained them in 1525, in a treatise, to which the Swabian ministers replied in the *Syngramma Suevicum*. In 1529 he disputed with Luther in the conference at Marburg. He died at Basel, Nov. 24, 1531, not long after the death of his friend Zwingli. He was remarkable for his gentleness of character. His treatise *De Ritu Paschali*, and his *Epistola Canonicorum Indoctorum ad Eccium*, are the most noted of his works.—See Herzog, *Das Leben des Joh. Œcolampadius* (1843); and Hagenbach's *Œcolampadius* (1859).

ŒCUMEN'ICAL (Gr. *oikoumenike,* "of, or belonging to, the *oikoumene,*" "the world"), the name given to councils of the entire church, and synonymous with the more ordi

nary name "general." See COUNCIL. The conditions necessary to constitute an œcumenical council are a subject of much controversy. As the subject is of less importance in Protestant divinity, it will be enough to explain here that a council is said by Roman Catholic divines to be œcumenical in three different ways: viz., in convocation, in celebration, and in acceptation. For the first, the summons of the pope, direct or indirect, is held to be necessary; this summons must be addressed to all the bishops of the entire church. To the second, it is necessary that bishops from all parts of the church should be present, and in sufficient numbers to constitute a really representative assembly; they must be presided over by the pope, or a delegate or delegates of the pope; and they must enjoy liberty of discussion and of speech. For the third, the decrees of the council must be accepted by the pope, and by the body of the bishops throughout the church, at least tacitly. The last of these conditions is absolutely required to entitle the decrees of a council to the character of œcumenical; and even the decrees of provincial or national councils so accepted, may acquire all the weight of infallible decisions, in the eyes of Roman Catholics.

ŒDE'MA (Gr. *a swelling*) is the term applied in medicine to the swelling occasioned by the effusion or infiltration of serum into cellular or areolar structures. The subcutaneous cellular tissue is the most common, but is not the only seat of this affection. It is occasionally observed in the submucous and subserous cellular tissue, and in the cellular tissue of the parenchymatous viscera; and in some of these cases, it gives rise to symptoms which admit of easy recognition during life. Thus œdema of the glottis (see LARYNX) and œdema of the lungs constitute well-marked and serious forms of disease; while œdema of the brain, though not easily recognized during life, is not uncommonly met with in the *post-mortem* examination of insane patients.

Œdema may be either passive or active, the former being by far the most common. *Passive œdema* arises from impeded venous circulation (as from obstruction or obliteration of one or more veins; from varicose veins; from standing continuously for long periods, till the force of the circulation is partly overcome by the physical action of gravitation; from deficiency in the action of the adjacent muscles, which in health materially aids the venous circulation, etc.); from too weak action of the heart (as in dilatation or certain forms of valvular disease of that organ); or from a too watery or otherwise diseased state of the blood (as in chlorosis, scurvy, Bright's disease, etc.). By means of the knowledge derived from pathological anatomy, we can often infer the cause from the seat of the swelling; for example, œdema of the face, usually commencing with the eyelids, is commonly caused by obstruction to the circulation through the left side of the heart, or by the diseased state of the blood in Bright's disease; and œdema of the lower extremities most commonly arises from obstruction in the right side of the heart, unless it can be traced to the pressure of the gravid uterus, or of accumulated fæces in the colon, or to some other local cause.

Active œdema is associated with an inflammatory action of the cellular tissue, and is most marked in certain forms of erysipelas. It is firmer to the touch, and pressure with the finger produces less pitting than in the passive form.

From the preceding remarks, it will be seen that œdema is not a disease, but a symptom, and ofen a symptom indicating great danger to life. The means of removing it must be directed to the morbid condition or cause of which it is the symptom.

OE'DENBURG, a co. in w. Hungary, bounded by Lower Austria, Raab, Eisenburg, and Wieselburg; 1280 sq. m.; pop. '90, 259,602; drained by the Raab, Leitha, and Rabnitz rivers, and intersected by the Vienna and Cilly railroad. Lake Neusiedler, one of the largest of Hungary proper, is included in the district. The surface is level and fertile in the s. and e., but mountainous in the n., and covered by forests. The staples are wine, tobacco, flax, fruits, and cattle. Starch, refined sugar, spirits, etc., are manufactured. Capital, Oedenburg.

OE'DENBURG (Hung. *Sopron;* anc. *Sempronium*), a municipality of Hungary, capital of a county of the same name, situated in an extensive plain, about 2 m. w. from the Neusiedlersee, on the Ilkva, a branch of the Raab. It is connected by railway with Vienna. Oedenburg is the chief town of a celebrated wine-producing district. It has manufactures of vinegar, sugar, soap, clocks, and agricultural implements; and a considerable trade in wine and cattle, the products of the neighborhood, which is rich and well cultivated. The wine of Rust, a small town 8 m. n. of Oedenburg; on hills sloping to the Neusiedlersee, is one of the best wines of Hungary, and inferior only to Tokay. The Roman station of *Sempronium* was one of considerable importance; and numerous Roman remains are found near Oedenburg. The inhabitants of Oedenburg are mostly of German race. Pop. '90, 27,213.

Œ'DIPUS (Gr. *Oidipous*), the hero of a celebrated legend, which, though of the most revolting nature in itself, has supplied both Euripides and Sophocles with the subject-matter of some of their most celebrated tragedies. The story, as generally related, is as follows: Œdipus was the son of Laius, king of Thebes, by Jocaste; but his father having consulted the oracle to ascertain whether he should have any issue, was informed that his wife would bring forth a son, by whom he (Laius) should ultimately be slain. Determined to avert so terrible an omen, Laius ordered the son which Jocaste bare him to have his feet pierced through, and to be exposed to perish on Mount Cithæron. In this help-

less condition, Œdipus was discovered by a herdsman, and conveyed to the court of Polybus, king of Corinth, who, in allusion to the swollen feet of the child, named him *Œdipus* (from *oideo*, to swell, and *pous*, the foot); and along with his wife, Merope, brought him up as his own son. Having come to man's estate, Œdipus was one day taunted with the obscurity of his origin, and in consequence proceeded to Delphi, to consult the oracle. The response which he received was, that he would slay his father, and commit incest with his mother. To escape this fate, he avoided returning to Corinth, and proceeded to Thebes, on approaching which he encountered the chariot of his father; and the charioteer ordering him out of the way, a quarrel ensued, in which Œdipus ignorantly slew Laius, and thus unconsciously fulfilled the first part of the oracle. The famous Sphinx (q.v.) now appeared near Thebes, and seating herself on a rock, propounded a riddle to every one who passed by, putting to death all who failed to solve it. The terror of the Thebans was extreme, and in despair they offered the kingdom, together with the hand of the queen, to the person who should be successful in delivering it from the monster. Œdipus came forward; the Sphinx asked him, "What being has four feet, two feet, and three feet; only one voice; but whose feet vary, and when it has most, is weakest?" Œdipus replied that it was "Man;" whereupon the Sphinx threw itself headlong from the rock. Œdipus now became king, and husband of his mother, Jocaste. From their incestuous union sprung Eteocles, Polynices, Antigone, and Ismene. A mysterious plague now devastated the country, and when the oracle declared that before it could be stayed, the murderer of Laius should be banished from the country, Œdipus was told by the prophet Tiresias that he himself had both murdered his father and committed incest with his mother. In his horror he put out his own eyes, that he might no more look upon his fellow-creatures, while Jocaste hanged herself. Driven from his throne by his sons and his brother-in-law, Creon, Œdipus wandered towards Attica, accompanied by Antigone, and took refuge in the grove of the Eumenides, who charitably removed him from earth; but the latter part of his life is differently told.

Œ'GIR, in Scandinavian mythology, the ocean god, a jotun, but friendly to Odin.

ŒHLENSCHLÄGER, Adam Gottlob, the greatest poet of northern Europe, was b. in 1779, at Copenhagen. His early years were spent at the palace of Fredericksborg, in the neighborhood of the Danish capital, where his father was employed, first as organist, and afterwards as steward or bailiff. During the absence of the royal family in the winter, Œhlenschlager and his sister amused themselves in roaming over the palace, and examining the paintings and works of art which it contained, and in improvising private theatricals, for which he supplied original pieces. After an irregular and desultory course of education, Œhlenschläger's love of the drama led him to offer his services to the manager of the Copenhagen theater; but, discovering soon that he had no chance of rising above the rank of a mere supernumerary, he entered the university of Copenhagen as a student of law. For a time he seems to have pursued his studies with tolerable assiduity, under the direction of his friend, A. S. Oersted, who, together with his distinguished brother, H. C. Oersted (q.v.), had cemented a life-long friendship with him. Œhlenschlager's studies were interrupted in 1801, when, on the bombardment of Copenhagen by Nelson and Parker, he and his friends served in the student-corps of volunteers. After this event, which roused the dormant patriotism of the nation, Œhlenschläger found the study of law too irksome, and devoted all his energies to the cultivation of the history and mythology of his own country. In 1803 appeared his first collection of poems, including one longer dramatic piece, *St. Hans Aften-Spil*, which attracted favorable notice for the lively fancy with which national habits and local characteristics were portrayed. The *Vaulunders Saga* in the *Poetiske Skrifter*, published in 1805, and his *Aladdin's forunderlige Lampe*, completed his success, and raised him to the rank of the first of living Danish poets; the former of these works having shown a marvelous capacity for reflecting the dark and stern coloring of the old northern Sagas, while the latter gave evidence of a rich and genial poetic fancy. These early efforts were rewarded by the acquisition of a traveling pension, which enabled him to spend some years in visiting various parts of the continent, and becoming acquainted with the great literary celebrities of the day, such as the Weimar circle, of whom Goethe was the head. During this period, Œhlenschläger wrote his *Hakon Jarl*, the first of his long series of northern tragedies, at Halle (1807; Eng. trans. by F. C. Lascelles, 1875), and his *Correggio*, at Rome (1809; Eng. trans. by Theodore Martin, 1854). In 1810 Œhlenschläger returned to Denmark, where he was hailed with acclamation as the greatest tragic poet Denmark had ever known; and having soon afterwards obtained the chair of æsthetics at the university, and received various substantial proofs of royal favor, he married, and settled in the capital, where his peace was, however, rudely disturbed by a literary feud with Baggesen, the Danish poet and critic, whose poetical supremacy had been superseded by that of Œhlenschläger. In 1819 appeared one of Œhlenschläger's most masterly productions, *Nordens Guder*, and this and the numerous dramatic compositions written about the same period, show that the severe criticism to which his writings had been exposed during the celebrated Baggesen quarrel, had corrected some of the faults, and lessened the self-conceit which had characterized his earlier works. His reputation spread with his increasing years both abroad and at home; and after having repeatedly visited the more

southern parts of Europe, he went, in 1829, to Sweden, where his arrival was welcomed by a public ovation; and after having received repeated marks of friendship from various sovereigns, he was honored in his own country by the celebration, in 1849, of a grand public festival, held in the palace at Copenhagen. But this ovation was unfortunately followed in less than two months by his death, which took place in Jan., 1850. His funeral was kept as a national solemnity, and he was followed to the grave by a civic procession, which included members of every class of society, from princes to artizans. The fame of Œhlenschläger will rest principally on his tragedies, of which he wrote 24, 19 of the number being on northern subjects. These were all composed originally in Danish, and re-written by himself in German. Besides those already referred to, the best are *Knud den Store, Palnatoke, Axel og Walborg, Væringerne i Miklagord.* His poems are for the most part indifferent, and his numerous prose writings deserve little notice. His Danish and German works amount in all to 62 volumes, to which must be added 4 volumes of his *Erindringer,* or *Autobiographical Recollections,* published after his death.

OEHLER, Gustav Friedrich von, 1812–72; b. Würtemberg; studied theology at Tübingen; was, 1834–37, a lecturer in the missionary institution at Basle, after which he returned to the theological seminary at Tübingen, teaching also in the university there. In 1840 he became vicar at Stuttgart and professor in the theological seminary at Schönthal. In 1845 he was chosen a member of the theological faculty at Breslau, and continued there until 1852, when he was called back to Tübingen where he lectured and was superintendent of the theological faculty. He published many essays and reviews, and several larger works. He was especially devoted to the study of the Old Testament for which he had a profound reverence as containing the commencement of the supernatural revelation which is completed in the New Testament. He held that the connection between the two is so intimate and essential that the genesis of all the New Testament ideas of salvation is found in the Old, and that the two must stand or fall together. His chief book is *The Theology of the Old Testament.*

ŒIL DE BŒUF, a French term literally signifying ox's eye, applied in architecture to those small round or oval openings in the frieze or roof of large buildings, which serve to give light to spaces otherwise dark. The most famous is that in the anteroom (where the courtiers waited) of the royal chamber at Versailles, which gave name to the apartment. Hence the expression, *Les Fastes de l'Œil-de-Bœuf*—i.e., the history of the courtiers of the Grand Monarque, and by extension, of courtiers in general.

Œ'LAND, a long and narrow island in the Baltic, lying off the eastern coast of Sweden, opposite to, and forming part of, the län of Kalmar, and at a distance of from 4 to 17 m. from the shore. It is 88 m. in length, and from 4 to 10 m. in breadth, with a harbor three acres in extent. The area is 530 sq. m., and the pop. 38,500. The island, which is scarcely more than a lime cliff, is scantily covered with soil, but in some parts it is well wooded, and has good pasture ground, which is turned to account by the islanders, who rear cattle and sheep. In favorable seasons, barley, oats, and flax yield good crops. The breed of small horses has now practically disappeared. The fishing is excellent all round the coasts. There are large alum-works on the island, and an extensive line of wind-mills along the range of the Alwar hills, near which stands Borgholm (pop. '90, 10,300), the only town on the island, the first foundations of which were laid in 1817. To the n. of the island lies the steep but wooded island-cliff, the Jungfruen, or Blaakulla, which bears the mythical reputation of having been the scene of various deeds of witchcraft, and the favorite resort of wizards and witches.

OELS, a small t. of Prussian Silesia, stands on a plain on the Oelsa, or Oelse, 16 m. e.n.e. of Breslau. Its castle, built in 1558, is surrounded by ramparts and ditches. It contains a gymnasium, several churches, and other public edifices. Pop. '90, 10,300 who carry on manufactures of shoes and of cloth goods.

ŒNANTHY'LIC ACID, $C_6H_{13}\cdot COOH$, is one of the volatile fatty acids of the general formula $C_nH_{2n}O_2$. It is a colorless oily fluid, with an aromatic odor, lighter than water, and insoluble in that fluid, but dissolving readily in alcohol and ether. According to Miller (*Organic Chemistry,* 2d ed. p. 355), it may be exposed to a cold of 0° without becoming solid ; while it boils and may be distilled (with partial decomposition) at 435·2° F. (224°.C.). It is (like many of the allied fatty acids) one of the products of the oxidation of oleic acid (q.v.) by nitric acid, and is likewise yielded by the action of nitric acid on castor oil, wax, and various fats. Its most characteristic salt is the œnanthylate of copper, which crystallizes in beautiful green needles

ŒNOTHE'RA, a genus of plants of the natural order *Onagraceæ* (q.v.), having four petals and eight stamens, the calyx-limb 4-cleft, the segments reflexed; the capsule 4-valved, with many naked seeds. The Evening Primrose (*Œ. biennis*), a native of Virginia, has been known in Europe since 1614, and is now naturalized in many parts of Europe and in some parts of Britain, on the banks of rivers, in thickets, on sandy grounds, etc. It is a biennial plant, and produces in the first year elliptic or obovate obtuse leaves, and in the second year a stem of 1½–4 ft. high, which bears at its summit numerous yellow flowers in a leafy spike. The flowers are fragrant in the evening. The root somewhat resembles a carrot in shape, but is short; it is usually red, fleshy and tender; it is eaten in salads or in soups, and as a boiled vegetable. The plant is often

cultivated for the sake of its large yellow flowers. Several other species of *Œnothera*, natives of North America, are occasionally cultivated in our gardens, and have eatable and pleasant roots.

OERE'BRO, an island t. of Sweden, capital of a län of the same name, is situated at the entrance of the Swart-Elf into the Heilmar lake, 100 m. w. of Stockholm. Pop. '94, 15,886. The town still retains many memorials of its earlier prosperity, when it was frequently the residence of the Swedish rulers, who found its central position in the more fertile southern portion of the kingdom favorable both in regard to safety and pleasantness of site. The old castle was built by Berger Jarl in the 13th c., and was in after-times frequently chosen as the seat of the national diets. Oerebro has manufactories of machinery, tobacco, matches, and chemicals; and these industrial products, together with the minerals obtained from the neighboring silver, copper, and iron mines, are conveyed to Gothenborg and Stockholm by means of the extensive system of canals which connects the lakes of the interior with the maritime ports.

OERSTED, Anders Sandöe, 1778–1860; b. in the island of Langeland belonging to Denmark; was educated at the university of Copenhagen, embraced the profession of law and rose to eminence as a successful practitioner and as editor of the *Juridiskt Archir* and other legal periodicals; he also wrote several treatises on the philosophy of Kant and Hegel. In 1825 he was intrusted with the drawing up of the ordinances of the Danish law, and in 1831 had an important share in forming the provincial constitutions granted by Frederick VI. to the states. For several years he was high commissioner, or king's representative, at the assembly of the states, and from 1841 to 1848 was a member of the Danish cabinet. In 1853 he again entered the cabinet as prime minister of Frederic VII., and acted as minister of the interior, of public worship, and of public instruction. Up to this time he had been considered as favoring constitutional reform, but he soon showed himself a violent reactionist. Public feeling was very strong and a revolution seemed at hand, but at the close of 1854 the king dismissed the Oersted cabinet. The point on which the contest of liberalism and prerogative turned was the right of the crown to grant new constitutions to Schleswig and Holstein without the consent of the diet. In 1855 Oersted and his colleagues in the cabinet were impeached by the diet; the trial lasted for a year and resulted in an acquittal under the Denmark law, the vote standing eight for conviction and eight for acquittal. An autobiography of Oersted was published 1851–57, and contains valuable material for Danish historians.

OERSTED, Hans Christian, one or the most distinguished scientific discoverers and physicists of modern times, was b. in 1777 at Rudkjöbing, on the Danish island of Langeland, where his father practiced as an apothecary. In 1794 he entered the university of Copenhagen, where he took the degree of doctor of philosophy in 1799, and soon afterward became assistant to the professor of medicine, in which capacity he gave lectures on chemistry and natural philosophy. In 1806, after having enjoyed a traveling scholarship for several years, and visited Holland, the greater part of Germany, and Paris, he was appointed extraordinary professor of natural philosophy in the university of Copenhagen. In 1812, he again visited Germany and France, after having published a manual under the title of *Videnskaben our Naturen's Almindelige Love*, and *Förste Indledning til den Almindelige Naturlære* (1811). During his residence at Berlin, he wrote his famous essay on the identity of chemical and electrical forces, in which he first developed the ideas on which were based his great discovery of the intimate connection existing between magnetism and electricity and galvanism—a treatise which, during his residence in Paris, he translated into French, in conjunction with Marcel de Serres. In 1819, he made known these important truths in a Latin essay, entitled *Experimenta circa efficaciam Conflictus Electrici in acum Magneticam*, which he addressed to all the scientific societies and the leading savans of Europe and America, and thus made good his claim to be regarded as the originator of the new science of electro-magnetism. This discovery which formed one of the most important eras in the history of modern physical science, obtained for Oersted the Copley medal from the Royal Society of England, and the principal mathematical prize in the gift of the Institute of Paris. The original and leading idea of this great discovery had been in his mind since 1800, when the discovery of the galvanic battery by Volta had first led him to enter upon a course of experiments on the production of galvanic electricity. The enunciation of his theory of electro-magnetism was followed by many important experiments in regard to the compression of water, and by numerous other chemical discoveries, among which we may instance his demonstration of the existence of the metal aluminium in alumina. The influence which Oersted exerted on the science of the day by his discoveries was recognized by the learned in every country, and honors increased upon him with increasing years. He was corresponding member of the French institute, perpetual secretary to the Royal Society of Sciences in Copenhagen, a knight of the Prussian Order of Merit, of the French Legion of Honor, and of the Danish Order of the Dannebrog, and a councilor of state. Oersted's great object through life was to make science popular among all classes, in furtherance of which he wrote numerous works, contributed scientific papers to the newspapers and magazines of his own country and Germany, and in addition to his regular prelections in the university, gave courses of popular scientific lectures to the public, including ladies. Among the works specially written to promote the diffusion of scientific knowl-

edge, those best known are *Aanden i Naturen* (Kop. 1845), and *Natur-læren's Mechanische Deel* (Kop. 1847), both of which have been translated into several other European languages. The majority of his more important physical and chemical papers are contained in Poggendorff's *Annalen*, and were written by him in German or French, both of which he wrote with the same facility as his own language. At the close of 1850, a national jubilee was held in honor of the 50th anniversary of his connection with the university of Copenhagen—a festival which he did not long survive, as his death occurred at Copenhagen Mar. 9, 1851. A public funeral, attended by all persons distinguished by rank or learning in the Danish capital, bore testimony to the respect and esteem with which he was regarded by his fellow-citizens, among whom his memory is cherished, not merely as one of the greatest scientific benefactors of his times, but as a man who contributed largely, by his eloquent and earnest advocacy of liberal principles, to the attainment of the high degree of constitutional freedom which Denmark now enjoys.

OE'SEL, an island of Russia, in the Baltic, belonging to the government of Livonia, and lying across the mouth of the gulf of Riga in lat. 57° 40′ to 58° 14′ n., long. 21° 40′ to 23° e. The s.w. end consists of a comparatively narrow peninsula. A narrow strait separates the n.e. end from the island of Dago. The surface is undulating, broken by low hills, marshy, watered by numerous small streams, and well wooded. The coast is generally formed by high cliffs. The climate is milder than that of the neighboring continental districts. The rocks are generally calcareous, and the soil is in many places gravelly; the chief crops are: wheat, oats, rye, barley, and pease. The rearing of cattle, horses, and sheep, and fishing, are, however, the principal occupations of the inhabitants. The seal-fisheries are of some importance. Pop. '92, 61,190, mostly Lutheran. The only town is Arensburg, on the s.e. coast, with a pop. 3600. Many of the inhabitants of Arensburg are of German descent, as are the nobles and clergy of the island; but the peasantry are Esthonian. The islanders of Oesel were in early times noted as pirates. The Danish king Waldemar conquered the island in the beginning of the 13th century. Albert von Buxhövden, bishop of Leal in Livonia, obtained it from Denmark in 1227, in order that he might reduce its inhabitants to subjection, and convert them to Christianity. Being partly subdued by the Teutonic knights, it remained for more than 300 years under its bishops, the seat of the bishopric being transferred to the island. The last bishop sold it to Denmark in 1559. It remained a Danish province till 1645, when it was given up to Sweden, and in 1721 fell into the hands of Russia.

ŒSOPH'AGUS (Gr. *oio*, to convey, and *phagein*, to eat), or **GULLET**, a membranous canal, about 9 in. in length, extending from the pharynx to the stomach, and thus forming a part of the alimentary canal. It commences at the lower border of the cricoid cartilage of the larynx, descends in a nearly vertical direction along the front of the spine, passes through an opening in the diaphragm, and thus enters the abdomen, and terminates in the cardiac orifice of the stomach opposite the ninth dorsal vertebra. It has three coats—viz., an external or muscular coat (consisting of two strata of fibers of considerable thickness—an external, longitudinal, and an internal, circular); an internal or mucous coat, which is covered with a thick layer of squamous epithelium; and an intermediate cellular coat, uniting the muscular and mucous coats. In this tissue are a large number of œsophageal glands, which open upon the surface by a long excretory duct, and are most numerous round the cardiac orifice, where they form a complete ring.

The œsophagus is liable to a considerable number of morbid changes, none of which are, however, of very common occurrence.

The most prominent symtom of *œsophagitis*, or *inflammation of the œsophagus*, is pain between the shoulders, or behind the trachea or sternum, augmented in deglutition, which is usually more or less difficult, and sometimes impossible. The affection is regarded as a very rare one, unless when it originates from the direct application of irritating or very hot substances, or from mechanical violence—as, for instance, from the unskillful application of the stomach-pump or probang. Dr. Copland, however, is of opinion that it is not unfrequent in children, particularly during infancy, and observes that "when the milk is thrown up unchanged, we should always suspect the existence of inflammation of the œsophagus." The ordinary treatment employed in inflammatory diseases must be adopted; and if inability to swallow exists, nourishing liquids, such as strong beef-tea, must be injected into the lower bowel.

Spasm of the œsophagus—a morbid muscular contraction of the tube, producing more or less difficulty of swallowing—is a much more common affection than inflammation. The spasm generally comes on suddenly during a meal. Upon an attempt to swallow, the food is arrested, and is either immediately rejected with considerable force, or is retained for a time, and then brought up by regurgitation; the former happening when the contraction takes place in the upper part of the canal, and the latter when it is near the lower part. In some cases, solids can be swallowed, while liquids excite spasm; while in other cases the opposite is observed; but in general either solids or liquids suffice to excite the contraction, when a predisposition to it exists. The predisposition usually consists in an excitable state of the nervous system, such as exists in hysteria, hypochondriasis, and

generally in a debilitated condition of the body. An attack may consist of a single paroxysm, lasting only a few hours, or it may be more or less persistent for months or even years. The treatment must be directed to the establishment of the general health, by the administration of tonics and anti-spasmodics, by attention to the bowels and the various secretions, by exercise in the open air, the shower-bath, a nutritious diet, etc.; and by the avoidance of the excessive use of strong tea, coffee, and tobacco. Care must also be taken not to swallow anything imperfectly masticated or too hot; and the occasional passage of a bougie is recommended. Brodie relates a case that ceased spontaneously on the removal of bleeding piles. Strychnia is deserving of a trial when other means fail; and if the affection assume a decidedly periodic form, quinia will usually prove an effectual remedy.

Paralysis of the œsophagus is present in certain forms of organic disease of the brain or spinal cord which are seldom amenable to treatment, and is often a very important part of the palsy that so frequently occurs in the most severe and chronic cases of insanity. In this affection there is inability to swallow, but no pain or other symptom of spasm; and a bougie may be passed without obstruction. The patient must be fed by the stomach-pump, and nutrient injections of strong beef-tea should be thrown into the lower bowel.

Permanent or organic stricture of the œsophagus may arise from inflammatory thickening and induration of its coats, or from scirrhous and other formations, situated either in the walls of or external to the tube. The most common seat of this affection is at its upper part. The symptoms are persistent and gradually increasing difficulty of swallowing, occasionally aggravated by fits of spasm; and a bougie, when passed, always meets with resistance at the same spot. When the contraction is due to inflammatory thickening, it may arise from the abuse of alcoholic drinks, or from swallowing boiling or corrosive fluids; and it is said that it has been induced by violent retching in sea-sickness. If unrelieved, the disease must prove fatal, either by ulceration of the tube around the seat of the stricture, or by sheer starvation. When the affection originates in inflammation, some advantage may be derived from a mild course of mercury, occasional leeching, and narcotics; and especially from the occasional passage of a bougie, of a ball-probang (an ivory ball attached to a piece of whalebone), or of a piece of sponge moistened with a weak solution of nitrate of silver. If it is dependent upon malignant disease, and the tissues have become softened by the infiltration of the morbid deposit, the bougie must be directed with the greatest care through the stricture, as a false passage may be easily made into important adjacent cavities.

Foreign bodies not very unfrequently pass into the œsophagus, and become impacted there, giving rise to a sense of choking and fits of suffocative cough, especially when they are seated in its upper part. They may not only cause immediate death by exciting spasm of the glottis, but if allowed to remain, may excite ulceration of the parts, and thus cause death by exhaustion. If the body is small and sharp (a fish-bone, for example), it may often be got rid of by making the patient swallow a large mouthful of bread; if it is large and soft (such as too large a mouthful of meat), it may generally be pushed down into the stomach with the probang; while large hard bodies (such as pieces of bone) should be brought up either by the action of an emetic, or by long curved forceps. If the offending body can neither be brought up nor pushed down, it must be extracted by the operation of *œsophagotomy*—an operation which can only be performed when the impacted body is not very low down, and which it is unnecessary to describe in these pages.

Œ'STRIDÆ, a family of dipterous insects, having a mere rudimentary proboscis or none, the palpi also sometimes wanting, and the mouth reduced to three tubercles; the antennæ short and inclosed in a cavity in the forepart of the head; the abdomen large. They are generally very hairy, the hair often colored in rings. They resemble flesh-flies in their general appearance, and are nearly allied to *muscidæ*. The perfect insect is very short-lived. The females deposit their eggs on different species of herbivorous mammalia, each insect being limited to a particular kind of quadruped, and selecting for its eggs a situation on the animal suitable to the habits of the larva, which are different in different species, although the larvæ of all the species are parasites of herbivorous quadrupeds. The characters and habits of some of the most notable species are described in the article Bot. Animals seem generally to have a strong instinctive dread of the œstridæ which infest them.

OETINGER, Christoph Friedrich, 1702–82; b. Göppingen, in Würtemberg; studied at the university of Tübingen, where he met those who styled themselves the *inspired*, and devoted himself to the mystical philosophy of Leibnitz and Wolf. After finishing his course at the university he became intimate with Bengel, with whom he corresponded and whom he frequently visited. His aim was to infuse more of the biblical element into the philosophy of Wolf, and to "ascertain therein the final principles and highest unity of all thought." He read carefully the church fathers, especially Augustine, and studied the Rabbins and their cabalistic speculations. He became acquainted with Francke, Spangenberg, and Zinzendorf. After traveling extensively he returned to Tübingen, where, having served as tutor and aided Zinzendorf in the translation of the Scriptures, he was appointed reader of theology in the university of Halle. This

post he resigned, and went to Holland to confer with its eminent theologians. Returning to Würtemberg he was appointed in 1738 pastor at Hirschau. Having adopted the views of the Pietists, "with whom his purity of life, earnestness of manner, extensive theological acquirements, and, perhaps, his mysticism of style, all combined to give him great influence," he became their leader in that part of Germany. About this time he became an earnest student of the writings of the mystic Böhme, and also an ardent disciple of Emanuel Swedenborg, some of whose writings he translated into German. He attempted to arrange a system of theology on the mystical interpretation of Scripture. In 1765 he published a treatise entitled *Earthly and Heavenly Philosophy*, which, with his translation of the works of Swedenborg, brought upon him the reprehension of his ecclesiastical superiors. Yet he was protected by the duke of Würtemberg, and was nominated to the superintendence of the churches in the district of Weinsberg, afterward in that of Herrenberg, and subsequently appointed prelate at Murhard, where he continued till his death. He was held in high regard as a philosopher and theologian by those who adopted his views. He wrote several philosophical and cabalistic works, and spent much time in studying the art of transmuting metals. His autobiography was published at Stuttgart in 1845, and a complete edition of his works was collected and edited in 1852 by Ehmann, who published his life and letters. The works of Oetinger amount to about seventy, the best of which is *Theologia ex Idea Vitæ Deducta*.

O'FALLON, John, b. Ky., 1791; served in the war of 1812 under Gen. Harrison, being wounded at Tippecanoe; was a merchant of St. Louis, Mo., where he acquired vast wealth, and contributed more than a million dollars to charitable and other institutions, among which is the O'Fallon polytechnic institution, which he endowed to the amount of $100,000. He d. in 1865.

O'FARRELL, Michael Joseph, d.d., b. Ireland, 1832; studied at All Hallows, Dublin, and St. Sulpice, France, and was ordained a Rom. Cath. priest, 1855. He came to the United States; was a missionary for 13 years; was stationed at St. Peter's church, New York, 1868–81; and was consecrated the first bp. of Trenton, N. J., 1881. He d. in 1894.

OF'FA'S DYKE, a remarkable relic of antiquity, an entrenchment extending along the whole border of England and Wales, from the n. coast of Flintshire, on the estuary of the Dee, through the counties of Denbigh, Montgomery, Salop, Radnor, and Hereford, into Gloucestershire, where its southern termination is near the mouth of the Wye, in the grounds of Sedbury park, which overlook the estuary of the Severn. In some places it is nearly obliterated by cultivation; in others it is of considerable height, although its appearance nowhere indicates that it can ever have been of much value as a rampart. It is therefore generally supposed to have been chiefly intended as a line of demarcation. Nearly parallel with it, but at a distance varying from a few hundred yards to 3 m., on the eastern or English side of it, is *Watt's dyke*, a similar relic of antiquity, which, however, seems never to have been so great a work, and is now in many places much obliterated. It has been conjectured that the space between them was neutral ground where the Anglo-Saxons and Welsh met for trading or other purposes. The principal dyke is ascribed by tradition to Offa, king of Mercia, who reigned in the 8th c.; but this is matter of tradition, and not of history.

OFF'ENBACH, a manufacturing t. of Hesse-Darmstadt, on the s. bank of the river Main, within the domains of the princes of Isenburg-Birstein, 4 m. s.e. of Frankfurt. Pop. '95, 40,310. Offenbach is pleasantly situated in one of the richest parts of the valley of the Main, and is one of the most important manufacturing towns in the province. Among the industrial products, its leather has acquired a pre-eminent character for excellence; and next to these stand its harness, articles of jewelry, gold and silver goods, carpets, and silk and woolen fabrics. It has also good manufactories of wax-cloth, papier-mâché snuff-boxes, tin-lackered wares, aniline dyes, perfumes, chemicals, wax-candles, machinery, type, shoes, and hats. Offenbach has several churches, and a Jewish synagogue. The palace is the winter residence of the Isenburg-Birstein family, to whom the old castle, now in ruins, also belongs. Railways to Frankfurt and Saxony facilitate intercommunication, and tend materially towards the maintenance of its active trade.

OFFENBACH, Jacques, a composer of dramatic music, who gained high popularity over the continent; of German birth, but a naturalized Frenchman. He was born in 1819, became *chef d'orchestre* in the Théâtre Français in Paris in 1847, and in 1855 manager of the Théâtre des Bouffes Parisiens. O. was composer of a vast number of light lively operettas, *Le Mariage aux Lanternes; La Fille d' Elezondo*, etc., perfect as musical trifles; but the productions by which he is best known are a series of *bouffonneries musicales*, or burlesque operas, including *Orphée aux Enfers; La Belle Hélène; La Barbe Bleue; La Grande Duchesse; Geneviève de Brabant*, and *Roi Carotte*, composed with the rather questionable aim of parodying music of a more serious description. *Madame Favart* became almost as popular in England as in France. He d. 1880.

OFFENSES Against Religion, Public Peace, etc. See Religion, Peace, etc.

OFFER and **ACCEPTANCE** is one mode of entering into a contract of sale. At an auction the highest offer is generally accepted as a matter of course; and when accepted, the contract is completed. An offer is often made by letter from one merchant to

another to buy or sell goods. In such a case, the party offering is bound to wait until he gets an answer by return of post or messenger; for until then the offer is supposed to be continuously made. But if A offer to B personally to sell, and B ask time to consider for a day, or any given time, A is not bound to wait a single moment, according to English law, and may withdraw at any time from the offer, because he had no legal consideration for waiting; whereas, in Scotland, in the same circumstances, A would be bound to wait the time agreed upon.

OFFERING. Under the head FIRST-FRUITS (q.v.) have been described the various offerings prescribed in the Jewish law. We shall have occasion to consider, under the head of SACRIFICE (q.v.), some further questions connected with the subject of offerings in public worship. In the Christian community there appears to have existed, from the earliest times, a practice of making voluntary offerings, for purposes not directly connected with public worship. See OFFERTORY.

OFFERTORY (Lat. *offertorium*, from *offero*, I offer) is the name given to that portion of the public liturgy of the Roman Catholic church with which the eucharistic service, strictly so called, commences. In the Roman liturgy it consists of one or two verses from some book of Scripture, generally from the Old Testament, but sometimes also from the epistles. In the Ambrosian liturgy it consists of a prayer, similar in form to the *collect* or *secret* of the mass; and in both, this recital is followed by the preparatory offering up of the bread and wine, accompanied by certain ceremonies and forms of prayer.

This offering of the bread and wine in the public service became, from a very early period, the occasion of a voluntary offering, on the part of the faithful; originally, it would seem, of the bread and wine designed for the eucharistic celebration and for the communion of the priest and the congregation, sometimes even including the absent members, and also for the *agape*, or common sacred feast, which accompanied it. That portion of the offerings which remained in excess of what was requisite for these purposes was applied to the relief of the poor, and to the support of the clergy. These offerings were ordinarily made by the faithful in person, and were laid upon the altar; and the Ambrosian rite still preserves this usage in a ceremonial which may be witnessed in the cathedral of Milan. By degrees, other gifts were superadded to those of bread and wine—as of corn, oil, wax, honey, eggs, butter, fruits, lambs, fowl, and other animals; and eventually of equivalents in money or other objects of value. The last-named class of offerings, however, was not so commonly made upon the altar and during the public liturgy, as in the form of free gifts presented on the occasion of other ministerial services, as of baptism, marriages, funerals, etc.; and from this has arisen the practice in the Roman Catholic church of the mass-offering, or *honorarium*, which is given to a priest with the understanding that he shall offer the mass for the intention (whence the honorarium itself is often called an "intention") of the offerent. In some places, however, and among them in some parts of Ireland, offerings "in kind" are still in use, not indeed in the form of the ancient offertory, but in the shape of contributions of corn, hay, etc., at stated seasons, for the use of the parochial clergy. At weddings also, and in some places at funerals, offerings in money are made by the relations and friends of the newly married or of the deceased. In the liturgy of the English church allusion is made to the practice of oblations, and some of the recent controversies have turned upon the revival of the "offertory," which has found some advocates.

OFFICE, in law, may be ministerial or judicial, and is in law the right and duty of one or more persons to discharge the functions of some position of trust or honor, and to receive the emoluments appertaining thereto. An office is ministerial when its exercise depends on the command or direction of others; judicial, when the officer is called upon to employ his own discretion. An example of the first is a sheriff, of the second a judge of a court of law. The two are sometimes united in one. The office is held for the benefit of the public, may be abolished by legislation, unless such action be expressly forbidden by the constitution; and cannot be the subject of sale or devise, though in England certain ministerial offices are regarded as the property of the incumbent and may descend in the family. When the office is in its nature judicial, the duties cannot be performed by deputy, as the personal skill or judgment of the officer are the reasons for his holding the office. With ministerial offices the reverse is the case. Thus a sheriff or other court officer may appoint deputies, and their acts are good in law; while the appointing officer remains responsible for such acts. Statutes in most of the states provide that offices shall not be sold, and such a sale would be void anywhere as contrary to the policy of the common law. So any agreement between the officer and one who by influence procures his appointment, to divide the compensation received, would be altogether void. It was a principle of the common law that no term of office should be created so as to begin at a certain time in the future, nor for a fixed term of years, but should be held for life or during good behavior, This was to prevent the holding of office after competency to perform the duties had ceased, and to render it impossible that the office should survive the officer. It is common in this country to limit the term to the life of the incumbent and to the attaining of a certain age, as 70 years. Two offices cannot be held by the same person where one is in the nature of its duties inconsistent with the other. This inconsistency may be patent from the nature of the offices

or it may be declared to exist by act of legislation. Where an office is filled in common by several persons, it has been held that if the office is of a public character all the officers must meet for consultation, but that a majority may act, while if the office is private, all must concur; but this is often governed by statute, and a decision by a majority, or even a majority of those present at any meeting, made binding. Members of state or national legislature are not usually termed officers, the word being confined in usage to those having executive or judicial authority. A *de facto* officer is one who is in possession of the authority and emoluments of an office without a good title thereto, while a *de jure* officer is one who has the legal right but not necessarily actual possession. It is evident that it would make much confusion and cause great injustice if all official acts of a *de facto* officer were to be considered as of no effect. Thus, in the case of a judge who was wrongfully on the bench, it would be a great hardship if all judgments given by him, and all criminal convictions of his court, should be set aside. But if suit be brought by a *de facto* officer in his public capacity, he may be debarred from recovery on the ground of defect in title, and the *de jure* officer may test the question of title by bringing a writ of *quo warranto*.

Public officers are appointed in the United States, under the provisions of the constitution, by the president with the advice and consent of the senate, with the exception that to congress is given the power to vest in the president alone, or in the heads of departments or courts of law, the appointment of "inferior officers." Ambassadors, public ministers and consuls, and supreme court judges are specified as not belonging to this "inferior" class, but beyond that the distinction is not clearly defined. In the various states the appointment of public officers is regulated by statutes, and even in the case of supreme court judges election is common. The appointee in most cases is required to take an oath to perform faithfully the duties of the office. A bond is often required where the officer has charge of financial interests or his duties affect property rights. Where he performs official acts before giving bond or taking oath, such acts will be valid unless he has been specially prohibited by statute or constitution from holding the office before the bond was filed or the oath administered. Compensation of officers may be fixed by law or may be obtained from fees. It is provided in the United States statutes that no officer of the government who holds an office with a salary of $2,500 or more shall receive extra compensation for performing the duties of any other office unless expressly authorized by law. Where an officer has been removed his salary will continue until proper notice of the appointment of his successor has been given him. Compensation does not begin until an officer is liable to duty. The law will presume that a public officer is acting within the scope of his duty until the reverse has been shown. Where discretionary power is given, the officer is made the exclusive judge of the facts. The officer is liable for wrongful acts both to the injured party and to the state. In the first cast remedy is by action, in the second by indictment or impeachment. The order of a superior is no bar to an action arising from an unlawful act of the inferior, nor is negligence on the part of a subordinate ground for holding the head officer responsible. Contracts made by public officers are governed by the general law of agency and they cannot bind the government beyond the extent of their legal authority. If an appropriation is exceeded, the officer is liable. A court officer cannot be held if acting under the proper order of a court having jurisdiction, but may be where there is no jurisdiction. If a sheriff seize property which is by law exempt, he is personally responsible. Fraud and embezzlement are made criminal offenses by statute. Forfeiture of office will follow such offenses, the proceeding being by information or *quo warranto*. The method of removing a public officer is not provided for in the constitution, and the question arises whether the power belongs to the president alone or whether he must receive he consent of the senate. Such "inferior" officers as may be appointed by congress may also be removed by proper legislation. It is said on the one hand, as to other officers, that there is a distinction between the right to nominate and the power of appointment, and that therefore the consent of the senate must be obtained in removing any officers in whose appointment it had a share. On the other hand, it is urged that removal is an executive act, that the power of nominating implies the power to remove, and that the public interest demands that the president should have power to dismiss an incompetent or dishonest official without the delay which would be entailed by awaiting the action of the senate. The question has several times come before congress, and the power of the president to act alone was sustained by a very close vote. In the contest of authority between president Andrew Johnson and congress the discussion on this point was very bitter. By statutes of 1867 and 1869 it was provided that a civil officer appointed by the advice and consent of the senate shall hold his place until removed by the same authority, but that during a recess of the senate the president may suspend such officer and appoint another to fill the duties of the position. The president is to make a nomination within 30 days after the beginning of the next session of the senate; and in case the senate directly refuse to confirm, he may nominate another person. These statutes are known as the tenure-of-office acts. State officers may in many cases be removed by the governor; the subject is governed by statutory enactments, which vary greatly in the different states. Elective offices cannot be vacated by an executive officer without showing cause, such as malfeasance or embezzlement. A term of office may be extended or reduced by action of the legislature

unless it be prescribed by constitutional provision or be elective in its nature. Officers of the United States courts hold during good behavior, but those of the territorial courts do not fall within the clause of the constitution already referred to, and depend upon the action of congress for the limitation of their terms. If neither state nor national constitution prescribe the length of a term, the subject is under legislative control, and may be extended or shortened, or the office altogether abolished.

OFFICE, The Divine (Lat. *officium*, duty), is the name popularly given to the canonical hours (q.v.) prescribed to be read each day by bishops, priests, deacons, and subdeacons in the Roman Catholic church. Under the head Breviary will be found a general description of the contents and the arrangement of that great service-book. The special portions assigned for any particular day constitute what is called the divine office for that day; and each person who is bound in virtue of his order to recite the breviary, is obliged, under pain of sin, to read, not merely with the eye, but with distinct, although it may be silent, articulation, each and all these portions. The adjustment of the portions of the office of each day, the combination of the "ordinary" portions which are read every day in common, with the parts "proper" for each particular day, is a matter of considerable difficulty, and is regulated by a complicated system of rubrics (q.v.).

OFFICE COPY is a copy made of a document by some officer of a court in whose custody the document is; and in general such copies are receivable in evidence, without further proof, in the same court, but not in other courts, except some statute makes them evidence.

OFFICE FOUND. See Inquest of Office.

OFFICE, HOLY, Congregation of the. In the article inquisition (q.v.) it has been explained that that tribunal is sometimes called by the name holy office. That title, however, properly belongs to the "congregation" at Rome, to which the direction of the tribunal of the inquisition at Rome is subject. This congregation was established by Paul III. in 1542, and its organization was completed by Sixtus V. It consists of twelve cardinals, a commissary, consulters, and qualifiers, whose duty it is to examine and report on each case for the information of the cardinals. In the most solemn sessions of the holy office the pope himself presides in person. The holy office decides questions of heresy, inquires into crimes against faith, and judges ecclesiastical offenses, especially in the administration of the sacraments. In the present condition of the papal court the action of the holy office is much restricted.

OFFICERS, Military and Naval. Military officers are combatant and non-combatant, the latter term including paymasters, medical officers, commissariat, and other civil officers. The great divisions of rank are commissioned and non-commissioned officers. Commissioned officers receive their commission from the President after being confirmed by the Senate, and upon passing the required examinations. (See Promotion.) The non-commissioned officers are enlisted men, and are sergeants, corporals, etc. Divided by their duties, they are staff officers, such as ordnance, engineers, medical officers, etc. (see Staff), or regimental officers (see Regiment); divided by rank, general officers (q.v.), field officers (q.v.), and troop, battery, or company officers, which includes captains, first and second lieutenants.

Officers, Naval, are commissioned, warrant, and petty officers. Commissioned officers are admiral, rear-admirals, commodores, captains, commanders, lieutenant-commanders, lieutenants, ensigns, and naval cadets, who are commissioned the same way as the army officers, and the staff corps, medical, pay, engineer, naval constructors, civil engineers, chaplains, and professors of mathematics. The warrant officers are boatswains, gunners, carpenters, and sailmakers. Petty officers are enlisted men.

OFFICIAL ASSIGNEE, in English law, is an offier of the bankruptcy court, in whom a bankrupt's estate vests the moment an adjudication of bankruptcy is made. He is the manager of the property, and can sell the estate under the directions of the court in urgent cases, such as where the goods are perishable; but, in general, he is assisted in the management by the creditor's assignees, who are selected from the body of creditors by the other creditors' votes. The official assignee is appointed by the lord chancellor, being selected from the body of merchants, brokers, or accountants. He is bound to find security to the extent of £6,000. He is prohibited from carrying on trade on his own account. The salary is £1000.

OFFICINAL PLANTS (Lat. *officina*, a shop) are those medicinal plants which have a place in the pharmacopœias of different countries, and which are therefore sold—or some of their products or preparations of them—by apothecaries and druggists. The medicinal plants cultivated to any considerable extent are all officinal, but many are also officinal which are not cultivated. See Medicinal Plants.

OFFSET, or Set-Off, the splay or sloping part of a wall, etc., joining parallel surfaces when the upper face recedes from the lower. This frequently occurs on buttresses. The offset is usually protected with dressed stones, having a projection or drip on the lower edge to prevent the rain from running down the wall.

OFFSETS, a term used by gardeners to designate the young bulbs which, springing from the axils of the scales of a bulb (q.v.), grow beside it, exhausting its strength, but which serve for the propagation of the plant. A crop of shallots, or of potato onions, consists entirely of the offsets of the bulbs planted in spring; although the term is not commonly used except as to bulbous-rooted plants, prized for the beauty of their flowers.

OFFSETS. Let AEF....B....D....C be a field with very irregular sides; take the points A, O, M, C at or as near the corners as convenient, the object being to inclose as much of the field as possible within the quadrilateral AOMC; and for this purpose, it is sometimes necessary, as in the present case, to include a corner (as SRQ) which is outside the field. The area AOCD is found by means of the diagonal AM, and the perpendiculars on it from C and O. The area AEFG....BL is found by dividing it into triangles and trapezoids by means of perpendiculars (to which the term *offsets* was originally applied, though it now denotes the irregular area before mentioned) from the corners E, G, H, etc. (see TRIANGLE and TRAPEZOID), and adding together the areas of the separate figures AEF, FG*g*, GH*gh*, etc. Similarly the

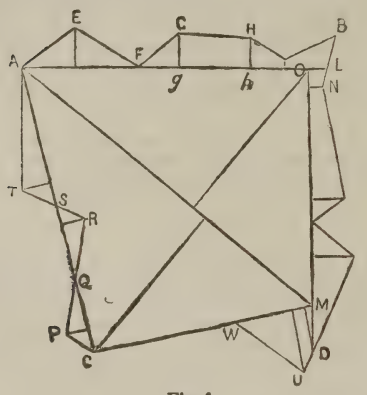

Fig. 1.

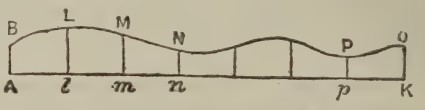

Fig. 2.

areas of OLN....D and MDUW are found. To the sum of these must be added the areas of the triangles ATS, QPC, diminished by the area of SRQ, and the result is the whole area of the field. If the offset have no distinct corners as (fig. 2) ABLMN....OK, then the base AK is divided into equal parts by perpendiculars ABL*l*, M*m*, N*n*, etc., and the area of the offset is found approximately as follows: the whole offset = ABL*l* + L*l*M*m* + M*m*N*n* + etc. + P*p*OK = A*l* × ½ (AB + L*l*) + *lm* × ½ (L*l* + M*m*) + *mn* × ½ (M*m* + N*n*) + ... + *p*K × ½ (*p*P + OK) = (since the divisions of the base are equal) A*l* × ½ {AB + 2L*l* + 2M*m* + 2N*n* + ... + 2*p*P + OK} = A*l* × $\left\{\frac{\text{AB} + \text{OK}}{2} + \text{L}l + \text{M}m + \text{N}n + \ldots. + \text{P}p\right\}$; i.e., the area of an offset is found approximately by adding the intermediate perpendiculars to the semi-sum of the first and last and multiplying the sum total by the length of a division of the base, the divisions being equal; and the greater the number of perpendiculars, the nearer the result is to the true area.

OG, an Amoritish king of Bashan. He reigned over 60 cities, of which the chief were Ashtaroth and Edrei, at the time of the entrance of the Israelites into Canaan, B.C. 1618. He and his people were defeated and destroyed at Edrei immediately after the conquest of Sihon, his friend and ally. His walled cities were taken, and his kingdom, with its capital, transferred to the tribes east of the Jordan. He was one of the last of the race of the giants, and Scripture records the size of his iron bedstead preserved in "Rabbath of the children of Ammon," which was about 15 ft. long and 6 broad.

OGDEN, city and co. seat of Weber co., Utah; at the confluence of the Ogden and Weber rivers, and on the Union Pacific, the Rio Grande Western, the Southern Pacific, and the Utah Central railroads; 37 miles n. of Salt Lake City. It contains the State school for the deaf and dumb, the State school for the blind, the State industrial school, Sacred Heart academy, Weber Stake academy (Mormon), city and Union Pacific railroad hospitals, public library, Lester and Liberty parks, several national and private banks, and electric light and street railroad plants. Among the local attractions is Weber cañon, where a $2,000,000 electric power plant has been installed. Pop. '90, 14,889.

OGDEN, AARON, LL.D., 1756–1839; b. Elizabethtown, N. J.; educated at Princeton college, where he graduated in 1773. In 1777 he became a captain in the first New Jersey regiment, and was made aid-de-camp to lord Stirling. In 1779 he was employed in the Indian campaign, and in 1781 commanded a regiment at Yorktown, where his gallantry received the personal commendation of Washington. At the close of the war he practiced law, held several minor offices, was elected United States senator from New Jersey in 1801, and in 1812 was governor of his state. He served in the war of 1812–14 at the head of the New Jersey militia and was offered the rank of major-general, which he declined.

OGDEN, DAVID, 1707–1800; b. N. J., graduated at Yale college, class of 1728; studied law in New York city, rose rapidly in his profession, and attained great distinction in his native state. He was called one of the "giants of the law." In 1772 he was appointed judge of the supreme court, and inclined toward the opinions of the loyalists during the disturbances preceding the revolution, though disposed to assist in an amicable settlement, and originated a plan for the government of the colonies in case they should submit to the authority of Great Britain. His wavering ending in toryism, his property was confiscated, and in 1776 he removed to New York, joined the refugees, became a member of the board, and in 1783 went to England for a few years, returning to his native land in 1790, and died in Queens co., Long Island. Of his sons, one, Abraham, became a distinguished lawyer and United States district attorney under president Washington, and Isaac was judge of the court of king's bench.

OGDENSBURG, city and port of entry in St. Lawrence co., N. Y., at the junction of the Oswegatchie and St. Lawrence rivers and on the Central Vermont and the Rome, Watertown, and Ogdensburg railroads; 175 miles n.n.w. of Albany. It was founded in 1749 and incorporated as a city in 1868, and is connected with Prescott, on the Canadian side of the St. Lawrence, by a steam ferry. The city contains a U. S. government building, St. Mary's (R. C.) cathedral, city hospital, orphanage, refuge for the aged, public library, national and state banks, public parks, grain elevators and warehouses, electric light and street railroad plants, and numerous manufactories supplied with power from the river. Ogdensburg has regular steamboat communication with the principal lake ports, and receives and ships large quantities of grain, lumber, and general produce. Pop. '90, 11,662.

OGEE', a moulding consisting of two curves, one concave and the other convex. It is called (in classic architecture) *cymatium* or *cyma reversa* (see MOULDINGS). The ogee is also much used in Gothic architecture.

OGEMAW, a co. in n.e. Michigan; watered by Rifle river; 570 sq.m.; pop. '90, 5583. The surface is rolling and well wooded. Co. seat, West Branch.

O'GHAMS, the name given to the letters or signs of a secret alphabet long in use among the Irish and some other Celtic nations. Neither the origin nor the meaning of the name has been satisfactorily explained.

The alphabet itself is called *bethluisnin*, or *bethluis*, from its first two letters, "*b*," called "*beith*" (birch), and "*l*," called "*luis*" (quicken). Its characters are lines, or groups of lines, deriving their significance from their position on a single stem or chief line—over, under, or through which they are drawn either straight or oblique. In some cases, the edge of the stone or other substance on which the oghams are incised, serves the purpose of the stem or chief line. About eighty different forms of the alphabet are known. Five characters were afterwards added to represent diphthongs. The sign for the diphthong "*ea*" is said to be the only one which has been observed on ancient monuments. It is added that the sign for "*ui*" sometimes stands for "*y*," that the sign for "*ia*" sometimes stands for "*p*," and that the sign for "*ae*" stands also for "*x*," for "*cc*," for "*ch*," for "*ach*," and for "*uch*."

Ogham inscriptions generally begin from the bottom, and are read upward from left to right to the top, when they are carried over, and run down another side or angle. Most of those which have been read give merely a proper name with its patronymic, both in the genitive case. The stones on which oghams are cut would seem, for the most part, to have been sepulchral. Oghams are of most frequent occurrence in Ireland, where they are found both written on books and inscribed on stones, metals, or bones. The oghams on stones are most numerous in the counties of Kerry and Cork. A few ogham inscriptions on stones have been discovered in Wales—as at St. Dogmael's, in Pembrokeshire; near Margam, in Glamorganshire; and near Crickhowel, in Brecknockshire. There are a few in Scotland, as on the Newton stone and the Logie stone in Aberdeenshire, on the Golspie stone in Sutherland, and on the Bressay stone in Shetland. One has been found in England—at Fardel, in Devonshire. Oghams have been observed on an ancient MS. of Priscian, which belonged to the famous Swiss monastery founded in the 7th c. by the Irish missionary St. Gall (see GALL, ST., ABBEY OF).

The difficulties of deciphering ogham inscriptions cannot be said to have been as yet altogether overcome. It is confessed by the most learned and judicious of ogham scholars, the Rev. Charles Graves, D.D., of Trinity college, Dublin, that the nature of the character is such that it does not at once appear which, of four different ways of reading, is the right one; and that the words being written continuously, as in ancient MSS., there is great chance of error in dividing them.

The old school of Irish antiquaries contended that the oghams were of Persian or Phenician origin, and were in use in Ireland long before the introduction of Christianity. But this theory is now generally discarded, as not only unsupported, but as contradicted by facts. A comparison of the Ogham alphabet with the alphabets of Persepolis and Carthage shows that there is no likeness between them. The great majority of ogham monuments, it has been observed, bear more or less distinct marks of Christian hands

Several are inscribed with crosses, as old, to all appearance, as the oghams themselves. Many stand in Christian burying-grounds, or beside Christian cells or oratories. Some still bear the names of primitive saints. At least one is inscribed with a Christian name; and some of the inscriptions betray an undeniable knowledge of Latin. At the same time, it has been argued by one of the most learned of Celtic philologists, Mr. Whitely Stokes, that "the circumstance that genuine ogham inscriptions exists both in Ireland and in Wales which present grammatical forms agreeing with those of the Gaulish linguistic monuments, is enough to show that some of the Celts of the islands wrote their language before the 5th c., the time at which Christianity is supposed to have been introduced into Ircland. It has been observed by Dr. Graves, on the other hand, that there are many points of resemblance between the oghams of the Celts and the Runes of the Norsemen; and, indeed, one Irish MS. asserts that the oghams came to Ireland from Scandinavia:

"Hither was brought, in the sword sheath of Lochlan's king.
The ogham across the sea. It was his own hand that cut it."

The ogham is said to have been in use so recently as the middle of the 17th c., when it was employed in the correspondence between king Charles I. and the earl of Glamorgan.

The best account of oghams is in the papers in the *Transactions of the Royal Irish Academy*, by Dr. Graves, now bishop of Limerick, vol. iv. pp. 70, 173, 183, 254; vol. v. pp. 234, 401; vol. vi. pp. 71, 209, 248, where also are some papers of value on the same subject by Mr. Samuel Fergusson; and the *Catalogue of the Museum of the Royal Irish Academy*, pp. 134–140; and in Mr. Whitley Stokes's *Three Irish Glossaries*, pp. 55–57, compared with Thomas Innes's *Critical Essay on the Ancient Inhabitants of Scotland*, vol. ii. pp. 440–466. The reader may also consult with advantage Astle's *Origin and Progress of Writing;* Petrie's *Essay on the Round Towers of Ireland;* John Stuart's *Sculptured Stones of Scotland*, and Ware's *Antiquities of Ireland.* Ogham inscriptions may be seen in the museum of the royal Irish academy at Dublin, in the museum of the society of antiquaries of Scotland at Edinburgh, and in the British museum at London.

OGILBY, John, 1600–76; b. Scotland; resided in London. In 1633 he went to Ireland in the employ of Wentworth, earl of Strafford, then deputy of Ireland, pursuing his vocation of copyist and his profession of dancing-master. About 1650 he studied Greek and published a poetical translation of Virgil, 1649–50. He conducted the poetical exercises at the coronation pageant in 1661 which attended the restoration of Charles II. to the throne, and erected a printing-office in the city of London in 1667. Associated with James Shirley, the dramatist, he translated the *Iliad*, 1660; and the *Odyssey* into English verse, 1665, the typography of which was considered very elegant. He translated the works of Montanus, a native of Phrygia, the founder of a Christian sect of the 2d century. His works were splendidly illustrated by Hollar, the Bohemian engraver and designer. It was from his Homer that Pope, in his boyhood, drew the inspiration for his own classical work. In 1671 he published *America, containing the Original of the Inhabitants and the Remarkable Voyages thither*, having 57 folding plates and maps, exclusive of those inserted in the text, among which is "the earliest view" of Nieue Amsterdam (New York). He was appointed royal cosmographer, and published many maps and geographical works; among them *Atlas Japanensis*, 1670, *Atlas Chinensis* 1671–73, *Britannia*, etc.

OGILBY, John David, D.D., 1810–51; an Episcopal clergyman, in 1829 became rector of the grammar school of Columbia college, New York, from which institution he had graduated in that year, and held the position 12 months. In 1832 he became professor of languages at Rutgers college, New Brunswick, N. J. He filled the chair of professor of ecclesiastical history in the general theological seminary of the Episcopal church in New York from 1841 to the time of his death, which took place in Paris. He published in 1842 *An Outline of the Argument against the Validity of Lay Baptism;* and in 1844, *The Catholic Church in England and America.*

O'GIVES, the arches in pointed Gothic vaulting which cross the vault diagonally from one angle to another.

OGLE, a co. in n. Illinois, drained by Rock river, Leaf river, and Pine creek; on the Chicago and Northwestern, Chicago, Burlington, and Quincy, and Illinois Central railroads; 780 sq. m.; pop. '90, 28,710, chiefly of American birth. The surface is rolling and the soil fertile with much prairie. The principal productions are corn, wheat, hay, barley, and potatoes. Co. seat, Oregon.

OGLE, Benjamin, 1746–1808; b. Md.; member of the Maryland council, and governor of that state 1798–1801.

OGLESBY, Richard James; b. Ky., 1824; studied law while living on a farm and working as a carpenter at Decatur, Ill., and commenced the practice of law at Sullivan in 1845. He was a soldier of the Mexican war, and at the battles of Vera Cruz and Cerro Gordo served as lieut. in the 4th regiment Ill. volunteers. In 1847 he went back to Decatur and the practice of his profession, studying at the same time at the Louisville law school, graduating in 1848. In the gold excitement of 1849 he crossed the continent to the mining districts of California, returned in 1851 to Illinois, went to Decatur

and resumed the practice of law. In 1858 he was a defeated candidate for congress, but in 1860 he represented his district in the state senate. When the civil war broke out in 1861 he resigned his seat to accept the position of col. of the 8th Ill. volunteers; on March 21, 1862, was promoted to brig. gen. of volunteers for bravery at Fort Donelson; and in 1862 (to rank from Nov. 1862), major-general. He was in the battle of Shiloh, under Gen. Grant, and was wounded at the siege of Corinth, where he fought under Gens. Halleck and Rosecrans. He was unfit for duty until the following spring, when he was assigned to the 16th army corps. In May, 1864, he resigned his commission: was governor of Illinois in 1865–69, 1873, and 1885–89; and U. S. senator in 1873–79.

OGLETHORPE, a co. in n.e. Georgia, bounded by Oconee river on the s.w., and Broad river on the n.e.; drained by many creeks; intersected by the Athens branch of the Georgia railroad; 528 sq.m.; pop. '90, 1695, chiefly of American birth, incl'g. colored. Surface broken and hilly and only moderately fertile; corn, cotton, and pork are the staples. Iron ore and granite are found. Co. seat, Lexington.

OGLETHORPE, James Edward, 1698–1785; b. England; entered Oxford in 1714, but soon afterwards accepted a commission in the queen's guards, and went through the Turkish campaign of 1716 as an aide-de-camp of Prince Eugene. He participated in the siege of Belgrade, and in 1722 returned to England and entered parliament. Having been appointed a trustee for the relief of insolvent debtors, he conceived a plan for the formation of a colony in America to improve their condition, and to afford a refuge for the persecuted Protestants of Europe. The unsettled country between Florida and South Carolina was selected as a site, and the government made a grant of £10,000. The colony received a charter, and in 1732 Oglethorpe, who was appointed governor, took out a party of colonists to Georgia. For his subsequent connection with the colony, see Georgia. In 1745 he was made a maj.gen., and after the invasion of the Pretender was ordered to pursue the rebels, and for his failure to overtake them was court-martialed, but acquitted. In 1752 he surrendered the charter of Georgia to the government, and in 1754 he resigned his seat in parliament. He was made lieut.gen. in 1747, and put upon half pay as gen. in 1765. He was offered the command of the British forces in America upon the withdrawal of Gage in 1775. He was eulogized by Pope, by Dr. Johnson, and by Thomson. The *Memoirs of James Oglethorpe,* by Robert Wright, appeared at London in 1867.

O'GOBAI, or more properly Ogowé, a large river of western Africa whose source has not yet been traced out entirely, within the district of the French Congo. It is conjectured to rise a little south of Ngango in about 2½° s. 14½° e., and falls into the sea by many mouths, between s. lat. 0° 40′ and 1° 20′. Its delta is not less than 1300 sq. m. in extent, and consists of a most complicated network of channels and creeks with two main branches, the most northerly of which reaches the sea at Nazareth bay, east of Cape Lopez, where its mouth is obstructed by a dangerous bar; the other principal mouth, the Yombe or Youmbe, about 50 m. further s., has its outlet at Lopez Bay. Its length up to the falls of Pubara, a few miles above Franceville, is 470 m. The researches of Du Chaillu, its first explorer, in 1856 and 1865; of Walker in 1866 and 1873; of Compiègne, Marche, and Dr. Lenz in 1874, and in 1875–78 of M. Savorgnan de Brazza and Dr. Ballay, have all helped to increase our knowledge of this region. About 60 m. inland, above the head of the delta, the Ogobai flows for a distance of about 50 m. from the eastward, its average width being about 2,500 yards. It then bends n. for 15 m., and here occurs the junction of the Okanda river, from the n.e., with the Ngunie from the south. Other tributaries seem to be the Lolo on the left bank and the Ivindo on the right bank, though but little is known about any of them. The bed of the main stream, the Okanda, is from 800 to 1000 yds. wide above the confluence, with a series of rapids on its upper waters, at a distance of 180 m. from the sea. Small steamers can navigate over 200 m. below Ndschola. The district below the Ngunie is distinguished by numerous lakes, one of which is connected with the Ogobai by three rivers. Lake Azingo, to the n., is connected with the Ogobai by the river Koli. In 1875 M. de Brazza was at Lopé, and explored the Fan country; he then advanced to Doumé, 50 m. s. of the equator, where the course of the river is from the s.e. to the n.w. He resumed his explorations in April, 1877, advancing to the Pubara falls, in 1° 45′ s., where the Ogobai becomes an insignificant stream interrupted by numerous rapids. Traveling eastward into unknown country, he crossed the water-parting, and discovered the Alima, which he found to be 150 yards wide, flowing eastward. The region between the Ogobai and Alima is 50 m. across and consists of hills of moderate height, with easy passes. The dense forests of the Ogobai are the main haunts of the gorilla (q. v.), and of several other anthropoid apes, among which are the nest-building apes. S. of the Ogobai dwell the Ashira and Apingi tribes, the latter being skillful weavers, though cannibals; between the Ogobai and the Gaboon are the Fans, first fully described by Du Chaillu, who are also cannibals and have been moving westwards for some years, so that the whole Gaboon region is occupied by them. The Fans excel in smith-work, but they have deteriorated since their contact with the whites. Next in importance to the Fans are the Bakalai, inhabiting the country around the confluence of the Ogobai and the Ngunie. Amongst the other tribes on the upper waters are the Okota, Osyeba (cannibals), and the Okanda. The rise of

the Ogobai corresponds with the heaviest rainfall, which takes place in March and April, and again in October and November. Inland, rain is more frequent than at the coast. The Ogobai seems to gather most of its volume from lands comparatively near the coast, and not to depend greatly on more remote tributaries.

OGY'GES, the earliest king of Attica and Bœotia named in Greek legend. In his time (according to Larcher, about 1759 B.C.) a great flood took place, called the Ogygian flood, which desolated all the lower districts of both countries, and destroyed their inhabitants. The different legends lead to the supposition that under Ogyges an Egyptian colony came to Bœotia, and thence to Attica. From him Bœotia took the name of Ogygia.

OGY'GIA, a mythical island supposed to have been inhabited by Calypso (q.v.), and located by Homer (q.v.) in the navel or central part of the sea, away from all lands. Later writers place it in the Ionian Sea, near the promontory Lacinium in Bruttium.

OHIO, an e. central state and the 4th in order of admission under the constitution; between lat. 38° 27′ and 41° 57′ n.; long. 80° 34′ and 84° 50′ w.; bounded on the n. by Michigan and Lake Erie; on the e. by Pennsylvania and West Virginia, the Ohio river separating; on the s. by West Virginia and Kentucky, the Ohio river still intervening; on the w. by Indiana. Its lake shore is 230 m. long and the Ohio river bounds it for 436 m. It is nearly 210 m. long from n. to s. and 215 m. from e. to w. Its land area is 40,760 sq. m.; total area 41,060 sq. m., or 26,278,400 acres.

The ARMS of the state show a sheaf of wheat, and a bundle of seventeen arrows (in allusion to the number of states in the Union at the time of its admission) in the foreground; the background, a mountain range with a sunrise beyond. The *motto* is *Imperium in Imperio*—"an Empire within an Empire." For name and its derivation, see POPULAR NAMES OF STATES.

HISTORY.—Among prehistoric people inhabiting O. were the mound builders," religious, warlike, and superior to the tribes succeeding them. A large number of their works remain in the form of animal-shaped earthworks, embankments, and sacrificial or sepulchral mounds, as at Newark, Marietta, and Portsmouth, and in these have been found small altars of stone, double hammers, pearl beads, and ornaments or implements of copper and of meteoric iron. The principal Indian tribes of the O. country when it became known to the French were the Miamis, the Wyandots (a branch of the Hurons), the western division of the Shawnee nation, the Senecas, and some scattered bands of Delawares. The Iroquois, or Five Nations, to whom the Senecas belonged, claimed to have subdued all the territory between the Alleghanies and the Mississippi, but the O. Indians repudiated their sway, and had, it appears, regained the lands from which they had once been driven. The treaty of Utrecht admitted the right of Great Britain to call the Iroquois her subjects, and the English based their claim to the n.w. territory on this pretended conquest of the Iroquois, as well as on the charter of James I. to Virginia and of Charles II. to Connecticut. Indeed, their traders had begun to compete with the French in the fur trade of the great lakes as early as 1684.

The French based their claim to the same territory on the discoveries of Joliet, Marquette, and La Salle, though in so far as the Ohio river is concerned there is no conclusive evidence that La Salle ever succeeded in visiting it. Traders established themselves on the Sandusky and Maumee, but no attempt was made to hold the country by colonization, if we except the little settlement at Sandusky; and the building of Fort Cadillac at Detroit in 1701 and the allegiance of most of the Indian tribes between lake Erie and the Ohio river practically gave France control of the debatable ground. Fearing this alliance between the French and the western Indians, the Iroquois, July 19, 1701, ceded the n.w. territory to the English, and again in 1726. Between 1720 and 1730 the Indian population of O. was increased by the arrival of Delawares and Shawnees from eastern Pennsylvania, the Delawares bringing with them some Moravian pastors. Trade between the O. Indians and the English colonies eastward followed, and the efforts of the French to shut out their rivals were impeded by an Indian revolt. In 1749 Maj. De Celoron led an expedition from Canada into O., won over or humbled the Indians, and built a fort on Sandusky bay. In 1753 another force, under the marquis Du Quesne, was sent to drive the English from the Ohio river; Fort Du Quesne was erected where Pittsburg now stands, and consequently O. formed a part of the French territory of Louisiana till 1763.

The conspiracy of Pontiac united the Indians of O., and not until they were defeated at Fort Pitt (Du Quesne) and afterwards forced into a treaty of peace by Col. Boquet's bold invasion of their country, 1764, was the opposition to British rule ended. Settlements beyond the Ohio had been forbidden by royal proclamation, but grants of lands s. of it were obtained by companies formed in Virginia and elsewhere, and the boundary line was ignored by the hunters and traders, who were naturally unwilling to stand by and see the French enriching themselves. In 1774 the "Quebec act" passed the English parliament, making the Mississippi and Ohio rivers the western and s.w. boundaries of Canada. During the American revolution the majority of the Indians sided with the British, but the Delawares were kept in a neutral attitude by the Moravians, who had established villages of Christian Indians on the Muskingum in 1772. These first settlements in O. were broken up in 1780 by base white men and the Indians they had incited; the peaceful missionaries and their converts were driven away, and in 1782, 96 who had returned

to gather the corn left in their fields were massacred by a band of whites. In 1780 two block-houses were built at Cincinnati. In 1782 New York relinquished her charter claim to the n.w. territory; in 1783 Virginia hers, obtaining, however, by compromise, a tract between the Scioto and Little Miami, which obtained the name of the Virginia military district. In 1785 Massachusetts yielded her claims, and in 1786 Connecticut hers, but gained in return for military services, like Virginia, the district known as the Western Reserve (q.v.). In 1785 the public lands w. of the Ohio river were surveyed by congress, and Fort Harmar was erected at the mouth of the Ohio and Muskingum. In 1786, Mar. 6, the "Ohio company of associates" was formed at Boston under direction of Gen. Rufus Putnam, its object being to buy lands for colonization. Other companies were formed, and by the agency of Rev. Manasseh Cutler, about 5,000,000 acres were granted by congress, 1,500,000 of which were secured by the Ohio company.

In 1787, July 13, congress passed the ordinance for "the government of the territory n.w. of the Ohio," a statute known in history as the ordinance of 1787 (q.v.). This provided for the formation of not less than 3 nor more than 5 states out of this immense tract, and forbade slavery and involuntary servitude therein, otherwise than in punishment of crimes. In the winter of 1787–88, 2 companies of pioneers from Massachusetts, under Gen. Putnam, journeyed across the Pennsylvania mountains to the Youghiogheny river, where they built a galley, the *Mayflower*, and embarking, Apr. 1, sailed down the Ohio to the mouth of the Muskingum, where they founded Marietta, Apr. 8. On July 17 the government of the n.w. territory was installed, with Gen. St. Clair as governor; on the 26th, Washington co., comprising nearly half the present state, was established, and on Sept. 2d the first court was held. During 1788 another colony entered, from New Jersey, a large tract between the great and Little Miami rivers having been purchased by a land company headed by John Cleves Symmes. In 1789 their town was laid out; its first name, Losantiville, meaning "the town opposite the mouth of the Licking," soon giving place to that of Cincinnati.

In 1790 Gallipolis was founded by French emigrants, and during that same year the first colony from Virginia came in, and established Massieville, now Manchester. In 1791 an uprising of the Indians occurred, and on Nov. 4 a force under Gen. St. Clair was surprised by them and scattered with great slaughter. Instigated, it is believed, by the British, the savages continued to make trouble till 1794, Aug. 20, when Gen. Wayne defeated them at the battle of Fallen Timbers, and saved O. to the U. S. In 1795 a permanent peace was made, by which about two thirds of the present state was ceded to the whites.

In 1792 500,000 acres in the western part of the Western Reserve were set aside by Connecticut as a compensation to those of her citizens whose property had been destroyed by the British during the revolution. These became known as the "fire lands," or "sufferers' lands." The rest of the tract was sold to the Connecticut land company, and in 1796, July 4, the first settlement, Cleveland, was made. It was the intention to erect the western reserve into a separate state, but in 1800 Connecticut yielded her jurisdiction in favor of congress. Fear of the Indians checked emigration to O., and not until 1799 did the population amount to 5000, the number requisite to the establishment of a legislature. The emigration from New England, Kentucky, and Virginia was supplemented by that of Scotch, Irish, and others of German stock from Pennsylvania. On Sept. 23, 1799, the first legislature met at Cincinnati, and on the 25th chose William Henry Harrison as its delegate to congress. In 1800, May 7, Indiana territory was set off. On April 30, 1802, congress authorized the calling of a convention to establish a state government if deemed expedient. This met at Chillicothe, Nov. 1, and on the 29th adopted a constitution. It was not till Jan. 11, 1803, that elections for officers were held; the first general assembly met on Mar. 1, and on Oct. 17 the states senators and representatives took their seats in congress. Several cities have been the seat of government; Chillicothe, 1800–10; Zanesville, 1810–12; Chillicothe, again, 1812–16; and, since 1816, Columbus. A minor incident in the early history of the state was the so-called conspiracy of Burr and Blennerhasset, the latter's flotilla having been built and equipped at Marietta.

Northwestern O. was the scene of some stirring events during the war of 1812–15, and the young state furnished 3 regiments to aid in carrying it on. In 1813 Gen. Harrison erected Fort Meigs on the Maumee, and held it against two attacks of British and Indians under Gen. Proctor; Maj. Croghan made a brilliant defense of a rude fort on the Sandusky, and Lieut., afterwards Com. Perry, won in Put-in bay his victory over the British fleet.

In 1812 the first steamboat descended the Ohio River; in 1825–33 the Ohio and Erie and Maumee canals were constructed, and in 1842 the first railroad, between Cincinnati and Springfield, was opened. Free schools were established in 1826, and in 1842 the first regularly equipped public astronomical observatory in the U. S. was founded, at Cincinnati. In 1835 a heated but bloodless controversy, known as the Toledo war (q.v.), occurred with Michigan over the boundary line, and involving the ownership of Toledo. The state sent 5536 troops into the Mexican war. On the outbreak of the civil war the senate, with but one dissenting voice, and the legislature unanimously, appropriated $1,000,000 for war purposes. Of 313,180 troops furnished, 5092 were colored, and about 8000 only were drafted. The bounties paid amounted to $23,557,373. Southern O. was much exposed, and Cincinnati, where "southern sympathizers" were numerous, was twice put under

martial law. In 1862 the defeat of Gen. Bragg in Kentucky lessened the danger of invasion, and in 1863 Gen. Morgan, who had invaded O. by way of Indiana, was captured at New Lisbon. A large number of the most successful generals on the union side were from O. O. contests with Virginia for the honor of being called "the mother of presidents," five having been born on her soil.

Topography.—Lake Erie on the n. is 573 ft. above the level of the sea. The Ohio river, which forms the entire s.e. and s. boundary of the state, descends from an elevation of a little less than 1000 ft. where it leaves Pennsylvania and strikes the e. line of O., and falls 600 ft. in the 436 m. of its course around the state to the Indiana line. The drainage divide of the state is about one-third of the distance from the n. to the s., so that about one-third of the state drains into the lake and two-thirds into the Ohio river. The summit level or dividing ridge runs from Trumbull co. in the n.e. to Mercer and Darke cos. in the s.w., with an average altitude of less than 600 ft. above the lake. The state has, therefore, a general plane of descent from the n.e. to s.w.; the exception being the n.w. cos., which rise on a gentle plane of ascent w. from the lake, into which they drain, through the Maumee river. The state has no mountains. Its greatest local elevation is in Logan co., near the middle of the western half of the state, 1337 ft. above the sea. The hilly or rolling surface of a large part of the Ohio river water-shed and the rounded bluffs that margin the large rivers are the remains of the great erosions by water of the original geologic plateaus. The Ohio river has worn its bed in many parts from 500 to 600 ft. below the hilly summits along its valley, and its tributaries have worn similar though less deep valleys. The main streams flowing into lake Erie, beginning at the e., are: the Cuyahoga river, emptying at Cleveland and forming its harbor; the Black river, 30 m. w.; the Vermilion, 12 m. farther; the Huron, 12 m. from it; the Sandusky, emptying into Sandusky bay; the Ottawa, emptying at Port Clinton; and the Maumee into Maumee bay. All of them have harbors at their mouths. Of these lake streams the Maumee drains much the largest country. The rivers flowing into the Ohio are the Muskingum, emptying at Marietta; the Hocking; the Sciota, having Portsmouth at its mouth; the Little Miami, emptying 6 m. above Cincinnati; and the Miami proper, or Big Miami, joining the Ohio about 20 m. below Cincinnati. All these river valleys are beautiful and fertile throughout, but growing richer in soil relatively from the e. westwardly; the two Miamis being the richest valleys on the Ohio slope; and the Maumee, the Portage, and the Sandusky, the streams flowing through the richest soils to the lake. The Ohio river, notwithstanding an average descent of $\frac{71}{100}$ ft. to the m., is navigable its entire distance along the state for steamers of considerable size at high stages of the water, and for barges at all stages. See Ohio River.

Geology and Mineralogy.—The geological structure of the state is simple, and varies little from the horizontal. Its surface is an erosion of the paleozoic system. There is no show of granite at the surface in the state. The carboniferous, Devonian, and Silurian systems form the surface-rock geology of the state. The quaternary or drift deposits cover a large part of the state, the lowest or first of these being the unstratified blue clay known as bowlder clay; the later deposit a laminate clay called by geologists the Erie clay; and above that vegetable deposits of varied character. The formation of the quaternary deposits is believed to have been going on during remote periods, during which not only alterations of the surface of prior formations were going on by elevation and subsidence, but the climate was varying radically at different periods, the region being at one time under glacial action, and at another under a climate warmer than now. The bowlder blue clay is the deposit of the glacial period. The carboniferous system embraces about one-third of the state, beginning near Portsmouth on the Ohio river for its easterly line of outcrop, and taking a n.n.e. direction to near lake Erie; overlying the Devonian system which geologically forms the surface of the n.e. and n.w. portions of the state. The Cuyahoga shales, Berea grit, and other O. sandstones, from near the lake, belong to the Waverly or lowest group of the Devonian stratification. Limestone and conglomerate formations are shown in the outcrops of the w. parts of the state. The whole of the s.e. half is underlaid with the coal-bearing formations; and the geological surveys show seven distinct veins of coal of superior quality for domestic use or for making gas and smelting-iron. The aggregate thickness of the coal beds which are convenient to work upon is about 50 ft. The outcrop of the coal is along the margins of an irregular belt reaching from Mahoning co. in the n.e. to the Ohio river in the s.; the two extremities of the belt being the most prolific in coal easily quarried, and the beds in the Hocking river valley being considered the great vein coal region of O. The e. outcrop of the coal basin is seen along the Ohio river for hundreds of miles, where tunnels on the coal veins are run directly into the hills from the river slope. The most marked feature in the basic geology of O. is what Prof. J. S. Newberry terms the Cincinnati Arch, which he describes as "a great fold of the strata raised at the close of the lower Silurian age, when it formed two islands, one in Tennessee, the other in Kentucky and O., around which the more recent rocks were deposited on a sloping shore. . . . In the coal-measure epoch, the Cincinnati Arch was apparently a land area throughout its entire length, its northern end being then as now its highest portion, and connected with the highlands of Canada," as shown "by the manner in which the coal-measure strata terminate on the western margin of the basin in Knox and Richland cos., where the coal-beds abut against pre-existent Waverly sandstone hills."

AREA AND POPULATION OF OHIO BY COUNTIES.

UNIVERSITY OF ILLINOIS
URBANA

Iron is found in abundance in certain parts of the state, particularly in Perry, Gallia, Licking, Lawrence, Jackson, Vinton, Meigs, Athens, and Hocking cos. Some of the ore is of superior quality and adapted to the finer class of castings. Clay in all its forms is found in large quantities; carbonate of lime, quick-lime, and water-cement are very extensively manufactured. Building stones and grindstones in great quantities are quarried in the northern part of the state. The sandstones w. of Cleveland, n.w. of the coal belt, form a great export of O., and are used in all the cities of the northern states and Canada for elegant buildings; also for grindstones. The coal fields of the state cover an area of 10,000 square miles, and have an annual output of over 13,000,000 short tons. Natural gas is found in the four geological horizons, the Berea grit, the Ohio shale, the Clinton group, and the Trenton limestone. The pressure and amount of production are gradually diminishing, the value of the gas consumed in 1895 being $1,255,700, against $5,215,669 in 1889. The four oil districts, Lima, Eastern, Mecca, and Beldere, yield nearly 20,000,000 barrels per annum, value nearly $17,000,000. Salt, both in rock and solution, yields about 800,000 barrels.

Zoology.—Among animals that have become rare are the gray wolf, prairie wolf, and deer, but the raccoon, opossum, skunk, weasel, woodchuck, rabbit, hare, gray squirrel, flying squirrel, etc., are abundant in many localities. The ornithology is largely that of New York and Pennsylvania, and includes the marsh hawk, goshawk, great horned owl, screech owl, grackle, fox sparrow, goldfinch, song sparrow, meadow lark, quail, and ruffed grouse. The reptiles are those of the Mississippi valley and Pennsylvania. Salmon, trout, whitefish, and muskallonge are found in lake Erie, and among natural and introduced species in the streams and ponds are black bass, pickerel, trout, roach, perch, mullet, and catfish.

Botany.—The forests which formerly almost covered the state have mostly disappeared. There are several species of horse chestnut or buckeye, and from the abundance of this tree, O. derives its popular name of the buckeye state. The oaks include the white, red, black, and burr; there are three species of ash, beech, and maple; 4 species of hickory; the white, slippery, and water elm; 5 species of thorn; red and black cherry; blackwalnut, butternut, sycamore, tulip, pine, hemlock, tamarack, balsam, gum, sassafras, Kentucky coffee tree, dogwood, hornbeam, catalpa, redbud, pawpaw, box elder, and several species of mulberry, locust, and poplar. The Catawba grape is indigenous, and among wild plants are the gentian, columbine, valerian, cohosh, bloodroot, painted cup, mandrake, and snakeroot.

Climate.—Like all the northern United States Ohio has a wide range of temperature, running from a tropical heat during a short summer term to an Arctic cold occasionally in winter. The difference between the n. and s. parts of the state is what would be expected from the difference of latitude and a slight difference in elevation; the n.e. part of the state, which is the highest in latitude and altitude, being the coldest in winter and summer; and the s.w., at Cincinnati, proportionally warmer. The shores of lake Erie are noted for their cooling breezes in July and August; receiving a land breeze in the morning, and a lake breeze in the afternoon. In spring, however, they are visited by winds blowing over ice fields floating down from the upper lakes, which chill the air in April and May, when the interior of the state has the most genial temperature.

The mean temperature of the year at Cleveland is 45·87°; at Toledo, 49·55°; at Massillon, 52·06°; at Portsmouth, 55·83°; at Cincinnati, 51·37°. The mean annual rainfall at these places is respectively, 38.43 inches, 38.64 inches, 32.44 inches, 38.32 inches, and 36.49 inches.

Productions.—There is probably no state of the union with less waste land than Ohio. The broken hills of the s.e., particularly noted for their products of coal and iron, are the least, and the central and w. the most, fertile. Every production of the temperate zone may be cultivated in some portion of the state, and every species of domestic animal is as profitable there as elsewhere. More than a fifth of the entire wool crop of the U. S. was produced in this state in 1870; nearly two-thirds of the flax; and of milk, butter, and cheese, only the state of New York produces more, or exceeds O. in the value of its farms per acre. The n.e. part of the state, known as the Western Reserve, or New Connecticut, is the most noted dairy region; the lake border is the most valued for fruit, especially grapes; the southern part for stock; and the w. and s.w. for corn; yet all portions grow pretty nearly the same crops, with a slight difference of adaptability.

In 1892 there were no less than 10,000,000 acres of tilled land in Ohio. The annual production of wheat is 22,000,000 bushels; of oats, 33,000,000; of potatoes, 17,000,000; of rye, 500,000; of buckwheat, 250,000; and of hay, 2,500,000 tons. Greater than all is the yield of corn, which reaches the enormous figure of 124,000,000 bushels. Other products that deserve especial notice are maple-sugar, with an annual amount of 3,000,000 pounds; honey, 2,500,000 pounds; and maple syrup, 600,000 gallons. There are, in the state, some 500,000 acres of orchards. Catawba grapes were introduced about the year 1835 by Nicholas Longworth, and now in the vicinity of Lake Erie there are several thousands of acres of vineyards, producing annually 2,500,000 gallons of wine and 30,000,000 pounds of grapes. Among small fruits, the strawberry is especially valuable in Ohio, and in a single year 400,000 bushels of berries have been sold. The live stock in the state was, in 1896, valued at about $80,000,000. Ohio sheep yield a fine quality of wool, reaching over 14,000,000 pounds yearly.

The fisheries of the state produce an important element of its commerce. Those conducted on a considerable scale are at the west end of Lake Erie, between the islands and the mainland for whitefish, and in the Sandusky and Maumee bays and their tributaries for pickerel, bass, mullett, catfish, and muscallonge. The annual output from the fisheries of the lake and its rivers exceeds $1,500,000 of value. They are packed principally at Toledo and Sandusky for export, and are consumed in the interior.

MANUFACTURES.—In 1890, Ohio ranked fifth among the states in the capital employed in manufacturing and in the value of manufactured products, second to Michigan in the value of woodenware, and first in the making of agricultural instruments, more than one-fourth of those used in America being made in Springfield, Columbus, Akron, and Canton. The manufacture of iron and steel is the most important industry; Ohio ranks next to Pennsylvania, and the annual output reaches over $57,000,000, and employs over 21,000 persons. About one-third of this iron industry is located in Cuyahoga county, Cleveland alone having one hundred and fifty iron and steel works; its rolling mills employ five thousand men, and its Bessemer steel furnaces annually produce one hundred thousand tons of rails. Among the specialties manufactured here from steel may be noticed astronomical telescopes and domes. The equatorial telescope mountings for the large telescope in Lick Observatory, in California, came from Cleveland, and among the steel observatory domes recently cast were two for the new Naval Observatory in Washington, D. C. Many varieties of labor-saving machines are also manufactured in Cleveland, such as automatic dumping buckets, furnace hoists for charging furnaces and kilns, cantilever derricks, and cranes for ship-builders' use in the construction of armored vessels and iron boats. The largest factory in the world for the manufacture of the carbons used in electric lighting is located here. These carbons are made of lamp-black, packed closely in molds and baked. Those used for the Statue of Liberty in New York Harbor are made here, and are of extra size. There are twenty oil works, chief of which are those of the Standard Oil company, employing three thousand men and a capital of $1,000,000. Cincinnati numbers among its numerous industries the largest safe, vault, and lock manufactory in the world. The production includes the most thoroughly constructed fire and burglar-proof safes, tank and safe deposit vaults, and every variety of complicated combination and time locks. The works cover over eight acres of floor space, and employ a capital of over $350,000. The largest cooperage works in the world are in this city, where thousands of the finest white oak packages for beer, wine, whisky, etc., are turned out daily. The works cover ten acres, and employ a capital of over $1,000,000. Another special manufacture is machinery of all sorts for reducing iron and lumber to the various forms in which they are needed for use in the arts. One firm alone makes over three hundred varieties of machines for wood reduction. The annual value of the iron products of this city is over $15,000,000, and the annual value of all its industries is over $200,000,000. Columbus has numerous factories for making steel scrapus and steam shovels; steel stamped or drawn articles, made by drawing a sheet of metal into any required shape, in place of the former method of cutting and riveting; express wagons, trucks, baggage and wheelbarrows, and one of the largest buggy and carriage trades in America. Springfield has immense factories for mowers and reapers, also the largest factory for grain drills and machines for sowing broadcast in the world. The works occupy about twenty acres, and have a floor space of over five acres. Dayton has a great variety of manufactures, among which may be noticed the great car works established in 1849, covering thirty acres and employing eighteen hundred men, and one of the largest car works in the world. Akron has the largest manufactory for matches in America. It was established in 1847, and now has a capital of $6,000,000, and a daily capacity of about seven thousand gross. The same corporation has factories in Boston, St. Louis, Detroit, and several other places. It is estimated that over six million gross of matches are used annually in this country alone, and twenty-seven million feet of pine lumber are consumed in their manufacture. Immense quantities of stone and earthen ware are made in the vicinity of Akron, of which this state produces one-third of the entire American supply, amounting to $1,000,000,000 annually. Findlay and East Liverpool make large quantities of green and window glass and glassware; Hamilton has extensive works for the manufacture of iron and metal power-cutting and punching—over three hundred varieties of shears and punches are made; Toledo, Zanesville, Canton, Lima, Youngstown, and Chillicothe are all noted for their many factories. The U. S. census of 1890 reported the total manufacturing establishments of Ohio at 28,673, employing $402,793,019 capital and 331,548 persons, paying $158,768,883 for wages and $341,016,464 for materials, and having an output valued at $641,688,064. After iron and steel, the most important industries, according to value of output, were foundry and machine shop products, flour and grist mill products, clothing, lumber and planing mill products, slaughtering and meat packing, malt liquors, petroleum refining, distilled liquors, and furniture. Reports since those of the census show nearly 1,000 clay-working plants, yielding common and pressed brick, $2,405,000; fire brick, $700,000; vitrified paving brick, $800,000; sewer pipe, $1,750,000; drain tile, $890,000; other tile, $800,000; and total products, over $10,500,000.

COMMERCE.—Ohio has three United States custom districts, of which the ports of entry are Toledo, Sandusky, and Cleveland, and Cincinnati is a port of entry in the

district of Louisiana for the state of Ohio. These customs ports represent only the foreign imports and exports, which the position of Ohio on the lakes, adjoining Canada, and in communication with ocean commerce through the Canadian canals and the St. Lawrence, enables her merchants to make direct to and from foreign countries. The same may be said of Cincinnati, though its foreign trade must be done much more indirectly through the Ohio and Mississippi rivers. The foreign commerce of Ohio is, however, insignificant compared with the vast domestic commerce east, west, north, and south, along her lakes, railways, canals, and great river. Lake Erie is still the greatest single highway of commerce for the state, and the government has improved several of its harbors, especially those of Cleveland and Sandusky, until they are the finest in the state. Sandusky Bay extends inland about eighteen miles, and admits the largest lake vessels to wharf. This is one of the largest fresh-water fish markets in America, its annual trade in fish alone amounting to over twelve thousand tons, valued at $1,500,000. Its annual export of native wines is over one million gallons; of lime from the Marblehead quarries, five hundred thousand barrels; of plaster from the adjacent gypsum beds, over sixty thousand barrels. Cleveland has an annual coal-trade of over $1,000,000. Immense quantities of lumber and iron ore are also brought from the Lake Superior region to her ship yards and furnaces. Toledo, five miles above the mouth of the Maumee, has an immense trade in coal, iron ore, lumber and grain.

Formerly the canals were expected to be second only to the lake and the Ohio River in volume of commerce, but the railways have far surpassed them in carrying facilities, so that the great value of the former is now to secure low rates on the railways by their always cheaper, though slower, transportation. The canals now operated comprise the Ohio canal, completed in 1835, extending from Cleveland to Portsmouth, 309 miles long, cost for construction and improvements $4,695,204; the Miami and Erie canal, completed in 1835, extending from Cincinnati to Toledo, 250 miles long, cost $8,062,680; the Hocking canal, a branch of the Ohio, completed in 1843, extending from Carroll to Nelsonville, 42 miles long, cost $975,481; and the Walhonding canal, completed in 1843, extending from Rochester to Roscoe, 25 miles long, cost $607,269. There is also a large mileage of artificial feeders and slack water navigation.

Railroads.—The first railroad in the state was one from Springfield to Sandusky, begun in 1835, and there are now nearly 9,000 miles of main track and over 13,500 miles of main, secondary, and siding tracks. The local and through trunk lines have a capital of over $523,000,000, and funded debt of over $500,000,000; cost for roads and equipments about $1,040,000,000, and have net earnings of over $32,000,000. The state is traversed by five great trunk systems, the Baltimore and Ohio, the Pennsylvania, the Lake Shore and Michigan Southern, the New York, Lake Erie, and Western, and the New York, Chicago, and St. Louis. Other large systems are the Cleveland, Cincinnati, Chicago, and St. Louis, the Columbus, Hocking Valley, and Toledo, the Cincinnati, Hamilton and Dayton, the Columbus, Sandusky and Hocking, and the Norfolk and Western. The traffic over these routes is enormous.

Banks.—In 1896 there were 248 national banks in operation with combined capital of $45,680,100, deposits $97,520,670, and reserve $28,836,528; 123 state banks, with capital $9,984,325, deposits $38,341,722, and resources $52,416,052; 4 mutual savings banks with deposits $25,406,430, resources $27,827,222; 7 stock savings banks with capital $1,799,450, deposits $8,458,193, resources, $12,098,543; and 59 private banks, with capital $1,603,275, deposits $5,196,407, and resources $7,422,012.

Statistics of Crime.—In 1896 there were 9,593 native-born prisoners in jails, and 1,299 set down as foreign-born or unknown. The statistics of crimes against the person and crimes against property show the usual marked excess of the latter. Crimes against the person numbered 909, and crimes against property numbered 3,083, according to the list of prosecutions, but the total number of convictions for both these classes of offences was 1526. There were 2,331 prosecutions for crimes against public peace, etc., and 950 convictions. In the same year 2,973 divorce suits were granted, and, at the close, there were pending 3,163 suits.

Education.—The total expenditures for school purposes in Ohio are over $12,000,000. One mill on the dollar constitutes the state tax for the educational fund. The number of public schools exceeds 13,000, and the number of pupils enrolled in them 800,000. Education is compulsory, but the law is not strictly enforced. There are a number of private and municipal normal schools, the principal one being at Lebanon. The state has a school fund, derived chiefly from public lands, and yielding over $200,000 per annum, and public school property valued at $40,000,000. The oldest college in the state is the Ohio University at Athens. In 1787 the Ohio company set apart for its use the proceeds of two townships of land. The school was organized in 1804 and is the oldest institution of learning northwest of the Ohio river. Other old colleges are Miami university, founded at Oxford in 1809; Kenyon at Gambier 1827; Western Reserve, founded in Hudson in 1826, was removed to Cleveland in 1882, liberally endowed by a wealthy citizen, and re-chartered as Western Reserve university. Oberlin college, founded in 1834, was one of the first colleges in the Union to recognize the claims of women to higher education, and the first to open its doors to the colored race. Nearly all the universities and colleges have scientific departments. The State university and Agricultural and Mechanical college at Columbus was founded in 1870, with a state endowment of $700,000; has buildings and grounds that cost $300,000; an income of $30,000 from its endowments; and is, in these respects, the strongest based institution in the state. The chief law school was founded in Cincinnati in 1833. There are numerous theological seminaries, medical colleges, and schools of design.

Libraries.—In 1853 a general school law was passed to raise a fund by a tax of one-tenth of a mill on the dollar yearly "for the purpose of furnishing school libraries and apparatus to all the common schools of the state." Within three years thereafter, 332,579 volumes were placed in the school libraries. The law was suspended in 1857–58, and the libraries were suffered to go down by negligence. In 1860 the law was re-enacted, and in 1865, 350,000 volumes were in the common school libraries. But the system was too attenuated. The small and poor districts had not sufficient funds to maintain continuous care of a library, so that books became scattered and lost almost as fast as fresh purchases were made. The small local school libraries have since been turned over to town library associations, under a general law passed in 1867. A law of Feb., 1868, authorized the city councils of any city of the second class to levy a tax, not exceeding one-half of a mill on the dollar, "for a free public library and reading-room, providing suitable accommodations are furnished without expense to the city." Under the action of this benign law noble public libraries are maintained in every large city, and smaller ones of great value in all small towns; and a local pride and public spirit is stimulated to promote their growth by private donations of every kind, to render them more creditable to the town which supports them. The Free Public Library of Cincinnati is probably the largest library ever created from a public fund derived from annual taxation. The library building was begun in 1868, partially occupied with about 31,000 volumes in 1870, and finished and dedicated Feb., 1874. It was at that time the finest library building in America, having a shelf capacity of 250,000 volumes. It opened with 70,000 volumes, and by June 30, 1880, by purchase and donations, the number had swelled to about 121,651 volumes. The number of readers in attendance on Sundays then averaged 1000. The annual income at the same time was $20,000, and increasing with the growth of the city. The creation of this public library at Cincinnati is a sample of the ambitious and successful development of smaller public libraries all over the state.

Publications.—The oldest newspaper in the state is the *Gazette*, founded in Cincinnati in 1793, and after it the *Gazette* of Chillicothe, established in 1800. The *Cincinnati Enquirer* is another of the first papers established in the state. In 1896 the total number of publications was 1,144.

Religious Organizations.—The Roman Catholic denomination is the strongest numerically, and after it the Methodist Episcopal, Presbyterian, Baptist, Disciples and United Brethren. The U. S. census showed 8,857 church edifices, 582 religious halls, 1,215,409 communicants, and church property valued at $42,138,862.

Public Charities.—Among the many noble public institutions are hospitals for the insane at Athens, Cleveland, Columbus, Dayton, Massillon, and Toledo; hospital for epileptics at Gallipolis; state reformatory at Mansfield; Boys' industrial school at Lancaster, Girls' industrial school at Delaware; institutions for the deaf and dumb, the blind, and the feeble-minded, all at Columbus; Soldiers' and Sailors' home at Sandusky; and the Soldiers' and Sailors' orphans' home at Xenia. There are also an oral and a public school for the deaf at Cincinnati, a day school for the deaf at Cleveland, and the Notre Dame school for the deaf at Cincinnati. The state contributes to the support of the hospital for the colored insane at Longview. Other institutions are the state penitentiary at Columbus, 8 workhouses in various parts of the state, 46 homes for children, and a public infirmary in every county. All the charitable and reformatory institutions of the state are under the supervision of the state board of charities and correction, of six members, appointed by the governor.

Government.—The capital is Columbus. The constitution of 1851, with some amendments, and the laws passed under it, are now codified and published. The conditions of suffrage are: to be a male, 21 years of age, native or naturalized, to be a resident one year in the state, 30 days in the county, and 20 days in the township, village, ward, or precinct, preceding the election. The first Tuesday after the first Monday in November is election day. The legislature consists nominally of a senate of 35 members and a house of representatives of 100 members; but actually (1897) of a senate of 37 members and a house of 112. All members are elected for two years and receive $600 per annum. The legislature meets in regular session biennially in even-numbered years and by adjournments also holds sessions in the intermediate years. The number of senators and representatives is determined biennially. An illustration of the activity of the legislature is afforded by the fact that in the session beginning Jan. 6th, and closing April 27th, 1896, there were passed 387 local laws, 316 general laws, and 75 joint resolutions. The general laws included some important statutes, as for instance, the creation of a state board of medical registration and qualification; the increase of the tax upon traffic in intoxicating liquors; provisions for the prevention of corruption at election, and in limitation of the expenditures of candidates; important amendments of the school laws; the establishment of execution by electricity for death sentence; the rendering of Saturday afternoon a legal holiday in municipalities or cities containing 50,000 or more inhabitants, and the introduction of the Torrens system of land title. The terms of the governor, lieutenant-governor, secretary of state, state treasurer, comptroller, and attorney-general are two years; that of the auditor four years; and those of the school commissioner and the board of public works, three years. The commissioner of railroads and telegraphs, superintendent of insurance, supervisor of public printing, gas commissioner, and state and law librarians, are appointed by the governor. The state board of agriculture consists of 10 members, five of whom are chosen annually for two years at a convention composed of the presidents of the county agricultural societies.

The National Guard of the state has an authorized strength of 9,460 officers and men, and an actual strength of 5,492. The state owns no permanent camp ground, but annual encampments are held in different localities, sometimes in sections, and sometimes the entire Guard. The total available force of the state in time of war is 650,000.

The registration of voters is required in this state in cities of not less than nine thousand inhabitants. New ballot laws, based on the Australian system, were adopted in 1891. The legal rate of interest is six per cent. but eight per cent. is allowed by contract. A judgment becomes dormant in five years, but may be revived; notes outlaw in fifteen years, and open accounts in six years. Wilful absence or habitual drunkenness for three years, extreme cruelty, imprisonment in penitentiary, divorce procured by either party in another state, are some of the chief causes for divorce. Residence required, one year.

FINANCES.—The state debt (funded) for the year ending Nov. 15, 1896, was $1,541,665, all out at 3 per cent.; state receipts, $7,126,385: expenditures, $6,601,260; total assessed valuation, $1,741,028,437.

JUDICIARY.—The judicial power of the state is vested in a supreme court, in circuit courts, courts of common pleas, courts of probate, justices of the peace, and such other courts inferior to the supreme court as the general assembly may from time to time establish. The supreme court consists of six judges, a majority of whom are necessary to form a quorum or to pronounce a decision. It has jurisdiction in *quo warranto*, *mandamus*, *habeas corpus*, and *procedendo*, and such appellate jurisdiction as may be provided by law. It must hold at least one term a year at the capital, and elsewhere as may be required by law. Supreme judges are elected for six years at general elections, one each year, and the judge having the shortest time to serve is the chief-justice for the year. The state is divided into eight circuits, with three judges in each, chosen, one every two years, for terms of six years. Courts must be held at least once a year in every county in the circuit, and two or more judges may hold court in a county at the same time, taking cases alternately on the docket in their order. The state is also divided into ten common pleas districts, nine of which are subdivided into three areas each, with one judge in each subdivision or more as the legislature may from time to time determine. All common pleas judges are elected for terms of five years. A probate judge is elected for three years by each county. The probate court has jurisdiction in probate and testamentary matters, the appointment of administrators and guardians, the settlement of their accounts and those of executors, and the power to limit and authorize their action. It is empowered also to try municipal cases involving the awards of damages for the condemnation of private property for public use, is a court of record, and has the issuing and record of marriage licenses.

The electoral votes have been cast as follows: 1804, Jefferson and Clinton, 3; 1808, Madison and Clinton, 3; 1812, Madison and Gerry, 7; 1816, Monroe and Tompkins, 8; 1820, Monroe and Tompkins, 8; 1824, Clay and Sanford, 16; 1828, Jackson and Calhoun, 16; 1832, Jackson and Van Buren, 21; 1836, Harrison and Granger, 21; 1840, Harrison and Tyler, 21; 1844, Clay and Frelinghuysen, 23; 1848, Cass and Butler, 23; 1852, Pierce and King, 23; 1856, Fremont and Dayton, 23; 1860, Lincoln and Hamlin, 23; 1864, Lincoln and Johnson, 21; 1868, Grant and Colfax, 21; 1872, Grant and Wilson, 22; 1876, Hayes and Wheeler, 22; 1880, Garfield and Arthur, 22; 1884, Blaine and Logan, 23; 1888, Harrison and Morton, 23; 1892, Harrison and Reid, 22; Cleveland and Stevenson, 1; 1896, McKinley and Hobart, 23.

POPULATION.—In 1800, 45,365; 1820, 581,295; 1840, 1,519,467; 1860, 2,339,511; 1880, 3,198,062—79,895 colored; foreign born, 386,009, including 192,597 from Germany, 143,267 from Great Britain and Ireland; males, 1,613,936; females, 1,584,126; dwellings, 586,604; families, 641,907; persons to sq. m., 7846; engaged in agriculture, 397,495. Pop. '90, 3,672,316. There are 88 cos.; for pop. '90, see Census Tables, Vol. XV. The largest cities, 1890, were Cincinnati, 296,908; Cleveland, 261,353; Columbus, 88,150; Toledo, 81,434; Dayton, 61,220; Youngstown, 33,220; Springfield, 31,895; Akron, 27,601; Zanesville, 21,009; Sandusky, 18,471. See Drake, *The Making of the Ohio Valley* (1894).

OHIO, a co. in s. e. Indiana, adjoining Kentucky; bounded on the e. by the Ohio, on the n.w. by Laughery creek: 90 sq. m.; pop. '90, 4953, chiefly of American birth. The surface is uneven and hilly, and the soil fertile. The principal productions are corn, wheat, barley, oats, and potatoes. Co. seat, Rising Sun.

OHIO, a co. in w. Kentucky, bounded on the s.w. by Green River, watered by Rough Creek; on the Paducah and Elizabethtown railroad; 610 sq.m.; pop. '90, 22,946, inclu. colored. The surface is rolling and well-wooded, and contains coal and iron. The soil is fertile, and the principal productions are corn, tobacco, wheat, potatoes, wool, and hay. Co. seat, Hartford.

OHIO, a co. in n.w. West Virginia, adjoining Pennsylvania, bounded on the w. by the Ohio, intersected by Wheeling creek; on the Baltimore and Ohio railroad; 120 sq.m.; pop. '90, 41,557, with colored. The surface is uneven and hilly, and contains deposits of bituminous coal. The soil is fertile, and produces good crops of corn, wheat, hay, and oats. There are many iron manufactories. Co. seat, Wheeling.

OHIO RIVER, a river of the U. S., and one of the three great affluents of the Mississippi, ranking in length and volume next to the Arkansas. The distance from where the

Ohio begins by the confluence of the Alleghany and Monongahela at Pittsburg to its mouth is 975 m. ; but the entire length of the river should include the whole length of the Alleghany, the longest of its river sources, which is not less than 300 m. more. According to tradition, which is disputed by some, the river was discovered by de la Salle in 1669–70. He had for years been gathering information concerning it from the Iroquois who visited his seignory at La Chine above Montreal, and finally reached its source by the way of Niagara and up Cattaraugus creek; from which his Indian guide is supposed to have led him to French creek, one of the w. sources of the Alleghany, and only 14 m. from lake Erie. It is supposed that his canoes were carried from Cattaraugus creek over to French creek, though it is possible that the portage may have been made from the upper waters of the Genesee river. With canoes launched in autumn on the stream of the Alleghany the discovery of the Ohio followed naturally, and was arrested only by the falls where Louisville now stands. There La Salle turned back, still undecided whether the stream emptied into the gulf of Mexico or into the Pacific ocean, but inclining to the latter opinion. It must have been from the time of this voyage that the river acquired the title of *la belle rivière*—the beautiful river, which it was subsequently called by the French. The source of the Alleghany is in the center of Potter co., Penn., the middle of the n. tier of counties, where the table-lands receive the rainfalls which hesitate which way to flow—whether to join the waters of the St. Lawrence, or to seek the valley that leads them to the gulf of Mexico. See ALLEGHANY RIVER. The junction of the Monongahela at Pittsburg forms the Ohio. These rivers, rising one n. and the other s. in the Alleghany range, meet in the heart of wooded hills like those through which they have flowed, and the Ohio for 500 m. of its course below, plows its way through a valley deepening and widening as it goes till the rounded hills along this part merge into the rolling prairies of southern Indiana and Illinois, and disappear in the lowlands below the junction of the Wabash. Its entire valley has been eroded by the action of the water, and though everywhere beautiful in a state of nature, is nowhere picturesque or wild. The geologic formations along its entire line are nearly level and little disturbed by any violent convulsion. The area of its drainage is 214,000 sq. m.; embracing a small part of the state of N. Y., one-third of Pennsylvania, two-thirds of Ohio, all of West Virginia, Kentucky, and Tennessee, small portions of North Carolina, Georgia, Alabama, and Mississippi, two-thirds of Indiana, and the s.e. part of Illinois. In this area are included the great valleys of the Tennessee and Cumberland rivers, which join the Ohio only near its mouth. The shores through much of the upper half of the river present a series of plateaus and broken bluffs that indicate successive wearings below the plane of its former flow, and exhibit a broad valley from 5 to 10 m. in width between its bounding hills. The immediate shores at ordinary stages of the water are cut through alluvium generally, with the marks of recent wearing of water and caving of banks. From Pittsburg to Portsmouth the adjacent hills are mined for coal or iron in many places, and the loading of both into barges in the river is done to an unusual extent by those who own both mines and boats and market their own productions. The s.e. part of Ohio as well as w. of Pennsylvania is a landscape spotted with the smoke of furnaces for the manufacture of iron. Among the abrupt hills below Pittsburg the river is only 1000 ft. wide at low water, and 1200 at high water. It widens gradually below and its high stages frequently cover a vast extent of bottom lands. The range between its high and low stages of water is very great, 60 ft. being the greatest difference, and 30 ft. the mean difference. The navigation below Louisville is good for large steamers at all seasons, and is usually maintained for most of the summer up to Wheeling, and in good stages of water up to Pittsburg; but is often too low in summer to permit the "down river boats" to make their trips up to Cincinnati. For rafting and for coal and iron barges it is good at all seasons. At Louisville are the only rapids. These fall 22½ ft. in 2 m., and are passed by means of a ship canal with locks for the largest river steamers, and affording an abundant water-power. The immense passenger travel formerly by river steamers has largely been transferred to the railways. The rate of the current varies from one to three m. an hour, depending on the volume. The rivers which flow to the Ohio from the n. are the Alleghany, Muskingum, Hocking, Sciota, Big and Little Miamis, and the Wabash; from the s. the Monongahela, Little Kanawha, Great Kanawha, Sandy, Licking, Kentucky, Green, Cumberland, and Tennessee. The principal cities and towns upon its banks are Pittsburg, Wheeling, Elizabethtown, Marietta, Parkersburg, Pomeroy, Gallipolis, Ironton, Portsmouth, Cincinnati, Covington, Newport, Laurenceburg, Madison, Louisville, New Albany, Leavenworth, Evansville, Paducah, and Cairo at its mouth where it joins the Mississippi.

OHIO STATE UNIVERSITY, at Columbus, O., having 337 acres in the city and 8 buildings valued at $375,000, and a library of 20,000 vols. It has a total income of $156,684.75. It confers degrees in law, arts, philosophy, science, agriculture, civil, mining and electrical engineering, pharmacy and veterinary surgery, and gives military instruction. A school of manual training was opened in 1893. In 1896 the university had a faculty of 79, and 969 students. Pres. J. H. Canfield, LL.D., M.A.

OHIO WESLEYAN UNIVERSITY, at Delaware, Delaware co., Ohio. Was founded in 1844, under the auspices of the Methodist Episcopal church in Ohio. In 1877 the Ohio Wesleyan Female college, founded in 1853, was united with the university. Its building is now known as the Monnett hall of the university, and is the home of the female students. The value of buildings, grounds and productive endowment is now more

than $1,000,000, and its annual income is over $90,000. The original campus contains 30 acres of ground and has on it 5 large buildings. One of these, University hall, is one of the largest college buildings in the United States and contains Gray chapel, with a seating capacity of more than 2500. The new Slocum library is an elegant stone structure with a capacity of over 100,000 volumes. About half a mile from the main campus are situated the Monnett hall campus of 10 acres, and the Observatory park of 7 acres. The university possesses finely lighted and equipped chemical, physical, biological, and physiological laboratories. The cabinet rooms are ample and admirably arranged. The collection contains about 100,000 specimens. In the departments of conchology and Ohio geology the series are quite complete. In 1896 the number of professors and regular instructors was 54. The faculty of arts is very thoroughly organized, and there are an important biblical course, and a full scientific course. The number of students in the catalogue of 1896 was 1271, of whom 728 were male, and 543 were female. There is likewise a conservatory of music well equipped with an enrollment of 151 students. The university maintains a preparatory department with a three years' course of study, and most of the college students are here prepared. The college classes number 513, the preparatory, including the commercial students, 525. President, Rev. Jas. W. Bashford, D.D.

OHLAU, OLAU, or OLAWA, a t. of Prussian Silesia, 17 m. s.e. from Breslau, on the Oder. Ohlau, which is on the railway between Breslau and Vienna, is an ancient town, with a royal palace and an old castle. At the present day, it is a place of considerable industrial activity. Being the capital of a circle, it has numerous district courts and offices. Pop. '85, 8575.

OHM, unit of resistance. See GALVANIC BATTERY: ELECTRICITY.

OHM, GEORG SIMON, 1787–1854; b. Germany; educated at Erlangen. After giving mathematical instruction in a number of places, he was called, in 1817, to a chair in the Jesuit college at Cologne, and the next year published an elementary treatise on geometry. He made a study of the laws of galvanic currents and finally discovered the theorem called "Ohm's law," upon which the mathematical theory of electricity is founded. An exposition of this theory is contained in *The Galvanic Chain, Mathematically worked out* (1827). Among his other works are: *Molecular Physics* (1849), and *Principles of Physics* (1854). He left his professorship at Cologne in 1826, was director of the Nuremberg polytechnic school 1833–49, and was then called to the chair of physics at Munich.

OĬDIUM, an important genus of minute fungi of the section *Hyphomycetes*, growing on diseased animal and vegetable substances. They consist of minute tubular threads, forming flocks, white in some species, brightly colored in others, simple or irregularly branched, assuming in their upper part the form of strings of beads, which finally break up into elliptic spores. The species actually existing are probably much more numerous than those which have been fully ascertained. Among the most important of the vegetable parasites of man is *O. albicans*, which is found on the epithelium in the mouth and throat in the disease called *aphthæ*, or thrush, and on that of the throat in diphtheria, also sometimes in the nostrils, stomach, and intestines, on the nails, the nipples, and other places. It is more common in children and in aged persons, than in those who are in the prime of life. It occurs frequently in the last stages of many diseases, when the mucous membrane is covered with nitrogenous decomposable matter. Indeed, it would seem that whatever may be the case as to other vegetable parasites, no species of Oïdium begins its attack upon a perfectly healthy surface, either animal or vegetable; a diseased state of the tissue being to these fungi a necessary condition of vegetation "just as the yeast-plant will not vegetate save in a fermentable fluid, that is, in a solution which, in addition to sugar, contains some decomposable albuminous matter." *O. albicans* appears to the naked eye as a white pasty substance, slightly elevated above the mucous membrane to which it adheres; but under the microscope, its filamentous structure is easily perceived. Its seat is at first on the upper surface of the epithelial cells, but its filaments soon penetrate deeply between them, and the upper epithelial layers are soon worn out, and thrown off by the rapid growth from below. However incapable the *O. albicans* may be of attacking a healthy surface, there can be no doubt that it greatly contributes to the extension of disease, and that it is very readily communicated from one patient to another when there is catarrh or other inflammatory affection of the mucous membrane.

Another species of oïdium which has attracted great attention is *O. Tuckeri*, regarded by many as producing the grape disease, which, several years ago, injured the vineyards of many parts of the world, but in accordance with the views already expressed, perhaps rather to be regarded as merely accompanying and extending the disease. It may probably be the case that over-cultivation of particular varieties of grape, and too long continued cultivation on the same ground, have so impaired the vigor and healthfulness of the plants as to make them liable to the attacks of this parasite. *O. Tuckeri* makes its appearance at first in the form of a *mycelium* of webby, creeping, branching filaments, which send out upright or decumbent jointed stems. The bead-like joints of the stems become successively filled with spores, which are finally discharged in little clouds for the multiplication of the species. The grape disease was first observed in Kent, England, in the spring of 1845, on vines in the vinery of Mr. Tucker. The ends of the

young shoots assumed a crispy appearance, began to wither, and then dried up. The unripe grapes were next attacked, becoming covered with a grayish-white bloom, the skin of the grapes being destroyed, and they rotted and dried up. The disease rapidly spread over other English vineries; was observed about the same time in the vineries of Paris, and soon in the vineyards of almost all parts of France, Italy, Greece, Tyrol, and Hungary; finally, and in a slighter degree, affecting the vineyards of the Rhine. Its ravages extended to Algeria, Syria, Asia Minor, and many other countries, among which is particularly to be noticed the island of Madeira, where it proved almost completely destructive to the grapes, and nearly put an end to the production of the celebrated Madeira wine. The importation of Madeira wine to Britain in 1831 amounted to 209,127 gallons; and in 1861 only to 28,749 gallons. It is probable that the complete isolation of the Madeira vineyards made the progress of the disease more rapid, and its results more complete than elsewhere, by causing a prevalence of the conditions favorable for it. No kind of vine escaped. The grape disease is first perceived in the leaves, which become whitish, in consequence of a mycelium spreading over the upper surface of the leaf. The leaves sometimes curl up, or they become black at the center, the blackness extending towards the circumference, and finally they drop off. The plant, through loss of its leaves, now becomes more unhealthy; the shoots are attacked by the disease, the stalks of the bunches of grapes, and the grapes themselves. The parasite penetrates into the young wood, the shoots are covered with spots and blotches of a reddish-brown, or even black color, and look as if a red-hot iron had been applied to them. Sometimes they secrete a clammy inodorous fluid all over their surface; and in many cases they wither from the top down half their length. The affected grapes very often first exhibit the disease in a single whitish spot on a single grape of a bunch, which enlarges by radiating irregularly. If in a bunch there is one abortive grape, it often shows signs of the disease, whilst the rest remain free. The creeping branches of the mycelium are fixed upon the skin of the grape by rootlets, which do not penetrate into the juicy pulp. The mycelium sends up vertical fertile branches of nearly equal height, densely aggregated, and forming a velvet-like mass. The extremities of these become beaded; and at last the uppermost cell or bead increases in volume, becomes detached, and is carried off by some slight breath of air, to multiply the species by the dispersion of its spores. The other bead-like cells follow in succession.

Various means were resorted to for the prevention and cure of the grape disease. The application of pulverized sulphur was found useful, the fungus withering and drying up when brought into contact with a minute particle of sulphur. The application of sulphur must be frequent, as portions of the mycelium and some of the spores always escape. The use of sulphur was the chief means of checking the spread of oïdium in French and European vineyards; it became general in the south of France and in Italy; and in consequence of its national importance, the duty on sulphur was reduced by the French government. Hydrosulphide of lime was also applied to vines with very beneficial effect. It is prepared by thoroughly mixing 68 ounces of flowers of sulphur with the same quantity of slaked lime, adding three or four quarts of water, boiling for about ten minutes, allowing it to settle, and decanting the clear liquor. When it is to be used, one quart is mixed with 100 quarts of water, and it is poured over the vines.

OIL-CAKE, the cake which remains in the press when seeds are crushed to express the oil which they contain. Oil-cake still retains a portion of the oil of the seed, along with almost all its other constituents, and is valuable either for feeding cattle or for manure. *Linseed-cake* is so much more largely used in Britain than any other kind that the name oil-cake is in general exclusively appropriated to it, the other kinds being known as *rape-cake*, *poppy-cake*, *hemp-cake*, *colza-cake*, etc., according to the plant from the seed of which they are produced. The use of oil-cake for feeding cattle has very much increased of late years, and it is an article of commercial importance. Large quantities are imported into Britain from different parts of the continent of Europe, and from North America. But *English linseed-cake*—cake made at oil-mills in England, mostly from imported seed—is preferred to any other, because heat not being so freely applied during the expression of the oil, more oil is left in the cake, and also because foreign cake often suffers from dampness both before and during the sea passage. Besides the oil which remains in it, linseed-cake contains from 24 to 33 per cent of nitrogenous substances or protein compounds, which make it very valuable both for feeding cattle and for manure. The value of linseed-cake for feeding is greater than that of any kind of grain or pulse.—*Rape-cake* is, next to linseed-cake, the kind of oil-cake best known in Britain. It is much cheaper than linseed-cake, but is not relished by cattle, having a hot taste, and a tendency to become rancid. Sheep, however, eat it readily, and it is often employed for fattening them. It is often also ground to a coarse powder (*rape-dust*), and used as a manure. Its fertilizing power is great, and it is used by the Flemish farmers as guano now is by those of Britain.—*Cotton seed-cake* is much used as a manure in some parts of North America.—*Cocoa-nut-cake* is used in the south of India, both for feeding cattle and for manure.—Other kinds of cake are noticed, if sufficiently important, under the plants from which they are derived. Their properties are generally similar to those of linseed-cake, although the pungency of some, as *mustard-cake*, renders them unsuitable for feeding cattle. See Oils.

OIL CITY, a city in Venango co., Pa.; at the confluence of the Allegheny river and Oil creek, and on the Allegheny Valley, the Erie, the Lake Shore and Michigan Southern, and the Western New York and Pennsylvania railroads; 132 miles n. of Pittsburg. It was founded in 1860, incorporated as a borough in 1862, and chartered as a city in 1870; is the center of the great petroleum belt, and is principally engaged in refining and shipping oil. There are national, state, and private banks, electric lights, electric street railroads, daily and weekly newspapers, high school, iron foundries, and boiler and engine works. Pop. '90, 10,932.

OIL-CLOTH. See FLOOR-CLOTH.

OIL-FUEL. A great incentive has been given by the discovery of copious wells of petroleum (see OIL-WELLS AND OIL-TRADE) to the invention of some mode of using oil as a fuel for furnaces and stoves. Such attempts had often been made before; but they assume a new aspect now that oil has become so much cheapened. Nearly half the carrying capacity of European steamships, and more than half in those which make long voyages, is taken up with the stowage of coal. Petroleum (q.v.) gives out nearly twice as much heat as an equal weight of anthracite or steam coal.

As respects the use of petroleum for raising steam, several reports have been made public, stating that it has been so employed with success; but a careful examination of the most reliable experiments plainly shows that as yet, at any rate, this cannot be done economically, except in rare instances, such as in the oil regions of the United States. In a full and apparently very reliable report on petroleum in all its bearings by Mr. J. Lawrence Smith, published in the general report of the judges of group III., Philadelphia exhibition of 1876, it is stated that the average price of anthracite coal in America is eight dollars per ton, and at this rate petroleum for equal heating-power would cost three times as much. In Great Britain, where paraffine oil is as cheap as petroleum, the advantage in the use of coal is much greater. The reports of Mr. T. Lloyd to the English admiralty, and by Mr. Isherwood, chief of the bureau of engineering in the U. S. navy, agree in stating that, although mineral oils can be burned without difficulty for raising steam, it has yet to be proved whether they can be used successfully and safely at sea. The eminent French chemist, St. Claire Deville, has perhaps made what are as yet the most trustworthy experiments respecting the burning of mineral oils for raising steam in locomotives. He considers that only the heavy and thick-flowing kinds can be used to advantage in heating these engines; that with heavy oil steam can be got up in the same time as with coal; and that, as compared with the latter, the oil required is only about one-half the weight. On one of the railways in the s. of Russia, the petroleum found at Baku, on the Caspian sea, was burned for a time in the locomotives; but although a success from an engineering point of view, it was found to be too costly a fuel. For a drawing of the furnace used, see *Engineering* for Jan. 5, 1877.

The chief advantages of petroleum compared with coal as a fuel in raising steam are its greater heating-power, the smaller storage space it requires, and its freedom from ash. Its disadvantages are greater cost, difficulty in burning without much smoke or tarry deposits, and the danger attending its use.

More success has attended the use of petroleum in metallurgical processes. Its freedom as a fuel from deleterious ingredients gives it at once a great advantage here. One of the best petroleum furnaces for working iron is that designed by Dr. C. J. Eames. The petroleum is made to drip over a series of shelves in an iron vessel, and is there converted into vapor and carried forward by superheated steam to be mixed with air, and is then immediately burned in the "combustion-chamber" at the end of the furnace, close to where the iron is piled. Steam in one condition or another is used to convert the petroleum into vapor in most furnaces where it is used. In furnaces for bending armor-plates, and also for working thinner iron plates, mineral oil has been found to have the advantage over coal of raising the heat required in a much shorter time. It also produces less scale on the iron, and with it the heat is more easily concentrated on a portion of the plate.

OILLE'TS, or ŒILLETS, small openings, often circular, used in mediæval buildings for discharging arrows, etc., through.

OIL MILL. See OILS.

OIL PALM, *Elæis*, a genus of palms, of the same tribe with the cocoa-nut palm. The best known species, the oil palm of tropical Africa, sometimes attains a height of 60 to 80 feet. The stems are thickest in the middle, tapering chiefly upwards. The leaves are pinnate, their footstalks spiny. The flowers have a strong peculiar smell, like that of anise or chervil. The fruit forms an immense head, like a great pine-apple, consisting of a great number of bright orange-colored drupes, having a thin skin, an oily pulp, and a hard stone. The pulp of the drupes, forming about three-fourths of their whole bulk, yields, by bruising and boiling, an oil, which when fresh has a pleasant odor of violets, and when removed into colder regions acquires the consistency of butter. This oil is now very largely imported from tropical Africa into Britain, and is much used for many purposes, as for making candles, toilet soaps, etc., and for lubricating machinery and the wheels of railway carriages. When fresh, it is eaten like butter. See OILS. The nut was formerly rejected as useless after the oil had been obtained from the fruit; but from its kernel a fixed oil is now extracted, called PALM-NUT OIL; which is clear and limpid, and has become to some extent an article of commerce. The

oil palm abounds in mangrove swamps, but is also a conspicuous feature of the landscape on sandy coasts in the tropical parts of western Africa. It yields from its trunk abundance of a pleasant and harmless beverage, which, however, becomes intoxicating in a few hours, called *malova* in Angola, and much used there as an alcoholic stimulant. The unripe nuts of the oil palm are used in some parts of Africa for making an excellent kind of soup. The oil palm has been introduced into some parts of America, and is now abundant in them. See illus., PALMS, vol. XI.

OIL-REFINING. Several oils, from the mode of their extraction, are necessarily impure, and various means are taken for refining or purifying them: thus, the so-called *fish-oils*—that is, whale, seal, cod, etc.—are clarified either by mixing them with a chemical solution, or by passing steam through them and filtering through coarse charcoal. The chemical solutions employed are various. One method is, to use a strong solution of oak bark, the tannic acid in which combines with the albuminous matters present in the oil, and precipitates them; another plan is, to agitate bleaching-powder, formed into a milk with water, with the oil; and then, after subsidence of the chloride of lime and water, to wash the oil with water, or jets of steam passed through it. A more simple and very effective plan, invented by Mr. Dunn, is to apply a steam heat not exceeding 200° F., and then pass a current of air of the same temperature through it continuously for some time: this effectually bleaches the oil.

Olive, and some other vegetable oils, are refined by agitating them with a saturated solution of caustic soda. This renders the whole soapy; but after a time the oil precipitates a saponaceous deposit, and the remainder becomes quite clear and pure, and is then poured off. The value of several of the most important oils of commerce is so greatly increased by refining, that this art has now become a very important branch of business, and is carried out on a large scale.

OILS (including fats). The fats and fixed oils constitute an important and well-marked group of organic compounds, which exist abundantly both in the animal and vegetable kingdoms. They are not simple organic compounds, but each of them is a mixture of several such compounds to which the term *glycerides* is applied; and the glycerides which by their mixture in various proportions form the numerous fats and oils are mainly those of palmitic, stearic, and oleic acids—if we adopt the recent view that margaric acid (q.v.) has no independent existence—and to a less extent those of other fatty acids, which will be presently noticed, such as butyric, caproic, caprylic, and capric acids, which are obtained from butter; myristic acid, which is obtained from cocoa-nut oil, etc. The members of this group may be solid and hard, like suet; semi-solid and soft, like butter and lard; or fluid, like the oils. The solid and semi-solid are, however, generally placed together and termed fats, in contradistinction to the fluid oils. The most solid fats are readily fusible, and become reduced to a fluid or oily state at a temperature lower than that of the boiling-point of water. They are not volatile, or, in other words, they cannot be distilled without decomposition, and it is not until a temperature of between 500° and 600° F. is reached that they begin nearly simultaneously to boil and to undergo decomposition, giving off acroleine (an acrid product of the distillation of glycerine) and other compounds. In consequence of this property, these oils are termed *fixed oils*, in contradistinction to a perfectly separate group of oily matters, on which the odoriferous properties of plants depend, and which, from their being able to bear distillation without change, are known as *volatile oils*. These, which are also known as *essential* or *ethereal oils*, differ *in toto* in their chemical composition from the compounds we are now considering, and will be separately noticed in the latter part of this article. All the fats and oils are lighter than water, and are perfectly insoluble in that fluid. Their specific gravity ranges from about 0.91 to 0.94. They dissolve in ether, oil of turpentine (one of the volatile oils), benzole, and to a certain extent in alcohol; while, on the other hand, they act as solvents for sulphur, phosphorus, etc. If a fatty matter be shaken with a watery solution of albumen, gum, or some other substance that increases the density of the water, and renders it viscid, the mixture assumes a milky appearance, in consequence of the suspension of the fat or oil in the form of microscopic globules, and is termed an *emulsion*. These bodies possess the property of penetrating paper and other fabrics, rendering them transparent, and producing what is well known as a greasy stain. They are not readily inflammable unless with the agency of a wick, when they burn with a bright flame. In a pure and fresh state they are devoid of taste and smell, but on exposure to the air they become oxidized and acid, assume a deeper color, evolve a disagreeable odor, and are acrid to the taste; or, in popular language, they become *rancid*. The rapidity with which this change occurs is considerably increased by the presence of mucilaginous or albuminous bodies. The rancidity may be removed by shaking the oil in hot water in which a little hydrated magnesia is suspended.

The general diffusion of fats and oils in the animal kingdom has been already described. (See FATS, ANIMAL.) In the vegetable kingdom they are equally widely distributed, there being scarcely any tissue of any plant in which traces of them may not be detected; but they are especially abundant in the seeds. The seeds of the *cruciferæ* are remarkably rich in oil; linseed yielding fully 20 per cent and rape-seed about 40 per cent of oil; and some fruits, as those of the olive and oil-palm, yield an abundance of oil.

The uses of the oils and fats are numerous, and highly important, various members of this group being extensively employed as articles of food, as medicines, as lubricat-

ing agents, in the preparation of soaps, plasters, ointments, varnishes, pigments, candles and other means of illumination, for the purpose of dressing leather, etc. The following are the most important members of the group:

1. *Vegetable Fats.*—The chief solid fats of vegetable origin are cocoa-nut oil, nutmeg butter, and palm oil. The fluid vegetable fats or oils are divisible into the *non-drying* and the *drying oils;* the latter being distinguished from the former by their becoming dry and solid when exposed in thin layers to the air, in consequence of oxygenation; while the former do not absorb oxygen, but are converted by hyponitric acid or sub-oxide of mercury into elaidine (as described in the article Oleine), a reaction which is not exhibited by the drying oils. Some of the drying oils, especially linseed oil, when mixed with cotton, wool, or tow, absorb oxygen so rapidly, and consequently become so heated as to take fire, and many cases of the spontaneous combustion of heaps of oily materials that have been employed in cleaning machinery have been recorded. The drying property may be much increased by treating the oils with a little litharge or oxide of manganese, and linseed oil thus treated is then known as *boiled oil.* The chief non-drying oils are olive oil, almond oil, and colza oil; while the most important drying oils are those of linseed, hemp, poppy, and walnut; castor oil seems to form a link between these two classes of oils, since it gradually becomes hard by long exposure to the air.

2. *Animal Fats.*—The chief solid fats are suet, lard, butter, goose grease, etc.; while among the fluid fats or oils, sperm oil, ordinary whale oil, cod-liver oil, and neat's-foot oil may be especially mentioned. In many of their characters, spermaceti and bees-wax resemble the solid fats, but, as will be shown in the articles on these subjects, they are not glycerides. As a general rule, stearine and palmitine, both of which have comparatively high fusing points (between 157° and 114° F.), preponderate in the solid fats; while oleine, which is fluid at 32°, is the chief constituent of the oils.

One or two of the most important of the decompositions of the fats must be noticed. When any of these bodies are heated with the hydrated alkalies, they undergo a change which has long been known as saponification, or conversion into soap (q. v.), in which the fatty acid combines with the alkali to form a *soap,* while the sweet viscid liquid glycerine is simultaneously formed. The combination of a fatty acid with oxide of lead forms a *plaster.* For further details on these points, the reader is referred to the articles Soap and Plasters.

The process of saponification affords a ready means of isolating the fatty acids, as the stearic or oleic acid may be at once separated from an alkaline stearate or oleate by the addition of hydrochloric or sulphuric acid. When the fatty acids are, however, required on a large scale, as for the manufacture of the so-called stearine-candles, which in reality consist mainly of stearic and palmitic acids, dilute sulphuric acid and the oil or fat are made to act upon each other at a high temperature. See Candle. The fatty acids may also be procured in a very pure form by the injection of superheated steam at a temperature of between 500° and 600° F. into heated fat—a process which, according to Prof. Miller, "from its simplicity and from the purity of the products which it yields, bids fair to supersede those previously employed in the preparation of the fatty acids for illuminating purposes."

The only fatty acids which have been specially mentioned in this article are those which occur in natural glycerides, such as stearic, palmitic, and oleic acids. The term *fatty acid* has, however, in chemistry a wide signification, and is applied to many acids homologous to stearic acid, but not occurring in any natural fats or oils. Thus stearic acid may be taken as the type of a group of acids (of which some thirty are already known) represented by the general formula $C_{2n}H_{2n}O_2$, commencing with formic acid, CH_2O_2, including acetic, propionic, butyric, valeric (or valerianic), caproic, œnanthylic, caprylic, pelargonic, capric, lauric, myristic, palmitic, stearic, arachidic, and cerotic acids, and terminating with melissic acid, $C_{30}H_{60}O_2$. These are divided into the volatile and the true (or solid) fatty acids; the volatile acids being those from formic to capric acid, while the remainder, beginning with lauric acid, are the true fatty acids. The *volatile fatty acids* are fluid, and for the most part oily at ordinary temperatures, may be distilled without change, possess a pungent odor, and are acid to the taste, and their solutions redden litmus paper strongly. The *true fatty acids,* on the other hand, are solid at ordinary temperatures, are devoid of taste and smell, cannot be distilled, except *in vacuo,* without decomposition, and only exert a slight action on litmus. The volatile acids occur in the animal and vegetable kingdoms (formic acid, for example, in red ants, and valeric acid in the root of valerian), and they are likewise produced by the oxidation and spontaneous decomposition of numerous animal and vegetable products. The entire series, up to capric acid, may be obtained by oxidizing oleic acid with nitric acid. The true or solid acids only occur as constituents of animal and vegetable fats.

Prof. Miller makes a second group of fatty acids, of which oleic acid is the type, and which have the general formula $C_{2n}H_{2n-2}O_2$; but as oleic acid is the only member of this group which is of any practical importance, it is sufficient to refer the reader to the special article on that acid.

A complete list of even the chief fats and fixed oils would take up far more space than we can command. In the article "Fixed Oils," in *The English Cyclopædia,* the reader will find 64 of the most important of these substances mentioned, with, in most

cases, a brief notice of the origin and properties of each. The British pharmacopœia contains hog's lard, mutton suet, cod-liver oil, concrete oil (or butter) of nutmeg, and almond, castor, croton, linseed, and olive oils, besides the closely allied substances spermaceti and wax.

The *Volatile* or *Essential Oils* exist, in most instances, ready formed in plants, and are believed to constitute their odorous principles. They form an extremely numerous class, of which most of the members are fluid; a few (oil of aniseed, for example) being solid at ordinary temperatures, but all of them are capable of being distilled without undergoing change. They resemble the fixed oils in their inflammability, in their solubility in the same fluids, and in their communicating a greasy stain to paper or any other fabric; but the stain in this case soon disappears, and they further differ in communicating a rough and harsh rather than an unctuous feeling to the skin. Their boiling points are in almost all cases far higher than that of water, but when heated with water they pass off with the steam—a property on which one of the chief modes of obtaining them depends. See PERFUMERY. The oils have characteristic penetrating odors, which are seldom so pleasant as those of the plants from which they are obtained, and their taste is hot and irritating. They vary in their specific gravity, but most of them are lighter than water, and refract light strongly. Most of them are nearly colorless when fresh, but darken on exposure to light and air; but a few are green, and two or three of a blue color. By prolonged exposure they absorb oxygen, and become converted into resins.

By far the greater number of them are products of the vital activity of plants, in which most of them exist ready formed, being inclosed in minute cavities, which are often visible to the naked eye. Although diffused through almost every part of a plant, the oil is especially abundant in particular organs of certain families of plants. In the *umbelliferæ*, it is most abundant in the seeds; in the *rosaceæ*, in the petals of the flowers; in the *myrtaceæ* and *labiatæ*, in the leaves; in the *aurantiaceæ*, in the rind of the fruit. As in the case of the animal and vegetable fats and fixed oils, so most of the essential oils occurring in plants are mixtures of two or more distinct chemical compounds, one of which usually contains no oxygen, while the others are oxidized. Of these, the former, which is a pure hydrocarbon, is the more volatile, and acts as a solvent for the others. Most of these oils, when cooled, separate into a solid and a fluid portion, to which the terms *stearopten* and *elæopten* have been applied.

In the comparatively few cases in which the oils are not formed naturally, they are produced by a species of fermentation, as in the case of oil of bitter almonds and oil of mustard (q.v.), while others are the product of the dry distillation or of the putrefaction of many vegetable bodies. Some of the natural oils, as those of cinnamon, spiræa, and winter-green, have also been artificially produced.

The essential oils are much employed in the fabrication of perfumery (q.v.), for the purpose of flavoring liquors, confectionery, etc., for various purposes in the arts (as in silvering mirrors), and in medicine. The special uses of the most important of these oils in medicine will be noticed subsequently.

The members of this group, which is an extremely numerous one (more than 140 essential oils being noticed in the article on that subject in the *The English Cyclopædia*), admit of arrangement under four heads. 1. Pure hydrocarbons; 2. oxygenous essential oils; 3. sulphurous essential oils; 4. essential oils obtained by fermentation, dry distillation, etc.

1. The *pure hydrocarbons* are for the most part fluid, and have a lower specific gravity, a lower boiling point, and a higher refractive power than the oxygenous oils. They absorb oxygen, and are converted into oxygenous oils and resins. They may be separated from oxygenous oils, with which they are usually associated, by fractional distillation. They include oil of turpentine, $C_{10}H_{16}$, and the oils of bergamot, birch, chamomile, caraway, cloves, elemi, hop, juniper, lemons, orange, parsley, savine, and valerian, most or all of which contain the same hydrocarbon as oil of turpentine (q.v.), and in addition to it an oxidized compound; oil of copaiva, $C_{15}H_{24}$, attar of roses, C_8H_{16}, etc.

2. The *oxygenous essential oils* may be either fluid or solid, the latter being also termed *camphors*. A stearopten separates from most of the fluid oils on cooling. They are more soluble in water and spirit of wine than the pure hydrocarbons. They may be divided into (1) those which are fluid at ordinary temperature, such as those of anise-seed, chamomile,* cajeput, caraway,* cinnamon, cloves,* fennel, lavender, peppermint, rue, spiræa, thyme,* winter-green, etc. Those marked with a (*) are associated with the pure hydrocarbons already described. (2) The camphors, such as ordinary camphor $C_{10}H_{16}O$, Borneo camphor, $C_{10}H_{18}O$, etc.

3. The *sulphurous essential oils* are chiefly obtained from the *cruciferæ*. They probably all contain the radical *allyl*, C_3H_5. The oils of garlic and of mustard (both of which have been described in special articles), and those of horse-radish, scurvy-grass, and asafœtida, are the best illustrative of this division.

4. Among the essential oils obtained by fermentation, dry distillation, etc., may be mentioned the oils of bitter almonds and of black mustard, the oils of milfoil, plantain, centaury, etc. (whose leaves have no smell until they have been moistened for some time with water, when a kind of fermentation is set up, and oil is yielded in abundance), furfuramide (q.v.), etc.

The U. S. pharmacopœia contains the essential oils of anise, cajeput, caraway, chamomile, cinnamon, cloves, copaiva, coriander, cubebs, dill, juniper, lavender, lemon, nutmeg, peppermint, pimento, rosemary, rue, savine, spearmint, and turpentine. Of these the oils of anise, cajeput, caraway, chamomile, coriander, dill, peppermint, pimento, and spearmint are used as stimulants and antispasmodics in cases of flatulence, griping, etc.; and to disguise the nauseous taste of various medicines. The oils of cajeput, cinnamon, and rue act similarly but more powerfully. The oils of copaiva and cubebs act in the same manner as the substances from which they are derived; oil of juniper is a powerful diuretic, and oil of savine (and to a less extent oil of rue) an emmenagogue. The oils of lavender and lemon are used to conceal the smell of sulphur ointment, and to give an agreeable odor to lotions, etc. The oil of rosemary is chiefly employed as a stimulating liniment, especially in cases of baldness; and the oil of nutmeg is seldom given medicinally except in the form of aromatic spirit of ammonia, into the composition of which it enters.

A very admirable paper on the essential oils was read Dr. Gladstone before the chemical society, in the month of Dec., 1863; and the reader who is anxious to pursue the subject further will find it advantageous to refer to this excellent production.

Bland oils—such, for example, as olive-oil—were much used by the ancients as external applications in various forms of disease. Celsus repeatedly speaks of the use of oil applied externally with friction in fevers, and in various other diseases. Pliny says that olive-oil warms the body and at the same time cools the head, and that it was used with these objects previously to taking cold baths. Aretæus recommends a sitz-bath of oil in cases of renal calculi, and Josephus relates that a similar mode of treatment was employed in the case of Herod. Galen prescribed "oil and wine" for wounds in the head; and the parable of the good Samaritan affords additional evidence that this was a common mode of treating wounds. The use of oil preparatory to athletic exercises is referred to by numerous Greek and Latin writers.

As a cosmetic—that is to say, as a means of giving to the skin and hair a smooth and graceful appearance—its use has been prevalent in hot climates from the earliest times. There is abundant historical evidence of this usage of oil amongst the Egyptians, the Jews, the Greeks, and the Romans; and Pliny's statement that butter is used by the negroes, and the lower class of Arabs, for the purpose of anointing, is confirmed by the observation of all recent African travelers. In hot climates there is doubtless a practical as well as an æsthetic object in anointing. The oil, being a bad conductor of heat, affords a certain amount of protection against the direct action of the solar heat; it is likewise serviceable as a protection against the attacks of insects, and as a means of checking excessive perspiration. The fact of oily and fatty matters being bad conductors of heat, serves also to explain why the Esquimaux and other dwellers in Arctic regions have recourse to the inunction of the blubber, etc. In their case the oily investment serves to prevent the escape of the bodily heat.

The Greeks and Romans not only employed oil for the purposes already mentioned, but in their funereal rites; the bodies of their dead being anointed with oil, with the view probably of postponing incipient decomposition. A similar practice existed amongst the Jews, and in the Gospels we find various passages in which our Lord referred to his own body being anointed by anticipation. It appears from the evidence of St. Chrysostom, and other writers, that this ancient usage of anointing the bodies of the dead was long retained in the Christian church. See Unction; Extreme Unction. Many physicians of the present day combine the inunction of cod-liver oil with its internal administration, a combination first recommended by Professor Simpson of Edinburgh; and sir Henry Holland advocates the practice of anointing the harsh, dry skin of dyspeptic patients with warm oils. See the paper "On the External Application of Oils," in the second volume of *The Edinburgh Medical and Surgical Journal*. The use of oil to lessen the effects of heavy seas was known to the ancients, and is now very general among American captains. The records for 1886 of the Hydrographic office in New York, show that in every case out of many reported, no failure ensued when vegetable or animal oils were used, and that kerosene or lighter oils sometimes produced the same effects; the waves being quickly reduced to long and heavy but harmless swells. A canvas bag punctured full of holes with a sail-needle, is filled with oil and a quantity of oakum, and, as a rule, is hung over the lee bows.

Oils in their Commercial Relations.—The solid animal oils found in commerce are butter and lard, tallow, mares' grease, goose grease, neats-foot oil, and unrefined yelk of egg oils. The two first are fully described under their names. See Butter, Lard. Tallow is the fat of oxen and sheep, but more especially the fat which envelops the kidneys and other parts of the viscera, rendered down or melted. The qualities of this solid oil render it particularly well adapted for making candles, and until the end of the first quarter of the present century, candles for ordinary use were almost wholly made of it, the high price of wax and spermaceti preventing their employment except by the most wealthy and for ecclesiastical purposes. Besides its use in making candles, tallow is most extensively used in the manufacture of soap, and for the purpose of preserving machinery from rust.

Mares' grease is not nearly so solid as tallow; it is a yellowish-brown grease, imported extensively from Monte Video and Buenos Ayres, where vast numbers of horses are

slaughtered for their hides, bones, and grease; it is particularly valuable as a lubricant for machinery, and is chiefly employed for that purpose after much of its stearine has been removed for candle-making. The reason this material is called *mares'* grease is said to be from the circumstance that in South America horses are chiefly used alive, and mares are slaughtered as comparatively useless. Goose grease is another soft fat, much valued by housewives for many purposes, but excepting that it is sold in some districts as a remedial agent, it has no commercial importance. Neats-foot oil is a soft fat procured in the preparation of the feet and intestines of oxen for food as sold in the tripe-shops. The quantity obtained is not very great, but it is in much request by curriers for dressing leather. Yelk of egg oil is a hard oil, which, though little known with us, is extensively used in other countries where eggs are cheaper. In Russia, for instance, it is manufactured on so large a scale as to supply some of the largest makers of fancy soaps, and it forms the principal material in the celebrated Kazan soap; and certain pomades are made of it which have a great reputation, and realize very high prices. This oil is not unlike palm-oil in color and consistency; but when refined is liquid, and has a reddish-yellow color.

The liquid animal oils are more numerous, and, excepting tallow, are far more important, the so-called fish-oils being the principal. These are whale, porpoise, seal, cod, herring, shark, etc. The whales which are pursued for their oil are: 1. The sperm whale. This huge creature is from 60 to 70 ft. in length, and yields generally from 5,000 to 6,000 gallons of oil. The finest oil is taken from the great reservoir on the head. The oil of this species is all of a quality superior to others, and is known as sperm oil. For the method of procuring this oil, see CACHOLOT. 2. The right whale, which yields by far the largest proportion of whale oil. This, with that yielded by other less important species, is usually called train oil. The term *train* is supposed to be a corruption of *drain*, and applies to the circumstance of the oil being drained out of the blubber; and in this sense it is also applied to sperm oil from the blubber of the cacholot, in contradistinction to the finer oil from the head matter. The right whale forms the chief object of the northern fisheries, but other species of balæna are pursued in different parts of the world for the sake of their oil. See WHALE.

Amongst the smaller cetaceans, the porpoises—called also dolphins ("puffydunters" on the east coast of Scotland)—and grampuses yield an excellent oil, second only in value to that of regular oil whales; and to obtain it, large numbers are occasionally killed in the British seas. The price of sperm oil ranges from $400 to $450 per tun, and that of ordinary train oil from $200 to $225 per tun of 252 gallons. A large quantity of very valuable oil is obtained from seals; and the seal-fishery, as a means of obtaining oil, is only second in importance to that of the whale. It is carried on chiefly on the shores of Newfoundland, Greenland, and Labrador. Like the whales, the seals have a thick layer of blubber in which the oil is contained. See SEAL. The first draining from the blubber is of a fine, clear, pale straw-color; the next, yellow or tinged; and the last is brown or dark.

Of the true fish oils, that from the cod is first in importance, more especially since its medicinal properties were discovered. It is made only from the liver of the fish; and the attempt which was made to induce a popular belief that the so-called cod-liver oil was different from the ordinary cod oil of commerce, was simply a cheat; no difference exists, and the oil is obtained just as good from the oil merchant at a moderate price per gallon as from the empiric at an exorbitant price per pint. Indeed, the purer the oil can be got, the better it is in a remedial point of view, notwithstanding the efforts made to convince the public that a certain color is better than any other.

Instead of the old and somewhat rude methods of preparing the oil (see COD-LIVER OIL), much more complete and efficient arrangements are now adopted. The livers, when taken from the fish, are all examined, washed in clean water, and placed in sieves to dry. Thence they are transferred to pans heated with steam, and after being exposed to a gentle heat for about three-quarters of an hour, the heat is discontinued; and when cold, the oil which has separated is skimmed off, and strained through flannel bags into tubs. Here certain impurities subside, and the clear oil is poured off from the dregs, and the contents of numerous tubs are transferred to galvanized iron cisterns, in which a further settlement takes place. The oil is now ready for the filters, which are made of the strong cloth called moleskin, through which it is forced by atmospheric pressure into the store-tanks, which are also of galvanized iron. Hence it is pumped into the casks for export, which are usually hogsheads, tierces, and barrels. The value of cod-liver oil is about $175 to $200 per ton. The imports vary much according to the success of the fishery; they have reached nearly 1000 tons per annum. Besides its consumption in lamps, and for medicinal purposes, cod oil is used in making some kinds of soap. Oil is occasionally made from the herring, but not in very great quantities; it, however, forms a commercial article. It is made from the whole of the fish, the smell of which it retains to a very disagreeable extent.

The lightest of all the fixed oils is made from the liver of the common shark; it ranges from specific gravity 0.865 to 0.867. This, and the oil made from the livers of the common skate (*Raia batis*), the Thornback (*R. clavata*), and the white skate (*Rhinobatus cerniculus*), are often substituted for the cod-liver oil used medicinally, but have not its valuable properties.

Under the name of lard oil, large quantities of the oleine of lard have been exported of late years from America. It is a secondary product, arising from the great manufacture of lard stearine for candle-making which has arisen in this country. Lard oil is worth about $225 to $275 per ton, and is principally used as a lubricant for machinery.

The solid vegetable fixed oils which find a place in commerce are palm oil, cocoa-nut oil, kokum or vegetable tallow, and carapa or carap oil. The palm oil is an oil of a bright orange-yellow color and an agreeable violet odor; it is obtained from the not very thick covering of the hard seeds of the oil-palm (q.v.). The fruits, when gathered, are shaken out of the clusters, and are laid in heaps in the sun for a short time, after which the natives boil them slowly in water, when the oil separates and is skimmed off the surface, and carried in small quantities to the depôts of the traders, who transfer it to casks which are prepared to receive it on board the ships. The quantity thus collected is enormous. Previous to 1840, the chief use of palm oil was in making soap, but it was about that time found that the palmitine or fat acid of this oil was admirably adapted for the manufacture of candles (q.v.); and since then it has become of much greater importance.

Cocoa-nut oil is a white fat, with the peculiar smell of the kernel; it is made by grinding or pounding the kernel of the cocoa-nut. After it has been boiled in water for a short time, the paste is submitted to great pressure, and a large quantity of milky juice is obtained; this is slowly boiled, and the oil separates and rises to the surface in considerable quantity, and is skimmed off. Twenty ordinary-sized nuts will yield as much as two quarts of oil. This oil is now very largely imported, and, treated in the same way as palm oil, forms a stearine, which greatly improves that of palm oil when mixed with it in proper proportions; neither does so well separately, and the consumption of cocoa-nut oil has consequently very greatly increased. Most of it comes from Ceylon, where the tree is largely cultivated on purpose. By far the greater proportion of this vast quantity is used by the candle manufacturers, and the remainder in making common soap, its disagreeable smell preventing it being employed for the better kinds.

Vegetable tallow, or kokum oil, is also used by the candle-makers; only small quantities, however, are imported. It comes from Singapore, and is produced from the seed of *Garcinia purpurea*, a species of the same genus with the mangosteen. Another kind of vegetable tallow is made in China, from the seeds of *Stillingia sebifera*.

Carapa, carap, crab, or Andiroba oil, is very extensively made in British Guiana and the West Indies, but it is nearly all used there, either as a pomade for preserving the hair, or as an unguent for rheumatism and neuralgic pains, for which purposes it is said to be very useful. See CARAPA.

The Bassia oil is beginning to attract attention, and several importations have taken place from India, and some rather large quantities have reached Liverpool from Bombay, under the name of Muohwa oil. This oil is of a soft butter-like consistence, and yellowish-green color, and is well adapted for soap-making, and for machinery grease. See BASSIA.

The liquid vegetable oils are very numerous, and several are of great commercial importance. First in rank is olive oil, made from the ripe fruit of the common olive (*olea Europea*). When good and fresh, it is of a pale greenish-yellow color, with scarcely any smell or taste, except a sweetish nutty flavor, much esteemed by those who use it. The finest qualities are the Provence oil (rarely seen in Britain), Florence oil, and Lucca oil. These are all used for salads and for cooking. The Genoa is used on the continent for the same purposes; and Galipoli, which is inferior, constitutes the great bulk of what is received in this country for cloth dressing, Turkey-red dyeing, and other purposes; the continental soap-makers also employ it extensively. The high price of the best qualities leads to adulteration with cotton-seed and other oils, but it is generally pretty safe when in the original flasks as imported. The mode of obtaining the finest kinds is by gentle pressure of the fruit. The cake is afterwards treated with hot water, from the surface of which an inferior quality is skimmed. The Galipoli oil is obtained by allowing the olives to ferment in heaps, and then to press them in powerful oil-presses; the cake or *marc* is then treated with water once or twice, until all the oil is removed; this inferior oil is darker in color, being a yellowish or brownish green. We receive the finest from Italy, and the commoner qualities from the Levant, Mogador, Spain, Portugal, and Sicily.

One of the chief seed oils is linseed (q.v.). Rape or colza oil is a name which covers the product of several cruciferous seeds, as rape, turnip, and other species of *brassica*, radish, *sinapis toria*, gold of pleasure, etc. The oil is clear brown and usually sweet, but with a mustard-like flavor; its illuminating powers are excellent, and it is also well adapted for wool-dressing. Very large quantities are made in Great Britain, chiefly from *sinapis toria* and other Indian mustard seeds, which are imported under the name of Surzee seed. The imports of these seeds are occasionally as much as 60,000 quarters per annum. Hemp seed yields a green oil which is much used in making soft soap, especially in Holland. In Russia it is eaten with various kinds of food, and is greatly liked by all classes.

The following are the names of a number of oils which are more or less used in this country: Cotton-seed oil. Palm-nut oil, a clear and limpid oil from the hard nut of the

oil-palm; this nut was formerly rejected as useless after the oil had been obtained from oil-palm; this nut was formerly rejected as useless after the oil had been obtained from the fruit. Safflower-seed oil, from the seeds of *carthamus tinctorius;* it constitutes the real Macassar oil. Sunflower-seed oil, from seed imported from the Black sea provinces of Russia; a rapidly increasing trade is springing up in this excellent oil. Poppy-seed oil, from the seed of *papaver somniferum,* largely imported from India; it is as sweet as olive oil, and is extensively substituted for it, especially in France, where it is also very largely cultivated. Gingelli-seed oil, from the seed of *sesamum orientale,* an important Indian staple of which we are large consumers; the oil is much used for wool dressing, etc. Ground-nut oil, from the seeds of *arachis hypogœa,* imported from western Africa and India; this oil is particularly adapted for fine machinery, as it is not affected by cold. Niger, til, or teel-seed oil, from the seeds of *Guizotia oleifera,* much imported from Bombay. Croton oil, from the seeds of *jatropha curcas,* largely used in wool dressing. The croton oil used in medicine is from *croton tiglium,* of which only small quantities are imported; whereas of the other 1200 or 1400 tons, besides a quantity of the seed, often reach us in one year. Another highly valuable medicinal oil, castor oil (q.v.), is of great commercial importance. Almond oil, chiefly used for perfumery purposes, is made from the kernels of the sweet and bitter almond; it is the most free from flavor and odor of any oil in use, notwithstanding that the essential oil of bitter almonds is so strongly flavored.

Oils made from the seeds of the following plants have some commercial value in other countries: *Madia setiva; argemone Mexicana;* various species of gourds; garden cress (*lepidium sativum*); tobacco, now extensively used in southern Russia, Turkey, and Austria; hazel-nuts; walnuts; nuts of stone pine; pistachio nut; tea-seed; this in China is a common painter's oil; the grape, from the seeds or stones, as they are called, saved from the wine-presses, used in Italy; Brazil-nuts (*Bertholetia excelsa*); *calophyllum inophyllum,* called pinnacottay oil in India; *melia azadirachta,* called in India by the names meem and margosa oil; *aleurites triloba,* called in India country almond oil, and much used for burning in lamps and torches; *psoralea corylifolia,* called baw-chee-seed oil. The seed is sometimes imported to this country for pressing. Ben-seeds (*moringa pterygosperma*); bon-duc-nuts, the seeds of *guilandina bonduc* and *G. bonducella.*

The following oils, then new to the world's commerce, were shown in the International Exhibition, 1862: *India.*—Teorah oil, from the seeds of *brassica erucastrum;* capala oil, from the seeds of *rottlera tinctoria;* cardamom oil, from the seeds of *elettaria cardamomum;* hidglee badham oil, from the seeds of *anacardium occidentale,* or cashew-nut, now largely cultivated in India; cassia-seed oil; chaulmoogra oil, from the seeds of *hydnocarpus odorata;* cheerongee oil, from the seeds of *Buchanania latifolia;* chemmarum oil, from the seeds of *amoora rohituka;* Circassian-bean oil, from the seeds of *adenanthera pavonina;* hoorhoorya oil, from the seeds of *Polanisia icosandra;* custard apple-seed oil, from the seeds of *anona squamosa;* exile oil, from the seeds of *cerbera thevetia;* monela-grain oil, from the seeds of *dolichos uniflorus;* kanari oil, from the seeds of *Canarium commune;* khaliziri oil, from the seeds of *vernonia anthelmintica;* malkungunnee oil, from the seeds of *celastrus paniculatus;* bakul oil, from the seeds of *mimusops elengi;* rana oil, from the seeds of *mimusops kaki;* moodooga or pulas oil, from the seeds of *butea frondosa;* nahor or nageshur oil, from the seeds of *mesua ferox;* hone-seed oil, from seeds of *calophyllum calaba;* poonga, caron, or kurrmig oil, from the seeds of *pongamia-glabra;* vappanley oil, from seeds of *Wrightia antidysenterica;* babool oil, from seeds of *accasia Arabica;* gamboge oil, from seeds of the gamboge tree (*garcinia pictoria*); coodiri oil, from the seeds of *sterculia fœtida;* kikuel oil, from the seeds of *salvadorea persica;* marotty, surrate, or neeradimootoo oil, from the seeds of *hydnacarpus inebrians;* and pundi-kai oil, from the nutmegs of *myristica malabarica.*

From Brazil.—Oils from the seeds of *feuille cardifolia. F. monosperma, anisosperma passiflora, cucurbita citrullus, mabea fistuligera, anda gomesii, myristica bicuhiba, carpotroche Braziliensis, dipterix odorata, theobroma cacao, acrocomia sclerocarpa, nectandra cymbarum,* and from the fat of the alligator and the tapir, all for medicinal and perfumery purposes; and oils from the seeds of *œnocarpus bacába, Œ. pataua, caryoca Braziliensis,* and *Euterpe edulis,* used for culinary and lighting purposes.

From British Guiana.—Oil drawn from the stem of *oreodaphne opifera;* it resembles refined turpentine, and is suggested as a solvent for india-rubber. Wallaba oil, from the wood of the wallaba tree (*eperera falcata*), medicinal.

The preparation of the essential oils is treated of under PERFUMERY.

OIL-WELLS AND OIL-TRADE. One of the most remarkable trades, suddenly sprung up into importance in modern times, is that in oil obtained from subterranean sources. See NAPHTHA.

At first the uncertainty in this trade was something extraordinary. On one occasion a well was bored with the usual centerbit to a considerable depth without any oil being found. On withdrawing the bit, and putting in the rimer or rimmer to widen the hole, a vein was struck at the side. The bit had just missed the vein, and the well would have been a failure had not the orifice been enlarged. This incident gives meaning to a phrase much used in America—that of "striking oil." Another well was bored, flowing a large amount of oil; but by the time the owner had built tanks to collect it, the oil had altogether disappeared. The deepest well sunk in the district, more than 1000 ft., yielded no oil whatever; and altogether only 15 per cent of the borings were successful.

When the oil began to be sent in large quantities to New York and other towns, the cheapness of price led to its application as lamp oil, and in many other ways; the increasing demand brought the price up again to a reasonable figure at Petrolia; and the price induced the sinking of new wells. Small villages rose into large towns, with banks, hotels, and wealthy people, all, however, begrimed with oil. Titusville, which had 243 inhabitants in 1855, rose to nearly 9,000 in 1870. Oil city has now become a town of great importance. The new oil exchange is a handsome building, providing amply for the requirements of "the most important petroleum market in the world."

The production for the year ended June, 1890, had risen to the enormous figure of 902,429,052 gallons. The exports were about 66 per cent. of the production, and were valued at $51,403,089. In 1876 it was estimated that 20,000 oil-wells had been dug in Pennsylvania and West Virginia, at a cost of $192,000,000. They have yielded oil to the value of $300,000,000 at the wells, or rather more than $400,000,000 at the seaboard. In 1890 about 664,000,000 gallons of mineral oil were exported from the U. S.

In Canada there are four areas in which oil-springs are found—two in Enniskillen, a third in Mosa and Oxford townships, and a fourth in Tilsonburgh. The Canadian oil is more troublesome to purify than that found in the States. Although it occurs abundantly, the production in 1878 was not more on the average than 1200 barrels per day. As explained under NAPHTHA, natural petroleums and the paraffin oils distilled from shale or coal very closely resemble each other, so that both kinds are used for the same purposes. In Scotland the paraffine-oil industry is an important one, yielding not much less than 30,000,000 gallons of crude oil annually, from which solid paraffin and other products are obtained as well as lamp oil. See SHALE. In Prussian Saxony the same or very similar products are distilled on nearly as large a scale from an earthy lignite found in the brown coal formation between Weissenfels and Zeitz. In Galicia, chiefly in the Boryslaw district, there are both a native oil and a native bitumen (ozokerite) found, which annually yield burning oil and paraffin to the value of nearly $250,000, and the industry is still prospering. There appears to be also a considerable supply of petroleum or rock-oil in Roumania.

In 1865 a shale was discovered in New South Wales, similar to the Boghead coal or Torbanehill mineral of Scotland, but richer in oil and more free from sulphur. When distilled at Sydney, from 100 to 160 gallons of oil were obtained from one ton of shale. Oil is now exported from the United States in vessels expressly made for the purpose and fitted with huge tanks.

Coal oil is mainly found in the Silurian and Devonian formations, although frequently occurring elsewhere. Porous beds of sandstone serve as the best reservoirs. When wells were first driven nothing was known of oil sands, but it was soon learned that by deep drilling, there existed three distinct layers, known as First, Second, and Third Sands, the distances between them varying from 35 to 100 feet. A Fourth sand is claimed to have been found, and is designated a black-oil sand, on account of its color.

Oil had been seen for many years on the surface of a well near Titusville, Pa., and great quantities had been taken up by absorption in flannel, and used for medicinal purposes, for which it seemed greatly adapted, but beyond this no knowledge was had of its quantity or possible uses. The Kanawah salt wells near the river of the same name, which, having its sources in the North Carolina mountains, flows westwardly until it mingles with the Ohio river, contained more or less petroleum, but the oil was allowed to flow over the top of the salt cisterns to the river, where it spread. Its beautiful iridescent hues, with a sometimes extremely unsavory odor, permitted its being readily traced for many miles down the stream. The boatmen, and others whose occupations led them up and down the river, gave the river the singular name of "Old Greasy," by which it was long familiarly known. At that time the oil had no known value, but was considered a great nuisance, and every effort made to tube it out and get rid of it. Long before the river was called "Old Greasy," the early settlers west of the Appalachian range, and the hunters and pioneers, were acquainted with the oily substance so mysteriously issuing from the bowels of the earth at various points. It seemed to them a miraculous gift from heaven, and was extensively used as a sovereign remedy in rheumatism, burns, coughs, sprains, etc., and justly entitled to a lasting celebrity. It received the name of Seneca oil, an exudation having been discovered near Seneca lake, New York. There was such a demand for it, that a small vial full sold for 40 to 50 cents. It was especially adapted to healing bruises in horse-flesh, and was singularly beneficial in keeping away flies and other insects, they having a natural antipathy to its effluvia. In neighborhoods where it was abundant, it was frequently used in lamps in the absence of spermaceti oil. It afforded a brilliant light, but filled the room with its own peculiar odor.

In the year 1853 a Dr. Brewer suggested its use for lubricating and for illumination, and set to work devising means for purifying the product. In 1854 the Pennsylvania Rock-oil company was formed, but without accomplishing any great results. It was finally resolved by members of the company to sink a well purposely to discover its sources if possible. The result of the first experiment was the tapping a reservoir which yielded by pumping from 400 to 1000 gallons a day of the crude material.

One of the most remarkable wells in the earlier history of the century is that of one sunk in 1829 near Burkeville, Ky. The proprietor was boring for salt and struck a

vein of remarkably pure oil. The discharges were by floods at intervals of from two to five minutes, at each flow vomiting forth many barrels of pure oil. The flowings continued for nearly a month, when they subsided to a steady and constant stream, affording many thousand gallons a day, flowing out and over the surface of the Cumberland river and reaching a distance of a hundred miles. On one occasion a boy set fire to it, and the effect was grand beyond description, the flames rising from the surface of the river to a height far above the tops of the highest trees, and affording literally the spectacle of a river on fire.

The rapid discoveries of oil by boring caused the news to spread, adventurers to flock to the scene, and by 1860 it had become known that oil existed in large quantities beneath more than 100 square miles of territory, at depths varying from 70 to 500 feet. The first large *flowing* well was struck in 1861, yielding 40,000 gallons a day, flowing freely, without the slightest use of pumping apparatus.

In 1858 and 1859, just before the "oil fever" began, the section of country now known as the "oil region" was an almost unbroken forest. The valleys and bottom lands had been broken up somewhat into farms, but there were few cultivated tracts. After the discovery, a demand arose for barrels and teams for hauling. They were so quickly forthcoming, that oil sunk in 1880 to 10 cents a barrel, and some sales were reported as low as 6 cents. Countless derricks covered the landscape; towns bounded into existence; the manufacture of tanks and barrels demanded and secured the work of armies of laborers; land sold for fabulous prices; fortunes were suddenly made and recklessly lost; railroads were pushed into regions hitherto unknown, except to the pioneer, trapper, or hunter. The oil meantime reached the surface faster than it could be secured, and, finding no obstacle, sought its way to the streams, where it floated on the surface and was the cause of countless conflagrations. Only about 15 per cent. of the borings had proved successful, but the quantities secured from them led to such a cheapness that it went into the New York market in abundance, and began to be extensively used as lamp oil. Many wells having become clogged, or run dry from exhaustion, Col. E. A. B. Roberts, in 1862, an officer in the volunteer service of the U. S. army, conceived the idea of exploding torpedoes in the bottom of the wells for the purpose of shattering the walls of the pits, and, if possible, securing a further flow without new sinking. His first attempt was in Titusville, Pa., in 1865. The risk of injury to the plant prevented the experiment being tried or permitted by the owners before that time. The trial proved eminently successful, and the result created a new excitement. Many patents were filed; innumerable lawsuits for infringements begun; ending finally in victory for Col. Roberts. The method of exploding was to sink a flask containing the explosive to the bottom of the shaft, and fill the well with water, thereby thoroughly tamping it. The explosion was caused either by electricity, or by the falling of a weight attached to a wire. A photograph taken in 1890, immediately after an explosion, by apparatus let down the well and taken by flash-light process, showed a forced space of some thirty feet in diameter with oil dripping heavily from every part. The expense incurred by using the Roberts' torpedoes led to their use by stealth in many localities. The parties who entered upon the business were called "Moonlighters." In the detective shadowing and resistance involved, many murders resulted.

The petroleum yield in 1870, in the 4 states of Pennsylvania, Ohio, West Virginia, and Kentucky, reached 4,531,440 barrels, valued at $19,304,224. New fields were opened in the same and adjoining states, and the year 1878 witnessed as its own production, 15,475,000 bbls., of which about 66 p.c. was exported. More than 20,000 oil wells had been drilled in the two states of Pennsylvania and West Virginia up to 1876, at a cost of $192,000,000, the product having a value of more than $400,000,000 at the seaboard.

The production of petroleum in the United States extended from the fields where originally discovered until communities in all parts of the country have been startled by the news of discoveries, until even the pacific coast rejoices in its own oil wells, many of them of great value. Few things in fiction are more wonderful than the history of petroleum since the opening of the first well in 1859. In 1860 an agent of American companies visited Europe, to introduce crude and refined oils, and attracted but little attention. In 1862 there were exported to Germany 14,700 bbls., which sold for $2000 less than the cost of transportation across the sea, yet, with such a drawback, the exportation steadily increased, until during the first 8 months of 1882 from official sources it was found that 433,261,181 gallons had been shipped.

The following account of petroleum mining is from a magazine article by Charles A. Ashburner, M.S.C.E.:

"Formerly the operation of drilling a well was very slow and very expensive; now an oil well can be drilled 2000 feet at one-tenth the cost, and in less than one-tenth of the time that was required when the Pennsylvania oil regions were first explored. The modern system, in its general method, is practically the same as the ancient Chinese system described by Huc, with the exception that steam power is used instead of manual power, which was transmitted through springing boards. Of course the special design and form of the present drilling tools are modern inventions.

"The present American practice may be briefly described as follows: Over the point where the well is to be drilled, a frame derrick is erected from 72 to 84 feet high, forming a square at the base 20 feet on the sides, and verging toward the top to a square having

an inside dimension along the sides of 2 feet 10 inches. On the top of the derrick is placed a crown pulley over which the cable or drill rope plays, the end of the rope inside the derrick is attached to a string of tools which measures from 55 to 70 feet in length, and which weighs from 1900 pounds to 3400 pounds, the height of the derrick depending upon the length of the string of tools, and the length of the string of tools depending upon the size and depth of the well and the character of the strata drilled through. The other end of the rope is attached to a horizontal shaft upon which it is wound and unwound at will, the power being supplied by a 15 to 25 horse-power engine, through a leather belt which passes over a large wheel called the "bull" wheel, which itself is attached to the end of the horizontal shaft. Directly over the hole to be drilled is placed the walking-beam, which is generally 26 feet in length, and which rests near the centre on a heavy post 13 feet high, known as the "sampson" post.

"Prior to the drilling process the tools are lowered into the upper part of the hole which has been dug out, and the rope to which the tools are attached is made fast to one end of the walking-beam. The walking-beam is operated the same as a similar beam on the common side-wheel river steamboats; this beam successively raises and drops the tools which pound the rock into fine fragments. When 5 feet depth of rock has been pounded up in this way, the tools are raised out of the hole and the broken débris is taken out of the hole by a bailer or sand-pump, which generally consists of a wrought-iron tube about 20 feet long. When the sand-pump is suspended it is closed at the bottom by a foot valve, and when it rests on the bottom of the hole the valve is opened.

"The cost of drilling wells depends upon many varying circumstances; in some places in Ohio and Indiana, wells have been drilled 1000 feet deep for $1000. In the Pennsylvania oil regions the cost of drilling a well 2000 feet deep varies under ordinary circumstances from $3000 to $3500. The depth of wells depends upon the relative position of the surface of the ground to the oil and gas rock. The average depth of the Pennsylvania wells up to 1876 was about 900 feet; since that date, the Bradford sand in McKean County, and the Washington sand in Washington County have been explored at considerable depths, so that the average depth of the Pennsylvania wells which have been drilled since 1876 would probably be not far from 1600 feet."

The Standard Oil Company, which is without doubt the largest company of its kind in the world, was organized in Ohio, in 1870, with a capital of $1,000,000. The original incorporators were John Rockefellar, of Cleveland, O.; his brother William, together with Henry M. Flagler and Oliver Paine. The business increased so greatly under their management, in the different states where their interests lay, that in 1882 the Standard Oil Trust Company Combination was organized. There were at the time several companies in as many different places: The Cleveland Standard Refinery; The Pittsburg Refinery; The Atlantic Refining Company of Philadelphia Chas. Pratt & Co.; but because of the disastrous history and condition of the business, and its hazardous nature, they entered into an alliance, forming the first great Trust Company, so called, in the United States. By their organization, an arrangement was entered into whereby the stockholders of the various corporations placed their stocks in the hands of certain trustees, and took in lieu thereof certificates showing each shareholder's equitable interest in all the stock so held. The stockholders thereby became interested in all the corporations connected with the Trust. See Trust.

The following table, compiled from the statistics of the Treasury department, shows the production and exportation of petroleum in the United States since 1883:

Year Ending June 30.	Production. Gallons.	Exportation Mineral Refined, or Manufactured.				Total Exports.	
		Mineral Crude. Gallons.	Naphthas, Benzine, Gasoline. Gallons.	Illuminating. Gallons.	Lubricating (Heavy Paraffine, etc.). Gallons.	Gallons.	Value.
1883	1,281,454,860	52,712,306	17,070,537	419,821,081	10,182,342	505,931,622	$44,913,079
1884	984,884,586	67,186,329	15,045,411	415,615,693	10,515,535	513,660,092	47,103,248
1885	1,017,174,396	81,037,992	15,822,853	458,243,192	13,002,483	574,668,180	50,257,947
1886	917,582,610	80,246,763	12,311,197	469,471,451	12,526,069	577,781,752	50,199,844
1887	1,178,723,322	76,062,878	15,735,239	480,845,811	16,910,513	592,803,267	46,824,915
1888	1,187,712,372	85,538,725	12,066,921	456,487,221	22,889,529	578,351,638	47,042,409
1889	1,159,705,050	72,987,383	14,100,054	502,257,455	25,166,913	616,195,459	49,913,677
1890	1,476,867,546	95,450,653	12,937,433	523,295,090	30,162,522	664,068,170	51,403,089
1891	1,924,552,224	91,415,095	12,171,147	571,119,805	33,514,730	709,819,439	52,026,734
1892	2,267,425,146	103,592,767	12,727,978	564,896,658	33,591,076	715,365,819	44,805,992
1893	2,121,383,712	111,703,508	17,304,005	642,239,816	32,432,857	804,221,230	42,142,058
1894	2,033,331,972	121,926,349	15,555,754	730,368,626	40,190,577	908,252,314	41,499,806
1895	2,072,469,622	111,285,264	14,801,224	714,859,144	43,418,942	884,502,082	46,660,082
1896	2,431,279,032	110,923,620	12,349,319	716,455,565	50,525,530	890,458,994	62,383,403

OISE, a river of France, one of the chief affluents of the Seine, rises in the vicinity of Rocroy, in the n. of the department of Ardennes, and flows s.w., joining the Seine at Conflans-Sainte-Honorine, after a course of 150 m., for the last 75 of which it is navigable. The fall of the river is very gradual, and its course is extremely sinuous. It is connected by canals with the Somme, the Sambre, and the Scheldt, and forms one of the chief commercial routes between Belgium and Paris. It becomes navigable at Chauny.

OISE, a department in the n. of France, is bounded on the e. by the department of Aisne, and on the w. chiefly by that of Seine-Inférieure, which intervenes between it and the English channel. Area, 2,261 sq.m., of which two-thirds are in arable land; pop. '96, 404,511. The principal rivers are the Oise—from which the department derives its name—and its tributaries the Aisne and Therain. The department is almost wholly included in the basin of the Oise; and as the course of that river indicates, the surface—consisting for the most part of extensive plains—has a general slope toward the s.w. Capital, Beauvais.

OJE'DA, ALONSO DE, about 1468–1514; b. Spain; went to America with Columbus in 1492. He conducted an exploring expedition through Santo Domingo, and a second one through the Vega Real. In 1499 he left Spain at the head of a new expedition, in which Amerigo Vespucci joined him. On this voyage he discovered Venezuela, which he named. In 1501 he again set sail from Spain with Vespucci, and this time he discovered the gulf of Uraba. He went back to Spain in 1508, and, having been granted the territory of Nueva Andalucia, the modern Colombia, he brought over a colony of 300, one of whom was Francisco Pizarro. He laid the foundations of a town called San Sebastian on the gulf of Darien, and, going to Hispaniola soon after for supplies and re-enforcements, was imprisoned by the owner of the ship in which he sailed. Transported to Cuba, he spent some years in fighting the Indians. He finally returned to Hispaniola exhausted by hardships, and soon died there.

OJIBWAYS, or CHIPPEWAS, a tribe of North American Indians of the Algonquin stock inhabiting the states of Michigan, Wisconsin, Minnesota, and the shores of lake Huron and lake Superior, with a rendezvous at La Pointe. They were discovered by the French about 1640, to which nation they were friendly, but continually at war with the Sioux. They were also allies of Pontiac, the great fighting chief of the Ottawas. When first discovered they were domiciled at Sault Ste. Marie, deriving the name of *Sauteur* from that place, by which they are still known to the Canadians. They have the customs of the Algonquins; they are brave and never knew defeat in their wars with the Foxes, Sioux, or Iroquois, their constant enemies. War had thinned their ranks, and in 1660 there were only 550 at the Sault. During the revolutionary war they were on the side of the British, but came over to the side of the colonists in 1785–89, turned against them subsequently and joined the Miamis, but again made peace in 1795. In 1805 they gave up nearly all their possessions as far e. as lake Erie. In the war of 1812 they were hostile, but in 1816 participated in the general treaty of the tribes, and in 1817 gave up all their lands in Ohio. In 1851 all but a few roving bands had been removed w. of the Mississippi and had ceded all their lands to the government except small reservations. The bands living near lake Superior and in Michigan are generally peaceable and industrious. Those w. of the Mississippi still have extensive tracts of land, amounting to more than 5,000,000 acres as established by treaties 1854–67. In 1872 the government owed them $750,000. In 1884 there were a few of this tribe in Canada, 9,500 in Michigan, 2,138 in Minnesota, and 3,592 in Wisconsin, and a small number living in other states. Where Protestant and Roman Catholic churches and schools have been established, they are well attended and with encouraging results, but there are still some who maintain belief in Kitchie Manitou, the great or good spirit, and Matchie Manitou, the evil spirit. Their priests are called medas. The principal occupation is making mats, and hunting and fishing; but many are cultivating farms with success. They speak the language of the Algonquins which is found in Eliot's Indian Bible, but in their use it is so intermixed with others that few original dialect forms remain. There are a dictionary and grammars by Bishop Baraga and the Rev. G. A. Belcourt, and treatises by Schoolcraft and others. A newspaper is printed in their language; and in 1851 George Copway, a native Ojibway wrote a *Traditional History of the Ojibway Nation*, and in 1861 Peter Jones of the same tribe was the author of a *History of the Oijbway Indians*.

O. K. In the colonial period of American history, the best tobacco and rum were imported from Aux Cayes, and hence Aux Cayes (pronounced *O Kay*) came to be a popular expression for general excellence. During the presidential campaign of Gen. Jackson against Henry Clay in 1832, the opponents of Jackson put into circulation a story to the effect that the General was accustomed to write as an endorsement upon official papers the letters "O. K." to signify "oll korrect." This meaning has since that time attached itself to the letters in popular use.

O'KA, an important commercial river of central Russia, the principal affluent of the Volga from the s., rises in the government of Orel, and flows in a generally n.e. direction. It joins the Volga at the city of Nijni-Novgorod. Its length is 962 miles. Its basin, estimated at 93,207 sq. m. in extent, comprises the richest and most fertile region of Russia. The principal towns on its banks are Orel, Serpukhov, Kaluga, Riazan, and Kolomna; the most important affluents are the rivers Moscow, Prona, and Tzna. The traffic on the Oka and its tributaries is immense, being estimated at 2,000,000 tons of corn, salt, metals, timber, etc.

OKANOGAN, a co. in Washington, formed from the n. western part of Stevens co., and organized 1888; 7258 sq. m.; pop. '90, 1467. It extends on the n. to the boundary line of the state. Its mineral resources are very great. Co. seat, Conconully.

OKEECHO'BEE, Lake, s. of Brevard co., Fla., between De Soto co. and the Everglades ; is about 40 m. in its greatest, and 25 m. in the shortest, diameter ; about 1250 sq.m. ; there are many inlets, of which the Kissimee river is the largest ; the waters are drained off into the Everglades, but there is no outlet of any size. The region about is wild and made up of swamp and jungle. Alligators and poisonous snakes abound.

O'KEEFE, John, 1747–1833 ; b. Ireland ; began to study painting when six years old with West, of the Royal Irish academy. At 16 he wrote a comedy, and at 18 a play of his was produced at Dublin. Soon after he joined a theatrical company, and wrote a number of small pieces, in which he appeared at his own benefits. His *Tony Lumpkin in Town* was produced at the Haymarket, London, in 1778, and gained for its author an English reputation. He settled in London, and though threatened with blindness, continued to write for the stage. His dramatic pieces number 68, and of these 56 were played on the stage; and some of them, such as the operatic farces, *The Highland Reel*, and *The Agreeable Surprise*, and the farce *Wild Oats*, had an unusually long run. He stopped writing in 1798, when he had become almost totally blind. For some years afterward he was in straitened circumstances, till he was relieved by a pension from the crown. He published in 1826 *Recollections of the Life of John O'Keefe, written by Himself*. A collection of his pieces in verse was published in 1834 under the title of *O'Keefe's Legacy to his Daughter*. He was himself a Roman Catholic, but his son became a clergyman in the English church. His works are deficient in characterization and incident, and rough in diction, but full of broad humor and rollicking spirits.

OKEFINO'KEE SWAMP, in Baker co., Florida, and Ware, Clinch, and Charlton counties, Ga. It touches the northern boundary of Florida, and consists of a series of swamps about 180 miles in circuit. It is filled with pools and islands, some overgrown with bay trees, others with vines and brush, and the waters teem with reptiles, lizards and alligators.

OKEGHEM, also **OCKENHEIM,** Jan, an eminent Flemish musician, was born in Hainault, Belgium, about 1430. He went to France early in life, and held important civil offices. He practised his profession in France, Italy, and Austria, and was every where considered its highest ornament. Among his pupils were Pierre de la Rue, Josse Desprès, Gaspard, and Verbonnet. The invention of artificial counterpoint and of the canon have been incorrectly attributed to him. He died about 1495.

O'KELLY, James, 1735–1826 ; of Irish birth ; a noted pioneer preacher in the Methodist Episcopal church, and the leader in the first secession from it. He became a local preacher, and the people flocked to hear him. In 1778 he was admitted among the traveling ministers, and soon became prominent for earnestness and fervor. At the organization of the church in 1784 he was ordained as an elder. One of his contemporaries speaks of him as "laborious, zealous, given to prayer and fasting, . . . and hard against negro slavery in private and from the pulpit and press." His labors and influence were confined chiefly to the southern counties of Virginia and the border counties of North Carolina. In 1790 he began to show dislike to what he thought the growing power of bishop Asbury, and called on him privately to suspend his episcopal functions for one year, if he did not wish to be publicly opposed. As this menace produced no effect he made the movement in the conference of 1791 that resulted in the withdrawal of himself and a few others from the church. At first they called themselves the republican Methodists, but afterwards changed their name to the Christian church. This company was soon divided and subdivided until only a few broken societies remained. O'Kelly lived many years, witnessing through them the failure of his plans. He saw his followers forsaking him and returning to the church which they had left. But he clung to his convictions to the last. See Methodist Episcopal Church (*Divisions*).

OKEN (originally Ockenfuss), Lorenz, a celebrated German naturalist, was b. at Bohlsbach, in Würtemberg, Aug. 1, 1779. He studied at Würzburg and Göttingen; became extraordinary professor of medicine at Jena in 1807, where his lectures on natural philosophy, natural history, zoology, comparative anatomy, vegetable and animal physiology, attracted much notice. In 1812 he was appointed ordinary professor of natural science; and in 1817 commenced the publication of a journal partly scientific and partly political, called *Isis*, which continued to appear till 1848. The opinions promulgated in the *Isis* led to government interference, and Oken resigned his chair, and became a private tutor, devoting his leisure to the composition of works on natural history. In 1828 he obtained a professorship in the newly-established university of Munich, but in 1832 exchanged it for another at Zürich, where he died, Aug. 11, 1851. Oken aimed at constructing all knowledge *à priori*, and thus setting forth the system of nature in its universal relations. The two principal works in which this idea is developed are his *Lehrbuch der Naturphilosophie* (Jena, 1808–11), and his *Lehrbuch der Naturgeschichte* (3 vols. Leip. 1813–27). The former has been translated into English, and published by the Ray society under the title of *Elements of Physio-philosophy*. As Oken's philosophic system of nature was very peculiar, and quite unlike anything that had preceded it, Oken invented a nomenclature of his own, which, however, in many cases is forced and pretentious, composed for the most part of new-coined words, and difficult to remember. It therefore found little favor, and Oken was long regarded—particularly by French and English savans—as a mere dreamer and transcendental theorist; nor can

it be denied that he is largely such, infected with the worst vices of the school of Schelling, to which he belonged; but some of his "intuitions"—if we may so term his scientific suggestions—were remarkably felicitous, and in the hands of rigorous demonstrators, have led to great results. In his work *Die Zeugung* (On Generation, Bamb. 1805), he first suggested that all animals are built of vesicles or cells; in his *Beitrage zur vergleichenden Zoologie, Anatomie und Physiologie* (1806), he pointed out the origin of the intestines in the umbilical vesicle; and in the same year lighted accidentally upon the idea, since so prolific of results, that the bones of the skull are modified vertebræ. On account of this discovery he has been termed "the father of morphological science." That Oken, and not Göthe, was the original discoverer of the vertebral relations of the skull, has been conclusively shown by Owen, in a valuable notice of Oken in the *Encyclopædia Britannica.*

OKHO'TSK, Sea of, an extensive inlet of the n. Pacific ocean, on the e. coast of Russian Siberia. It is bounded on the n. by the wastes of Siberia, on the e. by the peninsula of Kamtchatka, and is partially inclosed by the Kurile islands on the s., and by the island of Sakhalin on the west. The river Amur and other rivers of Siberia enter it. Owing to its position, the sea of Okhotsk is unlikely ever to become the scene of much commerce, since its shores are frozen from November to April. On its northern shore, at the mouth of the Okhota—from which it derives its name—is the small seaport of Okhotsk. This town has been entirely superseded by the ports of Ayan and Nikolaevsk.

OKLAHOMA, a territory of the United States, between lat. 34° and 37° n., long. 96° and 103° w.; bounded on the n. by Kansas and Colorado, on the e. by the Indian Territory, on the s. by the Indian Territory and Texas, on the w. by Texas and New Mexico; gross area, 39,030 sq. miles; land surface, 38,830 sq. miles, or 24,851,200 acres. It was originally a part of the Louisiana purchase, and afterward was included in the Indian Territory. In 1886 the U. S. government bought the treaty rights of the Indians to it; in 1889 it was thrown open to settlement; on May 2, 1890, the act of its organization as a territory was completed. Subsequent cessions of land were made by the Indians, and in 1893 the U. S. government bought the strip known as the Cherokee outlet, and opened it to settlement as a part of the area of the territory. The greater part of the territory is an upland prairie; the Cimarron, Canadian, and Red rivers, with their branches, water it, and the soil, similar to that of Kansas, is well adapted to agriculture, horticulture, and stock-raising. The average annual temperature is 58.4°; mean annual rainfall, 35 inches. The agricultural industry comprises the growing of wheat, corn, cotton, castor beans, oats, barley, sorghum, alfalfa, clover, timothy, flax, peanuts, and a large variety of fruit, and each crop yields abundantly. The territory is known to contain valuable minerals and building stones, as yet undeveloped, and tracts of walnut, hickory, oak, and other important timber. Educational provisions are very liberal. In 1896 there were 88,093 children of school age; the net proceeds from leasing school lands were nearly $72,000, and the apportionment to the counties aggregated nearly $54,000. There are a university of Oklahoma at Norman; agricultural and mechanical college at Stillwater; normal school at Edmond; Kingfisher college (Cong.) at Kingfisher; St. Joseph's academy (R. C.) at Guthrie; a number of denominational schools, and several commercial colleges. The insane are cared for in a private hospital at Norman, and convicts are confined in the Kansas penitentiary at Lansing. The Roman Catholic is the strongest denomination numerically, and after it the Baptist, Methodist Episcopal, Christian, Methodist Episcopal (South), Congregational, and Presbyterian. The number of churches reported in 1896 was 384, value $265,000, communicants, 33,457. The territory is well provided with national and other banks, railroads, telegraph, telephones, and sanitary authorities. The receipts and expenditures of the general fund are nearly equal, and the total indebtedness is less than one per cent. of the taxable property, which in 1896 was assessed at $24,815,711. Pop. '90, 61,834, including 5,538 in Greer co., claimed by Texas, but decided to belong to the U. S. in 1896; pop. '96, reported by the governor, 275,587.

OKRA, or Ochro. See Hibiscus.

OKTIBBEHA, a co. in n.e. central Mississippi, watered by the Noxubee and Oktibbeha rivers, traversed by a branch of the Mobile and Ohio railroad; about 460 sq. m.; pop. '90, 17,694, includ. colored. The surface is level and heavily wooded. The soil is fertile.

OKUBO TOSHIMICHI, a Japanese statesman, b. in the province of Satsuma about 1830. As a member of the proudest of the Japanese clans, he was nurtured in the traditions of exclusivism and undying jealousy of and hatred towards the tycoons of Yedo. At the bombardment of Kagoshimi by the British fleet in 1864, he served in one of the batteries as a defender of the city. In 1868, having pushed forward the secret plans of the revolutionary coalition at Kioto, he precipitated the crisis of six hundred years, and stepped into the front rank of leaders in the new government. He urged the unfurling of the mikado's brocade banner which stamped the tycoon as a traitor. He startled even the new government by urging the removal of the capital from Kioto to Yedo, the abandonment of the habits of excessive reverence to the sovereign, and his entrance into public life as the active ruler of his people. Such was the lively effect of Okubo's memorial, that within one month the mikado publicly took the oath on which the government of New Japan is built. The national capital was changed to Yedo, now called Tokio. Okubo thenceforward represented in his own person the foreign influences which have shaped the course of Japan since 1868. He was assassinated in 1878.

OKUMA SHIGE'NOBU, a Japanese statesman b. in the province of Hizen in 1837. He was among the number of progressive young men who early studied the Dutch language and sciences, going to Nagasaki for that purpose; whence he was called to Tokio, to a post in the foreign office. He was transferred to the finance department in 1870. There his conspicuous abilities brought him to the notice of the mikado, who created him a Sangi or imperial counselor. In 1871 he was made president of the commissioners to the Vienna exposition. The ability displayed by Mr. Okuma Shigenobu in handling the finances of an Asiatic nation while in a transitional condition from mediæval feudalism to modern forms of government, and through all the perplexities incident to not less than four great insurrections, have been acknowledged by many competent foreign observers. Under his administration the hereditary incomes of the samusai or gentry have been capitalized; an internal revenue and national banking system, based on those of the United States, have been established; the local paper money issues of the daimios replaced by national currency; loans raised, and the national credit maintained in Europe and at home. Shigenobu was, in 1880, a leading member of the Japanese cabinet, but he resigned his office in 1891.

OLAF, the saint, one of the most revered of the early Norwegian kings, was born in 995; and after having distinguished himself by his gallant exploits, and made his name a terror in several warlike expeditions on the coasts of Normandy and England, succeeded, in 1015, in wresting the throne of Norway from Eric and Svend Jarl. The cruel severity with which he endeavored to exterminate paganism by fire and sword, alienated the affection of his subjects, many of whom sought security from his persecution in the territories of Knut or Canute the great, king of Denmark; and it was only through the powerful aid of his brother-in-law, the Swedish Anund Jacob, that his authority could be upheld. Olaf's hot-headed zeal, however, after a time exhausted the patience of the people, who hastened to tender their allegiance to Knut, on his landing in Norway in 1028, when Olaf fled to the court of his brother-in-law, Jaroslav of Russia, who gave him a band of 4,000 men, at the head of whom he returned in 1030, and gave Knut battle at Stiklestad, where Olaf was defeated by the aid of his own subjects, and slain. The body of the king, which had been left on the field of battle, and buried on the spot by a peasant, having begun to work miracles, his remains were carefully removed to the cathedral of Trondhjem, where the fame of their miraculous power spread far and wide, attracting pilgrims from all parts of the Scandinavian peninsula. Olaf was solemnly proclaimed patron saint of Norway in the succeeding century; and from that period till the reformation he continued to gather round him a rich heritage of mythical legends and popular sagas, the memory of which still lingers in the folk-lore of Norway. In 1847 the order of Olaf was created, in honor of the saint, by King Oscar I. of Sweden and Norway.

ÖLAND. See ŒLAND.

OLBERS, HEINRICH WILHELM MATTHÄUS, a celebrated German physician and astronomer, was born at Arbergen, a small village of Bremen, Oct. 11, 1758. He studied medicine at Göttingen from 1777 till 1780, and subsequently commenced to practice at Bremen, where, both as a physician and as a man, he was highly esteemed by his fellow-citizens. In 1811 he was a successful competitor for the prize proposed by Napoleon for the best "Memoir on the Croup." Olbers wrote little on medical subjects, for, from 1779, all the leisure time which he could abstract from professional occupations was devoted to the enthusiastic study of astronomy. The first thing which brought him into notice was his calculation of the orbit of the comet of 1779, which was performed by him while watching by the bedside of a sick patient, and was found to be very accurate. Comets were the chief objects of his investigation, and he seems to have been seized with an irresistible predilection for these vagabonds of the solar system, which his two important discoveries of the planets Pallas (1802) and Vesta (1807) could not diminish. In 1781 he had the honor of first re-discovering the planet Uranus, which had previously been supposed, even by Herschel himself, to be a comet, and which had been sought for in vain. He also discovered five comets, in 1798, 1802, 1804, 1815, and 1821, all of which, with the exception of that of 1815 (hence called *Olbers's comet*), had been some days previously observed at Paris. His observations, calculations, and notices of various comets, which are of inestimable value to astronomers, were published in the *Annuaire of Bode* (1782–1829), in the *Annuaire of Encke* (1832), and in three collections by the baron de Zach. Most of these calculations were made after a new method, discovered by himself, for determining the orbit of a comet from three observations; a method which, for facility and accuracy, he considered as greatly preferable to those then in use. A detail of it appeared in a journal published at Weimar (1797), and a new edition by Encke in 1847. Olbers was one of that small band of astronomers which included also Schröter, Gauss Piazzi, Bode, Harding, etc., who in the first ten years of the 19th c. devoted their energies to the observation of those planets which were coming to light between Mars and Jupiter. As above stated, two of them, the second and fourth in order of discovery, were detected by Olbers himself; and the general equality of the elements of the four planetoids led him to propound the well-known theory, that these, and the other planetoids (q.v.) since discovered, are but fragments of some large planet which formerly revolved round the sun at a distance equal to the mean of the distances of the planetoids

from the same luminary. It was this theory which led him, after the discovery of Pallas, to seek for more fragments of the supposed planet, a search resulting in the discovery of Vesta. Olbers also made some important researches on the probable lunar origin of meteoric stones, and invented a method for calculating the velocity of falling stars. Olbers died at Bremen, Mar. 2, 1840; and in 1850 his fellow-citizens erected a marble statue in honor of him. Olbers, as a writer, possessed great powers of thought, combined with equal clearness and elegance of expression. The dissertations with which he enriched the various branches of astronomy are scattered through various collections, journals, and other periodicals.

OLDBURY, a parish and manufacturing t. of England, in the county of Worcester, 5½ m. w. by n. of Birmingham, on the river Teme. It contains numerous churches, meeting-houses, and schools. Owing to the extension of the iron trade, Oldbury has greatly increased in size and prosperity. There are coal and iron mines in the neighborhood; and in the town, iron, steel, aluminium, chemicals, etc., are manufactured. The Stour Valley railway passes close by the town, and there is a station here. Pop. 20,400.

OLDCASTLE, Sir JOHN, once popularly known as the "good lord Cobham," whose claim to distinction is that he was the first author and the first martyr among the English nobility, was born in the reign of Edward III.; the exact year is not known. He acquired the title of lord Cobham by marriage, and signalized himself by the ardor of his attachment to the doctrines of Wycliffe. At that time there was a party among the English nobles and gentry sincerely, and even strongly desirous of ecclesiastical reform —the leader of which was "old John of Gaunt—time-honored Lancaster." Oldcastle was active in the same cause, and took part in the presentation of a remonstrance to the English commons on the subject of the corruptions of the church. At his own expense he got the works of Wycliffe transcribed, and widely disseminated among the people, and paid a large body of preachers to propagate the views of the reformer throughout the country. During the reign of Henry IV. he commanded an English army in France, and forced the duke of Orleans to raise the siege of Paris; but in the reign of Henry V. he was accused of heresy, and having, in a disputation with his sovereign, declared that "as sure as God's word is true, the pope is the great Antichrist foretold in Holy Writ," he was thrown into the Tower, whence, after some time, he escaped, and concealed himself in Wales. A bill of attainder was passed against him, and 1000 marks set upon his head. After four years' hiding he was captured, brought to London, and—being reckoned a traitor as well as a heretic—he was hung up in chains alive upon a gallows, and fire being put under him, was burned to death, Dec., 1417. Oldcastle wrote *Twelve Conclusions addressed to the Parliament of England*, several monkish rhymes against "fleshlye livers" among the clergy, religious discourses, etc.—See *Life of Oldcastle*, by Gilpin.

OLD CATHOLICS, those members of the Roman Catholic church in Germany who, in 1870, took the ground that the dogma of the immaculate conception of 1854, the encyclical and syllabus of 1864, and the decree of papal infallibility had so changed the status of the Roman church that no man could continue in its communion and still adhere to the Catholic church of Christ. They disputed the œcumenical character of the Vatican council, and, although the promoters of the movement included *before* the promulgation of the decree the German and Austrian bishops who had entered a united protest against it, the bishops withdrew and submitted *after* its proclamation, July 8, 1870. A large number of German theologians and civilians, however, denounced the course of the bishops, and Prof. Michaelis openly charged the pope with heresy and apostasy. This was followed by a formal declaration and protest by Dr. Döllinger and 43 other professors of the university of Munich against papal infallibility and the validity of the Vatican decrees. A conference was held at Nuremberg, Aug., 1870, which, though purely consultative, drew up a united protest against the œcumenical character of the vatican council, and the binding authority of its acts. Prominent among the signers appeared the weighty names of Döllinger, Friedrich, Schulte, Michælis, and Lutterbeck.

This formal protest induced the bishops forthwith to initiate repressive measures. In a pastoral, Sept. 10, they sounded the alarm and warned all true Catholics to submit; and when it became evident that the movement had not become popular with the clergy and laity, they went further in depriving the protesting theologians of their functions, excommunicated them, and forbade students to frequent their lectures. With the exception of a few lukewarm, timid adherents, the great body of the reformers remained firm in their convictions. Döllinger, in a letter to his diocesan, dated Mar. 28, 1871, declared that, "as a Christian, as a theologian, as an historian, and as a citizen," he could not accept the new dogma. He was excommunicated for it April 17, 1871. His excommunication became the starting point of revived energy throughout Germany. In a formal declaration of principles the promoters of the movement said: "Faithful to the inviolable duty of every catholic Christian, which is also a thing not denied by pope or bishop, to hold fast by the ancient faith, and to reject innovations, even if proclaimed by an angel from heaven, we persist in the rejection of the Vatican dogma." The first old Catholic congress met at Munich, Sept. 22, 1871. It was attended by about 300 delegates from Germany, Austria, and Switzerland, and friends from Holland, France, Russia, England, and elsewhere. In the resolutions adopted the body defined its theological

status, and said with regard to its relations to other members of the Catholic church: "We declare that the reproach of Jansenism against the Utrecht church is causeless; there is no dogmatic difference between her and ourselves. We hope for reunion with the oriental Greek and with the Russian churches, whose separation was without absolute cause, and is based on no irreconcilable dogmatic difference. We expect, in the assumption of the reforms which we attempt, and in the way of science, and of progressing Christian knowledge, a gradual understanding with the Protestant and Episcopal churches." The disposition of Döllinger to stave off a complete ecclesiastical organization had to yield to the predominant opposite feeling. Meanwhile the old Catholic congregations were without episcopal supervision and ministrations, and the Bavarian congregations secured the friendly offices of the archbishop of Utrecht in the administration of confirmation. When the second old Catholic congress met at Cologne, Sept., 1872, the work of organization made progress. The church was to depend for episcopal functions temporarily on the bishops of the old Catholic church of Holland, and of the United Armenian church, whose attitude to Rome was analogous with their own. A commission was appointed to take order for the election of a bishop by the clergy and laity. Intercommunion with the Eastern and Anglican churches was sought to be established. The claim to recognition by the state, with a share of the church property, was asserted. In the following year (June 4, 1873) Dr. Joseph Hubert Reinkens, professor of theology in the university of Breslau, was elected missionary bishop for Germany, and consecrated Aug. 11, at Rotterdam, by the bishop of Deventer. The third Old Catholic congress was held Sept. 12–14 at Constance, whose crowning act was the adoption of a synodal constitution, which provides for diocesan, provincial, and general synods, composed of clerical and lay delegates, the latter on the basis of one delegate for every 200 constituents. The first synod, at Bonn, May 27, 1874, was attended by 28 clerical and 60 lay delegates. In the direction of reform its action was marked by conservative caution; confession, fasting and abstinence, and priestly celibacy were retained, the prevailing sentiment being the correction of Roman abuses and corruptions to the purer practice of the early church. The obnoxious features of so-called mixed marriages, i.e., marriages between Roman Catholics and Protestants, were set aside; the drafting of a new ritual and catechism was assigned to committees; a synodal representation or standing committee was appointed. The church at that time reported the existence throughout Germany of 132 parishes and societies, numbering about 25,000 souls, 41 priests, and 12 theological students. The 4th congress, at Freiburg, in Baden, Sept. 5—9, 1874, took action to establish an equitable legal status of the Old Catholic church in Germany, and a *pro rata* share of the church property. The congress was followed by a conference aiming at church unity, at Bonn, Sept. 14–16, 1874, at which Dr. Döllinger presided, and in which, besides old Catholics, Easterns and Anglicans participated. It was unanimously agreed that the insertion of the words *filioque* in the Nicene creed was unlawful, and that it was very desirable to have them expunged by the concurrent action of the different churches. Other points of agreement amongst Old Catholics, Anglicans, and orientals were also discussed; e.g., the place of the Apocrypha in the canon; the relation of versions of the Bible to the original text; the proper language (a dead one or the vernacular) for the conduct of divine service; the doctrines of supererogation and indulgences, and of the immaculate conception. The prevailing sentiment on these and kindred themes was decidedly anti-papal, and agreement on them was regarded as a possible basis for the unification of Christendom. See DÖLLINGER, JOHN J. I. VON.

The 5th Old Catholic congress was at Breslau, Silesia, Sept. 22–24, 1876, thinly attended, in part on account of the great distance of that city from the centers of the Old Catholic movement, and in part also on account of waning interest. The latter circumstance holds good also concerning the 6th congress, held Sept., 1878, at Mayence, of which no official report has been published. There is doubtless great disappointment in the comparatively slow progress of the movement, which has failed to enlist popular enthusiasm, but the tide seems to have set in the direction of greater growth and revived energy, as will be seen from a subsequent paragraph.

The national church of Holland, generally but erroneously styled Jansenist, has heartily entered into the Old Catholic movement, and may be regarded as occupying identical ground.

The relation of the Old Catholic church of Germany to the Anglican communion is very friendly. Representatives of the church of England and the Protestant Episcopal church in the United States have been present at most of their congresses, and several of their synods; and the Anglican communion may be said to be in cordial sympathy with the Old Catholics. The presence of Bishop Herzog at the general convention (Prot. Epis.) held at New York, Oct., 1880, has tended to strengthen that feeling (see below).

In Switzerland the old Catholic reform had a more pronounced effect on the people than in Germany. At Geneva it carried with it the majority of the Roman Catholics of the city. The cantonal government, moreover, aided it by speedy recognition. An old Catholic conference, held at Olten, Aug. 31, 1873, resolved upon drafting a constitution for a Swiss national church, and electing a bishop or bishops. At a like conference at the same place, Sept. 21, 1874, a constitution was adopted which provides for a national synod of "the Christian Catholic church of Switzerland," by which the Swiss Old Catholics are now known. Pastor Herzog of Olten was subsequently chosen and consecrated

bishop. The statistics of the church, presented to the synod in 1877, were: 66 parishes and 70 priests; baptisms for the year, 1182; number of persons confirmed, 3,098.

In Austria the Old Catholic movement has been very slow. There are several congregations in Bohemia, and under the influence of recent political changes the first lawfully authorized Old Catholic synod of Austria was held at Vienna, June 29, 1880, which adopted synodal and parochial regulations, and decreed the use of the language of the people in divine service.

In Russia, in the province of Volhynia, are also several Bohemian communities attached to the Old Catholic church, served by three priests, recognized and supported by the state, who were, in Dec., 1879, taking steps looking towards the formation of a synodal council.

At the Swiss Christian Catholic synod, at Geneva, May 20, 1880, Bishop Herzog reported that owing to peculiar state complications the church had lost in the canton of Bern 12 parishes and 10 priests; but that they numbered throughout Switzerland 59 priests in 48 established parishes. At this synod a prayer-book, framed after an Anglican model, was authoritatively set forth for present use. The executive council of Switzerland has issued a decree defining the right of possession of churches, to wit, that the majority in a parish, be they Roman or Old Catholic, are invested with the ownership, but that the minority are also entitled to worship in them without paying an indemnity.

The 7th Old Catholic congress, at Baden-Baden, Sept. 12–14, 1880, was attended by 150 delegates, at which Bishop Reinkens reported favorably of progress in Germany, in which now are somewhat less than 50,000 adherents. The congress resolved unanimously upon the universal use of the German liturgy in public worship, and adopted a number of theses, which accurately describe the present attitude of the Old Catholics towards the Latin church.

1. It is impossible that there should be a real contradiction between belief, based on historical testimony, of the fundamental truths of Christianity, and science, based on the absolute facts of nature and mind. They mutually protect, aid, and complete each other. 2. The independence of national churches accords as much with the universal character of the church as national peculiarities in the state, in art, and in science accord with the general objects of culture. 3. It is an unfortunate error of many Protestants to regard that church, which the adherents of the vatican are bound to acknowledge as alone saving, as a shield of faith, a prop of authority to the state or society, and a bulwark against destructive social tendencies; and to receive its adherents as conservative allies. 4. History, the task and duty of self-preservation compel the German empire to oppose the vatican system. 5. Negotiations with the infallible pope, or his organs, on all matters belonging to the legislative functions and the authority of the state should be repudiated. All such transactions conduce to the dissolution of the national state.

Ground, somewhat similar to that occupied by the Old Catholics, is held by the *Armenian* church, which, since 1867, felt greatly aggrieved by the course of the pope, who, in his bull *Reversurus*, changed the manner of choosing their patriarchs and bishops. The third vatican decree, declaring the pope's universal episcopate, was especially distasteful to them. In Oct., 1870, they declared that while they had not fully decided as to the vatican council, whose decrees many had refused to accept, who yet remained Catholics, they would not receive any decree which set aside that of Florence. In Nov., 1871, the pope excommunicated those of them who would not yield. They deposed their patriarch, and elected in his place Kiepeliau, archbishop of Diarbekir. They have since been put in possession, by the Turkish government, of many of the united Armenian churches.

In France, M. Hyacinthe-Loyson may be regarded as generally representing Old Catholic views. His aim is the reformation of the Roman Catholic church in that country on the basis and principles of the old Gallican church.

OLD COLONY, a popular name for Plymouth county, Mass.

OLD DOMINION is a name popularly given to the State of Virginia. The origin of this title has been traced to various sources, but the following seems the most probable one: In Captain John Smith's *History of Virginia*, published in 1629, he gives a map which includes all of the British settlements in America. On this map, the colony, which was afterwards called the New England Colony, is designated as "New Virginia" in contradistinction to the present State of Virginia, which is designated as "Ould Virginia." It is also known that, from the settlement of this colony to the time of the Revolution, in all British letters and documents, Virginia is designated as the "Colony and Dominion." The name "Old Dominion" seems to have been selected from both of these titles.

OLDENBERG, Hermann, philologist, was born in Hamburg in 1854, and was educated at Göttingen and Berlin. Upon graduation at the latter university, he became there a privat-docent, and later, professor extraordinarius, whence he was called to Kiel, in 1889, as Professor of Sanskrit and comparative philology. Dr. O. has published *The Dîpavamsa* (Lond., 1879); *The Vinaya Pitakam*, 5 vols. (Lond., 1879–83); *The Theragâthâ* (Lond., 1883); *Vinaya Texts* (1884); *Buddha, sein Leben, seine Lehre*, etc. (Berlin, 2d. ed., 1890); and *Die Hymnen des Rigveda* (Berlin, 1888).

OLDENBURG, a grand-duchy of northern Germany, consisting of three distinct and widely separated territories, viz., Oldenburg proper, the principality of Lübeck, and the principality of Birkenfeld. The collective area of these districts is now 2479 square miles. Pop. in '95, 373,739. Oldenburg proper, which comprises five-sixths of this area and most of the population, is bounded on the n. by the German ocean; e., s., and w. by the kingdom of Hanover. The principal rivers of Oldenburg are the Weser, the Hunte, and the Haase, Leda, and other tributaries of the Ems. Of great importance for navigation is the Ems-Jacle canal, which connects the Prussian naval station of Wilhelmshaven with the Dollart. The grand-duchy of Oldenburg proper is divided into 6 districts and the baronies of Jever and Kniphausen. The country is flat, belonging to the great sandy plain of northern Germany, and consists for the most part of moors, heaths, marsh or fens, and uncultivated sandy tracts; the climate is damp and malarious. Agriculture and the rearing of cattle constitute the chief sources of wealth. The horses and cattle raised in the marsh lands are excellent of their kind, and in great request; the horse-market at Oldenburg is the most important in the German empire. The scarcity of wood for fuel, and the absence of coal, are compensated for by the existence of turf-beds of enormous extent. Manufactures are advancing, especially in cigars. The country is traversed by canals which serve for drainage. There are, however, numerous distilleries, breweries, and tan-yards in all parts of the duchy.

The receipts for the collective grand-duchy were, in the budget for '96, 9,210,571 marks, and the expenditure, 10,445,551. The public debt, at the beginning of 1896, amounted to 46,614,244 marks.

The principality of Lübeck, consisting of the secularized territories of the former bishopric of the same name, is surrounded by the duchy of Holstein, and is situated on the banks of the rivers Schwartau and Trave. It contributes 199 sq. m. to the general area of the grand-duchy, and '95, 83,693 inhabitants to the collective population. It is divided into four administrative districts. It has several large lakes, as those of Plön—noted for its picturesque beauty—Keller, Uklei, and Gross-Eutin; while in regard to climate, soil, and natural products, it participates in the general physical characteristics of Holstein. The chief town is Eutin (pop. '90, 4625), pleasantly situated on the lake of the same name, with a fine castle surrounded by a magnificent park.

The principality of Birkenfeld, lying s.w. of the Rhine, among the Hundsrück mountains, and between Rhenish Prussia and Lichtenberg, is an outlying territory, situated in lat. 49° 30′—49° 52′ n., and in long. 7°—7° 30′ e. Its area is 192 sq. m., and its pop. '95, 42,258. The soil of Birkenfeld is not generally productive; but in the lower and more sheltered valleys it yields wheat, flax, and hemp. Wood is abundant. In addition to the rearing of cattle, sheep and swine, the polishing of stones, more especially agates, and the manufacture of jewelry constitute the principal source of industry. The only river is the Nahe.

Oldenburg is a constitutional ducal monarchy, hereditary in the male line of the reigning family. The constitution, which is based upon that of 1849, revised in 1852, is common to the three provinces, which are represented in one joint chamber, composed of 35 members, chosen by free voters. The principalities of Lübeck and Birkenfeld have, however, their special provincial councils, the members of which are likewise elected by votes; while each governmental district within the provinces has its local board of councilors, and its several courts of law, police, finance, etc.; although the highest judicial court of appeal, and the ecclesiastical and ministerial offices, are located at Oldenburg.

History.—The territory now included in the grand-duchy of Oldenburg, was in ancient times occupied by the Teutonic race of the Chauci, who were subsequently merged with the more generally known Frisii, or Frisians; and the land, under the names of Ammergau and Lerigau, was for a long period included among the dominions of the dukes of Saxony. In 1180, the counts of Oldenburg and Delmenhorst succeeded in establishing independent states from the territories of Henry the Lion, which fell into a condition of disorganization after his downfall.

This family has continued to rule Oldenburg to the present day, giving, moreover, new dynasties to the kingdom of Denmark, the empire of Russia, and the kingdom of Sweden. See OLDENBURG, HOUSE OF. On the death, in 1667, of count Anthony Gunther, the wisest and best of the Oldenburg rulers, his dominions, in default of nearer heirs, fell to the Danish reigning family, and continued for a century to be ruled by viceroys nominated by the kings of Denmark. This union was, however, severed in 1773, when, by a family compact, Christian VII. made over his Oldenburg territories to the grand-duke Paul of Russia, who represented the Holstein-Gottorp branch of the family. Paul having renounced the joint countships of Delmenhorst and Oldenburg in favor of his cousin, Frederick Augustus, of the younger or Kiel line, of the House of Oldenburg, who was prince-bishop of Lübeck, the emperor raised the united Oldenburg territories to the rank of a duchy. The present reigning family is descended from duke Peter Friedrick Ludwig, cousin to the prince-bishop, Frederick Augustus. For a time the duke was a member of Napoleon's Rhenish confederation; but French troops having, in spite of this bond of alliance, taken forcible possession of the duchy in 1810, and incorporated it with the French empire, the ejected prince joined the ranks of the allies. In recognition of this adhesion, the congress of Vienna transferred nearly 400 sq. m. of

territory, with Hanoverians and also inhabitants of the quondam French district of the Saar, altogether 50,000 in number, to the Oldenburg allegiance. From these new acquisitions were organized the district Amme, and the principality of Birkenfeld; while Oldenburg was raised to the dignity of a grand-duchy. The revolutionary movement of 1848 was quite as productive of violent and compulsory political changes in this as in other German states; and in 1849, after having existed for centuries without even a show of constitutional or legislative freedom, it entered suddenly into possession of the most extreme of liberal constitutions. The reaction in favor of absolutism, which the license and want of purpose of the popular party naturally induced all over Germany, led in 1852 to a revision and modification of the constitution, which, however, in its present form, contains the essential principles of popular liberty and security, though it must be confessed this is more verbal than real. In the German-Italian war, Oldenburg sided with Prussia, and afterward joined the North German confederation. The duchy concluded, in 1866, a treaty with Prussia, by which the grand-duke renounced his claims to the Holstein succession, for the cession to him of a small portion of Holstein territory, and an indemnity of 1,000,000 thalers. Oldenburg is now included in the German empire.

OLDENBURG, capital of the grand-duchy of the same name, is pleasantly situated on the banks of the navigable river Hunte, 25 m. w.n.w. of Bremen. Pop. '95, with garrison, 25,472. Oldenburg is the seat of the administrative departments, and the focus of the literary, scientific, and commercial activity of the duchy. It has a normal school, a military academy, a public library of 160,000 vols., a picture-gallery, museum, etc. The grand-ducal palace is worthy of note for its fine gardens, its valuable pictures, and other art collections, and its library. The principal church is St. Lambert's, containing the burying vaults of the reigning family. Oldenburg is the seat of an active river trade, and is noted for the great cattle and horse fairs which are annually held here in the months of June and August.

OLDENBURG, HOUSE OF, which lays just claim to being one of the oldest reigning families of Europe, has been rendered still more illustrious by various matrimonial alliances, which, in the course of ages, have successively been the means of creating new royal dynasties. Thus, for instance, in 1448, a scion of this house being elected king of Denmark, under the title of Christian I., became the progenitor of the Danish house of Oldenburg, the imperial house of Russia, the late royal family of Sweden, and the collateral and junior Danish lines of Augustenburg, Kiel, and Sonderburg-Glücksburg. Christian owed his election to the recommendation of his maternal uncle, duke Adolph of Schleswig, who, when the throne was offered to him on the sudden death of king Christopher, refused, on the ground of age, and proposed Christian of Oldenburg, who, as the direct descendant of Eric Glipping's daughter, princess Richissa, was allied to the old extinct house of Denmark. The death, in 1459, of Adolph, duke of Schleswig and count of Holstein, without male heirs, opened the question of succession to those states, which has since become one of such vexatious import. The ancient law of Denmark recognized hereditary fiefs only in exceptional cases; crowned fiefs being generally held for life or merely for a time *ad gratiam*. Such being the case, Schleswig might, on the death of Adolph, have been taken by the crown as a lapsed tenure; but Holstein, being held under the empire, would have been separated from it. Adolph and his subjects were alike anxious that Schleswig and Holstein should continue united; but although the Schleswig estates, at the wish of the duke Adolph, had recognized Christian as successor to the duchy before his accession to the throne of Denmark, the Holstein chambers were divided on the question of succession, the majority showing a preference for the claims of the counts of Schauenburg, who were descended from *male* agnates of the Holstein house. Christian in his eagerness to secure both states, was willing to sacrifice his rights in Schleswig to his schemes in regard to Holstein; and having bought over the Holstein nobles by bribes and fair promises, he was elected duke of Schleswig and count of Holstein at Ribe in 1460, where he signed a deed, alike derogatory to the interests and unworthy the dignity of his crown. In this compact, by which he bartered away the just prerogatives and independence of himself and his successors, for the sake of nominal present gain, he pledged his word for himself and his heirs, that the two provinces should always remain undivided, "*ewig bliben toosamende ungedeelt*," and not be dismembered by division or heritage. This document, which remained for ages unknown or forgotten, was discovered by the historian Dahlmann amid the neglected papers of the Holstein state achives at Preetz, and proclaimed in 1848 by that ardent admirer of Germany as the unchangeable fundamental law of the Schleswig-Holstein provinces. The confusion, dissension, and ill-will to which this fatal deed has given rise, are the fruits which Christian's unscrupulous desire to secure power at any cost has produced for his descendants, whose complicated claims on the duchies, resulted, in 1864, in a war which cost Denmark a large portion of her territorial possession. From Christian I. descend two distinct branches of the Oldenburg line: 1. The royal dynasty, extinct in the male line in Frederick VII., late king of Denmark, and the collateral branches of Sonderburg-Augustenburg and Sonderburg-Glücksburg; 2. The ducal Holstein-Gottorp line, descended from duke Adolph, who died in 1586, and was the second son of king Frederick I. This prince had received, during his father's life-time, a portion of the Schleswig and Holstein lands, which he was permitted, on the accession of his elder brother, Chris-

tian III., to retain for himself and his heirs. This line became illustrious by the marriage of prince Karl Friedrich, the son of Hedwig-Sofia, eldest sister of Charles XII. of Sweden (a direct descendant of duke Adolph) with the grand-duchess Anna, daughter of Peter the great, and thus gave to Russia the dynasty which still occupies the imperial throne; while Adolph-Friedrich, a cousin prince Karl Friedrich, by his election to the throne of Sweden in 1751, added another crown to those already held by the house of Oldenburg. The conduct of his descendants rendered the new dignity short-lived, for with the abdication of Gustavus IV., in 1809, the Holstein-Gottorp dynasty became extinct in Sweden.

The complicated relations of the house of Oldenburg in regard to the Danish succession, after giving rise to much angry discussion among the princes interested in the question, and the Danish people themselves, led the great powers to enter into a treaty, known as the London treaty of 1852, for settling the question of succession, on the ground that the integrity of the Danish monarchy was intimately connected with the maintenance of the balance of power and the cause of peace in Europe. England, France, Austria, Prussia, Russia, Sweden, and Denmark, were parties to this treaty, in the first article of which it was provided, that on the extinction of the male line of the royal house, prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, and his male heirs, according to the order of primogeniture, should succeed to all the dominions, then united under the sway of the king of Denmark. The rights of succession, which rested with the Augustenburg family, were forfeited by a compact with the duke of Augustenburg, entered into for the surrender of his claims, in consideration of a sum of money paid to him by Denmark. The duke's morganatic marriage, and his subsequent rebellion, in 1848, against the Danish king, were the causes which led to the arrangement of this family compact on the existing terms. This treaty, known as the London protocol of May, 1852, was followed in October of the same year by the publication of a supplemtary clause, which stipulated, that on the extinction of the heirs-male of prince Christian of Schleswig-Holstein-Sonderburg-Glücksburg, the Holstein-Gottorp, or imperial Russian line should succeed to the Danish dominions. This article, even more than the original clauses of the treaty, met with the strongest opposition among the Danes, and after being twice rejected in the Landsthing, the London treaty was only ratified after a new election of members, and on the assurance of the king that in excluding all female cognate lines from the succession, there was no definite intention of advancing the claims of Russia. King Frederick's death, in 1863, brought on the crisis of the much-vexed question of the Danish succession; and although the London treaty was so far followed that prince Christian succeeded as king of Denmark, the evils that were anticipated from the measure were in 1864 made painfully manifest; for the duke of Augustenburg, notwithstanding the renunciation by his family of all claims to the succession, appealed to the federal diet for the recognition of his rights on Holstein; and the German powers, glad of a pretext to extend their influence beyond the Eider, occupied the Schleswig-Holstein territory (see SLESWICK), and succeeded, by force of superior numbers, in advancing the boundary of Germany to the borders of Jutland. This led, however, to grave results affecting the whole of Europe. Prussia and Austria took possession of the conquests in their own names. The former power offered the latter pecuniary compensation for their assistance in the war, while indicating a determination to annex the duchies to its own dominions. Austria refused, and this led to the disastrous battle of Königgratz.

OLDHAM, a co. in n.w. Kentucky, bordering on Indiana, from which it is separated by the Ohio river, intersected by the Louisville and Nashville railroad; 170 sq. m.; pop. '90, 6754. Co. seat, Lagrange.

OLDHAM, a parliamentary borough and flourishing manufacturing t. of England, in the co. of Lancashire, stands on the Medlock, 7 m. n.e. of Manchester. It owes its rapid increase in population and in wealth to the extensive coal-mines in the vicinity, and to its cotton manufactures, which embrace more than 12,000,000 spindles, or nearly one-third of those employed in cotton spinning in the United Kingdom. The damp air of the region gives the humidity necessary for the spinning of yarn. It is not only the great center of the cotton manufacture, but is also celebrated for its manufactures of machinery for cotton spinning and woolen weaving machinery. The parish church, the town-hall, the blue-coat, and the grammar-schools, are the chief edifices. Pop. '91, 183,900.

OLDHAM, JOHN; about 1590–1635; b. England; emigrated to Plymouth in 1623, and in association with Lyford endeavored to establish a separate worship on the Sabbath. He was also credited with the intention of changing the form of government at Plymouth. In 1633, he went from Dorchester to what is now Windsor, Conn., and his exploration resulted in the settlement of that town. He represented Watertown in the general court of 1634, and was killed in 1635 by Indians who came aboard his ship to trade. His murder brought on the Pequot war.

OLDHAM, JOHN, 1653–83; b. England; educated at Oxford, where he won distinction by his proficiency in Latin and Greek, and by his English poetry. Want of means forced him to leave the university in 1674, and he soon secured employment as an usher at

the free school in Croydon Surrey. The first of his published poems was a Pindaric ode, on the death of his friend, Richard Morwent; it is rich in comparisons, and shows a tenderness in strong contrast with the fierce satire of his later works. He continued to cultivate poetry as a relief from the drudgery of "beating Greek and Latin for his life," as he describes it; and some of his MS. poems attracted the notice of the reigning London wits, sir Charles Sedley, the earl of Dorset, and the earl of Rochester, who paid him a visit at Croydon. By their influence he was made tutor to the sons of sir Edward Thurlow, with whom he lived till 1680. At this time he was engaged upon his *Satires upon the Jesuits*, which appeared in 1679, when the excitement in regard to the so-called "Popish plot" was at its height. They are full of bitterness and Protestant rancor, and gained for Oldham a high reputation. While tutor to the son of sir William Hicks, he became acquainted with Dr. Richard Lower, a famous London physician, and was induced to study medicine; but he abandoned it at the end of a year and, settling in London, devoted himself to literature. He was an intimate friend of Dryden and the other wits and satirists of the day. He refused the post of private chaplain to the earl of Kingston, who was his patron, and had proposed to have him enter holy orders. His last poem is called *A Sunday Thought in Sickness*, and is of a devotional character. His poems are forcible and vehement, but defective in versification. Oldham, in the opinion of Hallam, "ranks next to Dryden; he is spirited and pointed.

OLDHA'MIA, a genus of fossil zoophytes, dedicated by Forbes to Prof. Oldham, who was their discoverer. Only two species are known, but they are of peculiar interest, because, with their associated worm-tracts and burrows, they are the first distinct evidence of life on the globe. They exist as mere tracings on the surface of the laminæ of metamorphosed shales, all remains of the substance of the organism having entirely disappeared. The form of the hard polypidom is preserved, and shows a jointed main stem, giving off at each joint, in the one species, a circle of simple rays, and in the other a fan-shaped group. Forbes pointed out their affinities in some respects to the hydrozoa, and in others to the polyzoa. Kinahan, who described the genus at some length, considers them to have been hydrozoa allied to sertularia; while Huxley places them among the polyzoa. See illus., Silurian Fossils, vol. XIII.

OLD HUNDREDTH TUNE, The, a favorite hymn tune. Its authorship is unknown, but it is thought to be an adaptation of a popular tune of the 15th century. The melody was adapted to Beza's version of Psalm cxxxiv., included by him in the Geneva Psalter, the first copy of which, with his additional tunes, was printed in 1554. It was arranged by Louis Bourgeois, the musical editor of that book. The same tune is found with different endings in the Flemish Psalter (Antwerp, 1540); in the Dutch Psalter London (1561); in the Psalms with music by Marot and Beza (Lyons, 1563); in Claude Goudimel's famous collection of tunes (Paris, 1565); and also in English and German tune-books. In England it was sung to Kethe's version of the hundredth Psalm "All people that on earth do dwell," and called the "Hundredth Tune." The word old was added in Brady and Tate's new version of the Psalter (London, 1596). In America it is called "Old Hundred." Another name is "Savoy." See the Rev. W. H. Havergal's monograph of this tune with 28 specimens of the melody as sung from 1563 to 1847; Bovet's *Histoire du Psautier des églises réformées* (Neuchâtel and Paris 1872); and Douen, *Clément Marot et le Psautier Huguenot* (2 vols., Paris, 1878–'9).

OLD MAN OF THE MOUNTAIN. See Assassins.

OLDMIX'ON, John, 1673–1742; b. England. He superintended and revised the first edition of Bishop Kennett's collection of English historians. In 1708 he published *The British Empire in America*, 2 vols., later edition in 1741. In 1715–16 *Memoirs of North Britain* and *Memoirs of Ireland;* in 1727, *Clarendon and Whitlock Compared;* and in 1730, '35, '39, 3 vols., containing histories of the reigns of Henry VIII., Edward VI., Mary and Elizabeth, also of the Stuarts, William and Mary, Anne, and George I. In 1742 he published *Memoirs of the Press, Historical and Political, for Thirty Years.* He was a strong partisan, and was called a whig historian, defending whig principles even in his historical works. He was a severe and unscrupulous critic of Pope, Swift, Grey, and other celebrities of the time, in his contributions to the magazines, and his *Prose essay on Criticism*, which Pope notices in his *Dunciad.*

OLD MORTALITY, the nickname of Robert Paterson (1712–1801), a Scotchman who gave up his business of quarrying gravestones, and devoted most of his life to repairing or erecting headstones to covenanting martyrs, wherever such had been buried. See the Introduction (1830) to Scott's *Old Mortality.*

OLD NICK. This vulgar name for the Devil is of great antiquity, having originated among the Danes in mythological times, when he was regarded as an evil genius, often appearing as a sea monster, presaging shipwreck. In Scandinavian mythology a *nick* was a water-wraith or *kelpie*, and there were *nicks* in sea, lake, river, and waterfall. They were sometimes represented as half-child and half-horse, the hoofs of the animal being reversed; and sometimes as an old man sitting on a rock wringing the water from his hair. When one is drowned, they still say, "Nick took him." He is supposed to be the same as Odin, or the Northern Neptune. It is probable that as Christianity prevailed he was transformed into the father of evil.

OLD POINT COMFORT, a village and watering-place in Virginia, at the entrance of

Hampton roads and James river, 12 m. from Norfolk, and the site of fortress Monroe, the largest military work in the United States.

OLD PROBABILITIES. See MYER, ALBERT J.

OLD RED SANDSTONE, the name given to a large series palæozoic rocks, of which red sandstones are the most conspicuous portions, but which contains also white, yellow, or green sandstones, as well as beds of clay and limestone. The group lies below the carboniferous strata, and was called "Old" to distinguish it from a newer series of similar beds which occur above the coal measures. The discovery that the highly fossiliferous calcareous rocks of Devonshire and the continent occupied the same geological horizon, showed that the name was very far from being descriptive of all the deposits of the period, and suggested to Murchison and Sedgewick the desirableness of giving them a new designation. They consequently proposed Devonian, which has been extensively adopted; but it is liable to the same objection as that urged against the name it was intended to supplant, inasmuch as it incorrectly limits geographically what the other limits lithologically. Many names used by geologists are similarly at fault; there is therefore no good reason why the old name should be given up, especially as it has been rendered classical by the labors and writings of Hugh Miller, the original monographer of these rocks.

The position of the old red sandstone series is easily determined, though the sequence of the various beds which form it is somewhat obscure. All the rocks are situated between the beds of the Silurian and carboniferous periods.

The strata of the period have been arranged in four groups. 1. Upper old red sandstone, including the Marwood and Petherwin groups. 2. Middle old red sandstone, including the Dartmouth and Plymouth groups. 3. Lower old red sandstone, including the North Foreland and Torbay groups. 4. Tilestones or Ledbury Shales.

1. The upper old red sandstones are conformable with the inferior strata of the coal measures, and differ so little petrologically, or even paleontologically from them, that they have been considered as the basement series of that period. They consist of yellowish and light-colored sandstones, which are at Dura Den, in Fifeshire, remarkably rich in some of their layers in the remains of Holoptychius, Pterichthys, Dendrodus, etc. In the south of Ireland, and at Dunse, similar beds contain a fresh-water shell very like the modern anodon, and fragments of a fern called *cyclopteris hibernicus*. Mr. Saltar has shown, from the intercalation of the marine beds with the red sandstone, and from the identity of the fossils, that the Devonian representatives of these beds are the Marwood and Potherwin groups. These consist of dark-colored calcareous and argillaceous beds, and gray and reddish sandstones. The fossils found in them are shells and land-plants.

2. The middle old red sandstone is represented in the north of Scotland by the Caithness flags, a series of dark-gray bituminous schists, slightly micaceous or calcareous, and remarkably tough and durable. Throughout their whole thickness they are charged with fossil fish and obscure vegetable remains.

3. The lower old red sandstone consists of strata of red shale and sandstone, with beds of impure arenaceous limestone (cornstone), and frequently at the base great deposits of red conglomerate. The fossils peculiar to this division are the remarkable fish cephalaspis, and the huge crustacea of the genus Pterygotus, besides a few shells. To the south of the Grampians, the strata consists of a gray paving-stone and coarse roofing-slate. The Devonian representatives of this section are the sandstones and slates of the North Foreland, Linton, and Torbay, and the series of slaty beds and quartz ore sandstones developed on the banks of the Rhine near Coblentz.

4. The tilestones or Ledbury Shales consist of finely laminated reddish and green micaceous sandstones, which have been noticed underlying the old red only on its western borders in Herefordshire. The fossils of those beds show a Silurian fauna with a number of old red forms; the tilestones are consequently referred sometimes to the one period, and sometimes to the other.

The old red sandstone occupies a considerable portion of the surface of Great Britain. In the north, it forms the boundary lands of the Moray firth; beginning even as far north as the Shetlands and Orkneys, it covers the whole of Caithness, and in more or less broken tracts the east of Sutherland, Ross, and Cromarty, and the north of Inverness, Nairn, and Elgin. In the great central valley of Scotland it is the setting in which the coal measures are placed, stretching across the country on the one margin from Forfar to Dumbarton, and occurring on the other in separated tracts in Lanark and Berwick. In the southern division of the island it is limited to a large triangular district in the southwest. The apex of the triangle is at Wenlock, in Shropshire; a line thence to Start point, in Devon, would limit it on the east, and a second to Milford haven would do so on the west. The Bristol channel bisects it. A depression in the Welsh portion is occupied with South Wales coal-field; and in a similar depression in Devon, the culm-beds are situated. In Ireland, strata of this age are found in the counties of Kilkenny, Waterford, Cork, and Kerry. The Devonian rocks have been carefully studied in Belgium and the Rhine district, and also in Russia, where they cover a larger district in the north of the empire. The American representatives of this period are extensively developed in New York, Pennsylvania, and Canada. The invertebrate animals found in the old red do not differ much from those of the Upper Silurian. Corals are remarkably abundant and beautiful in the Devonian limestones. Goniatites and Clymenia make their first appearance in this period, with several forms of lower mollusca. Trilobites are still

numerous. But the most striking feature in the period is the abundance of fish of curious forms, strongly protected outside by hard bony cases, or by a dense armor of scales.

OLD SOUTH CHURCH, Boston. See BOSTON.

OLD STYLE. See DATES.

OLDHAM, city in Penobscot co., Me.; on the Penobscot river and the Maine Central and the Bangor and Aroostook railroads; 12 miles n. of Bangor, the co. seat. It was set off from Orono and incorporated as a town in 1840; was chartered as a city in 1891; and contains several villages, city hospital, public library, street railroad connecting with Bangor and Orono, electric light plant, waterworks, high school, and manufactories of bateaux and canoes, boots and shoes, carriages, coffins and caskets, woolen goods, snow shoes, lumber, chemical fiber, and foundry and grist mill products. The lumber interests of the city are very important. Pop. '90, 5312.

OLDYS, WILLIAM, a most erudite and industrious bibliographer, was a natural son of Dr. William Oldys, chancellor of Lincoln, and advocate of the admiralty court, and was born in 1696. Regarding his early life little is known. His father, dying in 1708, left him a small property, which Oldys squandered as soon as he got it into his own hands. The most of his life was spent as a bookseller's hack. He drank hard, and was so scandalously fond of low company that he preferred to live within the "rules" of the Fleet prison to any more respectable place. As may easily be supposed from his habits, the dissolute old bookworm was often in extremely necessitous circumstances, and when he died (April 15, 1761) he left hardly enough to decently bury him. It is but fair to add that Oldys had some sterling merits. Capt. Grose, who knew him, praises his good-nature, honor, and integrity as a historian, and says that "nothing would ever have biased him to insert any fact in his writings which he did not believe, or to suppress any he did." For about ten years Oldys acted as librarian to the earl of Oxford, whose valuable collection of books and MSS. he arranged and catalogued. His chief works are: *The British Librarian, Exhibiting a Compendious Review of all Unpublished and Valuable Books in all Sciences* (London, 1737, anonymously); a *Life of Sir Walter Raleigh*, prefixed to Raleigh's *History of the World* (1738); a translation of Camden's *Britannia* (2 vols.); *The Harleian Miscellany, or a Collection of Scarce, Curious, and Entertaining Tracts* (8 vols. Lond. 1753).

OLEA'CEÆ, a natural order of exogenous plants, consisting of trees and shrubs, with opposite leaves and flowers in racemes or panicles. The calyx is in one piece, divided, persistent; the corolla is hypogynous, generally 4-cleft, sometimes of four petals, sometimes wanting; there are generally two, rarely four stamens; the ovary is free, 2-celled, the cells 2-seeded; the fruit is a drupe, a capsule, or a samara (see these heads); the cotyledons are foliaceous. Nearly 150 species are known, mostly natives of temperate countries. Among them are the olive, ash, lilac, privet, phillyrea, fringe tree, etc. Between some of these there is a great dissimilarity, so that this order is apt to be regarded as a very heterogeneous group; but the real affinity of the species composing it is manifested by the fact that even those which seem most unlike can be grafted one upon another, as the lilac or the olive on the ash. Bitter, astringent, and tonic properties are prevalent in this order.

OLEAN, a city in Cattaraugus co., N. Y.; on the Alleghany river and Olean creek and the Central New York and Western, the Erie, and the Western New York and Pennsylvania railroads; 70 miles e. of Buffalo. It was incorporated as a city in 1893, and is noted for its hemlock lumber, tanning, and petroleum oil-piping interests. The city has the Forman public library, an abundant supply of natural gas for light and fuel, electric lights, electric street railroads, national banks, several large tanneries, extensive petroleum refineries, about a dozen churches, and daily and weekly newspapers. Pop. '90, 7358.

OLEAN'DER, *Nerium*, a genus of plants of the natural order *apocynacæ*, having a 5-parted calyx, set round on the inside at the base with many tooth-like points or glands, a salver-shaped 5-cleft corolla, in the throat of which is a 5-parted and toothed or lacerated corona, five stamens, the anthers adhering to the stigma, the fruit composed of two follicles. The species are evergreen shrubs with leathery leaves, which are opposite or in threes; the flowers in false umbels, terminal or axillary. The COMMON OLEANDER (*N. oleander*), a native of the south of Europe, the north of Africa, and many of the warmer temperate parts of Asia, is frequently planted in many countries as an ornamental shrub, and is not uncommon in Britain as a window-plant. It has beautiful red or sometimes white flowers. The English call it ROSE BAY, and the French ROSE LAUREL (*laurier rose*). It attains a height of 8 or 10 feet. Its flowers give a splendid appearance to many ruins in the south of Italy. It delights in moist situations, and is often found near streams. All parts of it contain a bitter and narcotic-acrid juice, poisonous to men and cattle, which flows out as a white milk when young twigs are broken off. Cases of poisoning have occurred by children eating its flowers, and even by the use of the wood for spits or skewers in roasting meat. Its exhalations are injurious to those who remain long under their influence, particularly to those who sleep under it. See illus., FLOWERS, vol. VI.

OLEAS'TER. See ELÆAGNUS.

OLE BULL. See BULL, OLE BORNEMANN.

O'LEFIANT GAS, C_2H_4, is transparent and colorless, possesses a disagreeable alliaceous odor, and acts as a poison when breathed. Its specific gravity is 0.970. It takes fire when brought in contact with a flame, and burns with a bright clear light. When this gas is mixed with oxygen or atmospheric air in the proportion of 1 volume with 3 volumes of oxygen, or with 15 volumes of atmospheric air, it forms a powerfully explosive mixture. It is more soluble in cold than in hot water—100 volumes of water at 32° F. absorbing 26.5 volumes of the gas, while at 68° they only absorb 14 volumes. It was liquefied by Faraday under great pressure; its boiling-point is —157° F. (—105° C.). If it be conducted through strongly-heated tubes, or if a continuous series of electric sparks be passed through it, it is decomposed into a very dense black carbon, and double its own volume of hydrogen; and if it is subjected to a less intense heat, the products of decomposition are carbon and light carbureted hydrogen or marsh gas, CH_4. Chlorine acts upon this gas in a very remarkable manner. When the two gases are mixed in equal volumes, they combine to form a heavy oily liquid, to which the term chloride of olefiant gas, or Dutch liquid (q.v.), is given. It is from this reaction that the term *olefiant* was originally applied to this gas.

Olefiant gas is a constituent of the gaseous explosive admixtures that accumulate in coal-pits, and of the gaseous products yielded by the distillation of wood, resinous matters, and coal; and the brightness of the flame of ordinary gas is in a great measure dependent upon the quantity of olefiant gas that is present.

This gas is most readily obtained by the action of oil of vitriol on alcohol; the reactions that ensue are too complicated to be described in these pages.

O'LEIC ACID, $C_{18}H_{34}O_2$, at temperatures above 57° F. (14° C.), exists as a colorless limpid fluid, of an oily consistence, devoid of smell and taste, and (if it has not been exposed to air) exerting no action on vegetable colors. At 40° F. it solidifies into a firm, white, crystalline mass, and in this state it undergoes no change in the air; but when fluid it readily absorbs oxygen, becomes yellow and rancid, and exhibits a strong acid reaction with litmus paper. It is not a volatile acid, and on the application of a strong heat it breaks up into several substances, such as caproic, caprylic, and sebacic acids—the last named being the most characteristic product of the distillation. If oleic acid be exposed to the action of hyponitric acid, N_2O_4, it is converted into an isomeric, solid, fatty acid, termed *elaidic acid*. A very small quantity of hyponitric acid (1 part to 200 of oleic acid) is sufficient to effect this remarkable change, the nature of which is unknown. When distilled with moderately strong nitric acid, it is oxidized into a large number of products, including all the volatile fatty acids represented by the formula $C_{2n}H_{2n}O_2$, from formic acid, CH_2O_2, to capric acid, $C_{10}H_{20}O_2$, with six fixed dibasic acids of the formula $C_{2n}H_{2n-2}O_4$, viz., succinic acid, lipic acid, adipic acid, pimelic acid, suberic acid, and anchoic (or lepargylic) acid. When heated with hydrated potash it breaks up into palmitic and acetic acids, as shown in the equation:

$$\overbrace{C_{18}H_{34}O_2}^{\text{Oleic Acid.}} + \overbrace{2(KOH)}^{\text{Hydrated Potash.}} = \overbrace{C_{16}H_{31}O_2,K}^{\text{Palmitate of Potash.}} + \overbrace{C_2H_3O_2,K}^{\text{Acetate of Potash.}} + 2H$$

These decompositions and disintegrations seem to illustrate the facility with which, by the mere process of oxidation, which is perpetually at work in living structures, one organic acid can be converted into others.

Oleic acid is a constituent of *oleine* (q.v.), which exists in most of the fats and fatty oils of the animal and vegetable kingdoms, and most abundantly in the liquid fats or oils, and hence its name is derived. It is very difficult to obtain the acid in a state of purity, in consequence of the readiness with which it oxidizes; and we shall not enter into details regarding the method of its preparation. It is obtained in a crude form, as a secondary product, in the manufacture of stearine candles, but almond oil is generally employed when the pure acid is required.

Oleic acid forms normal (or neutral) and acid salts; but the only compounds of this class that require notice are the normal salts of the alkalies. These are all soluble, and by the evaporation of their aqueous solution form *soaps*. Oleate of potash forms a soft soap, which is the chief ingredient in Naples soap; while oleate of soda is a hard soap, which enters largely into the composition of Marseilles soap.

The oleates of the alkalies occur in the animal body, in the blood, chyle, lymph, and bile; they have also been found in pus, in pulmonary tubercles, and in the excrements, after the administration of purgatives.

O'LEINE, $C_3H_5(C_{18}H_{33}O_2)_3$, is proved, by the researches of Berthelot, to be a triglyceride of oleic acid. See GLYCERINE. Pure oleine is a colorless and inodorous oil, which solidifies into acicular crystals at about 23° F. (—5° C.), is insoluble in water, and only slightly soluble in cold alcohol, but dissolves in ether in all proportions. By exposure to the air it darkens in color, becomes acid and rancid (from the gradual decomposition of the oleic acid), and finally assumes a resinoid appearance. Hyponitric acid converts it into an isomeric, white, solid fat, named *elaidine*—the glyceride of the elaidic acid described in the preceding article.

Pure oleine is obtained by cooling olive oil to 32° F., which occasions the separation of the stearine and palmitine in a solid form. The fluid portion is then dissolved in alcohol, which on being cooled to 32° deposits in a solid form everything but oleine.

which is obtained in a pure state by driving off by heat the alcohol from the decanted or filtered solution.

The drying oils, such as those of linseed, hemp, walnut, poppy, etc., contain a variety of oleine, which is not converted into elaidine by the action of hyponitric acid, or of subnitrate of mercury, which, when prepared without the aid of heat, contains enough of the acid to produce a similar effect. Hence these substances may be used to detect fraudulent adulterations of olive or almond oil with poppy and other cheap drying oils.

OLEOGRAPH, a chromo-lithograph which has been "roughed" on a lithographic stone engraved so as to imitate canvas. The resemblance to oil-painting is further increased by mounting the O. on canvas, sizing and varnishing. The colors used in printing oleographs are a little darker than in the case of chromo-lithographs in imitation of water-color paintings.

OLEOMARGARINE, from the Latin *oleum*, oil, and *marga* (the latter from the Greek *margarete*) a pearl; margarine being the solid derived from olive and other oils under pressure, and so-called from its pearl-like appearance. The name is applied to a product of beef fat, and was given to it by act of the legislature of New York, with a view to prevent the sale of the article as dairy butter, by having it stamped or branded legibly with this name under penalty duly applied for neglect thereof. The material of which the article is manufactured is beef fat, excepting the suet and the fat of the kidneys, which parts are left in the carcass for the butcher. The caul and the enveloping fat of the intestines only are employed—except in cases of adulteration. The process of manufacture is as follows: the beef carcass having been permitted to hang until the animal heat has entirely left it, the fat is placed in tanks of cold water and thoroughly cleansed from all impurities, this process being three times repeated. It is next conveyed to the cutting-machine, an instrument supplied with revolving knives, which cut it into small bits, when it is forced as a pulp through a screen or colander. This pulp is now placed in the melting-kettle, in which it is subjected to a heat of 112° to 118° F., being at the same time vigorously stirred by an *agitator*, or paddler, worked by machinery. From the melting-kettle the melted fat is run into a series of vats, the refuse or residuum passing through a valve in the bottom of the kettle, and into receptacles for tallow. From the vats the oil is transported in metal-lined coolers (wagons drawn by hand) to a room which is kept at a temperature of 85° to 87°, where it becomes a granulated mass. In this form it is served to the hydraulic presses by the following method: an upright shaft, having a revolving horizontal wheel at the top, stands at a convenient height from the ground for service. On the outer extremity of the spokes of this wheel are arranged boxes in which the material is placed, being first packed in cloths; it thus takes form, like that of a square loaf of bread, being then transferred to metal plates in the press, plate after plate being covered in layers until the press is full. The power is then applied, when the pure oil runs off into a reservoir, and the residue (stearine) is left in thin white sheets resembling paraffine. These are afterwards collected and packed in hogsheads, for disposal to those who make use of the article. The solid elements of the fat have now been entirely eliminated in the stearine, the tallow, and the refuse—the latter being the wash of the coolers, which is obtained by thoroughly scalding the latter. This is afterwards run through gutters into the tallow-room. Here it passes into a large tank, from which it is removed in barrels to an iron vat resembling a vertical boiler, where it is put under steam-pressure and the tallow obtained; the whole of which goes to the soap manufacturers and tallow-chandlers, the final refuse in the iron vat being expelled through a manhole, packed in casks, and disposed of for fertilizing purposes. From the press-room reservoir, the oil is pumped to the butter-room, where it is received in large churns worked by steam-power. In these, after being combined with a proportion of one-fifth milk, it goes through a churning process which occupies about forty minutes. From the churns the product is run into coolers containing broken ice, with which it is thoroughly mixed to solidify it, being afterwards separated from the ice on tables. The butter, being of unequal consistency and temperature, is next passed through a machine called a crusher, out of which it comes a perfectly homogeneous mass. It now goes to the salting-table, where it is salted and worked, after which it is packed in boxes, firkins, and barrels, every package being branded "oleomargarine" according to law. This manufacture in New York amounts to about 350,000 lbs. per week; there are manufactories in other cities as to which no statistics are available. In 1880 the article interfered so greatly with the sale of dairy butter, particularly in competition with the export trade in the latter, through false representation, as to arouse a powerful opposition to its manufacture and sale, both on the part of dairymen, and that of the New York produce exchange.

The English house of commons declared, 1881, that the substances composing O. were innocuous, and that good butterine was better than bad butter. The industry is now largely carried on in the U. S. According to analyses made by Dr. Henry A. Mott, of New York, the constituents of O. are: Water, 11.203; butter solids, 88.797; the constituents of butter made from cream being: Water, 11.968; butter solids, 88.032. Acts were passed by the N. Y. legislature, 1882, regulating the manufacture and sale of imitation butter, and prohibiting the coloring of the same in semblance of dairy products. The act of 1884, "To prevent deception in sales of dairy products," absolutely prohibited the manufacture from any oleaginous substance of "any article designed to take the

place of butter or cheese produced from pure unadulterated milk or cream of the same;" but these laws became dead letters; and in 1885, June, the Court of Appeals made void the act of 1884. By act of congress, 1886, all substitutes for butter are taxed 2 cts. per pound. Imported O. must pay an internal revenue tax of 15 cts.; manufacturers pay $600; wholesale dealers, $480; retail dealers, $48. O. must be packed in firkins, tubs, etc., of not less than 10 pounds, and stamped; and O. retailed must be sold only from original stamped packages of not less than 10 pounds, and must be delivered in marked wooden or paper packages. Perhaps the simplest test for the detection of O. is by chemical analysis as follows: Potassic hydrate is used to saponify the fat, which is then mixed with 50 per c. of alcohol. If the solution is clear, the soap is decomposed and the acids are weighed. If the percentage of these fat-acids reaches as high as 95½ it may be asserted that the substance is oleaginous, as their percentage in cream butter is about 87. Weak sulphuric acid should be used in decomposing.

OLEOM'ETER, or ELAÏOMETER, an instrument for ascertaining the densities of fixed oils. It consists of a very delicate thermometer-tube, the bulb being large in proportion to the stem. It is divided into fifty degrees, and floats at zero in pure oil of poppy-seed, at 38° to 38½° in pure oil of almonds, and at 50° in pure olive oil.

O'LEOPHOSPHO'RIC ACID is a yellow viscid substance, which is insoluble in water and cold alcohol, but dissolves readily in boiling alcohol and in ether. When boiled for a long time with water or with alcohol, or when treated with an acid, it resolves itself into oleine and phosphoric acid; while alkalies decompose it into phosphoric acid, oleates, and glycerine. It exists, according to Frémy and other chemists, in the brain, spinal chord, kidneys and liver.

OLÉRON, ISLE OF (anc. *Uliarus*), an island of France, forming a portion of the department of Charente Inférieure, lies off the w. coast of France, opposite the mouth of the river Charente. It is 20 m. long and from 2 to 6 m. broad, and is unusually fertile, producing abundantly all the crops grown in the department to which it belongs. Salt is also largely produced. See CHARENTE-INFÉRIEURE. At its northern extremity, is the light-house of Chassiron. The inhabitants are skilful seamen. The town of Saint-Pierre-d'Oléron (pop. 1,575) stands near the center of the island. The pop. of the island is given at 18,000.

OLERON, LAWS OF, or JUDGMENTS D'OLÉRON, a celebrated code of maritime law compiled in France in the reign of St. Louis, and so named from a groundless story, that it was enacted by Richard I. of England during the time that his expedition to Palestine lay at anchor at that island. The real origin of these laws was a written code, called *Il Consolato del Mare,* of about the middle of the 13th c., compiled either at Barcelona or at Pisa, forming the established usages of Venice and the other Mediterranean states, and acceded to by the kings of France and counts of Provence. Besides containing regulations simply mercantile, this system defined the mutual rights of belligerent and neutral vessels, as they have been since understood in modern international law. The so-called laws of Oléron were a code of regulations borrowed from the *Consolato,* which for several centuries were adopted as the basis of their maritime law by all the nations of Europe. Copies of the *Jugements d'Oléron* are appended to some ancient editions of the *Coutumier de Normandie.* See NORMANDY, CUSTOMARY LAW OF.

OLGA, SAINT, a saint of the Russian church, wife of the duke Igor of Kiev, who, having undertaken an expedition against Constantinople, which proved unsuccessful, was slain on his return to his own dominions. His widow Olga avenged his death, assumed the government in his stead, and for many years governed with much prudence and success. Having resigned the government to her son Sviatoslaff about the year 952, she repaired to Constantinople, where she was baptized, by the patriarch Theophilaktes, and received into the church, assuming at baptism the name of Helena, in honor of St. Helena, mother of Constantine. She returned to Russia, and labored with much zeal for the propagation of her new creed; but she failed in her attempt to induce her son, Sviatoslaff, to embrace Christianity. Her grandson, Vladimir, having married Chrysoberga, the sister of the emperors of Constantinople, Basil and Constantine, was baptized in the year 988; but his grandmother did not live to enjoy this gratification, having died in 978, or, according to other authorities, as early as 969. She is held in high veneration in the Russian church. Her festival is held on July 21, and the practice of venerating her appears to date from the early period of the Russian church, before the schism between the Eastern and Western churches.

OLIB'ANUM, a gum-resin, which flows from incisions made in *boswellia serrata,* a tree found in some parts of the east. See BOSWELLIA. It is the *lebonah* of the Hebrews, *libanos* or *libanotos* of the Greeks, *thus* of the Romans, of all which terms the ordinary English translation is *frankincense* (q.v.). It occurs in commerce in semi-transparent yellowish tears and masses; has a bitter nauseous taste; is hard, brittle, and capable of being pulverized; and diffuses a strong aromatic odor when burned. It was formerly used in medicine, chiefly to restrain excessive mucous discharges; but its use for such purposes is now rare. It sometimes enters as an ingredient into stimulating plasters. It is chiefly employed for fumigation, and is used as incense in Roman Catholic churches. It is sometimes distinctively called *Indian olibanum;* a similar substance, in smaller tears, called *African olibanum,* being produced by *boswellia papyrifera,* a tree

found growing on bare limestone rocks in the e. of Abyssinia, and sending its roots to a great depth into the crevices of the rock. The middle layers of the bark are of fine texture, and are used instead of paper for writing.

O'LIGARCHY (*oligos,* few, and *archo,* to govern), a term applied by Greek political writers to that perversion of an aristocray in which the rule of the dominant part of the community ceases to be the exponent of the general interests of the state, owing to the cessation of those substantial grounds of pre-eminence in which an aristocracy originated. The governing power in these circumstances becomes a faction, whose efforts are chiefly devoted to their own aggrandizement and the extension of their power and privileges.

OLIGOCHÆTA, an order of annelids, of which the common earth-worm is a good example. Their locomotive appendages are in the form of bristles attached in rows to the sides and ventral surface of the body; no branchiæ; all hermaphrodite; young pass through no metamorphosis. The order is divided into two families, *terricolæ* or earth-worms, and *limicolæ* or mud-worms and water-worms. These families have also been named, respectively, *lumbricidæ* and *naidæ.* In the *lumbricus* or common earth-worm (q.v.), the edentulous mouth opens by a muscular pharynx and short œsophagus to a muscular crop or *pro-ventriculus,* succeeded by a second muscular stomach or gizzard.

OLIN, Henry, 1767–1837 ; b. Vermont, and spent his earlier years in Addison county. He was a member of the general assembly consecutively from 1799 till 1825, excepting four years ; also a member of three constitutional conventions. He was associate judge in 1801, chief judge in 1807, member of congress in 1824, and lieut.-gov. in 1827. Stephen Olin, the Methodist minister and educator, was his son.

OLIN, Stephen, d.d., ll.d.; 1797–1851; b. Vt.; oldest son of Henry. The son graduated at Middlebury college in 1820, with the highest honors of his class. His health being impaired by intense study, he went to South Carolina, and became the principal of Abbeville academy. While there, he abandoned the study of law which he had commenced, and entered the ministry of the Methodist Episcopal church, and in 1824 was admitted to the South Carolina conference. He was stationed in Charleston for two years, where, associated with another, he preached to four congregations, in which were 3,000 slaves. Of these he received 200 into the church. In July, 1826, he was elected professor of English literature in the university of Georgia, where he remained seven years. In 1834 he was inaugurated president of Randolph Macon college, Va., which under his administration had great prosperity. In 1837–41 he made an extended tour in Europe and the east, and in 1843 published in 2 vols. *Travels in Egypt, Petra, and the Holy Land.* His account of Egypt was pronounced "the best, on the whole, in the language." In his *Travels* he spoke of "a broken arch supposed to be the remains of an ancient bridge connecting the Temple with Mount Zion, as having been known to Mr. Catherwood, and other travelers and residents," for which he was accused in the *North American Review* of plagiarism, Dr. Robinson in his *Biblical Researches* and in the *Bibliotheca Sacra,* having claimed to be the discoverer of this monument, and especially to have been the first to recognize in this fragment of an arch the remnant of the bridge spoken of by Josephus. A controversy ensued, in which Dr. Olin positively denied the charge of plagiarism, supporting his denial by the testimony of two missionaries, the Rev. Dr. Hamlin and the Rev. Mr. Homes, the latter declaring that he himself informed Dr. Robinson of the existence of the arch as a remnant of the bridge mentioned by Josephus. In 1842 Dr. Olin was elected president of the Wesleyan university in Middletown, Conn., where he remained till his death. During his administration the college prospered greatly, and attained a high rank. He excelled as an educator. He contributed to the *Wesleyan Journal, The Christian Advocate and Journal,* and the *Methodist Quarterly Review;* two volumes of *Sermons, Lectures, and Addresses,* also a work entitled *Greece and the Golden Horn* appeared after his death. In 1853 were published his *Life and Letters,* edited by Mrs. Olin, assisted by Dr. McClintock, Dr. Holdich, and other friends. The *New Englander* says of him: "He had the real celestial fire of sacred oratory. He had great power of insight and logic; but his chief strength lay in the enkindling and electric energy of his sympathetic and emotional nature."

OLINDA, a suburb of Pernambuco (q.v.).

OLIN'DA, a small coast town of Brazil, in the province of Pernambuco, and 4 m. n.e. from Pernambuco. It was formerly the capital of the province, had convents and magnificent temples, and there were bloody contests between Spain and Holland for the possession of it. The whole aspect of the town is that of a place half deserted. Pop. 8,100.

OLINDA, Pedro de Araujo Lima, Marquis of, 1793–1870; b. in Pernambuco, Brazil; educated there and studied law at the university of Coimbra, Portugal. In 1820 he became a member of the Portuguese assembly, and on his return to Brazil was elected to that of Brazil, and was a member until his death. He was three times president of the chamber of deputies, four times minister of state, and twice regent in the minority of Pedro II. He was made viscount in 1841, and marquis in 1854. In politics he was liberal but not a radical.

OLIPHANT, Laurence, b. England, 1829; son of sir Anthony, chief justice of Ceylon. He went to India when quite young, and visited the Nepaulese court. He published in 1852 a description of this visit, under the title of *A Journey to Katmandhu, or the Nepaulese Ambassador at Home.* He read law at the university of Edinburgh, and was admitted to the Scotch, and afterwards to the English bar. In 1852 he traveled through Russia and the Crimea, an account of which tour appeared in 1853 as *The Russian Shores of the Black Sea.* He was appointed private secretary to the earl of Elgin, gov.gen. of Canada, and was for a time superintendent of Indian affairs in Canada. In 1855 he published an account of his travels in the United States and Canada, called *Minnesota and the Far West;* and soon afterwards a pamphlet on the Crimean war, called *The Coming Campaign.* In 1856 appeared his *Transcaucasian Campaign under Omer Pasha.* He went to China in 1857, as private secretary and historiographer to Lord Elgin. In 1860 he published *A Narrative of the Earl of Elgin's Mission to China and Japan;* and *Patriots and Filibusters; Incidents of Travel.* In 1861 he was *chargé d'affaires* in Japan, where he was dangerously wounded by assassins. He was returned to parliament in 1865, but resigned in 1868, when, with his mother, Lady Oliphant, he joined the community of the "brotherhood of the new life" at Portland, Chautauqua co., N. Y., where he remained for about two years. In 1870 he was at Paris, a correspondent of the London *Times,* and he was the American Manager of the direct cable company, 1873–75. He published *Piccadilly; a Fragment of Contemporaneous Biography* (1870); *The Land of Gilead* (1880); *Traits and Travesties,* including the well-known *Tender Recollections of Irene McGillicuddy* (1882), *Altiora Peto* (1883), etc. He d. 1888. See *Life* by Mrs. Oliphant (1891).

OLIPHANT, Mrs. Margaret (*née* Wilson), one of the most distinguished of recent female novelists, was born in Wallyford, near Musselburgh, Midlothian, Scotland, in 1828. Her maiden name was Wilson, and though her fondness for treating Scottish character and incident in her earlier works rather suggested Scottish nationality, she was believed for many years to have been born in Liverpool. Her mother was a Scotchwoman of a somewhat remarkable type, strongly attached to old traditions. In 1849 Mrs. Oliphant published her first work, *Passages in the Life of Mrs. Margaret Maitland of Sunnyside,* which instantly won attention and approval. Its most distinctive charm is the tender humor and insight which regulate its exquisite delineation of Scottish life and character at once in their higher and lower levels. This work was followed by *Merkland* (1851); *Adam Graeme of Mossgray* (1852); *Harry Muir* (1853); *Magdalen Hepburn* (1854); *Lilliesleaf* (1855); and subsequently by *Zaidee, Katie Stewart,* and *The Quiet Heart,* which originally appeared in succession in *Blackwood's Magazine.* Though these are of somewhat various merit, in all of them the peculiar talent of the writer is marked. They are rich in the minute detail which is dear to the womanly mind; have nice and subtle insights into character, a flavor of quiet humor and frequent traits of delicacy and pathos in the treatment of the gentler emotions. It was, however, on the *Chronicles of Carlingford* that her reputation as a novelist was first secured. In the first of the two sections, separately published, apart from its other merits, which are great, the character of little Netty, the heroine, vivifies the whole work, and may rank as an original creation. The other, *Salem Chapel,* perhaps indicates a wider and more vigorous grasp than is to be found in any other work of the authoress. More recent novels are *Three Brothers* (1870), *Squire Arden* (1871), *Ombra* (1872), *A Rose in June* (1874), *Phœbe Junior* (1876), *The Primrose Path* (1878), *Within the Precincts* (1879), *A Little Pilgrim* (1882), *The Ladies' Lindores* (1883), *The Victorian Age of English Literature* (1893), *Historical Characters of the Reign of Queen Anne* and *Sir Robert's Fortune* (1894), *Diana, the History of a Great Mistake* (1895), *Jeanne d'Arc, Her Life and Death* (1896), etc. Other works are *Life of Edward Irving; St. Francis of Assisi; Memoir of the Comte de Montalembert; The Makers of Florence; The Literary History of England* from 1790 to 1825 (1882), and *Dante* and *Cervantes* in the *Foreign Classics for English Readers,* of which she was editor. She d. June 25, 1897.

OLIVA, a genus of gasteropod mollusks of the family *buccinidæ,* order Prosobranchiata. See Invertebrate Animals, sub-kingdom mollusca, division B, mollusca proper, class II., Gasteropoda, section A, order I., family 3. They are sometimes classed with the *volutidæ,* see as above, family 5. The genus has the following characters: animal involved, compressed, with a small head terminated by a proboscis; tentacles approximated, enlarged at their base, and subulate at their extremities, carrying the eyes on small convexities about their middle part externally; foot very large, oblong, and slit transverse anteriorly; mantle with a single lateral lobe covering the shell in great part, with two tongue-like processes at the side of the branchial opening, and forming in front a very elongated siphon; a single branchial pectination. Oliva is one of the richest in color of shell and in variety of species, which form considerable sections in the cabinets of many collectors. *O. textilina,* the "astrolabe," has a cinereous white shell, subreticulated with flexuous dotted lines, with two brown bands, covered with characters, as though hieroglyphic. This beautiful shell with its animal is found in the Antilles and New Guinea. *O. maura* has a cylindrical shell, with the apex rounded and a slight depression (retuse); aperture white, East Indian ocean and Australia. *O. sanguinolenta* has a cylindrical shell, very beautifully and delicately reticulated, with reddish-brown small lines, girt with two brown zones; the pillar orange-red. It is found in the East Indian ocean and on the coast of Timor. These species have been found at various depths, from

the surface to 12 fathoms, on mud, sandy mud, coarse sand, etc. They are very carnivorous, but live only upon the juices of other animals. They are taken at the Mauritius in the following manner: a line is secured in position near the bottom of the sea, to which short lines with nooses containing pieces of the arms of cuttle fish are attached, so that they touch the bottom. After the apparatus has remained for a time in position one end is raised from a boat, and examined along its course, and the animals which adhere to the cuttle fish removed.

OLIVAREZ, Don Gaspard de Guzman, Count of, duke of San Lucar, and prime-minister of Philip IV. of Spain, was b. Jan. 6, 1587, at Rome, where his father was ambassador. He belonged to a distinguished but impoverished family, received a learned education, became the friend of Philip IV., his confidant in his amours, and afterwards his prime-minister, in which capacity he exercised almost unlimited power for 22 years. Olivarez showed ability for government, but his constant endeavor was to wring money from the country that he might carry on wars. His oppressive measures caused insurrections in Catalonia and Andalusia, and roused the Portuguese to shake off the Spanish yoke in 1640, and make the duke of Braganza their king, an event which Olivarez reported to Philip with satisfaction, as it enabled him to confiscate the duke's great estates in Spain. But the arms of Spain being unsuccessful, the king was obliged to dismiss the minister in 1643. He would probably have been recalled to the head of affairs, but for a publication in which he gave offense to many persons of influence. He was ordered to retire to Toro, and confine himself to that place, where he died, July 22, 1645. (Cespedes, *Hist. De Felipe IV.*)

OLIVE, *Olea,* a genus of trees and shrubs of the natural order *oleaceæ;* having opposite, evergreen, leathery leaves, which are generally entire, smooth, and minutely scaly; small flowers in compound axillary racemes, or in thyrsi at the end of the twigs; a small 4-toothed calyx, a 4-cleft corolla, 2 stamens, a 2-cleft stigma; the fruit a drupe. The species are widely distributed in the warmer temperate parts of the globe. The Common Olive (*O. Europæa*), a native of Syria and other Asiatic countries, and perhaps also of the s. of Europe, although probably it is there rather naturalized than indigenous, is in its wild state a thorny shrub or small tree, but through cultivation becomes a tree of 20–40 ft. high, destitute of spines. It attains a prodigious age. The cultivated varieties are very numerous, differing in the breadth of the leaves, and in other characters. The leaves resemble those of a willow, are lanceolate, entire, of a dull dark-green color above, scaly and whitish-gray beneath; the flowers small and white, in short dense racemes; the fruit greenish, whitish, violet, or even black, never larger than a pigeon's egg, generally oval, sometimes globular, or obovate, or acuminate. The fruit is produced in vast profusion, so that an old olive-tree becomes very valuable to its owner. It is chiefly from the pericarp that olive oil is obtained, not from the seed, contrary to the general rule of the vegetable kingdom. Olive oil is much used as an article of food in the countries in which it is produced, and to a smaller extent in other countries, to which it is exported also for medicinal and other uses (see Oils). Olives, gathered before they are quite ripe, are pickled in various ways, being usually first steeped in lime-water, by which they are rendered softer and milder in taste. They are well known as a restorative of the palate, and are also said to promote digestion. Disagreeable as they generally are at first, they are soon greatly relished, and in the s. of Europe are even a considerable article of food. Dried olives are there also used, as well as pickled olives.—The wood of the olive-tree takes a beautiful polish, and has black cloudy spots and veins on a greenish-yellow ground; it is principally used for the finest purposes by cabinet-makers and turners. The wood of the root is marked in a peculiarly beautiful manner, and is used for making snuff-boxes and small ornamental articles. The bark of the tree is bitter and astringent; and both it and the leaves have febrifuge properties. A gum resin exudes from old stems, which much resembles storax, has an odor like vanilla, and is used in all parts of Italy for perfumery.—Among the Greeks the olive was sacred to Pallas Athene (Minerva), who was honored as the bestower of it; it was also the emblem of chastity. A crown of olive-twigs was the highest distinction of a citizen who had merited well of his country, and the highest prize of the victor in the Olympic games. An olive branch was also the symbol of peace (compare Gen. viii. 11); and the vanquished, who came to supplicate for peace, bore olive branches in their hands.—The olive has been cultivated in Syria, Palestine, and other parts of the east, from the earliest times. Its cultivation extends southwards as far as Cairo, and northwards to the middle of France. It is very generally propagated by suckers, but where great care is bestowed on it, inarching is practiced. It grows from cuttings. The climate of England is too cold for the olive, yet in Devonshire it ripens its fruit on a s. wall.—*Olea similis* and several other species are useful trees of s. Africa, yielding a very hard and extremely durable wood. Some of them bear the name of Ironwood at the cape of Good Hope. The American Olive (*O. Americana*) is also remarkable for the hardness of its wood. It is found as far n. as Virginia. It is a tree of 30–35 ft. high, with much broader leaves than the common olive. Its fruit is fit for use. Its flowers are fragrant. The Fragrant Olive (*O. fragrans*, or *Osmanthus fragrans*) of China and Japan has extremely fragrant flowers, which are used by the Chinese for flavoring tea. See illus., Tea, etc., vol. XIV.

OLIVE BRANCH. See FLOWERS, NATIONAL AND SYMBOLICAL.

O'LIVENITE, a mineral consisting chiefly of arsenic acid and protoxide of copper, with a little phosphoric acid and a little water. It is generally of some dark shade of green, sometimes brown or yellow. It is found along with different ores or copper in Cornwall and elsewhere. It is often crystalized in oblique four-sided prisms, of which the extremities are acutely beveled, and the obtuse lateral edges sometimes truncated, or in acute double four-sided pyramids; it is sometimes also spherical, kidney-shaped, columnar, or fibrous.

OLIVEN'ZA, a t. of Spain, near the Portuguese frontier, 15 m. s. by w. from Badajoz, on a small river which flows into the Guadiana. Pop. (comm.), 8200.

OLIVER, a co. in central N. Dakota; 720 sq. m.; pop. '90, 464. Co. seat, Sanger.

OLIVER, ANDREW, 1706–74; b. Boston; educated at Harvard college, and in 1743 elected to the general court, in which he served three terms. He was a member of the council, 1746–65, and secretary of the province, 1756–70. He succeeded his brother-in-law, Hutchinson, as lieut.-gov. in 1771. After the passage of the stamp act by parliament in 1765, he took the place of stamp-distributor, but was forced to resign, after having been hanged in effigy on the "liberty tree." The zeal with which he seconded the measures of the British ministry was evident in his letters, which were sent over to this country by Franklin in 1772, and the general court petitioned George III. for his removal.

OLIVER, PETER, LL.D., 1713–91; b. England; brother of Andrew, lieut.gov. of Massachusetts in 1770; graduated at Harvard, 1730. Not regularly bred to the law, he adopted that profession, and on Sept. 14, 1756, was appointed judge of the supreme court, and in 1771 chief-justice. When the colonies assumed control of their own judicial affairs, and sides were taken on the question of loyalty to the crown, he espoused the tory cause, and in Mar., 1774, refused the compensation offered him for his services, when required to give his word not to receive either pay or emolument from any other source than the assembly. He was impeached, and fled from Boston with the British troops in 1776. He was pensioned by the British government, and Oxford, in 1776, conferred upon him the degree of LL.D. His son Peter was a graduate of Harvard, class of 1761, practiced medicine in Middleborough, also returned to England, and died there in 1822, at the age of 80. Peter, the elder, contributed a number of articles to *The Censor*, a tory paper, and published *Speech on the Death of Isaac Lothrop* (1750); *Poem on the Death of Sec. Willard* (1757); *Scriptural Lexicon* (1784–85); new ed. 1832. He transcribed the manuscript history of Wm. Hubbard, and collected many valuable records of the old colony.

OL'IVES, MOUNT OF, called also MOUNT OLIVET, an inconsiderable ridge lying on the e. side of Jerusalem, from which it is only separated by the valley of the brook Kidron. It is called by the modern Arabs Jebel-el-Tor, and takes its familiar name from a magnificent grove of olive-trees which once stood on its western flank, but has now in great part disappeared. The road to mount Olivet is through St. Stephen's gate, and leads by a stone bridge over the now almost waterless brook Cedron. Immediately beyond, at the foot of the bridge, lies the garden of Gethsemane; and the road here parts into two branches, northwards toward Galilee, and eastwards to Jericho. The ridge rises in three peaks, the central one of which is 2,556 ft. above the level of the sea, and 416 ft. above the valley of Jehosaphat. The southern summit is now called "the mount of Offense," and was the scene of the idolatrous worship established by Solomon for his foreign wives and concubines. The northern peak is the supposed scene of the appearance of the angels to the disciples after the resurrection, and is remarkable in Jewish history as the place in which Titus formed his encampment in the expedition against the fated city of Jerusalem. But it is around the central peak, which is the mount of Olives properly so called, that all the most sacred associations of Christian history converge. On the summit stands the church of the Ascension, built originally by St. Helen, the modern church being now in the hands of the Armenian community; and near it are shown the various places where, according to tradition, our Lord wept over Jerusalem, where the apostles composed the apostles' creed, where our Lord taught them the Lord's prayer, etc. Near the church of the Ascension is a mosque and the tomb of a Mohammedan saint. In the garden of Gethsemane, at the foot of the hill, is shown the scene of our Lord's agony. The northern peak spreads out into a plain of considerable extent, which is painfully notable in Jewish history as the place where, after the Jews on occasion of the revolt under Bar-Kochebah, were debarred by Adrian from entering Jerusalem, they were wont to assemble annually on the anniversary of the burning of the temple to celebrate this mournful anniversary.

OLIVET, a village in Eaton co., Mich.; on the Chicago and Grand Trunk railroad; 10 miles s.w. of Charlotte, the co. seat. It was incorporated in 1839, and is principally known as the seat of Olivet college (Cong.), founded in 1844, and having, in 1896, 23 professors and instructors, 240 students, and valuable library and other buildings. The president was the Rev. Willard G. Sperry, D.D. Pop. '90, 790.

OLIVETANS, a religious order of the Roman Catholic church, one of the many remarkable products of that well-known spiritual movement which characterized the 12th and 13th centuries. The Olivetans, or brethren of our lady of mount Olivet, are

an offshoot of the great Benedictine order (q.v.), and derive their origin from John Tolomei, a native of Siena, born in the year 1272. Tolomei had been a distinguished professor of philosophy in the university of his native city; but his career was suddenly interrupted by the loss of his sight. Although he was cured of his blindness (and, as he himself believed, miraculously), this visitation convinced him of the vanity of earthly things; and in company with some friends he withdrew to a solitary place near Siena, where he devoted himself to prayer and religious exercises. By the direction of the pope, John XXII., the new brethren adopted the Benedictine rule; but they chose as their especial province the cultivation of sacred science, and the duty of teaching. In the year 1319 Tolomei was chosen as the first general; and even in his lifetime the institute made rapid progress, especially in Italy. It numbered at one time eighty houses, but at present the number is reduced to four—namely, the parent house, so called, of Monte Oliveto, in the diocese of Arezzo in Tuscany, one at Rome, one at Genoa, and one at Palermo.

OL'LA PODRI'DA (literally, *putrid pot*), a Spanish term, originally signifying an accumulation of remains of flesh, vegetables, etc., thrown together into a pot, but generally employed to designate a favorite national dish of the Spaniards, consisting of a mixture of different kinds of meat and vegetables stewed together. It has also come to be figuratively applied to literary productions of very miscellaneous contents. The French equivalent is *pot-pourri*, and the Scotch *hotch-potch*, both of which, but especially the former, are also employed in a figurative sense.

OLLIVIER, Emile, b. in Marseilles, 1825, son of Démosthène, who was exiled from the time of the *coup d'état* of Napoleon, in 1851, to 1860. Emile was educated for the practice of law; was made commissary-gen. at Marseilles by Ledru Rollin in 1848, and thereafter prefect. In 1849 he resumed the practice of law in Paris; was elected a liberal member of the legislative assembly from Paris in 1857, and re-elected in 1863. In 1867 he was won over to the Bonapartists, and failed of an election in Paris the following year; but secured a seat by an election as deputy from the department of Var. In December of that year Napoleon made him minister of justice under the new constitution of the empire, which office he entered upon Jan. 2, 1870. He was chiefly noted for his subserviency to the policy of the emperor, and his pretensions to statesmanship. He assumed a supercilious confidence in the French military superiority on the breaking out of the German war in 1870, and retired with his master after the first great reverses to French arms. Through imperial favor he had been made a member of the French academy in 1870, succeeding to the chair of Lamartine. In 1874 he read a eulogy of Napoleon before the academy, and afterward became its chancellor. He published *Church and State at the Council of the Vatican*, and in 1894 published the first of a series of volumes on the history of the French empire under Napoleon III.

OLMSTED, a co. in s.e. Minnesota; drained by the Zumbro and Root rivers and their branches; intersected by the Chicago and Northwestern railroad; 648 sq. m.; pop. '90, 19,434, chiefly of American birth. The surface is mostly a rolling prairie, and the soil very productive; wheat, oats, hay, and dairy products are the staples. This is the largest wheat-producing county in the state. Co. seat, Rochester.

OLMSTED, Denison, ll.d., 1791–1859; b. Conn.; graduated at Yale College, 1813, and was tutor 1815–17. He was professor of chemistry in the North Carolina university 1817–25; and from that time till his death was connected with Yale, holding a professorship of mathematics until 1836, and after that, of natural philosophy and astronomy. In 1831 he published a treatise on natural philosophy, and in 1840 one on *School Astronomy*, followed in 1841 by the *Compendium of Astronomy*. These text-books came into almost universal use in the colleges of this country, and in an abridged form, in many public schools. They are still used, though in general supplanted by the more modern works of prof. Loomis and others. Profs. Olmsted and Loomis were the first observers of Halley's comet of 1835. He wrote sketches of the lives of sir Humphrey Davy, Roger Sherman, Eli Whitney, Pres. Dwight, of Yale, and others, and contributed a very large number of scientific and biographical papers to the *American Journal of Science; New Englander; Journal of Commerce*, and many other periodicals.

OLMSTED, Frederick Law, b. Hartford, Conn., 1822; educated there, and at Yale college, making a specialty of agricultural science and engineering. He began life as a farmer and horticulturist; in 1850 traveled on foot through portions of England, Scotland, and the continent, and published, in 1852, a book of observations under the head of *Walks and Talks of an American Farmer in England*, which was replete with information, and widely read. In 1852–53 he traveled in the cotton states, gathering information which was published in 1856 in a book entitled *A Journey in the Seaboard Slave States*. This was followed by a *Journey Through Texas*, 1857, and *A Journey in the Back Country*, in 1860. Abstracts of these works were issued in two vols. in London in 1861 under the title of *The Cotton Kingdom*. In 1855 he was traveling in France, Italy, and Germany, studying especially their parks and horticultural arts. In 1857, when premiums were offered for the best plans for the Central Park in New York, Mr. Olmsted associated himself in the preparation of plans with Mr. Calvert Vaux,

partner of A. J. Downing, the distinguished landscape gardener, who was preparing plans for the park when he died. Their combined labors produced the plan which was chosen out of a competition of 34 designs. During the next four years the park was developed under the plans of these gentlemen, in which the most cultivated taste was combined with economy and thoroughness. In 1859 Mr. Olmsted visited Europe to study park works. On the breaking out of the civil war in 1861 he was appointed by president Lincoln on a commission to investigate the sanitary condition of the U. S. army, and resided for three years in Washington as the business head of the commission. He then spent two years in California, and was made one of the commissioners of the National park of the Yosemite. He returned to New York in 1866 to join Mr. Vaux in the execution of plans for Prospect Park in Brooklyn, which they nearly completed under their own supervision. He has since been associated in designs for parks and other public works in Washington, Chicago, San Francisco, Buffalo, and Montreal.

OLMÜTZ, the chief fortress of Moravia, Austria, is the capital of a district of the same name, and is situated 40 m.n.e. of Brünn, at an altitude of 740 ft., on an island of the river Moravia, which, by means of sluices, can be opened into the moats, and thus made available for purposes of defense. Olmütz is the see of an archbishop nominated by the chapter, and is the chief seat of the administrative departments. Its university, founded in 1581, and reorganized in 1827, was reduced to a theological faculty in 1858. Olmütz has a library of 75,000 volumes; good natural history, physical, and other museums; a gymnasium, an archiepiscopal seminary, artillery and infantry academies, polytechnic and other schools, a hospital, an asylum for widows and orphans, etc. The most noteworthy of its churches are the cathedral, a fine old building, and the church of St. Mauritius, completed in 1412, with its celebrated organ, having 48 stops and more than 2,000 pipes. The noble town-hall, with its complicated clock-work, set up in 1574, and the lofty column on the Oberring, with several fine fountains in the squares, and the splendid archiepiscopal palace and chapter-house, all contribute towards the picturesque aspect for which Olmütz is distinguished. The deficiency in public gardens has of late years been in part supplied by the draining and planting of some of the inner moats, and the conversion of some portions of the fortifications into pleasure grounds. A mile from the city lies the monastery of the Premonstratensians at Hradisch, founded in 1074, now a military hospital. Olmütz is the commercial center for the mining and industrial products of the region, and is the seat of an extensive trade in cattle from Poland and Moldavia. Pop., with garrison, '90, 19,761. Prior to 1777, when Olmütz was raised into an archbishopric, its bishops had long been in the enjoyment of the rank of princes of the empire. The city suffered severely during the Thirty Years' war, and again in the Seven Years' war of Silesia, when it more than once fell into the hands of the Prussians. In 1848 Ferdinand I. signed his abdication here in favor of his nephew, Franz-Joseph I.; while in 1850 Olmütz was chosen as the place of conference between the Prussian, Austrian, and Russian plenipotentiaries, for the adjustment of the conflicting differences which had arisen in the German states generally, as the result of the revolutionary movement of 1848.

OLNEY, city and co. seat of Richland co., Ill.; on the Baltimore and Ohio Southwestern and the Peoria, Decatur, and Evansville railroads; 117 miles e. of St. Louis. It contains a public high school, public library, driving park, electric light plant, several banks, and manufactories of ice, paving bricks and tiles, barrels, vinegar, and canned goods. Pop. '90, 3831.

OLNEY, Richard, was born at Oxford, Mass., Sept. 15, 1835. He graduated from Harvard college in 1856, and after further study at the Harvard law school, began the practice of law in Boston, advancing rapidly in his profession and paying especial attention to legislation affecting railroads. He served one term in the lower house of the Mass. Legislature in 1874, and was once an unsuccessful candidate for the office of attorney-general of the state. He refused an appointment to the Supreme Court offered him by Governor Russell. In March, 1893, he was appointed attorney-general of the United States by President Cleveland, and in 1895 secretary of state.

OLONETZ', a government in the n. of Russia, bounded on the w. by Finland, and on the e. and n.e. by Archangel. Area, 57,438 sq. miles. Pop. '93, 362,131. Large lakes abound in this government, the chief, after lake Onega (q. v.), being lakes Wyg and Ladoga. The surface is in general elevated, and about seven-tenths of it are covered with wood. The soil is sterile, and the climate is cold and damp.

OLORON, or Oloron-Sainte-Marie, a t. of France, in the department of Basses-Pyrénées, on the Gave d'Oloron, 15 m. s.w. of Pau. The church of St. Marie is in the transition style from Romanesque to Gothic. The principal articles of manufacture are the checkered handkerchiefs which form the favorite head-dresses of the peasantry of Aragon and Gascony, and also the "barrets" or caps of the Béarnais. Pop. '91, 7266.

O'LOT, a t. of Spain, in the province of Gerona, and 22 m. n.w. from Gerona, near the base of the Pyrenees, on the Fluvia. There are 14 volcanic cones close to the town; the crater of the largest is a mile in circumference and 445 ft. in depth. The whole district is volcanic. In many places, and even in the town itself, currents of air blow continually from the porous lava. These are called *bufadores* and *sopladores*, and some of them are conducted beneath houses and used as refrigerators in hot weather. They maintain the temperature of about 53° F. both in hot and cold weather, but the gust of air is strongest in hot weather. Olot contains cotton and cloth manufactures. Pop. (comm.), 7600.

OLS'HAUSEN, HERMANN, 1796–1839; b. Oldesloe, in the duchy of Holstein. He studied theology in 1814–18 at Kiel and Berlin, hearing at the former the lectures of Twesten, and at the latter those of Neander and Schleiermacher. His first work was a prize-essay, *Melanchthon's Characteristik aus seinen Briefen dargestellt.* He became in 1818 licentiate in theology in the university; in 1821 was elected professor extraordinary at Königsberg, and in 1827 a regular professor. In 1834 he accepted a theological professorship at Erlangen, where he died at the early age of forty-three. Besides his prize-essay he published *Historiæ eccles. veteris monumenta; Die Aechtheit der vier Kanonischen Evangelien aus der Geschichte der zwei ersten Jahrhunderte erwiesen; Ein Wort über tieferen Schriftsinn; Die Bibl. Schriftauslegung; Noch ein Wort über tieferen Schriftsinn.* In this last work he rejects a literal verbal inspiration of the Scriptures. His most valued work is his commentary on the New Testament, translated into English for Clark's foreign theological library, and revised and reprinted with Olshausen's tract on the *Genuineness of the Writings of the New Testament,* by Prof. A. C. Kendrick, of Rochester university, 6 volumes.

OLYM'PIA, the scene of the celebrated Olympic games (q.v.), is a beautiful valley in Elis, in the Peloponnesus, through which runs the river Alpheus. As a national sanctuary of the Greeks, Olympia contained, within a small space, many of the choicest treasures of Grecian art belonging to all periods and states, such as temples, monuments, altars, theaters, and multitudes of images, statues, and votive-offerings of brass and marble. In the time of the elder Pliny, there still stood here about 3,000 statues. The Sacred grove (called the *Altis* of Olympia, inclosed a level space about 4,000 ft. long by nearly 2,000 broad, containing both the spot appropriated to the games and the sanctuaries connected with them. It was finely wooded, and in its center stood a clump of sycamores. The Altis was crossed from w. to e. by a road called the "Pompic way," along which all the processions passed. The Alpheus bounded it on the s., the Cladeus, a tributary of the the former, on the w., and rocky but gently swelling hills on the n.; westward it looked towards the Ionian sea. The most celebrated building was the *Olympieium,* or *Olympium,* dedicated to Olympian Zeus. It was designed by the architect Libon of Elis in the 6th c. B.C., but was not completed for more than a century. It contained a colossal statue of the god, the masterpiece of the sculptor Phidias, and many other splendid figures; its paintings were the work of Panænus, a relative of Phidias. Next to the Olympieium ranked the *Heræum,* dedicated to Hera, the wife of Zeus, and the queen of Heaven, containing the table on which were placed the garlands prepared for the victors in the games; the *Pelopium,* the *Metroum,* the ten *Thesauri* or treasuries, built for the reception of the dedicatory offerings of the Greek cities, the temples of Eileithyia and Aphrodite also deserve mention; the *Stadium* and the *Hippodrome,* where the contests took place, stood at the eastern end of the Altis. The plowshare now passes through the scene of these contests, but many ruins still attest the ancient magnificence of the buildings. In 1875 explorations, at the expense of the German government, were undertaken at Olympia, and several important "finds" have been made.

OLYMPIA, city, capital of Washington, and co. seat of Thurston co.; at the southern extremity of Puget sound and on the Northern Pacific and the Port Townsend Southern railroads; 40 miles s.w. of Tacoma. It was laid out in 1851 and chartered as a city in 1856. Des Chutes river, which enters the sound at this point, is spanned by a bridge from Olympia to Tumwater, and there is a bridge over 2,000 ft. long across the inlet. The surrounding country is covered with forests, and lies between the Coast and Cascade mountains. The streets are wide and regularly laid out, bordered with shade trees, and lined with handsome residences. Des Chutes river furnishes ample water-power for manufactures, descending 82 ft., and broken into 3 falls. Steamers run almost daily to Victoria and other points on Puget sound. The city contains a county court-house, cost $150,000; St. Martin's college (R. C.); St. Peter's hospital; Providence academy; national banks; waterworks supplied by high pressure from large reservoir; electric light and street railroad plants; several churches; large hotel; and saw, shingle, and flour mills, iron works, wooden pipe works, ice factory, and boot and shoe factory. Pop. '90, 4698.

OLYMPIAD (Gr. *olympias*), the name given to the period of four years that elapsed between two successive celebrations of the Olympic games (q.v.); a mode of reckoning which forms the most celebrated chronological era among the Greeks. The first recorded dates from July 21 or 22, 776 B.C., and is frequently referred to as the Olympiad of Corœbus; for historians, instead of referring to the olympiad by its number, frequently designate it by the name of the winner of the foot-race in the Olympic games belonging to that period, though at times both the number and the name of the conqueror are given. A slight indefiniteness is frequently introduced into Greek chronology, from the custom of mentioning only the olympiad, neglecting to specify in which year of the olympiad a certain event happened. As this era commenced in 776 B.C., the first year of our present era (1 A.D.) corresponded to the last half of the fourth year of the 194th with the first half of the first year of the 195th olympiad, and 394 A.D. corresponds to the second year of the 293d olympiad, at which time reckoning by olympiads terminated. This era is used

only by writers, and is never found on coins, and very seldom on inscriptions. Another olympic era, known as the "New Olympic Era," was commenced by the Roman emperors, and dates from 131 A.D.; it is found both in writings, public documents, and inscriptions.

OLYMPIAS, the wife of Philip II., king of Macedon, and mother of Alexander the Great. She was the daughter of Neoptolemus I., king of Epirus. She possessed a vigorous understanding, but was of a most passionate, jealous, and ambitious character. Philip having, on account of disagreements, separated from her and married Cleopatra, niece of Attalus (337 B.C.), she went to reside with her brother Alexander, king of Epirus, where she incessantly fomented intrigues against her former husband, and is believed to have taken part in his assassination by Pausanias, 337 B.C. On the accession of her son Alexander to the throne, she returned to Macedonia, where she contributed to bring about the murder of Cleopatra and her daughter. Alexander was filled with indignation, but Olympias was his mother, and he could not obey the dictates of justice. During his brief but magnificent career he always treated her with the utmost reverence and esteem, though he never allowed her to meddle with his political schemes. After his death she endeavored to get possession of the vacant throne, and obtained the support of Polysperchon in her designs. In 317 the two defeated Arrhidæus, the weak-minded step-brother and successor of Alexander, and his wife Eurydice, whom she caused to be put to death in the same year. She now began to glut her revenge on such of the Macedonian nobles as had shown themselves hostile to her; but her cruelties soon alienated the minds of the people from her, even though she was the mother of their heroic king, whereupon Cassander (q.v.), her principal adversary, marched n. from the Peloponnesus, besieged her in Pydna, and forced her to surrender in the spring of 316 B.C. She was immediately afterward put to death. Olympias was a woman of heroic spirit, but of fierce and uncontrollable passions, and in the perpetration of crime, when she reckoned it necessary, displayed an unscrupulousness peculiarly feminine.

OLYMPIC GAMES, the most splendid national festival of the ancient Greeks, were celebrated every fifth year in honor of Zeus, the father of the gods, on the plain of Olympia (q.v.). Their origin goes back into prehistoric ages. According to the myth elaborated or preserved by the Elean priests, they were instituted by the Idæan Herakles in the time of Kronos, father of Zeus; according to others, by the later Herakles, son of Zeus and Alkmene; while Strabo, rejecting the older and more incredible legends, attributes their origin to the Herakleidæ after their conquest of the Peloponnesus. But the first glimpse of anything approaching to historic fact in connection with the games is their so-called revival by Iphitos, king of Elis, with the assistance of the Spartan lawgiver, Lycurgus, about 884 B.C.; or, according to others, about 828 B.C., an event commemorated by an inscription on a disk kept in the *Heræum* at Olympia, which Pausanias (flor. 2d c. A.D.) saw. That festive games were celebrated here—in other words, that Olympia was a sacred spot long before the time of Iphitos, can indeed hardly be doubted: the universal tradition that the Elean king had only "revived" the games proves this; but nothing whatever can be historically ascertained concerning their origin, character, or frequency, in this remoter time. Iphitos may, therefore, be regarded as their founder, yet the reckoning of time by olympiads (q.v.)—the real dawn of the historical period in Greek history—did not begin till more than a century later. At first, it is conjectured, only Peloponnesians resorted to the Olympic games, but gradually the other Greek states were attracted to them, and the festival became *Panhellenic*. Originally, and for a long time, none were allowed to contend except those of pure Hellenic blood; but after the conquest of Greece by the Romans, the latter sought and obtained this honor, and both Tiberius and Nero figure in the list of Roman victors. Women—with one exception, the priestess of Demeter Chamyne—were forbidden to be present, on pain of being thrown headlong from the Typæan rock. The games were held from the 11th to the 15th of the Attic month *Hekatombaeon* (our July–August), during which, first throughout Elis, and then throughout the rest of Greece, heralds proclaimed the cessation of all intestine hostilities; while the territory of Elis itself was declared inviolable. The combatants were required to undergo a preparatory training for 10 months in the gymnasium at Elis, and during the last of these months the gymnasium was almost as numerously attended as the games themselves. Much uncertainty prevails as to the manner in which the contests were distributed over the different days. Krause (*Olympia*, p. 106) suggests the following order: On the first day the great initiatory sacrifices were offered, after which the competitors were properly classed and arranged by the judges, and the contests of the trumpeters took place; the second day was set apart for the boys who competed with each other in foot-races, wrestling, boxing, the *pentathlon*, the *pankration*, horse-races; the third and principal day was devoted to the contests of men in foot-races of different kinds (as, for example, the simple race, once over the course; the *diaulos*, in which the competitors had to run the distance twice; and the *dolichos*, in which they had to run it seven or twelve times); wrestling, boxing, the *pankration* (in which all the powers and skill of the combatants were exhibited), and the race of *hoplites*, or men in heavy armor; on the fourth day came off the *pentathlon* (contest of five games —viz., leaping, running, throwing the discus, throwing the spear, and wrestling), the chariot and horse races, and perhaps the contests of the heralds; the fifth day was set

apart for processions, sacrifices, and banquets to the victors (called *Olympionikoi*), who were crowned with a garland of wild olive twigs cut from a sacred tree which grew in the Altis (see OLYMPIA), and presented to the assembled people, each with a palm branch in his hand, while the heralds proclaimed his name, and that of his father and country. On his return home, he was received with extraordinary distinction; songs were sung in his praise (14 of Pindar's extant lyrics are devoted to *Olympionikoi*); statues were erected to him, both in the Altis and in his native city; a place of honor was given him at all public spectacles; he was in general exempted from public taxes, and at Athens was boarded at the expense of the state in the Prytaneion.

The regulation of the games belonged to the Eleans, from whom were chosen the *hellanodikai*, or judges, whose number varied. At first there were only two, but as the games became more and more national, and consequently more numerous, they were gradually increased to ten, sometimes even to twelve. They were instructed in their duties for ten months beforehand at Elis, and held their office only for one year. The officers who executed their commands were called *alytai*, and were under the presidency of an alytarch.—See Crause's *Olympia oder Darstellung der grossen Olympischen spiele* (Wien, 1838.)

OLYMPIODO'RUS, one of the latest of the Alexandrian Neoplatonists, flourished in the first half of the 6th c. after Christ, during the reign of the emperor Justinian. Regarding his life nothing is known. Of his writings, we possess a *Life of Plato*, with commentaries or scholia on several of his dialogues, the Gorgias, Philebus, Phædo, and Alcibiades I. In these he appears as an acute and vigorous thinker, and as a man of great erudition. Olympiodorus's *Life of Plato* was published by Wetstein (1692), Etwall (Lond. 1771), and Fischer (Leips. 1783); the best edition of the scholia is that of Mystoxides and Schinas (Venice, 1816).

OLYMPUS, the ancient name of several mountains or chains of mountains—*e.g.*, of the north-western continuation of Taurus in Mysia, of a mountain in the island of Cyprus, of one in Lycia, of another in Elis, of one on the borders of Laconia and Arcadia, and of another on the frontiers of Thessaly and Macedonia. Of these, the last-mentioned (now called *Elymbo*) is the most famous. Its eastern side, which fronts the sea, is composed of a line of vast precipices, cleft by ravines, filled with forest-trees. Oak, chestnut, beech, plane tree, are scattered abundantly along its base, and higher up appear great forests of pine, as in the days of the old poets of Greece and Rome. With Euripides, it is *poludendros Olympos;* with Virgil, *frondosus Olympus;* and with Horace, *opacus Olympus.* Its highest peak is 9,754 ft. above the level of the sea, and is covered with snow for about nine months of the year. It was regarded by the ancient Greeks as the chief abode of the gods, and the palace of Zeus was supposed to be upon its broad summit. According to Greek legend, it was formerly connected with Ossa, but was separated from it by an earthquake, allowing a passage for the Peneius through the narrow vale of Tempe to the sea. The philosophers afterwards transferred the abode of the gods to the planetary spheres, to which they likewise transferred the name of Olympus.

OLYNTHUS, an ancient city of Macedonia, situated on the Toronäic gulf. It was probably founded by the Eubœan Etrurians and Chalcidians. At the time of the second Persian invasion the town was captured and sacked by Artabazus, one of Xerxes's generals. When Brasidas overthrew the Athenian power in Chalcidice, Olynthus gradually gained importance and became the head of an alliance among the northern Greek states, which soon provoked the jealousy of Athens and Lacedæmonia. When the annexation of Appollonia and Acanthus was threatened by Olynthus, 383 B.C., an army of 10,000 men was sent against that republic by the Peloponnesian states, under the command of Teleutias, a Spartan. The Olynthians were driven back into their city; but, in a sortie, surprised the enemy and threw them into a panic. Teleutias being killed while trying to rally his forces. Agesipolis then took command, and had gained the advantage, when he died, and Polybiades, his successor, compelled the surrender of the city in 379 B.C. The confederation was broken up. For some time they had an alliance with Philip of Macedonia; but, two years after they had completed a league with Athens, 352 B.C., war broke out between Olynthus and Macedonia. It was in advocacy of the policy of supporting the Olynthians that Demosthenes uttered the Olynthiacs, among the best of his orations. Some aid was sent by Athens, but it was totally inadequate, and in 347 B.C. Philip razed the city to the ground and sold the inhabitants as slaves.

OM is a Sanskrit word which, on account of the mystical notions that even at an early date of Hindu civilization were connected with it, acquired much importance in the development of Hindu religion. Its original sense is that of emphatic or solemn, affirmation or assent. Thus, when in the White-Yajur-Veda (see VEDA) the sacrificer invites the gods to rejoice in his sacrifice, the god Savitr'i assents to his summons by saying: "*Om* (i.e., be it so); proceed!" Or, when in the Br'had-âranyaka-Upanishad, Prajâpati, the father of gods, men, and demons, asks the gods whether they have understood his instruction; he expresses his satisfaction with their affirmative reply, in these words: "*Om*, you have fully comprehended it;" and, in the same Upanishad, Pravâhan'a answers the question of S'wetaketu, as to whether his father has instructed him, by uttering the word "*Om*," i.e., "forsooth (I am)." A portion of the R'igveda, called the Aitareya-Brâhman'a, where describing a religious ceremony at which verses from

the R'igveda, as well as songs called Gâthâs, were recited by the priest called Hotr'i, and responses given by another priest, the Adhwaryu, says: "*Om* is the response of the Adhwaryu to the R'igveda verses (recited by the Hotr'i), and likewise *tathâ* (i.e., thus) his response to the Gâthâs, for *Om* is (the term of assent) used by the gods, whereas *tathâ* is (the term of assent) used by men" (the R'igveda verses being, to the orthodox Hindu, of divine, and the Gâthâs of human, authorship). In this, the original sense of the word, it is little doubtful that *om* is but an older and contracted form of the common Sanskrit word *evam*, "thus," which, coming from the pronominal base "*a*"—in some derivations changed to "*e*"—may have at one time occurred in the form *avam*, when, by the elision of the vowel following *v*—for which their are numerous analogies in Sanskrit—*avam* would become *aum*, and hence, according to the ordinary phonetic laws of the language, *om*. This etymology of the word, however, seems to have been lost, even at an early period of Sanskrit literature; for another is met with in the ancient grammarians, enabling us to account for the mysticism which many religious and theological works of ancient and mediæval India suppose to inhere in it. According to this latter etymology, *om* would come from a radical *av* by means of an affix *man*, when *om* would be a curtailed form of *avman* or *oman;* and as *av* implies the notion of "protect, preserve, save," *om* would be a term implying "protection or salvation;" its mystical properties and its sanctity being inferred from its occurrence in the Vedic writings, and in connection with sacrificial acts, such as are alluded to before.

Hence *Om* became the auspicious word with which the spiritual teacher had to begin, and the pupil had to end each lesson of his reading of the Veda. "Let this syllable," the existing Prâtis'âkhya, or grammar of the R'igveda, enjoins, "be the head of the reading of the Veda, for, alike to the teacher and the pupil, it is the supreme Brahman, the gate of heaven." And Manu (q.v.) ordains: "A Brahman, at the beginning and end (of a lesson on the Veda), must always pronounce the syllable *Om;* for unless *Om* precede, his learning will slip away from him; and unless it follow, nothing will be long retained." At the time when another class of writings, the Purân'as (q.v.), were added to the inspired code of Hinduism, for a similar reason, *Om* is *their* introductory word.

That the mysterious power which, as the foregoing quotation from the law-book of Manu shows, was attributed to this word, must have been the subject of early speculation, is obvious enough. A reason assigned for it is given by Manu himself. "Brahmâ," he says, "extracted from the three Vedas the letter *a*, the letter *u*, and the letter *m* (which combined result in *Om*), together with the (mysterious) words *Bhûh'* (earth), *Bhuvah'* (sky), and *Swah'* (heaven);" and in another verse: "These three great immutable words, preceded by the syllable *Om*, and (the sacred R'igveda verse, called) Gâyatrî, consisting of three lines, must be considered as the mouth (or entrance) of Brahman (the Veda)"—or, as the commentators observe—the means of attaining final emancipation; and "The syllable *Om* is the supreme Brahman, (three) regulated breathings (accompanied with the mental recitation of Om, the three mysterious words, Bhûh', Bhuvah', Swah', and the Gâyatri), are the highest devotion. . . . . All rites ordained in the Veda, such as burnt and other sacrifices, pass away; but the syllable *Om* must be considered as imperishable, for it is (a symbol of) Brahman (the supreme Spirit) himself, the Lord of Creation." In these speculations, Manu bears out, and is borne out by, several Upanishads. See VEDA. In the *Katha-Upanishad*, for instance, *Yama*, the god of death, in replying to a question of Nachiketas, says: "The word which all the Vedas record, which all the modes of penance proclaim, of which desirous the religious students perform their duties, this word I will briefly tell thee, it is *Om*. This syllable means the (inferior) Brahman and the supreme (Brahman). Whoever knows this syllable, obtains whatever he wishes." And in the *Pras'na-Upanishad*, the saint Pippalâda says to Satyakâma: "The supreme and the inferior Brahman are both the word *Om;* hence the wise follows by this support the one or the other of the two. If he meditates upon its one letter (*a*) only, he is quickly born on the earth; him carry the verses of the R'igveda to the world of man; and if he is devoted there to austerity, the duties of a religious student, and faith, he enjoys greatness. But, if he meditates in his mind on its two letters (*a* and *u*), he is elevated by the verses of the Yajur-Veda to the intermediate region; he comes to the world of the moon, and having enjoyed there power, returns again (to the world of man). If, however, he meditates on the supreme Spirit by means of its three letters (*a*, *u*, and *m*), he is produced in light, in the sun; as the snake is liberated from its skin, so he is liberated from sin." According to the Mân'd'ûkya-Upanishad, the nature of the soul is summarized in the three letters *a*, *u*, and *m*, in their isolated and combined form—*a* being Vais'wânara, or that form of Brahman which represents the soul in its waking condition; *u*, Taijasa, or that form of Brahman which represents the soul in its dreaming state; and *m*, Prâjna, or that form of Brahman which represents it in its state of profound sleep (or that state in which it is temporarily united with the supreme Spirit); while *a*, *u*, *m*, combined, i.e., Om, represent the fourth or highest condition of Brahman, "which is unaccountable, in which all manifestations have ceased, which is blissful and without duality. *Om*, therefore is soul; and by this soul, he who knows it enters into (the supreme) soul." Passages like these may be considered as the key to the more enigmatic expressions used, for instance, by the author of the *Yoga* (q.v.) philosophy, where, in three short sentences, he says: "His (the supreme Lord's name) is *Pran'ava* (i.e., *Om*); its muttering (should be made) and reflection on its

signification; thence comes the knowledge of the transcendental spirit and the absence of the obstacles" (such as sickness, languor, doubt, etc., which obstruct the mind of an ascetic). But they indicate, at the same time, the further course which superstition took in enlarging upon the mysticism of the doctrine of the Upanishads. For as soon as every letter of which the word *Om* consists was fancied to embody a separate idea, it is intelligible that other sectarian explanations were grafted on them, to serve their special purposes. Thus while S'ankara, the great theologian and commentator on the Upanishads, is still contented with an etymological punning, by means of which he transforms "*a*" (or rather "*â*") into an abbreviation of *âpti* (pervading), since speech is pervaded by Vais'wânara; "*u*" into an abbreviation of *utkarsha* (superiority), since Taijasa is superior to Vais'wânara; and "*m*" into an abbreviation of *miti* (destruction), Vais'wânara and Taijasa, at the destruction and regeneration of the world, being, as it were absorbed into Prâjna—the Purân'as (q.v.) make of "*a*" a name of Vishn'u; of "*u*," a name of his consort *S'rî;* and of "*m*," a designation of their joint-worshipper; or they see in *a, u, m,* the Triad, Brahmâ, Vishn'u, and S'iva; the first being represented by "*a*," the second by "*u*," and the third by "*m*"—each sect, of course, identifying the combination of these letters, or Om, with their supreme deity. Thus, also, in the Bhagavadgîtâ, which is devoted to the worship of Vishn'u in his incarnation as Kr'ishn'a, though it is essentially a poem of philosophical tendencies, based on the doctrine of the Yoga, Kr'ishn'a in one passage says of himself that he is *Om;* while, in another passage, he qualifies the latter as the supreme Spirit.—A common designation of the word *Om*—for instance, in the last named passages of the Bhagavadgîtâ—is the word *Pran'ava,* which comes from a so-called radical *nu,* "praise," with the prefix *pra,* amongst other meanings, implying emphasis, and therefore literally means "eulogium, emphatic praise." Although *Om,* in its original sense, as a word of solemn or emphatic assent, is, properly speaking, restricted to the Vedic literature, it deserves notice that it is nowadays often used by the natives of India in the sense of "yes," without, of course, any allusion to the mystical properties which are ascribed to it in the religious works. See also the article Om Man'i Padme Hûm'.

That there exists no connection whatever, as has been supposed by some writers to be the case, between *Om* and *Amen,* requires scarcely any remark, after the etymological explanations given above; but it may not be without interest to observe that, though the derivation of *Om,* as a curtailment of *av-man,* from *av,* "protect, save," is probably merely artificial, and, as stated before, invented to explain the later mystical use of the Vedic word, it seems more satisfactory to compare the Latin *omen* with a Sanskrit *avman,* "protection," as derived by the grammarians from *âv* (in the Latin *âve-o*), than to explain it in the fashion of the Roman etymologists: "Omen, quod ex ore primum elatum est, osmen dictum;" or, "Omen velut oremen, quod fit ore augurium, quod non avibus aliove modo fit." And since *pra-nava,* from Sanskrit *nu,* "praise," is, like *Om,* used in the sense of "the Deity," it is likewise probable that *numen* does not come, as is generally believed, from Latin *nu-(ere),* "nod," but from a radical corresponding with the Sanskrit *nu,* "praise."

OMAGH (Irish, *Oigh magh,* "Seat of the chiefs"), an ancient t., capital of the co. of Tyrone in Ireland, situated on the river Strule, distant 34 m. s. from Londonderry, and 110 m. u.n.w. from Dublin, with both which cities it is connected by railway. Omagh grew up around an abbey founded in the year 792, but is first heard of as a fortress of Art O'Nial in the end of the 15th c., about which time it was forced to surrender to the English, although its possession long continued to alternate between Irish and English hands. It formed part of James I.'s "Plantation" grants, and was strongly garrisoned by Mountjoy. On its being evacuated by the troops of James II. in 1689, it was partially burned, and a second fire in 1743 completed its destruction. But it has been well rebuilt, and is now a neat and prosperous town. Pop. 81, 4,126. Omagh contains a very handsome court-house, where the assizes for county Tyrone are held, several neat churches (Roman Catholic, Episcopal, and Presbyterian), a convent, several partially endowed and national schools, a district lunatic asylum, and the work-house of the Poor-Law Union of which it is the center. There is also a barrack station—it being within the Belfast military district. Its trade is chiefly in brown linens, corn, and agricultural produce.

OMAHA, city, port of entry, and co. seat of Douglas co., Neb.; on the Missouri river and the Burlington Route, the Chicago, Milwaukee, and St. Paul, the Chicago, Rock Island, and Pacific, the Chicago, St. Paul, Minneapolis, and Omaha, the Fremont, Elkhorn, and Missouri Valley, the Missouri Pacific, and the Union Pacific railroads; opposite Council Bluffs, Ia. Omaha is finely situated on a plateau, broken by bluffs which are largely used for residences, and from its important position with reference to the west has been called the Gate City. Its name is derived from one of the tribes of Dakota Indians. It was laid out in 1854, became an incorporated city in 1859, and was planted on a scale of magnitude that anticipated the growth of a great city. The territorial capital was first located here, but was subsequently fixed at the city of Lincoln. Before the construction of the Union Pacific road, which began at this point, it was the most northerly outfitting place for overland trains to the "far west."

The aid of the government in the construction of the Union Pacific railway, and the choice of Omaha as its starting-point on the Missouri in 1864, made it the theatre of great speculation in the belief that it was destined to an extraordinary growth. Its growth has, in fact, been rapid, though less so than was anticipated by some enthusiasts. It now has connections by two bridges across the Missouri, uniting it through the city of Council Bluffs on the e. side with a great radiating system of railways to all points eastward, and with the country to the n., w., and s. by other roads, of which it is the terminus.

The city is the seat of the U. S. military head-quarters of the department of the Platte. Among the noteworthy buildings are the U. S. government building, Douglas county hospital, Clarkson memorial hospital, Immanuel hospital, Methodist Episcopal hospital, Presbyterian hospital, St. Joseph's hospital, Nebraska institution for the deaf, Open-door home for girls, Rescue and Young Women's homes, public library, Creighton college (R. C.), Brownell hall (P. E.), St. Catherine's academy (R. C.), normal industrial college, high school, and about 40 public grammar schools. There are several public parks, gas and electric light plants, electric street railroads, over 100 churches, including St. Philomena's (R. C.) and Trinity (P. E.) cathedrals, and numerous national and state banks. The city has extensive iron works for making and rolling railroad iron, machine shops, and one of the most complete establishments in the country for smelting, separating, and refining the ores of gold, silver, copper, lead, and zinc, which come to Omaha to be treated from the mining regions along the line of the Union Pacific and other railways. The trade in live-stock, grain, lumber, boots and shoes, hats and caps, and groceries is enormous and increases in volume yearly. Linseed-oil, white lead, carriages, and bricks are manufactured in large amounts. The capital invested in manufacturing aggregates about $50,000,000. At South Omaha, adjoining the city, there are extensive stockyards and packing houses. Pop. '90, 140,452.

OMAHAS, an Indian tribe of the Dakota family, living when visited by the early explorers along the St. Peter's river, divided into two tribes, Ishtasundas and Hongashanos, and 13 clans, one of which had charge of a sacred shell, kept in a temple. One of their customs forbade a man's speaking with his father-in-law or mother-in-law. They could, at one time, muster 700, but in 1802 small-pox had reduced their number to 300. They now left their settlements and for some years led a roving life, constantly harassed by the Sioux. The explorers Lewis and Clarke found them in 1805 living along the Quicoure river. Their number was then 600. Between 1815 and 1854, they ceded large portions of their lands. Missions were established among them in 1839, and again in 1846, but met with little success. They had succeeded in making a permanent treaty of peace with the Poncas and Pawnees in 1800, but were continually at war with the Sioux, who several times forced them to withdraw to the Elkhorn. In 1843 they negotiated a treaty of peace with some of the Sioux, and went back to their old settlements. The most famous of their chiefs, Logan Fontanelle, was slain by the Sioux in 1855. For the last generation they have followed agriculture, and have been more prosperous; and their number has increased to about 1167. They have established schools and a church, and hold property valued at $75,000. They live on an extensive reservation in Blackbird co., Nebraska.

OMAN' an independent Arab state, a strip of maritime territory, extending between Cape Mussendam to the port of Mirat, bounded on the n.e. by the gulf of Oman, and on the s.w. by the deserts of the interior. The sultan of Oman also claims authority over the coast lands stretching west from Cape Mussendam to the gulf of Bahrein. At a distance of from 20 to 40 m. from the coast, a chain of mountains runs parallel to it, which reaches in its highest ridge, called *Gebel Achdar* ("Great Mountain"), an elevation of 10,000 ft.; the average height is 4,000 feet. There are a few not inconsiderable streams, and some richly fertile tracts in this region, but the greater part is a waste of sand, with here and there a small oasis, where, however, the vegetation is most luxuriant. The staple products are dates and grains, indigo, wine and coffee; copper, sulphur and lead are worked, and the dromedaries of Oman are famous. Early in the 19th century the Sultan's sway extended over parts of Persia, Zanzibar and adjacent Africa. The pop. is estimated at 1,500,000.

OMAR, ABÛ-HAFSA-IBN-AL-KHETTAB, the second caliph of the Moslems, was b. about 592. His early history is little known, but previous to his conversion he was an ardent persecutor of Mohammed and his followers. After his conversion he became as zealous an apostle as he had formerly been a persecutor, and rendered valuable aid to the prophet in all his warlike expeditions. After Mohammed's death, he casused Abu-bekr to be proclaimed caliph, and was himself appointed *haujeb*, or prime-minister. Though of a fiery and enthusiastic temperament, he proved a sagacious adviser, and it was at his suggestion that the caliph put down with an iron hand the many dissensions which had arisen among the Arabs after the prophet's decease, and resolved to strengthen and consolidate their new-born national spirit, as well as propagate the doctrines of Islam, by engaging them in continual aggressive wars. On the death of Abu-bekr, Omar, succeeded as caliph, and pushed on the wars of conquest with increased vigor. He was summoned to Jerusalem in 637, to receive the keys of that city, and before leaving gave orders to build a mosque, now called by his name, on the site of the temple of Solomon. Omar now took the command of a portion of the army, and reduced the other chief cities of Palestine. He then planned an invasion of Persia, which was commenced the

same year, and by 642 the whole of what is now known as Persia was subdued. In the meantime the war in Syria was vigorously prosecuted, and the Byzantine armies, repeatedly defeated, at length gave up the contest. In 639, Amrû, one of his generals, had invaded Egpyt with a considerable force; but such was the prestige of the Arabs, or the incapacity of the lieutenants of the emperor Heraclius, that this valuable country, with its six millions of people, was reduced under the caliph's authority without a single contest, and only two towns, Misr and Alexandria, were even attempted to be defended. (For the story which was till lately believed concerning the destruction of the Alexandrian library, see ALEXANDRIAN LIBRARY.) Barca and Tripoli were next subdued by Amrû. On the n., Armenia was overrun in 641, and the caliph's authority now reached from the desert of Khiva to the Syrtis, an enormous extension in ten years. In 644 Omar was assassinated in the mosque of Medina by a Persian slave from motives of revenge. He languished five days after receiving the wound, but refused to appoint a successor, and named six commissioners who were to choose one from themselves. He was buried in the mosque of Medina, near the prophet and Abu-bekr, and his tomb is still visited by pilgrims.

Omar may be called the founder of the Mohammedan power, as from a mere sect he raised it to the rank of a conquering nation, and left to his successor an empire which Alexander the great might have envied. In him we find a rare combination of qualities, the ardent zeal of the apostle side by side with the cautious foresight and calm resolution of the monarch. His great military talents, and severity to "obstinate unbelievers," rendered him formidable to his enemies, and his inexorable justice rendered him no less obnoxious to the more powerful of his subjects, and gave rise to many attempts at his assassination. Omar was the founder of many excellent institutions; he assigned a regular pay to his soldiers, established a night-police in towns, and made some excellent regulations for the more lenient treatment of slaves. He also originated the practice of dating from the era of the *Hedjrah* (q.v.). He assumed the title of *Emir-al-mumenin* ("Commander of the Faithful") in preference to that of *Khalifah-rasouli-Ilahi*, the ordinary designation; and to the present day his name is held in the greatest veneration by the orthodox or Sunî sect of Moslems.

OMAR KHAYYAM, b. in or near Nishapur, Persia; d. 1123. His name Khayyám, tentmaker, was probably derived from his father's trade. He early formed a close friendship with the famous statesman Nizam-ul-Mulk, and when the latter was raised to the rank of vizier by Sultan Alp Arslan, 1063, he bestowed an annual stipend upon K. This enabled him to devote himself to his favorite studies of mathematics and astronomy. He published standard treatises on algebra, on the extraction of cube roots, and the explanation of difficult definitions in Euclid, and assisted Sultan Malikshah in a thorough reform of the Persian calendar. But his scientific fame has been eclipsed by his poetical renown. His Rubaiyat, or Quatrains, are remarkable for artistic perfection, for the bitter energy of their attacks upon the orthodoxy of his day, for their wide sympathy with suffering humanity, and especially for the way in which his joyous celebration of the good things of this life is constantly overshadowed by the dread and horror of death. An admirable translation of the Rubaiyat into European verse was pub., 1879, by Edward Fitzgerald. An edition illustrated by Vedder was published, 1884. A metrical translation by Richard Le Gallienne appeared in 1897.

OMAR PASHA, a celebrated Turkish general, was b. at Plaski, an Austrian village in the Croatian military frontier, in 1806 (according to some authorities, in 1811). His real name was Mikail Lattas, and his father being an officer in the Austrian army, Mikail was educated at the military school of Thurn, near Carlstadt. He joined a frontier regiment; but to escape punishment for some offense, fled to Bosnia, embraced Mohammedanism, became tutor to the sons of the governor of Widin, and in 1834 was appointed writing master in a military school in Constantinople. Employed in the same capacity by Abdul Medjid, heir to the throne, Omar received the rank of captain in the Turkish army, and on the accession of his patron, 1839, the rank of colonel; was made military governor of the Lebanon district in 1842, and pasha in 1843, and gained honor by subduing rebellions in Albania, Bosnia, and Kurdistan. In 1852 the interference of Austria prevented him from crushing the Montenegrins. On the invasion of the principalities by the Russians (July, 1853), Omar collected at Schumla an army of 60,000 men to cover Constantinople; but being no less a politician than a soldier, he soon divined that the Russians would not immediately cross the Danube, and accordingly pushed on to Widin, where he crossed the river in presence of the enemy and intrenched himself at Kalafat. A detachment of the Turkish army, intrenched at Oltenitza, on Nov. 4, severely repulsed the attack of a Russian force. The Russians, though twice defeated at Kalafat, in 1855, in 1856 attacked Silistria (q.v.), which Omar had fortified, but their assaults were invariably repulsed with severe loss. The Russians then withdrew from the principalities, and Omar entered Bucharest in triumph in August, 1854. On Feb. 9, 1855, he embarked for Eupatoria, where, on the 17th of the same month, he was suddenly attacked by 40,000 Russians, who were repulsed with great loss. He was soon afterward (Oct. 3, 1855) sent to relieve Kars, but arrived too late, and the armistice which followed (Feb. 29, 1856) put a stop to his military career. He was subsequently made governor of Bagdad; but having been accused of maladministration, was banished to Kaarport in 1859. He was recalled in the following year, and in September, 1861, was sent to pacify

Bosnia and Herzegovina, which were again in insurrection. This being accomplished, he attacked the Montenegrins, captured their chief town of Cetinji, and overran the country in 1862. Omar held the grand cross of the legion of honor, and was a knight of the Russian order of St. Anne. He ceased to take part in public life in 1869, being thereafter regarded as a minister without portfolio; and died in 1871.

OMBAY, or MALOEWA (Maluwa), an island between Celebes and the n.w. coast of Australia, lies to the n. of Timor, from which it is separated by the strait of Ombay, lat. 8° 8′ to 8° 28′ s., long. 124° 17′ to 125° 7′ east. Area, 961 sq.miles. The pop. amounts to about 194,000. The hills of Ombay are volcanic, and the coasts steep and difficult to approach. The inhabitants are dark brown, have thick lips, flat nose, and woolly hair, appearing to be of mixed negro and Malay origin. They carry on agriculture and ship-building and deal in slaves, and live on the produce of the chase, with fish, cocoanuts, rice, and honey. A portion of the island formerly belonged to the Portuguese, but since Aug. 6, 1851, it is entirely a Netherlands possession. The Dutch post-holder resides at the village of Alor, to which iron wares, cotton goods, etc., are brought from Timor, and exchanged for wax, edible nests, provisions, and other native products. Ombay has oxen, swine, goats, etc., and produces maize, rice and pepper. Amber is also found, and the Boeginese of Celebes import European and Indian fabrics, exchanging them for the produce of the island, which they carry to Singapore.

O'MEARA, BARRY EDWARD, was b. in Ireland in the year 1786. Otherwise without claim to be remembered, his name remains notable from his connection with the first Napoleon, whom he accompanied to St. Helena as household physician. At the age of 18 he entered the British army as assistant-surgeon. In 1808, being stationed at Messina, he became concerned in a duel as second, under circumstances which must more or less have been held discreditable, as his dismissal from the service by sentence of court-martial was the result. Afterward he succeeded in procuring an appointment as surgeon in the navy, and as such for some years is certified to have discharged his duties with zeal and efficiency. As it chanced, he was serving with Capt. Maitland in the Bellerophon, when the emperor Napoleon (q.v.) surrendered himself to that officer. During the voyage from Rochefort to Plymouth he was introduced to Napoleon, on whom the impression he produced was favorable, leading to a proposal that he should accompany the emperor into exile as private physician, an arrangement to which he acceded, stipulating that he should retain his rank in the navy, and be permitted to return to it at pleasure. By Napoleon, with whom he remained in daily intercourse at St. Helena for about three years, he seems to have been admitted to something more or less like intimacy; and occasionally it might well be, as he says, that the great captive would kill the creeping hours by loose talk with his attendant over the events of his strange life. Of these conversations O'Meara naturally enough took notes, which he afterward published. Meantime he became involved in the interest of Napoleon, in the series of miserable and petty squabbles which he waged with the governor, sir Hudson Lowe (q.v.). The result of these, as regards O'Meara, was that in 1818, after a violent altercation with sir Hudson, he was committed to close arrest, and was authorized by the emperor to resign his post. On his return to England, he addressed a letter to the admiralty, in which, among other things, he accused sir Hudson Lowe of intentions against the life of his captive, and even of having, by dark hints to himself, insinuated a desire for his services as secret assassin. For this he was instantly dismissed the service. The accusation was plainly monstrous and incredible. In 1822, after Napoleon's death, O'Meara published *Napoleon in Exile*, by which book alone he is now remembered. As conveying to the world the first authentic details of the prison-life of the great deceased, it made on its appearance an immense sensation, and— though for obvious reasons everywhere to be accepted, if at all, with caution—it is still not utterly without interest. The last years of O'Meara's life were passed in obscurity in the neighborhood of London, where, in 1836, he died.

OMELET, or OMELETTE, French, a dish chiefly composed of eggs. These are broken, and their contents put into a proper vessel, in which they are whipped into a froth, which is poured into a very clean and dry frying-pan, with the addition of lard or butter to prevent sticking, and then fried carefully, so that the outside is nicely browned. Before frying, one of a number of ingredients may be added to vary the omelet, such as chopped savory herbs, minced ham or bacon, salt-fish, shell-fish, game, etc. Or sweet omelets may be made by placing preserved fruits upon them when quite or nearly cooked. The omelet is an excellent dish, and, simple though it be, it requires much skill to prepare it successfully.

O'MEN (for the deriv., see OM), or PRODIGY (generally said to be from *pro* and *dico*, but more probably from *pro* and *ago*, to lead; hence anything conspicuous, or *extra*ordinary), the name given by the Romans to signs by which approaching good or bad fortune was supposed to be indicated. The terms *omen* and *prodigy* were not, however, exactly synonymous; the former being applied rather to signs received by the ear, and particularly to spoken words; the latter to phenomena and occurrences, such as monstrous births, the appearance of snakes, locusts, etc., the striking of the foot against a stone or the like, the breaking of a shoe-tie, and even sneezing, etc. If an omen or prodigy was promised on the part of a god, it was to be interpreted according to the promise; but otherwise, the interpretation was extremely arbitrary. It was supposed

that evil indicated as approaching might be averted by various means, as by sacrifices, or by the utterance of certain magic formulas; or by an extempore felicity of interpretation, as when Cæsar, having fallen to the ground on landing in Africa, exclaimed: "I take possession of thee, Africa." Occasionally, it is true, we read of a reckless disregard of omens; as, for example, when P. Claudius, in the first Punic war, caused the sacred chickens, who would not leave their cage, to be pitched into the sea, saying: "If they won't eat, they must drink." Still the belief in them was universal, and in general the greatest care was taken to avoid unfavorable omens. The heads of the sacrificial priests were covered, so that nothing distracting might catch their eyes; silence was enjoined at the commencement of every sacred undertaking, and at the opening of the *Ludi*. Before every sacrificial procession ran the heralds, calling on the people to "pay respect to it," and admonishing them to cease working till it should have passed, that the priests might not hear unfavorable sounds. At the beginning of a sacrifice the bystanders were addressed in the words *favete linguis* ("speak no word of evil import"), and the aid of music was sought to drown whatever noises might prove unpropitious. Compare AUGURIES AND AUSPICES, and DIVINATION. See also Fallati, *Ueber Begriff und Wesen des Rom. Omen* (Tüb. 1836).

The belief in omens has existed in all ages and countries, and traces of it linger even yet in the most civilized communities; in the dread, for instance, that many entertain at sitting down to table in a party of thirteen. Not a little of the philosophy of omens is contained in the Scottish proverb: "Them who follow freits, freits follow;" meaning, that a fatalistic belief in impending evil paralyzes the endeavor that might prevent it.

OMENTUM. See PERITONEUM.

OMISH, or **AMISH**, a branch of the Mennonites, founded in 1693, in Alsace, by Jacob Amman, from whom they derive their name. His special tenets were plainness in dress, absolute separation from the excommunicated, and washing of feet. His followers did not use buttons on their clothing, and were hence called *Häftler*, or "Hooker" Mennonites, while the rest of that body was called *Knöpfler*, or "Buttonites." Their number in this country is next to that of the old Mennonites.

OM MAN'I PADME HUM' is the "formula of six syllables" which has acquired much celebrity from the conspicuous part which it plays in the religion of the Buddhists, and especially in that form of it called *Lamaism* (q.v.). It is the first subject which the Thibetans and Mongols teach their children, and it is the last prayer which is muttered by the dying man; the traveler repeats this formula on his journey, the shepherd when attending his flock, the housewife when performing her domestic duties, the monk when absorbed in religious meditation, etc. It is met with everywhere; on flags, rocks, trees, walls, columns, stone-monuments, domestic implements, skulls, skeletons, etc. It is looked upon as the essence of all religion and wisdom, and the means of attaining eternal bliss. "These six syllables," it is said, "concentrate in themselves the favor of all the Buddhas, and they are the root of the whole doctrine . . . . ; they lead the believer to re-birth as a higher being, and are the door which bars from him inferior births; they are the torch which illuminates darkness, the conqueror of the five evils;" etc. They are likewise the *symbol* of transmigration; each syllable successively corresponding with, and releasing from, one of the six worlds in which men are reborn; or they are the mystical designation of the six transcendental virtues, each successive syllable implying self-offering (*dâna*), endurance (*kshânti*), chastity (*śîla*), contemplation (*dhyâna*), mental energy (*vîrya*), and religious wisdom (*prajnâ*). The reputed author of this formula is the Dhyâna-Bodhisattwa, or deified saint, *Avalokiteswara*, or, as the Thibetans call him, *Padmapâni* (i.e. the lotus-handed). It would not belong, accordingly, to the earliest stage of Buddhism, nor is it found in the oldest Buddhistic works of the north of India or of Ceylon. Its original sense is rather obscure. Some suppose that it means O! (*óm*), the jewel (*mani*) in the lotus (*padme*), amen (*hûm*); "the jewel" being an allusion to the saint Avalokiteswara himself, and the word "*padme*, or in the lotus," to the belief that he was born from a lotus. It is probably, however, more correct to interpret the formula thus: "Salvation (*om*) [is] in the jewel-lotus (*mani-padme*), amen (*hûm*);" when the compound word "jewel-lotus" would mean the saint and the flower whence he arose. If this interpretation be correct, the formula would be originally nothing more than a salutation addressed to Avalokiteswara or Padmapâni; and the mystical interpretation put upon each syllable of it, would then be analogous to that which imparted a transcendental sense to each of the letters of the syllable Om (q.v.). Dr. Emil Schlagintweit, in his valuable work on *Buddhism in Thibet* (Leipsic, 1863), relates (p. 120) that "in a prayer-cylinder which he had the opportunity of opening, he found the formula printed in six lines, and repeated innumerable times upon a leaf 49 feet long and 4 inches broad. When Baron Schilling de Canstadt paid a visit to the temple Subulin, in Siberia, the lamas were just occupied with preparing 100,000,000 of copies of this prayer to be put into a prayer-cylinder; his offer to have the necessary number executed at St. Petersburg was most readily accepted, and he was presented, in return for the 150,000,000 of copies he forwarded to them, with an edition of the Kanjur, the sheets of which amount to about 40,000. When adorning the head of religious books, or when engraved upon the slabs resting on the prayer-walls, the letters of the formula are often so combined as to form an anagram. The longitudinal lines occurring

in the letters "*manî padme hûm*" are traced close to each other, and to the outer longitudinal line at the left are appended the curved lines. The letter "*om*" is replaced by a symbolical sign above the anagram, showing a half-moon surmounted by a disk indicating the sun, from which issues a flame. Such a combination of the letters is called in Thibetan *nam chu vangdan*, "the ten entirely powerful (viz., characters, six of which are consonants, and four vowels);" and the power of this sacred sentence is supposed to be increased by its being written in this form. These kind of anagrams are always bordered by a pointed frame indicating the leaf of a fig-tree."—See also E. Burnouf, *Introduction à l'Histoire du Buddhisme Indien* (Paris, 1844); C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857–59); and the works quoted by these authors.

OMMIADES (Omaiades, or Ommeyades), a dynasty (deriving its name from an ancestor, Ommeyah) which succeeded to the Arabian caliphate on the death of Ali, the fourth caliph after Mohammed, and possessed it till superseded by the Abbasides (q.v.) in 750. Moawiyah, the founder of the dynasty, was the son of Abu-Sofiau, who defeated Mohammed at Beder, and his mother was the notorious Hinda. After the death of Othman the third caliph, Moawiyah, who was his cousin, claimed the throne, and during the whole of Ali's reign ruled over the western provinces of Syria and Egypt; but it was not till the death of that caliph, and the abdication of his son Hassan in 661, that MOAWIYAH'S authority was fully recognized. In that year he transferred the seat of the caliphate to Damascus; Kufa having been the residence of Ali, and Medina of the first three caliphs. The Arabs continued to extend their conquests during his reign; the Turks in Khorassan were subdued, Turkistan invaded, and several important acquisitions made in Asia Minor. But besides aggrandizing his empire, the caliph neglected no means of consolidating it, and partly for this reason he made the succession hereditary, and caused his son YEZID (680–83) to be recognized as his heir. The reigns of Yezid and his successors, MOAWIYAH II. (683) and MERWÂN I., formerly the traitorous secretary of the caliph Othman (683–85), are devoid of importance, as their sway extended only over Syria and Palestine. ABDULMELEK (685–705), an able and warlike prince, after a long and varying struggle of eight years, succeeded in rendering himself undisputed ruler of the Mohammedan world (692), but the latter part of his reign was much disturbed by rebellions in the eastern provinces. He was the first caliph who interested himself in the promotion of liberal knowledge, by causing the most celebrated poetical and other works of the Persians to be translated into Arabic; and under his reign coined money was first introduced. It was to this prince that his court-fool related the celebrated fabulous conversation between the owl of Bassora and that of Mosul. Four of his sons, WALID I. (705–16), SULIMAN (716–17), YEZID II. (720–23), and HESHÂM (723–42), successively occupied the throne, and a fifth son, Mosslemah, was, from his great military abilities and zealous devotion to the interests of his brothers, the terror of all their enemies, both domestic and foreign. Under Walid, the Ommiade caliphate reached the summit of its power and grandeur; northern Africa (709), and Spain (712), Turkistan (707), and Galatia (710) were conquered; while toward the close of his reign, his empire was extended even to the Indus. The slender structure of the minaret was now for the first time introduced into mosque architecture. OMAR II. (717–20), who, in the justice and mildness of his government, surpassed the whole of the race of Ommeyah, was appointed to succeed Suliman; but having excited discontent among his relatives, by suppressing the formula of malediction, which had hitherto been regularly pronounced at all public ceremonies against Ali and his descendants, he was poisoned. During his reign, Mosslemah had completed the conquest of Asia Minor, and even compelled the emperor Leo to submit to the humiliation of walking beside his horse through the principal streets of Constantinople itself, and paying a large ransom (equivalent to about £140,000) for his capital Heshâm, though like his immediate predecessor, fond of pleasure, possessed all the qualities necessary for a sovereign. The Greeks, who still strove for the possession of Asia Minor, were repeatedly defeated: the fierce Turks of northern Persia and Turkistan, were kept in stern subjection; and the civil affairs of the empire carefully and strictly administered. The death of Mosslemah, the champion of the Ommiade dynasty, seems to have been the signal for insurrection; the descendants of Ali raised the standard of revolt, and no sooner were they subdued than Ibrahim, the fourth in direct descent from Abbas the uncle of Mohammed, solemnly invested the celebrated Abu-Mosslem (stated to be a descendant of Koderz, one of the most distinguished heroes of Firdusi's admired work the *Shah-nameh*) with the arduous duty of enforcing his long-agitated claims to the throne. During this reign the progress of Arab conquest in western Europe was checked by Charles Martel, who inflicted upon the Arabs a severe defeat at Tours (732), and almost annihilated their army at Narbonne (736). The reigns of WALID II. (742–43), YEZID III. (743–44), and IBRAHIM (744), though of ephemeral duration, were long enough to produce a complete disorganization of the empire; and though MERWÂN II. (744–50), the next and last caliph of the house of Ommeyah, was both an able and politic ruler, and a skillful warrior, the declining fortune of his family was beyond remedy. Abu-Mosslem, who had published the claims of the Abbasides amidst the ruins of Meru in 747, took the field at the head of a small but zealous band, and carried the black flag of the Abbasides from victory to victory, till before the close of the following year the whole of Khorassan acknowledged his authority. Irak was subdued in 749; and though Ibrahim

the Abbaside claimant was seized by Merwân, and executed in the same year, his brother Abul-Abbas succeeded to his claims, and the unfortunate caliph, defeated in two engagements, fled to Egypt (750), whither he was pursued and slain. Abdallah, the uncle of the successful claimant, treacherously invited the remaining members of the house of Ommeyah to a conference, and ordered a general massacre of them. Two only escaped: the one to the s.e. of Arabia, where he was recognized as caliph, and his descendants reigned till the 16th c.; the other, Abderrahman, to Spain, where he founded the caliphate of Cordova.

Ommiades of Spain.—Abderrahman I. (731–787), on accepting the Spanish throne, which was offered him by the Arab chiefs, assumed the title of *Caliph* and *Emir-al-mumenin*, and in spite of numerous revolts, strengthened and extended his power in Spain, till, with the exception of Asturias and the country n. of the Ebro, his authority was everywhere acknowledged. His defeat of Charlemagne at Roncesvalles (q.v.) is too widely known to require further notice. He divided his kingdom into six provinces, whose rulers, with the *walis* of the twelve principal towns, formed a sort of national diet. His successors, Hesham I. (787–96) and Al-Hakem I. (796–821), were much troubled with internal revolts, under cover of which the Christians in the n.e. established the state known as the "Spanish March." Abderrahman II. (821–52) re-established internal quiet, and occupied his subjects with incessant wars against the Christians. These conflicts developed among the Arabs that chivalrous heroism which is found nowhere else in the Mohammedan world. Abderrahman, himself a man of learning, greatly encouraged the arts and sciences, and diffused information among his people; he also attempted, by regulating the laws of succession to property, to constitute his kingdom on a basis analogous to that of other European nations. During his reign Mohammedan Spain was the best governed country in Europe. His successors, Mohammed I. (852–80), Mondhar (880–82), and Abdallah (882–912), followed in his footsteps. Abderrahman III. (912–61), after suppressing some dangerous revolts which had gathered head during his minority, conquered the kingdom of Fez from the Edrisites, and brought a long and exhausting war with the powers of Asturias and Leon to a victorious conclusion. This period is justly termed the golden age of the Arab domination in Spain, for at no period was their power so consolidated, and their prosperity so flourishing. Abderrahman, like his predecessors, was a great encourager of learning, and a poet of no mean ability. He founded schools which far surpassed those in other parts of Europe. His son, Al-hakem II. (961–76), was in every way worthy to be his successor, but his premature death was the cause of the downfall of the Ommiades in Spain. Hesham II. (976–about 1013), a child of eight years, now occupied the throne; but fortunately his mother, Sobeiha, possessed the abilities necessary for such an emergency, and appointed as her son's vizier Mohammed ben Abdallah, surnamed Al-Mansor, who had originally been a peasant. This remarkable man gained the affections of all ranks by his pleasing manners and great abilities; his administration was equally just and judicious, and his encouragement of literature, science, and art alike liberal and discriminating. But it is as a warrior that he is chiefly remembered; he had vowed eternal enmity to the Christians, and in all his numerous expeditions fortune seemed chained to his standard. The lost provinces were recovered; Castile, Leon, and Barcelona were conquered; and Navarre was on the point of sharing the same fate, when a rebellion in Fez compelled him to detach a portion of his force for service in Africa, and the combined armies of the four Christian monarchies, seizing this opportunity, inflicted upon the Arabs a sanguinary defeat in 1001. Mohammed's spirit was completely broken by this blow, and he died a few days afterwards. With him the star of the house of Ommeyah set for ever. The rest of Hesham's reign was a scene of disorder and civil war. Pretenders to the caliphate arose, while the "walis" of the various provinces set up as independent rulers, and the invasions of the Christians added to the confusion. Hesham finally resigned the throne about 1013; and, with the exception of the brief reign of Hesham III. (1027–31), from this time the family of Ommeyah, which had for more than two centuries so happily and brilliantly governed the greater part of Spain, disappears from history. One remarkable feature of their rule deserves mention, as it contrasts them so favorably with the contemporary and subsequent rulers of Spain, even to the present time, and that is their universal toleration in religious matters.

OMNIBUS (Lat. *omnibus*, "for all,"), familiarly contracted into "bus," is the largest kind of public street conveyance, and is appointed to travel between two fixed stations, starting at certain fixed hours, and taking up or setting down passengers at any point on its route. Vehicles of this sort were first started in Paris in 1662, when it was decreed, by a royal edict of Louis XIV., that a line of *carosses à cinq sous* ("twopence-halfpenny omnibuses"), each containing eight places, should be established for the benefit of the infirm, or those who, requiring speedy conveyance from one part of the town to another, were unable to afford a hired carriage for themselves; these "carosses" were bound to run at fixed hours from one station to another, whether full or empty. The public inauguration of the new conveyances took place March 18, 1662, and was the occasion for a grand fête; and the novelty took so well with the Parisians, that the omnibuses were for some time monopolized by the wealthier classes. However, when the rage for them died away, it was found that those for whose special benefit they were instituted

made no use of them, and they, in consequence, gradually disappeared. The omnibus was not revived in Paris till 1827, when it was started in its present form, carrying from 15 to 18 passengers inside, with only the driver above and the conductor behind; and on July 4, 1829, they were introduced into London by a Mr. Shillibeer. Shillibeer's conveyances, which for some time afterwards were known as *shillibeers*, were of larger size than the French ones, carrying 22 passengers inside, and were drawn by three horses abreast. The omnibus was introduced into Amsterdam in 1839, and since that time its use has been extended to all large cities and towns in the civilized world. The seats of the omnibus are generally placed lengthwise, and the door behind.

OMNIBUS BILL, OR CLAUSE (Lat., Dative plural form of *omnis*, "for all") is an act of legislation whose measures are not limited. A well-known "Omnibus Bill" is that passed by Congress in 1850, which provided for "the admission of California into the Union as a State with its anti-slavery constitution, for the admission of Utah and New Mexico, as Territories, with no mention of slavery, for the abolition of the slave-trade in the District of Columbia, and for the rendition of fugitive slaves." See COMPROMISE MEASURES. A more recent instance may be cited in the Springer "Omnibus Bill," passed by Congress, Feb. 22, 1889, providing for the admission into the Union as States, of Washington, Montana, and the Dakotas. A famous "Omnibus Clause" is that which was appended to the divorce law of Connecticut a few years since, so comprehensive in its scope as to include nearly every reason that might be advanced as liable to render the marriage relation an unhappy one. This was afterwards repealed, but not before it had given rise to the popular plea of "incompatibility of temper"—since then so frequently adduced as sufficient reason for divorce.

OMPHALUS (Greek, "navel") is a name given by the ancient Greeks to the city of Delphi (q.v.), which was considered the exact centre of the world. Here stood the Temple of Apollo, within whose walls was planted the *omphalos*, or navel stone, which was supposed to mark the centre of the earth. Mythology relates that two eagles sent by the hand of Zeus from opposite directions met at this point, which augury furnished the foundation for this belief.

OMSK, a t. of the Russian province of Central Asia, capital of the government of Akmollinsk, stands at the confluence of the Om—a river upwards of 200 m. in length—with the Irtish; 1624 m. by rail from Moscow. Lat. 54° 59′ n., long. 73° 30′ e. It was built in 1716, as a defence against the Khirghiz; but is now of no importance as a fortress. It is the center of government for the Steppes, the center of the administration of Siberian Cossacks, the seat of the Siberian corps of cadets. It is also the seat of the West Siberian Geographical Society. Hitherto its commerce has been limited to a trade with the Khirghiz, who drive up their cattle to this place. It has an advantageous position on the great post-road and commercial line of traffic from Europe across the whole of Siberia to the Chinese frontier, and is connected by steamers with Tobolsk and Semipalatinsk. Pop. '90, 38,000.

OMUL, *Salmo migratorius*, a fish of the salmon and trout tribe, abounding in lake Baikal and other waters of the e. of Siberia, from which great quantities are sent salted to all the western parts of that country. In size it is rarely more than 15 or 16 in. long. Its flesh is very white and tender.

O'NAGER. See ASS.

ONAGER. See BALISTA.

ONAGRACEÆ, a natural order of exogenous herbs constituting the evening primrose family, principally found in America, but also inhabiting temperate latitudes in the eastern continent. There are several genera, the principal of which are *circæa, epilobium, œnothera,* and *Ludwigia.* Circæa, or enchanter's nightshade, named from Circe the enchantress, is a low perennial growing in cool or damp woods; calyx tube slightly prolonged, deciduous; lobes 2, reflexed; petals 2, inversely heart-shaped; stamens 2; pod does not split open. Two species from Europe are *C. Lutetiana,* and *C. alpina, Epilobium* or willow herb, has several species in this country, most of them brought from Europe. The great willow herb, *E. angustifolium,* has a simple, tall stem from 4 to 7 ft. high, with lanceolate leaves, and grows on low grounds, in newly cleared lands; flowers pink-purple, very showy. *E. alpinum* is found on the summits of the White mountains, and also the Adirondacks. It is only from 2 to 6 in. high, nearly smooth; stem simple; leaves ovate-oblong, obtuse, on short leaf stalks; flowers few or solitary, drooping in the bud; petals purple; pods long, smooth. *E. molle* (Torrey), native in bogs from Rhode Island to Pennsylvania and Michigan northward. It grows from one to one foot and a half high; soft-downy all over; erect, branching toward the top; leaves crowded; linear-oblong or lanceolate; petals rose color, small. Œnothera, or the evening primrose, is the principal genus. *Œ. biennis,* or the common evening primrose, has ovate-lanceolate leaves, acute, obscurely notched; flowers in a terminal spike; calyx much prolonged; petals inversely cordate, light yellow color; pods oblong; several varieties, as *muricata, grandiflora, parviflora, cruciata,* and *oakesiana.* The other species of

œnothera are *rhombipetela* (having rhombic petals), *sinuata, glauca, fructiosa* (sundrops), *riparia, linearis, chrysantha, serrulata,* and *pumila.* This latter grows southward along the Alleghanies, flowering in June. The *Œ. serrulata* is found at the falls of St. Anthony, and in Wisconsin and westward. In the genus *Ludwigia,* or false loosestripe, the calyx tube is not at all prolonged beyond the ovary; petals 4, small or wanting; stamens 4; pod short, many seeded; seeds minute and naked. Named in honor of Christian G. Ludwig, professor of botany at Leipsic, contemporary with Linnæus. The seed-box and water purslane are species belonging to this genus, the former growing in swamps along the coast, the latter in swamps or ditches, and very common.

ONAT'AS, a Greek sculptor and painter, whose skill is praised by Pausanias the author, was the son of Micon, himself an artist, was born at Ægina, and flourished about the middle of the fourth century before Christ. A picture of the expedition of the Argives against Thebes and statues of Hercules, Mercury, and Apollo, were among his most important works.

ONCIDIADÆ, a family of gasteropod mollusks, belonging to the section *plumonifera,* division *inoperculata.* The animal is slug-like and without a shell. The body resembles that of the garden slug, but has a shield-like leathery covering to the back; head continuous with the body, and the eyes at the end of non-retractile cylindrical pedicels which spring from near the antero-lateral margins. There are no tentacles, and the lingual ribbon is broad, with nearly uniform teeth in numerous, straight, transverse rows. There are several genera, the species living in damp places near either fresh or salt water, and they are supposed to live on vegetable food. They are tropical, or inhabit warm climates, with the exception of one species, *peronia celtica,* which is British.

ONCKEN, JOHANN GERHARD, b. at Varel, Oldenburg, Germany, about the year 1800. In early life he was a domestic servant; afterward lived in England, where he married. At Hamburg he joined an English Independent church, opened a book-store, and acted as agent of the Lower Saxony tract society and the Edinburgh Bible society. In 1834 he organized a Baptist church with 6 others, and became its pastor. In 1835 the American Baptist general convention appointed him their missionary. As such he visited nearly all Germany and Denmark. He was imprisoned several times in Hamburg for preaching and baptizing, but the kindness shown by his family and congregation to those who had suffered by the great fire in 1842 led the senate to grant them unconditional liberty of worship. After that time Oncken zealously performed his mission work, preaching, baptizing, distributing the Scriptures, writing, and publishing religious books and tracts, establishing churches in Denmark, Switzerland, Austria, and some of the states of Germany, editing, with the aid of his daughter, a religious periodical in English, and another in German. In 1852 he visited the United States to obtain funds for the erection of chapels. The number of churches which he established in 30 years was 76, with 11,289 church members. He d. 1884.

ONCOCARPUS, a genus of trees of the natural order *anacardiaceæ.* One of the most remarkable trees of the Fiji islands is *O. atra,* or *O. vitiensis,* a tree about 60 ft. high, with large oblong leaves and a corky fruit, somewhat resembling the seed of a walnut; the sap of which, if it comes into contact with the skin, produces a pain like that caused by red-hot iron. The wood is often called itch-wood, because of the effect produced on persons who ignorantly or incautiously bark it whilst the sap is fresh, even the exhalations causing an intolerable itching and innumerable pustules, with excessive irritation for several days, whilst the effects continue to be unpleasantly felt even for months.

ON'DERDONK, BENJAMIN TREDWELL, D.D., LL.D., 1791–1861; b. New York; graduated at Columbia college, 1809; ordained a presbyter in the Protestant Episcopal church, 1813; was a professor in the General Theological Seminary, 1826–35; bishop of the diocese of New York, 1830–45, when, having been tried by the house of bishops on charges preferred against him, he was suspended from the exercise of his official functions.

ONDERDONK, HENRY USTICK, LL.D., 1789–1858; b. New York; graduated at Columbia college 1805; studied medicine in London, and took the degree of M.D at Edinburgh 1810; studied theology and was ordained deacon in the Protestant Episcopal church 1815; settled at Canandaigua, N. Y., 1816–20; rector of St. Ann's church, Brooklyn, N. Y., 1820–27; assistant bishop, and, on the death of Bishop White, bishop of the diocese of Pennsylvania 1827–44, when, having been tried by the house of bishops, on charges preferred against him, was suspended; was restored 1856, but did not resume the active exercise of his office.

O'NEALL, JOHN BELTON, LL.D., 1793–1863; b. S. C., a graduate of the university of South Carolina at Columbia, class of 1812, and was a teacher in the Newberry academy. He studied law, but left his reading to carry a musket in the war with England that occurred in that year, returning in due time to the more limited field of litigation, was admitted to the bar in 1814, inaugurating a successful practice. He represented his district in the legislature of his native state in four sessions, 1816, '22, '24, and '26; was elected speaker in '24 and again in '26. He rose rapidly to distinction as a jurist. In 1828 he was appointed associate judge; in 1830 judge of the court of appeals; in 1850 presiding judge of the court of errors and the court of law appeals, and filled the office of chief justice of the supreme court of South Carolina. In 1832 he gave up the use of stimulants, and in 1841 was elected president of the state temperance society. He was

an active philanthropist, and in 1852 was elected to fill the highest office in the order of sons of temperance of North America. He wrote *A Digest of the Negro Law of South Carolina*, *Annals of Newberry, S. C.*, and *Biographical Sketches of the Bench and Bar of South Carolina*, and contributed reminiscences of the revolution to the *Southern Literary Messenger*.

ONE'GA, a district t. and seaport in the n. of Russia, in the government of Archangel, and 154 m. w. of the city of that name. It stands at the mouth of a river, and on the shore of a gulf of the same name; the latter a branch of the White sea. Lat. 63° 54′ n., long. 38° 7′ e. Pop. 2750, employed in connection with the saw-mills of the "Onega Trading Wood Company." Ships can come only within 9 m. below the town.

ONEGA, LAKE, an extensive lake in the n. of Russia, government of Olonetz, and, after Ladoga, the largest lake in Europe; is 50 m. in average breadth, and 145 m. in length. Area, 3,763 sq. miles. Numerous islands dot its surface. The most important of them are Klimezki, containing over thirty villages, the Olenji group, Sumari, Kish, Kirk, Sjenogubskij, etc. It is fed by numerous rivers, and receives through the river Vodla the waters of the lake of that name. Its only outlet is the river Swir, which flows s.w. into lake Ladoga. By means of the Mariinsky system of communication, lake Onega communicates with the Volga, and thence with the Caspian sea on the s., and with the Dwina, and thence with the White sea on the north. The depth ranges from 550 to 700 ft. The navigation of the lake is dangerous, and commerce is chiefly confined to the Onega canal, which extends from the town of Vytegra on the river of that name to the river Swir. Quarries of sandstone are found on the s.w. shore.

ONE'GLIA, a t. of n. Italy, in the province of Porto Maurizio, on the gulf of Genoa, 40 m. e.n.e. from Nice, at the mouth of the Impero, a small river which rushes down from the Apennines, and which is crossed at Oneglia by two iron bridges. The harbor has an area of 26 acres. The city contains a prison, a gymnasium, a theater, and several manufacturing establishments. The principal articles of export are wine, oil and fruits. Andrea Doria, the great Genoese admiral, was born here. Pop. 7,400.

ONEIDA, a co. in s.e. Idaho, touching Snake river on the northwest and Utah on the south, drained by Bear and Malade rivers, 2700 sq. m.; pop. '90, 6819. The surface is mountainous, but the river valleys are fertile. Co. seat, Malad City.

ONEI'DA, a co. in central New York, having Oneida lake and Oneida creek for a portion of its w. boundary, and West Canada creek on the e. drained by the Mohawk, Black, Oriskany, and Fish rivers; 1196 sq. m.; pop. '90, 122,922, chiefly of American birth, with colored. It contains the head-waters of the Chenango and Unadilla rivers, and Trenton falls of West Canada creek, having 5 cascades and a total descent of 400 ft. in a course of 2 miles. Near the falls are quarries of Trenton limestone; other mineral products are iron ore, gypsum, peat, and marl. Its soil is exceptionally fertile, especially in the Mohawk valley, extending across the county from e. to w., and spreading out into broad green fields diversified by pasture lands of superior elevations, celebrated for its wild and rough but charming scenery. N. and s. of this valley the surface is hilly. It is intersected by the New York Central and Hudson River, and several other railroads. Its agricultural products are grain, live stock in great numbers, dairy products, maple sugar, hops, and potatoes. The leading industries are the manufacture of furniture, wooden-ware, lime, cement, cotton and woolen goods, metallic wares, boots and shoes, hosiery, iron castings, etc. Co. seat, Utica.

ONEIDA, a co. in northern Wisconsin, formed in 1885; drained by the Wisconsin and Tomahawk rivers, 2036 sq. m.; pop. '90, 5610. Co seat, Rhinelander.

ONEI'DA, a village in Madison co., N. Y.; on the New York Central and Hudson River, the New York, Ontario, and Western, and the West Shore railroads; near Oneida lake, and 26 miles e. of Syracuse. It contains a high school with college preparatory course, several district schools, electric light plant, waterworks on the gravity system owned by the village, street railroad system, national and state banks, iron works, and manufactories of caskets, flour, wagons, furniture, and sash and blinds. Among the places of historical interest is the home of the famous tribe of Indians after whom the village was named. Pop. '90, 6,083.

ONEI'DA COMMUNITY (see PERFECTIONISTS), after continuing 30 years unmolested in the practice of what they called "complex marriage," every man being considered as married to every woman and every woman to every man, found themselves surrounded with a state of public opinion that led to a resolute effort to break up this offensive feature of their association. In 1879 a conference of clergymen of different denominations and from the principal cities in the state of New York, was held at Syracuse to form a plan for eradicating the evil. A committee then appointed proceeded to collect evidence bearing on the actual practices of the community. Before their report was published the effect of the agitation of the subject was manifested in a proposition made by the leader of the community to its managers to abandon the distinctive feature of their association; not because they were convinced of its immorality, but in deference to the public sentiment that was evidently rising against it. This proposition having been accepted by the managers, an announcement was afterward publicly made

that the Oneida community had abandoned what they had called "complex marriage," and would hereafter be divided into the regularly married and those who prefer to remain single. And this was followed in due course by articles of association being filed, according to law under the name of the Oneida community "*limited*," which was to be the same as the old association of the same name, except that the marital relations of its members were changed.

ONEI'DA LAKE, in central N. Y., 20 m. long by 6 m. wide, and 12 m. n.e. of Syracuse, occupying portions of Oneida, Madison, Oswego, and Onondaga counties. It is 369 ft. above the level of the sea, abounds in fish of excellent quality, and empties into the Oneida river.

ONEI'DAS, a tribe of American Indians whose name signifies "tribe of the granite rock." Originally belonging to the Mohawks, they were set off from them and formed part of the Iroquois confederation of Six Nations. Their possessions included the section of country between Deep Spring near Syracuse, Onondaga co., N. Y., and a point directly e. in the vicinity of Utica, Oneida co., and embracing the lake which takes its name from them. Their *totem*, or symbol, was a stone in a forked stick. The tribe was divided into 3 clans, the wolf, bear, and turtle, and 9 sachemships. In the earliest years of the settlement of Canada they sustained hostile relations with the French, and the Hurons, and Montagnas, who were friendly to the Canadian settlers—only occasionally relaxing their enmity sufficiently to permit the visits of missionaries; and although their fellow members of the confederation, the Onondagas, made peace with the French in 1665, they kept up the war until 1666; the French making two raids into their country. At the time of the treaty they were reduced to 150 warriors, who joined in the general treaty of peace with the French, Sept. 8, 1700, being governed thereafter in their movements by the English, until the revolution, when they with the Tuscaroras were faithful to the colonists. This was owing to the influence of Samuel Kirkland, a Congregational minister, appointed missionary in 1766 by a missionary board in Connecticut, who settled in the midst of the tribe and was with them when the war broke out. He left them at that time to fill a chaplaincy in the army, but was engaged in negotiations with them throughout the war, and accompanied some of their warriors in 1791 to the meeting of congress in Philadelphia. By their fidelity to the colonists they incurred the enmity of other tribes, who, led by Joseph Brant or Thayendanega, a famous chief of the Mohawks and leader of the Iroquois, drove them from their homes and burned their church and houses; in this aided and abetted by the British and their adherents. At the close of the war they with the Tuscaroras were the only members of their confederation who remained in the United States, the remainder settling on Grand river in Canada. By the treaty of Fort Stanwix, Oct. 23, 1784, they were confirmed in their title to their lands, and in 1785 and 1788 the state of New York purchased their lands, with the exception of a reservation for each, which was never to be sold, and leased only in part. The Brotherton and Stockbridge Indians retained their lands which they had received from them and now live on the same reservation. In 1840, 430 emigrated to Canada. Those who settled at Green bay, Wisconsin, purchased the lands, and have erected churches, and availed themselves of educational privileges, advancing as fast as possible in agriculture and mechanical arts. There are 65,540 acres of land in this reservation, the inhabitants numbering 1,500 in '85. They are mostly Episcopalians, the book of Common Prayer having been translated into their language. There were in 1873, 633 on the Thames, in the province of Ontario, and 172 in New York in '80, near Oneida castle, s. of Utica, having 1 church. The number in the year indicated belonging to the tribe is larger than at any time since the advent of white population into their domain, and double their number at the close of the war. Several works have been written on this tribe and the Iroquois confederacy, beginning with Colden's *History of the Five Nations*, 1727.

O'NEILL, ELIZA (Lady Becher); 1791–1872; b. Ireland. Her father was manager of a strolling company, and at a very early age she became familiar with the stage. Her fame gradually extended, until she secured an engagement in Dublin, and eventually in London, where she first appeared as "Juliet," in 1814. Her success was immediate. But at the height of her popularity she retired, on her marriage, 1819, to William Wrixon Becher, M.P., for Mallow, who was knighted, 1831, and who died, 1850. Miss O. is currently believed to have been the original of Thackeray's character of "The Fotheringay" in *Pendennis*.

ONION (Fr. *oignon*, from Lat. *unio*, a pearl, but found in Columella, signifying a kind of onion), the name given to a few species of the genus *allium* (q.v.), and particularly to *A. cepa* (Lat. *cepa*), a biennial bulbous-rooted plant, with a swelling stem, leafy at the base, tapering fistular leaves, a reflexed spathe, a large globose umbel, usually not bulbiferous, the lobes of the perianth obtuse and hooded, not half as long as the stamens. The bulb is simple—not composed of cloves like that of garlic; and in the common variety is solitary, showing little tendency to produce lateral bulbs. The native country of the onion is not certainly known, some supposing it to be India and some Egypt, in both of which it has been cultivated from the most remote antiquity. The part chiefly used is the bulb, but the young leaves are also used and young seedlings drawn from onion beds are a very common ingredient in soups and sauces in the beginning of summer. These are known in Scotland as *syboes* (evidently another form of the word *cibol*). In warmer climates the onion produces a larger bulb

and generally of more delicate flavor than in Britain; and is more extensively used as an article of food, being with us whether fresh or pickled, generally rather a condiment. In Spain and Portugal a raw onion is often eaten like an apple, and often with a piece of bread forms the dinner of a working-man. The onion is, however, very nutritious. It contains a large quantity of nitrogenous matter and of uncrystalizable sugar; with an acrid volatile sulphurous oil, resembling oil of garlic. The oil of the onion is dissipated by boiling so that boiled onions are much milder than raw onions. In Britain onions are sown either in spring or in August. Great fields of them as of other favorite vegetables are cultivated for the London market; and large quantities of onions are also imported from more southern regions. The Bermudas are celebrated for their onions. The onion loves a rich light soil and a dry subsoil. The transplanting of onions is often practiced, especially of onions sown in autumn which are transplanted in spring, and when these are placed so that the small bulbs are on the surface of the ground, and surrounded with decayed manure, very large bulbs are obtained. The frequent stirring of the soil is of great advantage. The bulbs are taken up when the leaves decay, and after being dried in the open air or in a loft, may be kept for a considerable time.—The POTATO ONION, also called the EGYPTIAN or GROUND ONION, is a perennial variety which produces offset bulbs at the root like the shallot; but the bulbs are much larger than those of the shallot and have less of the flavor of garlic, although stronger than those of the common onion. It is sometimes said to have been introduced into Britain from Egypt by the British army in 1805, but erroneously, as it was cultivated in some parts of Britain long before. It is in very general cultivation among the peasantry in some parts of Scotland.—The PEARL ONION is a similar variety with much smaller bulbs.—The TREE ONION is also generally regarded as a variety of the common onion. It produces bulbs at the top of the stem, the umbels becoming viviparous.—Onions are similar to garlic (q.v.) in medicinal properties but milder. As a condiment or article of food they agree well with some stomachs and stimulate digestion, but are intolerable to others. Roasted onions with oil make a useful emollient and stimulating poultice for suppurating tumors. The use of onions stimulates the secreting organs.—The CIBOL or WELSH ONION (*A. fistulosum*), a native of Siberia, cultivated in Britain but more generally in Germany, has a perennial fibrous root with no bulb, very fistular leaves and a 3-cornered ovary. It is useful as supplying tender green leaves for culinary use in the beginning of spring, like the chive, and somewhat earlier in the season. It is much larger than the chive but its use is similar.

ONIS'CUS. See WOODLOUSE.

ON'KELOS, the supposed author of an Aramaic version (Targum) of the Pentateuch. The name seems a corruption from that of Akilas, one of the Greek translators of the Old Testament (see AQUILA, PONTICUS). The translation said to be by Onkelos is, in its present shape at least, probably the work of the Babylonian schools of the 3d and 4th centuries A.D. At first orally transmitted, various portions of it began to be collected and written down in the 2d c., and were finally redacted about the time mentioned. The history of the origin and growth of Aramaic versions in general will be treated under BIBLE; TARGUM. The idiom of Onkelos closely resembles that of Ezra and Daniel. The translation itself is executed in accordance with a sober and clear, though not a slavish exegesis, and keeps closely to its text in most instances. In some cases, however, where the meaning is not clear it expands into a brief explanation or paraphrase, uniting the latter sometimes with Haggadistic by-work, chosen with tact and taste, so as to please the people and not to offend the dignity of the subject. Not unfrequently it differs entirely from the original, as far, e. g., as anthropomorphisms and anthropopathies—anything, in fact, which might seem derogatory to the Deity—are concerned. Further may be noticed a repugnance to bring the Divine Being into too close contact, as it were with man, by the interposition of a kind of spiritual barrier (the "word," "Shechinah," "glory") when a conversation or the like is reported between God and man. Its use lies partly in a linguistic, partly in a theological direction; but little has been done for its study as yet. Notwithstanding the numerous MSS. of it extant in almost all the larger libraries of Europe, and in spite of the grossly incorrect state of our current printed editions, no critical edition has ever been attempted.

ONOBRY'CHIS. See SAINFOIN.

ONOMAC'RITUS, a celebrated religious poet of ancient Greece, lived at Athens in the time of the Peisistratidæ. He collected and expounded—according to Herodotus—the prophecies or oracles of Musæus (q.v.), but is said to have been banished from the city by Hipparchus, about 516 B.C., on account of interpolating something of his own in these oracles. He then, we are told, followed the Peisistratidæ into Persia, and while there was employed by them in a very dishonorable way. They got him to repeat to Xerxes all the ancient sayings that seemed to favor his meditated invasion of Greece. Some critics, among whom is Aristotle, have inferred from a passage in Pausanias that Onomacritus is the author of most of the so-called Orphic hymns. More certain, however, is the view which represents him as the inventor of the great Orphic myth of Dionysus Zagreus, and the founder of Orphic religious societies and theology. Pausanias states that "Onomacritus established orgies in honor of Dionysus, and in his poems represents the Titans as the authors of the sufferings of Dionysus." See Müller's *Geschichte der*

Griech. Literatur bis auf das Zeitalter Alexander's (Breslau, 1841); Grote's *History of Greece*, etc.

ONOMATOPŒ'IA, the Latin form of the Greek word *onomatopoïa*, means literally the making or invention of names, and is used in philology to denote the formation of words in imitation of natural sounds, as in *cuckoo*, Lat. *cucu* (lus); *pee-wit*, Scan. *pee-weip*, Dutch, *kiewit; cock; clash, rap, tap, quack, rumble, whizz, clang.* Such words are sometimes called onomatopœias; more properly they are onomatopœian, or formed by onomatopœia.

In a more extended sense, the term is applied to the rhetorical artifice by which writers (chiefly poets) seek, through the choice and arrangement of words, to make the "sound," throughout whole phrases and sentences, "an echo to the sense," as in Homer's well-known *poluphloisboio thalasses*, expressive of the breaking of the waves upon the sea-shore; or where Tennyson makes the sea

Roar rock-thwarted under bellowing caves.

The occurrence of so many obviously onomatopœian words in all known languages, suggests the question, whether the same principle may not have been concerned in producing the original germs or roots of the great bulk of words. There is little hope that the question will ever be conclusively settled either way; for the changes of time have made it, in most cases at least, impossible to say what the first form and signification of a root were; but the balance of arguments seems in favor of the affirmative answer. "The action of the mind," as it has been expressed, "produced language by a spontaneous repercussion of the impressions received." Now, the articulate sound first affixed in this way to an object or an action as its sign cannot be conceived as arbitrary; nor is there any mysterious and inherent correspondence between any one conception of the mind, and a particular articulate sound. The sound uttered must have been suggested by something connected with the object or action itself; and by what more naturally than by the inarticulate sound which the object or action itself emits

The chief objection to this theory is, that if the first words were merely reproductions of natural sounds, the same natural objects would have had the same names all the world over. To which it is answered, that the mind in its first efforts at naming did not seek an exact reproduction of the sound, but a suggestive imitation; primitive words were not echoes, but "artistic representations." Now, the sounds of nature are not simple, but composite. Like other concrete phenomena, they present a variety of aspects; and according as one or another aspect seemed the most prominent to the observer, a different vocal sound would suggest itself as the appropriate symbol. Thus when Professor Max Müller argues (*Science of Language*, Lond. 1861) that if the "bow-wow" theory, as he nicknames it, were true, men would have everywhere spoken of a *moo*, as is done in the nursery, and not of a *cow;* it seems a valid answer to say, that the Indian *gu*, the Teut. *kuh* (Eng. *cow*), and the Græco-Lat. *bou-*, are really as suggestive imitations of the animal's actual voice as *moo*. To take a more striking instance: few words differ more in sound and aspect than the Eng. *thunder* (Ger. *donner*, Lat. *tonitru*, Fr. *tonnère*) does from the Mexican name for the same thing, *tlatlatnitzel*, and yet it would be difficult to say which is the more suggestive of the natural sound.

It is no doubt true that the great bulk of names are derived from roots having a general predicative power; but this by no means excludes the principle of onomatopœia. Thus, to take one of the instances adduced by Professor Müller himself, that of *raven* or *crow* (Sans. *kârava*, Lat. *corvus*, Gr. *korônê*); this is derived from the root *ru* or *kru*, which means to cry or call, and the bird was called a kârava, or crow, not in imitation of his voice, but because he was "a shouter, a caller, a crier. The name might have been applied to many birds, but it became the traditional and recognized name of the crow." But how came the articulation *ru* or *kru* to be chosen to convey the general meaning of crying or calling; may we not suppose that it was suggested by the voice of birds of the crow kind, whose notes are most markedly cries or calls to their fellows, as distinguished from singing? Once adopted in this particular case, it would naturally be extended to any kind of cry or call, from the harshest to the softest.

ONONDA'GA, a co. in central New York, separated from lake Ontario by Oswego co., and bounded also on the n.e. by Oneida lake and river, and on the s.w. by Skaneateles lake; drained by Seneca river and Chittenango and Onondaga creeks; intersected by the Erie canal, the New York Central railroad, and minor lines centring at Syracuse (q.v.); pop. '90, 146,247, chiefly of American birth. The surface is level in the w. and undulating or hilly in the east. There is excellent farming land, producing all the cereals. The dairy products are large and noted for their excellence. Salt, gypsum, and limestone suitable for building purposes are found. Area, 824 sq. m. Co. seat, Syracuse.

ONONDA'GA LAKE, in Onondaga co., N. Y., near Syracuse, is 5 m. long, about a mile wide, and its greatest depth is 65 feet. Its waters are saltish and stagnant, and, as there are extensive salt formations in the vicinity, it is supposed that the lake was formed by the gradual dissolving of the salt rock and the consequent falling in of the ceiling of the cave thus formed. Seneca river is the outlet.

ONONDAGA, a town in Onondaga co., N. Y.; on Onondaga creek, 2½ miles from Syracuse. It has an academy, electric railroad, several churches, and large farming interests. Pop. '90, 6,038.

ONONDA'GAS, one of the five tribes of Iroquois Indians which inhabited and gave their name to Onondaga county, N. Y.; these five tribes forming a confederaey, which

POPULATION OF THE PROVINCE OF ONTARIO.

LIBRARY
UNIVERSITY OF ILLINOIS
URBANA

was ruled over successively by 14 great sachems, the *atotarho*, the Onondaga chief, being the first; they had charge of the wampum belts, the treaties, and the council fires, and their dialect was considered the purest and grandest of the confederacy. Their principal village was about 5 m. from Syracuse. It is not known in what year the confederacy was formed, but as early as 1609 they were waging war with their neighbors, the Hurons, against whom they were bitterly hostile; and in 1649 gathered their forces and devastated the settlement of the Hurons, many of whom were killed and some made prisoners, the whole tribe being scattered. Then followed an unsuccessful war with the Eries and Susquehannas. In 1653 a treaty of peace of short duration was effected with the French, who, at the solicitation of the Onondagas, sent missionaries among them, and established a settlement there, which was abandoned a year later on the settlers discovering a plot for their massacre by the Indians. The Onondagas were continually at war with the Algonquins of Canada, and in 1662 they devastated Montreal island and killed the renowned Indian fighter Lambert Closse. In 1668 the French again settled among them. Onondaga county became alternately the rendezvous for the French and English; the latter a few years later building a fort there, which was demolished by the Indians before their withdrawal from the town during Frontenac's incursion in 1696. A general treaty of peace was signed in 1700, between the French and the Onondagas at Montreal, which lasted 9 years. They took sides with the English in the French and Indian war, 1756–63, and also during the latter part of the revolutionary war, in which they suffered severely. They ceded the most of their land to New York in 1798, reserving a small portion for themselves, where about 340 of them still remain, some of whom have been converted to Christianity. About 400 of the tribe are found in Ontario, Canada, and a few have joined the Senecas and Tuscaroras. They number about 860 in all.

ONSLOW, a co. in s.e. North Carolina, bounded on the s.e. by the Atlantic ocean, watered by the New river; about 640 sq.m.; pop. '90, 10,303. The surface is even, much of it swamp or sandy barrens. The soil is fertile, and produces good crops of Indian corn, sweet-potatoes, rice, and cotton. Tar and turpentine are manufactured. Co. seat, Jacksonville.

ONSLOW, George, 1784–1853; b. France, descended from a noble English family, son of Hon. Edward Onslow, the youngest son of the earl of Onslow, who married a French lady and settled in France. He married a wealthy lady of Rouen, was rich himself, and passed his life in elegant retirement on his estate near Clermont. Devoting his time to the study of music, in which he had been carefully instructed by Dussek, Cramer, and Hullmandel, on the piano-forte, and in harmony and composition by the celebrated Reicha, a professor of the conservatoire. He cultivated his talent with such success that he early won distinction among the artists of his time. He was the author of a number of concertos for the piano-forte with orchestral accompaniments, quintets, quartets, symphonies, and sonatas, which are still performed. The most esteemed are his quintets for 2 violins, viola, and two violoncellos. He wrote in 1824 *L'Alcalde de la Vega*, and in 1827 *Le Colporteur*, both operas being well received, and in 1837 *Le Duc de Guise*. He was a member of the academy of fine arts, being the successor of Cherubino, and when he died, Halévy pronounced his eulogy.

ONTARIO, the easternmost and smallest of the five great lakes of North America, lies in 43° 10′ to 44° 8′ n. lat., and 76° 30′ to 80° w. long. At its s.w. corner it receives the waters of the upper lakes by the Niagara, and at its n.e. corner it issues into the St. Lawrence; which for some distance below is called the lake of the Thousand Isles. Its surface, which varies a few feet with the seasons, is about 330 ft. below that of lake Erie and 247 ft. above tide-water. Its bottom, therefore, must be considerably lower than the level of the Atlantic, as it is in some places 600 ft. deep. It is 190 m. long, 55 in its widest part, and about 480 in circumference. Sufficiently deep throughout for vessels of the largest tonnage, it has many convenient and thriving ports, of which the chief are Kingston, Port Hope, Cobourg, Toronto, Hamilton, on the Canadian shore, and Oswego, Sackett's Harbor, and Charlotte in the United States. Its navigation has been facilitated by the erection of many lighthouses on the American and on the Canadian sides, while it is connected with lake Erie by the Welland canal, with the Erie canal and New York by the Oswego canal, and by the Rideau canal with the Ottawa. Lake Ontario is subject to violent storms, and it is probably owing chiefly to the constant agitation of its waters that it freezes only for a few miles from the shore. The shores of lake Ontario are generally very flat, but the bay of Quinte, a long crooked arm of the lake, which stretches about 50 m., possesses some attractive scenery. Burlington bay, on which Hamilton lies, is a large basin, almost inclosed by a natural, but strangely accumulated bank of sand, which forms a beautiful drive.

ONTARIO, Province of, formerly Upper Canada, or Canada West, the most populous province in the Dominion of Canada. On the n.e. and e. it is bounded by the province of Quebec; on the s.e. and s.s.w. by the St. Lawrence river, the great lakes, and the district of Keewatin; and on the n.w. and n. by Hudson bay and the North-West territories. Its length from s.e. to n.w. is about 750 m.; from n.e. to s.w. about 500 m.;

area 222,000 sq. miles. The face of the region is diversified by rivers and lakes. A ridge of high land extends in the s.e. portion from Niagara falls n.w. to lake Huron and along the peninsula between that lake and Georgian bay. Other ranges of hills are the Laurentian, crossing the Ottawa river at Quebec, and extending s. and thence w. to Georgian bay; and the Blue mountains, s. of Georgian bay, which attain a height above lake Huron of 1900 feet. The slopes are generally gradual and the valleys wide. In the s.w. lies a great plain, extremely fertile and valuable, underlaid by Silurian and Devonian limestones, sandstones, and shales, on which are found beds of clay and gravel. Much of this region abounds in hard-wood forests, and is fertile in wheat, corn, and all kinds of farm products. The principal rivers of the province are the tributaries of the Ottawa river, which forms the boundary between Ontario and the province of Quebec; the French, the Maganetawan, the Severn, and the Nottawasaga, falling into Georgian bay; the Saugeen, the Maitland, and Aux Sables, falling into lake Huron; the Thames, running s. into lake St. Clair; the Grand, flowing s.e. into lake Erie; the Trent, in part of its course called the Otonabee, and the Moira, flowing s.e. into the bay of Quinte; and the Niagara, falling into lake Ontario. The great lakes Superior, Huron, Erie, and Ontario, with their connecting waters, afford a water front to the province of about 3,000 m., with many good harbors. The principal minor lakes are Nipigon, Simcoe, and Nipissing; and the chief bays are the Georgian, Nottawasaga, Owen sound, Long Point, Burlington, and Quinte. The winters throughout the country are very cold, and the heat during summer is occasionally extreme; but the climate is considered healthy.

Ontario, like the rest of Canada, was first settled by the French, and together with the province of Quebec passed into the control of the English in 1760. It became a separate province in 1867. It is divided into 42 counties, 6 provisional districts, and 92 electoral districts. The cities of the province, with their population in 1891, are: Toronto, 181,220; Hamilton, 48,980; Ottawa, 46,154; London, 31,977; Kingston, 19,264; Brantford, 12,753; Guelph, 10,539; St. Thomas, 10,366; Windsor, 10,322; Belleville, 9,914; Stratford, 9,501; and St. Catharine's, 9,170. The population of the province in 1881 was 1,926,922, and in 1891, 2,114,321, of whom 1,708,702 were born in Canada, and 405,619 elsewhere, 329,037 in various British possessions, 42,702 in the United States, 23,440 in Germany, and 10,440 in other countries. The greatest number of the inhabitants are settled in the s. and s.w. parts of the province. A large proportion of the soil is of excellent quality, and in the s.w. the influence of the surrounding bodies of water aids the natural richness of the soil. Large crops of wheat are raised, also oats, barley, Indian corn, rye, potatoes, turnips, etc.; and in the s.w. the apple-orchards are very productive; and pears, plums, grapes, cherries, and various kinds of berries thrive. The regions lying between the Ottawa river and the Georgian bay contain large tracts of fertile ground, and produce a variety of timber consisting chiefly of white and red pine. In this district lumbering is extensively carried on, and the sawing of timber is among the principal industries of the province. Chief among the other manufactures are cotton and woolen goods, linen, furniture, iron and hardware, paper, soap, starch, hats, boots and shoes, steam-engines and locomotives, sewing machines, wooden ware, and agricultural implements. The principal merchandise imported was sugar, tea, coal, Indian corn, wheat, iron manufactures, and cotton and woolen goods. In 1891, the shipping of the province was registered at 1312 vessels of 138,738 tons. At Sudbury is a great vein of nickel, from which nickel matter valued at more than $1,000,000 was taken in 1891.

In railroad construction the province has made great progress. In 1881 there were 3,478 miles of road in operation; and in 1895, 6,403 miles, or more than one-third of the whole mileage of the Dominion. Chief among these were the Canada Southern; the western division of the Grand Trunk; and the Great Western. There are also a number of canals, the principal of which are the Welland, 28 m. long, from Port Dalhousie to Port Colborne, and the Rideau, from Kingston to Ottawa, 126 miles.

The school system affords all children free education, and is under the general management of a chief superintendent. Besides the common schools, the law provides for the establishment and maintenance of classical and English high schools for both sexes, and collegiate institutes. Official returns for 1894 showed: number of public schools, 5,977; school population, 593,840; enrollment, 483,203; teachers, 8,824; receipts, $4,972,507; expenditures, $4,248,131; Roman Catholic separate schools, 328; enrollment, 39,762; expenditures, $337,307. There were also 10 Protestant separate schools, 129 high schools, 59 model and normal schools, 90 kindergartens, and many colleges, including Trinity college, Toronto university, Kingston university, Ottawa college, and the Kingston military college. The number of newspapers and periodicals published in the Dominion is over 500, and of these the majority are published in the province of Ontario. The principal religious denominations, with their strength in 1891, are the Methodist, 654,033; Presbyterian, 453,147; Church of England, 385,999; Roman Catholic, 358,300; Baptist, 106,047; Lutheran, 45,029; and Congregational, 16,879. The M. E. church in Canada and the British M. E. church each have a bishop. The Anglicans have three dioceses—Toronto, Ontario, and Huron. The Roman Catholics have an archbishop at Toronto, and bishops at London, Hamilton, Kingston, and Ottawa.

The provincial government is administered by a lieutenant-governor, appointed by a governor-general of the Dominion for five years, assisted by an executive council of

8 members, which includes an attorney-general, commissioner of agriculture, secretary, registrar, treasurer, commissioner of crown lands, and commissioner of public works. The legislative assembly has only one house of 92 elective members. Voting is by ballot, and the right of suffrage is conferred on all male British subjects 21 years of age, possessed of some property qualification. The judicial power is vested in a superior court of judicature, consisting of the high court of justice (with Queen's bench, common pleas, and chancery courts), and the court of appeal. In the Dominion parliament the province of Ontario is represented by 24 senators and 92 members of the house of commons. See CANADA.

ONTARIO, a co. in w. New York, having Seneca lake for its s. e. boundary, Canandaigua lake, 16 m. long, on the s., drained by Flint, Honeoye, and Mud creeks, and Canandaigua outlet; 674 sq. m.; pop. '90, 48,453, chiefly of American birth; with colored. The surface is composed of hills and valleys, and crossed by high ridges furnishing excellent pasturage, and in some portions covered with groves of ash, beech, elm, sugar-maple, and forests of hard-wood timber. It is intersected by the New York Central and Hudson River and the Northern Central railroads. The shores of its picturesque lakes, Canandaigua and Seneca, are attractive for summer resort; and the smaller bodies of water, lakes Honeoye, Canadice, and Hemlock, are noted for their beauty. Its soil is a fertile sandy loam with a mixture of clay in some places, having a foundation of limestone and sandstone, and deposits of gypsum and water-limestone. The country is suited to stock-raising, and every variety of grain is produced; also fruit, wool, dairy products, potatoes, and hops. The leading industries are the manufacture of cooperage, saddlery, agricultural implements, tin, copper, and sheet iron ware, bricks, carriages, and wagons, iron castings, leather, malt, woolen goods, lumber, and flour. Co. seat, Canandaigua.

ONTARIO, a town in Wayne co., N. Y.; on the Lake Ontario division of the Rome, Watertown, and Ogdensburg railroad; 4 miles s. of Lake Ontario, 18 miles e. of Rochester. It contains a village of the same name; is the center of a large fruit-growing region; has a union school, several churches, and an electric railroad; and is principally engaged in drying and shipping fruit. Pop. '90, 2,611.

ONTENIENTÉ, a t. of Spain, in the province of Valencia, 45 m. s. by w. from Valencia, on the right bank of the Clariano, and near the railway which connects Valencia with Madrid. Linen and woolen fabrics are manufactured here: there are also numerous paper mills. Pop. (comm.), 11,200.

ONTOLOGY. See METAPHYSICS.

ONTONAGON, a co. in extreme n.w. Michigan, bounded n.w. by lake Superior, s.w. by Wisconsin; drained by the Montreal, Ontonagon, Fire Steel, Iron, Presque Isle and Black rivers; 1342 sq.m.; pop. '90, 3756. The surface is rugged and covered with forests. The mining of copper and iron is the chief employment. Co. seat, Ontonagon.

ONUS PROBANDI, i.e., the burden of proof, is often a difficult question in litigation; but, as a general rule, the plaintiff who institutes the suit is bound to give proof of the allegations on which he relies. There are many nice and technical rules on the subject, both in suits and actions, which are too minute to be here stated.

ONYX, an agate formed of alternating white and black, or white and dark-brown stripes of chalcedony. More rarely, a third color of stripes occurs. The finest specimens are brought from India. Onyx is in much esteem for ornamental purposes. The ancients valued it very highly, and used it much for cameos. Many of the finest cameos in existence are of onyx. The name onyx, however, appears to have been applied by the ancients more extensively than it now is, and even to striped calcareous alabaster, such as is now called onyx marble. The *sardonyx* of the ancients is a variety of onyx, in which white stripes alternate with stripes of a dark-red variety of carnelian, called *sard* or *sarda*. It is one of the rarest and most beautiful kinds of onyx, and is more valued than carnelian. See illus., DIAMONDS, ETC., vol. IV.

ONYX MARBLE, a very beautiful material, which first came into general notice in this country in 1862, when the French made a large display of it in the international exhibition. It is a stalagmitic formation, which was discovered by the French in making roads in the province of Oran in Algiers. It is a translucent limestone, containing traces of magnesia and carbonate of iron; its specific gravity is 2.730. The quarries are worked by a company, and the artistic workmen of France are turning it to good account, in the manufacture of very beautiful ornamental works.

OOLITE (Gr. egg-stone), a variety of limestone, often very pure calcareous spar, distinguished by its peculiar structure, being composed of grains connected together by a calcareous cement; the whole much resembling the roe of a fish. The grains are not unfrequently hollow. Many oolites, as in the south of England, are excellent building-stones. There is no important mineralogical differences between oolite and *pisolite*, or pea stone. Oolite, as a geological term, is extended far beyond its mineralogical and original signification.

OOLITE or JURASSIC **GROUP** (in Geology), an extensive and important series of strata of secondary age, underlying the chalk formation, and resting on the trias. In Britain

they received the name Oolite because in the district where they were first examined and described by Dr. W. Smith, the limestones contained in them had an oolitic structure (see foregoing article). The name Jurassic has been given to them on the continent because the range of the Jura mountains in the n.w. of Switzerland is almost entirely composed of them. The strata of the group have been arranged in the following order. The maximum thickness of each division is given in feet:

	Feet.
Upper Oolite.	
1. Purbeck beds	200
2. Portland beds	170
3. Kimmeridge clay	600
	970
Middle Oolite.	
4. Coral rag	190
5. Oxford clay	600
	790
Lower Oolite.	
6. Cornbrash and forest marble	80
7. Great oolite and stonesfield slate	150
8. Fuller's earth	150
9. Inferior oolite	250
	630
Lias.	
10. Upper lias	300
11. Marlstone	200
12. Lower lias	600
	1100
Total	3,490

It is apparent from this table that the oolitic rocks consist of three extensive clay deposits, each of which forms the basis of a smaller and variable set of sands and limestones; the upper oolites resting on the Kimmeridge clay, the coral rag on the oxford clay, and the lower oolite on the lias.

1. The Purbeck beds, unlike the other oolitic rocks, are chiefly freshwater deposits. Though lithologically they are very similar throughout, the peculiarities of the contained fossils have caused them to be grouped into three series—upper, middle, and lower. The upper Purbecks are purely fresh-water, containing beds of limestone and shale, which abound in shells of lake and river mollusca and cyprides. The stone called Purbeck marble, formerly so extensively used in the ornamental architecture of English churches and other buildings, belongs to this division; it consists of the shells of Paludinæ, held together by a somewhat argillaceous paste. The middle Purbecks are partly fresh-water, and partly brackish or marine. The "cinder-bed," composed of a vast accumulation of shells of *Ostrea distorta*, occurs in this section, and near it is the narrow layer from which Mr. Beckles recently obtained the remains of several mammalia. The lower Purbecks are chiefly fresh-water, with some intercalated brackish or marine beds, and one or two old vegetable soils called by the quarrymen "dirt-beds," which contain the stems of cycadaceous and coniferous plants. 2. The Portland beds consist of oolitic and other limestones interstratified with clays, and passing below into sands and sandstones, from which the well-known building-stone is obtained, of which St. Paul's and many of the principal buildings in London are built. 3. The Kimmeridge clay is generally a dark-gray bituminous shale, with intercalated beds of sand, calcareous grit, and layers of septaria. The dark shale in some places passes into an impure brown shaly coal. 4. The coral rag contains, as its name implies, an abundance of corals, in bluish limestone beds mixed with layers of calcareous grit. The Solenhofen lithographic stone, with its beautifully preserved and varied fossil remains, belongs to this division. 5. The Oxford clay is a dark-blue or blackish clay without corals but having a large number of beautifully preserved Ammonites and Belemnites. Beds of calcareous sandstone, called Kelloway rock, occur in its lower portion. 6. The cornbrash consists of thin beds of cream-colored limestone, with sandstones and clays, and the forest marble (so named from Wychwood forest) is composed of an argillaceous limestone, with numerous marine fossils, blue marls and shales, and yellow silicious sand. At Bradford, Wiltshire, the forest marble is replaced by a considerable thickness of blue unctuous clay. 7. The great oolite is composed of shelly limestones, sandstones, and shelly calcareous sandstones, and the Stonesfield slate is a slightly oolitic shelly limestone, which splits into very thin slabs, erroneously called "slates:" it is

remarkable for the remains of terrestrial reptiles and mammals found in it. The Bath oolite, a celebrated building-stone, belongs to this division. 8. The fuller's-earth group is a local deposit found near Bath; it consists of a series of blue and yellow shales and marls, some of which have properties fitting them for the use of the fuller. 9. The inferior oolite is composed of a series of beds of pisolitic and shelly limestones, brown marl, and brown sandy limestone, all abounding in fossils. 10. The lias (q.v.) is a great clay deposit. It is divided into the upper and lower lias, which consist of thin beds of limestone scattered through a great thickness of blue clay, and, separating these two groups, the marlstone, or calcareous or ferruginous sandstone. The lias abounds in beautifully preserved fossils.

The oolite occupies, in England, a zone nearly thirty miles in breadth, extending across the country from Yorkshire to Dorsetshire. In Scotland, patches of lias and Oxford clay occur in the islands of Mull and Skye, and on the western shores of the mainland, and beds belonging to the lower oolite are found at Brora, on the east coast of Sutherland, which contain an impure coal. The only oolite rocks in Ireland are a few isolated patches in Antrim, which abound with the fossils of the lower lias. On the continent, rocks of this age occur in Germany and France, but they have been most extensively studied in the Jura mountains, which, though having a height of 6,000 ft. are entirely composed of oolite and cretaceous rocks. The strata are greatly bent and contorted, and as they approach the Swiss Alps, the great mass of which is also formed of oolite, they become completely metamorphosed into clay slates, mica schists, gneiss, and crystalline limestones. Beds of oolite have been noticed in Cutch, in India. In Australia similar beds occur on the western coast, and probably some of the coal-beds of New South Wales, Victoria, and Tasmania belong to the oolite. In both North and South America, fossils, apparently of oolitic age, have been found; but these deposits require to be more exactly examined.

The oolite is remarkable for the abundance of its fossils, and is in this respect in striking contrast to the immediately preceding Triassic and Permian periods. The several fresh-water deposits, and the ancient vegetable surfaces, contain the remains of a considerable number of plants. Ferns still abound, and with them are associated species that are evidently related to the living genera *cupressus, araucaria,* and *zamia.*

Corals abound in several of the beds. The brachiopods are the only division of the mollusca that is not largely represented. The conchifers and gasteropods show a great number and variety of new genera, which are nearer the forms of the present day than those that preceded them. But the remarkable feature of molluscan life is the enormous development of the cephalopods. Whole beds are almost entirely made up of their shells. No less than 600 species of ammonites have been described, chiefly from the rocks of this period, and the belemnites were also very numerous. The crinoids have become scarce, but are replaced by star-fishes and sea-urchins. The fresh-water beds contain the remains of many insect forms. The heterocercal-tailed fish give way to the more modern homocercals, and the true sharks and rays make their appearance, though the old cestracionts are still represented by some survivers. The characteristic feature of the oolitic period was its reptiles. The land, the sea, and the air had each their fitting inhabitants of this class. The various species of pterodactyles, some not larger than the bat, others surpassing, in the stretch of their membranous "wing," the size of the largest living bird, were the terrors of the air; while their allies, the monster ichthyosaurs and plesiosaurs, held the mastery of the waters; and the huge megalosaurs, some not less than 30 ft. in length, trod the earth. The few mammalian remains hitherto found have a special interest from their antiquity, being the first evidence of this high order of animals on the globe. They belong, apparently, to marsupial animals; one species is, however, supposed by Owen to have been a hoofed and herbivorous placental mammal.

OOMRAWUTTI. See AMRAOTI.

OOMS, KARL, a Belgian painter, was born Jan. 27, 1845, studied first in the academy at Antwerp in 1857 and remained there as a pupil 8 years, completing his art education in the studio of Keyser, then director of the academy. He received in 1870 the second Roman prize and continued his studies in extended travels in Holland, England, Germany, and Italy. He is one of the most powerful historical and portrait painters of Belgium. Among his portraits are "Philip II. and Don John of Austria," in the museum at Antwerp; "The Death of the Duke of Alva;" and "Last Days of Rubens."

OONALASKA. See UNALASHKA.

OORALSK. See URALSK.

OORFA. See URFA.

OORGA. See URGA.

OORI, or LIMPOPO river, an important river system of south-eastern Africa, rising to the w. of Pretoria, in the high plateau called the Magaliesberg, which forms the northern limit of the basin of the Orange river. Throughout a great part of its course, the Limpopo bounds on the n. the Transvaal territory which it separates from British South Africa. It flows in a north-easterly direction through the plateau in which it rises, then turns sharply to the s.e. and s., when it enters the lowlands. It reaches the

Indian ocean to the n. of Delagoa, in lat. 25° 10′ s. Its course is about 1000 m. long, and it has numerous large tributaries, the Mariqua, Olifants, etc. Yet it is difficult of navigation, in the dry season on account of shallowness, and in the rainy season because of the swiftness of its current and the quantity of floating timber.

OOROOMEYAH, town and lake. See URUMEYAH.

OOSTERHOUT, a flourishing town in the Netherlands, province of North Brabant, 6 m. n.n.e. from Breda, is situated in a well-wooded, fertile district of country. Pop. '89, 10,425. Much business is done in the grain and cattle markets. There are tanyards, several flourishing beer-brewing establishments, potteries, and brick works. There is also an active trade in linen, wood, and agricultural products. Oosterhout has a grammar-school, and a nunnery, the inmates of which employ themselves in teaching the children of the poor. The handsome town-house and great Roman Catholic church stand on the market-place, which is shaded with linden trees.

Near Oosterhout is an extensive wood, where are the ruins of the house of Stryen or Oosterhout, formerly the residence of the counts of Stryen, under whose jurisdiction were not only the town and barony of Breda, but also the marquisate of Bergen-op-Zoom.

OOTACAMUND or UTAKAMAND, the chief town in the Nilgiri hills, and the great sanitarium of the Madras presidency and the summer headquarters of the Madras government. These hills are situated between 11°—12° n. lat., and 76°—77° e. long. The elevation of Ootacamund′ is 7,228 feet above the sea; the mean temperature being about 49°, the maximum 76°, and the minimum 38°. The average rainfall is 45 inches. Its distance is only about 350 m. from Madras, and it is easy of access, as the railway now conveys the traveler to the foot of the hills. The town contains the Lawrence asylum, Hobart park, the botanical gardens, and recreation grounds. The number of European settlers on these hills is increasing. There are thriving plantations of tea and coffee, and the cinchona or quinine plant. Pop. 15,100.

OOTRUM, an Indian fiber, derived from the stem of *dæmia extensa*, a plant of the natural order *asclepiadiaceæ*, abundant in many parts of Hindustan. The fiber is soft, white, silky, and strong, and is regarded as a promising substitute for flax.

O′PAH, or KING-FISH, *Lampris guttatus* or *L. luna*, a fish of the dory (q.v.) family (*zeïdæ*), occasionally found in the British seas, but more common in more northern regions, and found not only in the Atlantic and Arctic oceans, but also in the Pacific, as on the coasts of China and Japan. It is of an oval form, greatly compressed, with small thin scales, the mouth small and destitute of teeth, a single dorsal fin much elevated in front and extending almost to the tail. This fish attains a large size, being sometimes 5 ft. long and 150 lbs. in weight. It is brilliantly colored; the upper part of the back and sides rich green, reflecting purple and gold in different lights, the lower parts yellowish-green; round yellowish-white spots above and below the lateral line; all the fins bright vermilion. The flesh is much esteemed; it is red like salmon, and is said to resemble it in flavor.

O′PAL, a mineral which differs from quartz in containing from 5 to 13 per cent of water, its only other essential constituent being silica, although a little alumina, oxide of iron, etc., is often present. It is never found crystallized, and does not exhibit a crystalline structure like quartz. It has a conchoidal fracture, and is very easily broken. There are many varieties, which pass into one another, so that their precise limits cannot be defined, from which has arisen no little confusion of names. The finest kind is called *precious opal* or *noble opal*, and sometimes *oriental opal*. It is semi-transparent or translucent, usually of a bluish or yellowish white color, yellow by transmitted light, and exhibits a beautiful play of brilliant colors, owing to minute fissures which refract the light. It is much valued for setting in rings, brooches, etc., and is polished with a convex surface, never cut into facets, both because of its brittleness, and because its play of colors is thus best exhibited. The ancients valued opals very highly. The Roman senator Nonius preferred exile to giving up an opal to Mark Antony. This opal was still to be seen in the days of Pliny, who ascribes to it a value equal to more than £100,000 sterling. The Imperial Cabinet of Vienna contains the most celebrated opal now known to exist. It is 5 in. by 2½ inches. The finest opals are almost all brought from Kaschan in Hungary, where they are found disseminated in a trachytic conglomerate. They are mostly very small, but even a very small opal, if really beautiful, is worth four or five pounds; and the price increases very rapidly with increase of size. Precious opal is found also in Saxony, in South America, etc. When the colors are not equally diffused, but in detached spots, jewelers call it *harlequin opal*. There is a dark or blackish variety, apparently tinged by oxide of iron, which occasionally exhibits very beautiful reflections, and is then much prized. *Girasol* (q.v.) and *cacholong* (q.v.) are varieties of opal. What lapidaries call *prime d'opal* is clay-porphyry, or other stone containing many small grains of opal. It is cut into slabs, and made into boxes and other ornamental articles, the stone which contains the opals being often artificially blackened by boiling in oil, and afterwards exposing to a moderate heat.—*Common opal* is semi-transparent, white, yellow, green, red, or brown, and does not exhibit any play of colors. It is not a rare mineral, and is chiefly found in clay-porphyry. *Semi-opal* is more opaque. *Wood*

opal is a petrifaction, and exhibits the form and structure of wood, the place of which has been taken by the siliceous mineral. *Hyalite* and *menilitë* are varieties of opal.

O'PATAS, an Indian tribe about the Mayo and Yaqui rivers in s. Sonora, Mexico. They number about 30,000, are semi-civilized, and govern themselves. They are, however, on the best of terms with the state government, and often lend assistance in repelling the depredations of the Apaches. They are also known as Yaquis or Mayos.

OPELIKA, city and co. seat of Lee co., Ala.; on the Central of Georgia, the Western of Alabama, and the Lafayette railroads; 68 miles n.e. of Montgomery. It contains a public school, public library, national and state banks, public parks, waterworks supplied from springs, electric-light plant, street railroad to Auburn, several mills and cotton ginneries, fertilizer and brick works, and bottling works. Pop. '90, 3,703.

OPELOU'SAS, town and parish seat of St. Landry parish, La.; on the Southern Pacific railroad; 45 miles n.w. of Baton Rouge. It contains a high school, female institute, convent of the Immaculate Conception, St. Mary's academy, several colored schools, U. S. and parish court houses, state banks, cotton compress, cotton oil and rice mills, ice factory, and bottling works. Pop. '90, 1,572.

OPEN-BILL, *Anastomus*, a genus of birds of the heron family (*ardeidæ*), natives of the East Indies and of Africa, remarkable for the structure of the bill, the mandibles being in contact only at the base and tip, with a wide interval between their edges in the middle. They frequent the sea-coast and rivers, and prey on fish and reptiles.

OPERA, a musical drama, in which music forms an essential part, and not a mere accessory accompaniment. As in the higher drama, poetry supersedes the prose of ordinary life, so in the opera, with perhaps as great artistic right, the language of music is introduced at a considerable sacrifice of probability. The libretto or words are, in the modern opera, a peg on which to hang the music, rather than the music an accessory to the written drama. The component parts of an opera are recitatives, duets, trios, quartets, choruses, and finales, accompanied throughout by an orchestra, and the whole is preceded by an instrumental overture (q.v.). Recitative is declamation, which, in its succession of musical sounds and rhythm, strives to assimilate itself as much as possible to the accents of speech, and therefore does not entirely conform to musical rhythm. The accessories of scenic representation are also present, and a ballet (q.v.) is also frequently introduced. In some of the German operas, and in the French *opéra comique*, spoken dialogue without music takes the place of recitative. Among the different varieties of the opera enumerated are the great opera or *opera seria*, of a dignified character; the romantic opera, embracing an admixture of the grave and lively; the comic opera, or *opera buffa;* as well as many intermediate varieties.

The idea of the opera may in part have arisen from the Greek drama, which possessed, to a considerable extent, the operatic character: the choral parts were sung, and the dialogue was delivered in a sustained key, probably resembling operatic recitative more than ordinary speech. The earliest extant example of any composition resembling the lyric drama of the moderns is Adam de la Hale's comic opera of *Li gieus (le jeu) de Robin et de Marian*, composed in the 13th c., the music of which is wonderful for its date. The next appearance of anything like opera is in the 16th c., when various musical dramas were composed in the madrigalesque style. An opera composed by Zarlino is said to have been performed at Venice when Henry III. passed through that city on his way from Poland to France. About the same time a pastoral called *Dafne*, written by the poet Rinucci, was set to music by Peri; and the same poet and musician conjointly produced the lyric tragedy of *La Morte di Euridice*, which was represented at the theater of Florence in 1600. Claudio Monteverde, one of a society of amateurs known as the "Florentine academy," who devoted themselves avowedly to the study and revival of Greek music, soon afterwards produced his *Orfeo*, a "*favola di musica*," in whose performance an orchestra of no fewer than 36 performers was called into requisition, most of the instruments being, however, only used in twos or threes, and never more than ten at a time. From these beginnings, the opera advanced into one of the permanent institutions of Italy—a development of music at first strongly opposed in character and style to the music of the church. With the progress of music, and the perfecting of the musical instruments which went to form the orchestra, the lyric drama began, towards the middle of last century, to approach its present character. Of the innumerable Italian operas of last century, only Cimarosa's *Matrimonio Segreto* retains its place on the stage. Cherubini, the first of the more modern school, after producing his *Quinto Fabio* at Milan, became naturalized in France: Rossini, who succeeded him in Italy, is the greatest name in the Italian opera. Nothing can exceed the deliciously fresh character of the best-known operas of this truly great musician, *Il Barbiere di Siviglia; Otello; La Gazza Ladra; Semiramide;* and *Guillaume Tell.* Next to them rank the equally well-known works of Bellini, *Norma; La Sonnambula;* and *I Puritani;—Lucia di Lammermoor; Lucrezia Borgia;* and *L'Elisir d'Amore*, the three *chefs-d'œuvre* of Donizetti, alone rivaling them in public estimation. A newer school of opera has recently sprung up in Italy, more grand if less fresh, of which the chief master is Verdi, whose *Ernani; Nabuchodonosor; I Lom-*

bardi; Otello; Rigoletto; Il Trovatore; La Traviata, and others have attained immense popularity in Italy, and wherever the Italian opera has been naturalized.

From Italy the opera was introduced into Germany, where, more scientific and less sensuous than in Italy, it flourished in opposition to national as well as ecclesiastical music. Germany divides with Italy the honor of perfecting orchestral music and the opera. Glück, educated in Italy, produced his *Orfeo* in Vienna, and then went to Paris, where the French adopted him as we did Handel. Mozart was the first composer of operas for the modern orchestra; *Idomeneo, Il Seraglio, Le Nozze di Figaro, Don Giovanni,* and *Zauberflöte* are his principal operatic works, unsurpassed by anything that has succeeded them. The most important German operas composed since their date are *Fidelio* by Beethoven; *Der Freischütz, Euryanthe,* and *Oberon* by Weber; *Faust* by Spohr; and the gorgeous operas of Meyerbeer—*Robert le Diable, Les Huguenots* and *Le Prophète,* and *L'Étoile du Nord. Les Huguenots,* notwithstanding its involving enormous difficulties in representation, keeps its place in every operatic theater in Europe. Wagner, the chief exponent of a more recent school, generally known as that of the "music of the future," has produced the operas of *Tannhäuser, Lohengrin,* etc., which enjoy at present a large share of public favor in Germany, and have also become known in England.

In France, the earliest operatic representation of which we have any record was in 1582. About 1669 the abbot Perrin obtained from Louis XIV. the privilege of establishing an opera in the French language at Paris, and in 1672 the privilege was transferred to Lulli, who may be considered the founder of the French lyrical drama. Lulli's popularity continued during a long period, and was only put an end to by the rise of the German Glück, who, naturalized in Paris, produced there his *Iphigènie in Aulide* and *Alceste.* It is greatly through Glück's influence that the modern French opera has become what it is, a composite work combining French, German, and Italian elements. Its best-known productions include Méhul's *Joseph,* Halévy's *Juive,* Auber's *Masaniello, Fra Diavolo,* and *Diamans de la Couronne,* and Gounod's recent opera of *Faust.* The Italian opera, introduced in Paris in 1646 by cardinal Mazarin, and superseded in 1670, was revived in the beginning of the present century, and has since flourished side by side with the national opera of France.

The possibility of a national English opera seems first to have been shown by Purcell, who, through Humphreys, had learned much from Lulli. His music to Dryden's *King Arthur* is very beautiful, though kept throughout subordinate to the business of the drama. *The Beggar's Opera,* as set to music by Dr. Pepusch, was a selection of the airs most popular at the time. It has retained its place on the stage, as also has Dr Arne's *Artaxerxes,* a translation from Metastasio adapted to music rich in melody. The importation of the Italian opera put a stop, for a time at least, to the further development of an opera in England. In 1706 *Arsinoë,* with English words adapted to Italians airs, was performed at Drury Lane. In 1710 *Almahide,* wholly in Italian, was performed exclusively by Italian singers at the Haymarket theater; and a succession of attempts of the kind ended in the permanent establishment of the Italian opera. The arrival of Handel in England decided the future progress of the opera. That great master was during the greater part of his life an opera composer and opera manager. He composed for the London stage no fewer than 44 operas, German, Italian, and English. These now forgotten operas were of course not the complex compositions of a later period, which could not have been performed in the then imperfect state of orchestral instruments. A recitative was set to music nearly as fast as the composer could put notes on paper, and the songs were accompanied in general by only one violin and bass, the composer sitting at the harpsichord, and supplying what was wanting. From Handel's time onwards, the opera flourished as an exotic in Britain, the singers being foreign, and the works performed being either Italian or occasionally German or French. Attempts crowned with some measure of success have latterly been made to establish an opera of a national character in England. Balfe's *Bohemian Girl* and *Rose of Castile* are the best works which this school has produced, and have attained, with other operas by Balfe, Wallace, and Macfarren, a considerable measure of popularity. See Hogarth's *Memoirs of the Opera* (London, 1851); S. Edward's *History of the O.* (1862); Grove's *Dictionary of Music;* Upton's *The Standard Operas* (1885).

UNIVERSITY OF ILLINOIS-URBANA
